HINCKS, SIR FRANCIS (1807-85). A Canadian statesman, born in Cork, Ireland, and educated at Fermoy and at the Royal Belfast Institution. Having received a business training, he emigrated to Upper Canada in 1832, and settling in Toronto became a wholesale merchant. His interest in politics led him to found and edit the *Examiner* (1838), a Liberal newspaper, in which he advocated responsible government. In 1841 he was elected a member of the Canada Legislative Assembly, and in 1842-43 was Inspector General (Minister of Finance) in the first Baldwin-Lafontaine administration. In 1844 he failed of reelection, and went to Montreal, where he established the *Pilot* and for several years was its chief contributor. He con-

tinued to defend responsible government and demanded the abolition of the clergy reserves and seigniorial tenures. (See CANADA, *History*.) In the second Baldwin-Lafontaine administration (1848-51) Hincks was again Inspector General and had charge of the commercial and economic measures. He procured active governmental aid to railway building and started the movement for reciprocity in natural products with the United States—not realized until 1854. (See RECIPROCITY TREATY.) In 1849 he was a special envoy to England in regard to the Rebellion Losses agitation. In the Hincks-Morin administration (1851-54), of which he was joint Premier, Hincks's wide knowledge of trade and financial affairs was used to promote a commercial treaty with the United States and to develop mines and railways. In the latter part of his administration he was opposed by the advanced Liberals of Upper Canada for failure promptly to carry out their programme of secularizing the clergy reserves and for yielding to the Roman Catholic demand of separate schools. After his defeat he was made Governor of Barbados (1855-62) and of British Guiana (1862-69). He returned to Canada and in 1869-73 was Minister of Finance in the Coalition administration of Sir John A. Macdonald. He afterward removed to Montreal, where he edited the *Journal of Commerce*. In 1869 he was knighted. His principal publications are: *Canada: Its Financial Position and Resources* (1849); *Reply to the Speech of Joseph Howe on the Union of the North American Provinces*, (1855); *Religious Endowments in Canada* (1869); *The Boundaries Formerly in Dispute between Great Britain and the United States* (1885); *Reminiscences of my Public Life* (1885), a work of permanent value on the political history of Canada in 1840-54. Consult S. B. Leacock, *Baldwin, Lafontaine, Hincks, in the "Makers of Canada Series"* (Toronto, 1907).

HINCMAR (806-882). A celebrated churchman of the ninth century. He was born presumably in Toulouse, as he belonged to the family of the counts of that province. He was educated in the monastery of Saint-Denis, near Paris, and was intrusted with the framing and carrying out of a plan for the reformation of the monastery. In 845 he was elected Archbishop of Rheims. In this position he had to deal with the case of the alleged heretic Gottschalk (q.v.), whom he treated with great severity. The followers of his predecessor, Ebbo, who had been deposed, remained bitter enemies. In 862 he became involved in a controversy with Pope Nicholas I. Rothadius, Bishop of Soissons and Suffragan to Hincmar, deposed a priest of his diocese, who appealed to Hincmar, as Metropolitan, and was ordered by him to be restored to office. Rothadius, resisting this order and having been in consequence condemned and excommunicated by the Archbishop, appealed to the Pope, who ordered Hincmar to restore Rothadius, or to appear at Rome in person, or by his representative, to vindicate the sentence. Hincmar sent a legate to Rome, but refused to restore the deposed Bishop; whereupon Nicholas annulled the sentence and required that the cause should again be heard in Rome. Hincmar, after some demur, was forced to acquiesce. The cause of Rothadius was reexamined, and he was acquitted and restored to his see. Under the successor of Nicholas, Adrian II, a question arose as to the succession to the sovereignty of

Lorraine on the death of King Lothaire, the Pope favoring the pretensions of the Emperor Louis II in opposition to those of Charles the Bald of France. To the mandate which Adrian addressed to the subjects of Charles and to the nobles of Lorraine, accompanied by a menace of the censures of the Church, Hincmar offered a firm and persistent opposition. He was equally firm in resisting the undue extension of the royal prerogative in ecclesiastical affairs. Hincmar died at Eprenay, whither he had fled from the Normans, Dec. 21, 882. His works were collected by Sirmond (Paris, 1645), reprinted in Migne, *Patrol. Lat.*, cxxv-cxxvi. Many others of his works are still in manuscripts. For his life, consult: J. C. Prichard, *Life and Times of Hincmar* (Littlemore, 1849); C. N. D. Diez, *De Hincmari vita et ingenio* (Sens, 1859); W. F. Gess, *Merkwürdigkeiten aus dem Leben und den Schriften Hincmars* (Göttingen, 1860); Carl von Noorden, *Hinkmar, Erzbischof von Reims* (Bonn, 1863); Theodor Foerster, *Drei Erzbischofe vor tausend Jahren* (Gütersloh, 1873); Auguste Vidieu, *Hincmar de Reims; étude sur le IX^e siècle* (Paris, 1875); Max Sdralek, *Hincmars von Reims kanonistisches Gutachten über die Ehescheidung des Königs Lothars II.* (Freiburg-im-Breisgau, 1881); J. H. Schorörs, *Hinkmar, Erzbischof von Reims* (ib., 1884).

HIND, hind (AS., Icel. *hind*, OHG. *hinta*, Ger. *Hinde*, hind; probably connected with Goth. *hinnan*, to catch, related to AS. *huntian*, Eng. *hunt*, possibly connected with Gk. *κεῖνός*, *kemas*, gazelle). The female of the red deer, a correlative of "stag" or "hart" (q.v.). In strict use, according to the ancient laws and customs of venery, it did not become the designation of a female red deer until the third year of its age. Latterly the word has become, outside of England, a synonym of "doe."

HIND. A fish. See GROUPE.

HIND, HENRY YOULE (1823-1908). A Canadian explorer and geologist, born in Nottingham, England. He was educated at Leipzig and at Cambridge and went to the United States in 1846 and in 1847 to Upper Canada. He was made mathematical master in the provincial normal school and in 1851 became professor of chemistry and geology in Trinity College, Toronto. In 1857 he was appointed geologist to the Red River exploring expedition, and in 1858 he was placed in charge of the expedition sent to explore the country between the Red and Saskatchewan rivers. His reports on these expeditions were published by the Canadian and British parliaments. In 1861 he made an exploratory survey in Labrador. He removed to New Brunswick in 1864, made a geological survey of that province, and later, having gone to Nova Scotia, was appointed professor of chemistry and natural history in King's College, Windsor. In 1876 he made a geological exploration of the northeastern part of Newfoundland and the Atlantic coast of Labrador. He prominently assisted in the scientific work of the Fisheries Commission which met in Halifax in 1877 under the provisions of the Treaty of Washington (q.v.). In 1860 he was elected a fellow of the Royal Geographical Society. He published the *Northwest Territory* (1859) and many other reports of his geological and exploring expeditions.

HIND, JOHN RUSSELL (1823-95). An English astronomer, born at Nottingham. When a mere boy, he devoted himself to astronomy and

at the age of 17 he was given a position in the Royal Observatory at Greenwich. In 1844 he was appointed member of the commission sent to determine the exact longitude of Valentia. On his return he was appointed observer in Bishop's Observatory, Regent's Park, London. He calculated the orbits of a number of planets and comets, noted many new variable stars and nebulae, and discovered 10 new planetoids (q.v.), viz., Iris and Flora in 1847; Victoria in 1850; Irene in 1851; Melpomene, Fortuna, Calliope, and Thalia, in 1852; Euterpe in 1853; and Urania in 1854. In 1851 Hind received from the Academy of Sciences in Paris the Lalande medal and was elected a corresponding member. In 1852 he received the gold medal of the Astronomical Society of London and obtained a pension of £200 a year from the British government. He was superintendent of the *Nautical Almanac* in 1857-91. His scientific papers have generally been published in the *Transactions of the Astronomical Society*, the *Comptes Rendus*, and the *Astronomische Nachrichten*. His principal popular works are: *The Solar System* (1846); *Astronomical Vocabulary* (1852); *The Comets* (1852); *Descriptive Treatise on Comets* (1857); *Introduction to Astronomy* (3d ed., 1871). He was president of the Royal Astronomical Society in 1880.

HIND AND THE PANTHER, THE. A satirical poem by John Dryden (1687). It is a defense of the Roman Catholic church in the form of an allegory, in which all characters are represented by animals. The Hind stands for the Roman, the Panther for the Anglican church.

HINDENBURG, hin'den-burg, KARL FRIEDRICH (1741-1808). A German mathematician, born at Dresden. Educated at Leipzig, he became docent (1771) and professor of philosophy (1781) in the university there. In 1786 he became professor of physics. He edited the *Magazin für reine und angewandte Mathematik*, with Bernoulli (1786-88), and the *Archiv der reinen und angewandten Mathematik* (1794-99); but he is best known as the discoverer of combinatory analysis and as author of *Kombinatorisch-analytische Abhandlungen* (1796 and 1800).

HINDENBURG, PAUL VON BENECKENDORFF UND VON (1847-). A German soldier, born in Posen. He became a subaltern in 1866, served in the war against Austria, distinguishing himself at the battle of Königgratz, and participated during the Franco-Prussian War in the storming of St. Privat, near Metz, and in the battle of Sedan. After receiving a military education (1872-75) he served in various capacities with the general staff—in active service in the field and as head of a bureau of the War Department. He was promoted major general in 1900 and lieutenant general in 1903, was retired in 1911, but, when the Great European War broke out, in 1914, was recalled and made general-oberst, with chief command of the campaign in East Prussia against Russia. At Tannenberg he won one of the greatest German victories in the campaign against Russia. In 1870 and again in 1914 he was decorated with the order of the Iron Cross, and in November of the latter year he was made field marshal. See WAR IN EUROPE.

HINDERSIN, GUSTAV EDUARD VON (1804-72). A Prussian soldier, born at Wernigerode. He joined the Prussian artillery in 1820, became

an officer in 1825, attended the Kriegsakademie at Berlin in 1830-37, and in 1841 was detailed for duty on the general staff, of the topographical section of which he was later director. As lieutenant general, he had charge of the artillery attack on Düppel during the war with Denmark in 1864 and for his services was ennobled. He was chief of artillery on the King's staff during the war with Austria in 1866 and during the Franco-Prussian War. His energy led to great improvement of the artillery efficiency, to the substitution of the rifled gun for the smoothbore, and to the organization of the artillery school.

HINDI. See HINDUSTANI LANGUAGE AND LITERATURE.

HINDLEY, hīnd'li. An urban district in Lancashire, England, 3 miles southeast of Wigan. Coal mining and cotton manufactures are important industries. Its chief buildings are the free grammar school and the old parish church, which was desecrated by the Cavaliers during the Puritan Revolution. The municipality operates markets and remunerative gas and water works. Pop., 1901, 23,504; 1911, 24,100.

HINDMAN, hīnd'man, THOMAS CARMICHAEL (1818-68). A Confederate officer in the American Civil War. He was born in Tennessee, was educated in the common schools, studied law, and removed to Mississippi to practice his profession. As a lieutenant in a Mississippi regiment, he took part in the Mexican War and was a Democratic member of Congress from 1858 to 1861. He was appointed to the command of a brigade in the Confederate army soon after the Civil War began and first served under Gen. Simon Buckner in Kentucky. At Memphis he was in command and was afterward defeated at the battles of Newtonia and Prairie Grove. Promoted to be a major general at the battle of Shiloh, he was transferred to Arkansas. After the close of the war he went to the city of Mexico, but finally returned and settled in Arkansas in 1867. The following year General Hindman was murdered by one of his former soldiers in revenge for some disciplinary act during the war.

HINDOOSTAN, hīn'dōō-stān'. See HINDUSTAN.

HINDU CHRONOLOGY. See VEDA.

HINDUISM. The national religion of India. The result of a compromise between Brahmanism (q.v.) and the religious ideas of the lower Aryan castes and the non-Aryan population of India, modern Hinduism is as diversified as there are degrees in this compromise. Standard Hinduism is characterized by professed reverence for the Veda and the traditions of the Brahmins, with the consequent acknowledgment of Brahman privileges; the observance of certain prescriptions concerning food, marriage, and burial; and the practice of a number of rites, sacraments, and forms of divine worship. But if any one of the traits alluded to in this formal definition be chosen as a test of Hinduism, its application would lead to impossible consequences. This holds true of even its most tenacious traits, such as the cremation of the dead, the respect for the cow, and the employment of Brahman ministrations. Nor is Hinduism wholly coextensive with the caste system. (See CASTE.) This many-sided and elusive aspect of Hinduism is quite natural in view of its syncretism, which has incorporated animist, fetishist, and shamanist elements to a philos-

ophy derived from Vedic and Sankhya (q.v.) sources and to Vedic worship has added sectarianism, mysticism and magic, theriolatry and phallicism, the cult of numerous local divinities, and reverence for holy men.

The movement has not always been from Brahmanism downward; local and primitive faiths and rites have imitated the appearance of Hinduism into which they were finally merged. Hinduism has thus come to comprise "entirely different sets of ideas, or, one may say, widely different conceptions of the world and life. At one end, at the lower end of the series, is Animism, an essentially materialistic theory of things which seeks by means of magic to ward off or to forestall physical disasters, which looks no further than the world of sense. . . . At the other end is Pantheism, combined with a system of transcendental metaphysics." (Risley.) The author just quoted has, in fact, epigrammatically defined Hinduism as "magic tempered by metaphysics." Related to this character of Hinduism is the importance it attaches to a sensuous symbolism, which, to a non-Hindu at least, frequently seems to obscure rather than bring out the underlying idea. This peculiarity explains the lapse of philosophical schools of religion into mere formalism, with its exaggerated emphasis of externals to the detriment of real religious feeling. On the other hand, what at first glance resembles idol worship may be a consciously symbolic act of reverence.

The Sanskrit word *dharma* (right, duty, law, usage, institution, conduct, morality, piety, religion) exactly indicates the scope of Hinduism. The terms "Brahmanism" and "Hinduism" are often interchangeable; usually, however, the former is restricted to the orthodox religion of the Brahmins, which is nearer Vedic belief than the newer and more popular forms of worship which constitute Hinduism proper.

According to the census of 1911, Hinduism is professed by 217,586,900 individuals out of a total Indian population of upward of 313,000,000. The religion next in numbers is Mohammedanism, which in India counts over 66,000,000 adherents. Buddhism claims 10,721,449 people, while upward of 10,000,000 are classed as animists. The non-orthodox sect of the Sikhs is represented by more than 3,000,000 individuals and Jainism by some 1,250,000. The immense preponderance of Hinduism is therefore obvious. Its numerical strength is also an index of the diversity of this religion which is "monotheistic in essence, multifarious and grotesque polytheism in semblance, with pantheism for a harmonizing principle." (Moore.) We are thus led to distinguish between a purely speculative and theological and a low sectarian aspect of this faith. True sectarianism is to a large extent subversive of orthodoxy. Frequently antagonistic to the Brahmins, the sectaries revere religious teachers (*gurus*) of their own and often set aside caste differences within their fold. The sects have special Puranas (see PURANA) and other religious and semireligious works, liturgies, formulas (*mantras*), and emblems to which they tenaciously cling, and which differentiate them from one another. A position apart is held by the numerous ascetics, religious mendicants, and Yogi jugglers, whose sectarianism is often nominal, and who may comprise several sects in the same order. A general sketch of the development of Hindu religion will be found under the heading INDIA, section *Religion*, while

under BRAHMANISM is treated the change of Vedic religion to Brahmanism and early Hinduism. (See INDIAN MYTHOLOGY.) The present article endeavors to touch on the philosophic aspects of Hinduism. The written sources of Hinduism are the epics of Mahabharata and Ramayana, and especially the Bhagavad-Gita and Harivansa portions of the former, the Puranas, and other sectarian writings, such as the *Bhakti Sūtras* of Sāṅdilya and Nārada, the philosophical writings of the founders of sects, their commentators and opponents, and numerous treatises of edification, stotras, or odes in praise of the divinity, etc.

Two doctrines lay from the time of the Upanishads (q.v.) at the basis of every Hindu speculative system, viz., the doctrine of an indefinite series of rebirths (*saṁsāra*, or transmigration), and that of the permanence of the effects of one's action (*Karma*, *adṛṣṭa*), all Hindus agreeing that every action invariably brings about its reward or punishment in either this life or in some future existence, and that, conversely, the nature of one's existence, the lot of man, is rigorously determined by the merit or demerit incurred by previous actions. This is held to be possible because of the existence of a "subtle body" (*sūkṣma śarīra*) which accompanies the soul in all its wanderings. Several corollaries of these doctrines are important from a religious point of view. Between the gods and men there is thus no difference of essence, but only of degree, because both gods and men are but steps in the *saṁsāra*. In consequence of this belief atheism does not in India possess the significance it has in the religious history of Europe. God, moreover, the highest good, came to be regarded as the ultimate and desirable goal of universal evolution. To reach him, to obtain deliverance (*mukṭi*, *mokṣa*) from the sluggish course of *saṁsāra* became the supreme task of theology, man's aim being to obtain at first a partial state of freedom (*jīvanmukṭi*), which merges into perennial bliss when all the previous karma has been spent out. This conception is foreign to the Vedic age when the worshiper's sole concern was to demand of the gods certain material benefits in the return for the sacrifice. The Brahmanas may be said to countenance a "practical road" (*Karma-marga*) to salvation, a view which later received an elaborate treatment at the hands of the famous Kumārila (700 A.D.). Opposed to this is the Upanishad (q.v.) theory of saving knowledge (*jñānakāṇḍa*), which, elaborated in the Vedānta (q.v.) system of philosophy, is practically identical with esoteric Brahmanism. The chief theological contribution of Hinduism, on the other hand, is the doctrine that salvation is primarily dependent on *bhakti*, faith or devotion to one divinity.* It is therefore essentially theistic as against the pantheistic Vedantism. The opposition of the two is not, however, felt in religious practice and is diminished by the belief in the incarnations (*avatāras*) of Vishnu, which bridge the gulf between an immanent all-god and a personal deity. The personal pantheism of Krishnaism has been compared with

the Christian doctrine of the Son's incarnation, but differs from it inasmuch as Christianity is not pantheistic. In Hinduism, on the other hand, "the immanence of God in the external world and in the heart of man is the cardinal doctrine." (Bhandarkar.) God is therefore both the material and the efficient cause of the world in the majority of Hindu systems. Nevertheless philosophic Sivaism, and some schools of Vishnuism, admit a dualism of matter and mind which entails a differentiation, in some respects at least, of God from the world.

The Bhakti doctrine is especially promulgated by the Vishnuite schools; but there also is a Siva-bhakti. Originally a religion of reform, like Jainism and Buddhism, and likewise directed against Brahmanism, the new faith appeared not much later than the two great heterodox religions as a monotheism preaching "the religion of a single-minded love and devotion to One," Ekāntika Dharma. In a sectarian form this monotheism was absorbed by the Vāsudeva worship of the Bhāgavata and Pancharātra sects and flourished among the Kshatriya tribe of the Sātvatas. The religion was well established in the fourth century B.C., a date which, according to Sir R. Bhandarkar, is the *terminus ad quem* of the Bhagavad-Gita, the Vishnuite Bible. This poem shows strong influence of Upanishad, Sankhya, and Yoga (qq.v.) ideas—a fact which must have increased its popularity. Successive identification of the Bhāgavata divinity with Puruṣa Nārāyaṇa, the primeval Man, with the Vedic Vishnu (q.v.), the cowherd boy-divinity Gopāla-Kṛṣṇa of Gokula (see KRISHNA), and with the hero Rāma transformed the original monism into a number of related sects. Vishnu finally became an all-god, and his religion the sectarian aspect of Vedantic monism. Vedantic Sivaism, as Professor Hopkins has rightly observed, is, on the contrary, only nominal Sivaism, or, if true Sivaism, only nominally Vedantic.

The Vedantic philosophy received its definite formulation in the ninth century A.D., when Sankara, commenting on the Brahma Sūtra of Bādarāyana, elaborated the doctrine of idealist singularism which declared the phenomenal world an illusion (*māyā*) due to "ignorance" conceived as an active principle. The only true reality is God, or absolute being, with whom the saved soul is identical. Sankara thus opposed a transcendent (*nirguṇa*) divinity, which is incogitable to the personal, "qualified" (*saguṇa*) Brahma of the Upanishads, and declared the latter to be a concession to the vulgar minds. To the enlightened practical worship has no importance. This doctrine soon found an echo among the enlightened Brahmins and was strengthened by the elaboration of a kindred psychology and cosmology. As it endangered practical religion, it also had many opponents. One of them, the Vishnuite Rāmānuja (born in 1016 A.D.), revived the old teaching of the Bhagavad-Gita, and its Sankhya principles. His system of "qualified monism" (*viśiṣṭādvaita*) teaches that God is, not pure being, as held Sankara, but a personality qualified by all the perfections, such as intelligence, joy, power, mercy, etc. The insensate world (*aśit*) and the individual, atomic, souls which together constitute the *chit*, are both the body, or attribute (*prakṛti*) of the cosmic soul that controls the universe (Īśvara, identified with Nārāyaṇa). God appears in several modes, the highest being

* While Vedāntin Brahmins restrict salvation to members of the Brahmin class, the others having first to be born in this class before they may be saved, modern Hinduism promises salvation to all the people in its fold; even Sudras. Hinduism is to Vedic religion what the New Testament is to the Old, and some scholars, like Grierson, believe that its establishment was influenced by Christian ideas coming from the northwest.

Para and Viuha, and the next Vibhava, which comprises the 10 avatāras of Vishnu, and Antaryāmin, or inner soul, perceived by the Yogins; and in the idols. The practice of *bhakti*, which he conceived as identical with the *upāsana* (meditation) of the Upanishads, is not open to the Sudras, who know not the Vedas and the rites, but even they may attain salvation if they abandon the world and throw themselves on God's mercy (*prapatti*, surrender). The saved soul enjoys all the attributes of God save the creative. Rāmānuja has many followers in the south of India. His contemporary Nimbārka taught that the *chit* and *achit* constitute the Sakti, or divine capacity, being a development of his potentiality. Bhakti he conceived in an erotic sense (the term is applied in Hindu theosophy to the female generative principle). He adored the divine pair of Krishna and his mistress Rādhā and won many followers in Bengal. A more refined system was elaborated by Madhva-Anandatīrtha, an eclectic who denied God as a material cause of the universe (thirteenth century). His followers are recruited among the Brahmins.

Vedantic pseudo-Sivaism is typified in the Kashmir school (ninth to eleventh centuries A.D.), which held that the world is a reflection of Siva's splendor in himself. God is therefore the archetype of the world and the source of all true knowledge. These ideas were not destined to become popular. Popular Sivaism is, as a rule, associated with brutal and obscene rites and with degraded asceticism. This evil side of the faith was apparent from the beginning of the cult; Rudra-Siva being a terrible divinity, the lord of wild places, of cemeteries and forests and of the people who live in them, thieves and outcasts. The horrible sects of the Kāpālas and Kālāmukhas, who practiced human sacrifices, and the erratic (*antimargika*) school of Pāsupatas, who took refuge in the mystic and extravagant practices of the Yogi type, illustrate low Sivaism. From the philosophical point of view, however, the last-named school holds out, as does ordinary Sivaism (*Siddhānta-darśana*, *Saivādharśana*), the theory of a material or formative principle (*prakṛti*, *Māyā*) distinct from Siva but under his control. The Lingayats of Dekkan, an anti-Brahmanic sect which originated towards the middle of the eleventh century of our era, show Vishnuite influence. They hold that Siva, or Linga,* qualified by Sakti, is the efficient and material cause of the world, "the instructor and redeemer of mankind" (Bhandarkar), to whom the souls aspire by virtue of an innate bhakti. Devotion and renunciation to the world are necessary to salvation. The Virasaivas, or Lingayats, are recognized by the phallus, or *linga*, which they usually carry in a box suspended from their neck.

While Sivaism appealed to the enlightened few and to the rabble, Vishnuism is a middle-class religion divided into two main branches—a purer, or Ramaite, and a lower and less chaste Krishnaite. The cult of Rāma, the epic hero conceived as an incarnation of Krishna, and of his spouse Sītā, received a mighty impetus in the fourteenth century when Rāmānuja, preaching in the vernacular, called to the fold even the degraded classes. Although his disciples

(Avadhūtas, the freed) threw off many sectarian practices, they are still true Hindus. They also show reverence for the monkey Hanuman, the mythical friend of Rāma. A number of modern reformers claiming fidelity to Rāmananda's teaching, stripped his theology of all its sectarian characteristics until it became, under Moslem influence, a pure unitarianism. The most famous of these were Dādu, a contemporary of Akbar, the weaver* Kabir (fifteenth century), and Nanak, the reputed founder of the Sikhs (q.v.). Rāma faith was professed by the poet† Tulsī Dāsa (1574-1623), who, although not a sect founder, wrote a Hindi Ramayana which may be called the New Testament of Vishnuism, both for its moral doctrines and also because Rāma is therein said to have sacrificed himself for the salvation of men. The two Marāṭha saints Nāmdev (end of fourteenth century) and Tukārām (born in 1607 A.D.) may be mentioned here. They, like Kabir, denounced mere formalism and laid stress on moral purification as prerequisite to salvation. The erotic aspect of the Krishna-Rādhā cult is most noticeable among the followers of Vallabha (sixteenth century); they are wealthy middle-class men of Gujarat and Rajputana, who imitate their sporting divinity by leading an easy and care-free life. Less sensual is the sect inaugurated by Chaitanya of Bengal, a contemporary of Luther; it represents the mystical and emotional side of bhakti. Both sects show an exaggerated respect for their religious teachers (*gurus*, *gosains*).

We may reckon among the Sivaites the votaries of Ganeśa, whose cult has been contaminated by that of Vināyaka, the prince of evil spirits, the followers of Karttikeya, once numerous, and most of the Yogis. A peculiar position is held by the Śāktas, or worshipers of the female principle (*śakti*), personified in Siva's consort of many names, Mahādevī, Durgā, Kālī, Pārvatī, Kālālā, etc. The śakti cult has a bloody and a sensual form. (See THUG; TANTRA.) It is among the "left-hand" Śāktas, who form a secret association chiefly represented in East Bengal and Assam, that unspeakable orgies form a part of worship. Yet even these gross aberrations admit of a symbolic interpretation strengthened by a philosophic terminology. Yoga exercises of all kinds, mystic gestures (*mudrās*), cabalistic formulas (*mantras*), symbolic emblems, and the "five m's" (viz., *māḍya*, wine, *māṃsa*, meat, *mātsya*, fish, *mudrā*, parched grain, and *maithuna*, union of the sexes) play an important rôle in Śākta worship, which is typically syncretistic inasmuch as it associates phallicism, magic, and shamanism with Vedic rites, fetishism, and the worship of mother divinities. It is pleasant to oppose to this degraded worship and its accompanying beliefs not only the pure unitarianism professed by the enlightened members of the Brahmo-Somaj (q.v.), the more national religion of the Arya Somaj, the philosophic Vedantins, and the nonsectarian worshipers of one god under the name of Rāma, Viṭhobā, etc., but also the uncultured adherents of both monotheism and polytheism found in Berar. Hinduism is thus seen to contain an

* These later reformers are sometimes of low station. Senā was a barber.

† To Vishnuism belong the Sanskrit poet Jayadeva and the Tamil Thiruvalluva Nāyanār (author of the Kurral); while the Tamil saint Tīrūnāna Sambandha and the poet Manikka Vāsagar were Sivaites.

* Linga is the phallus; but the Sankhya school uses the term for the "subtle body" which is the unpershable substratum of psychic life. Among the more refined Lingayats God is identical with the ether linga, which is infinity.

infinity of potencies, good and bad. Contrasted with the Vedic religion, it shows a more advanced stage because it appeals to more classes of people than did Vedic worship, and because it no longer is content with formalist ritualism, but lays stress on love as a means of salvation. But although, under the influence of Mohammedanism and Christianity, it has cast off some of its specific Hindu garb, Hinduism still continues to be a nationalist and not a universal religion.

Bibliography. Among the works treating of Hinduism in conjunction with other religions may be mentioned Chantepie de La Saussaye, *Lehrbuch der Religionsgeschichte*, vol. ii (Tübingen, 1905), and G. F. Moore, *History of Religions* (New York, 1913), a good popular introduction, with bibliography. Of literary histories which give a large place to Hindu religious thought: Macdonell, *History of Sanskrit Literature* (London, 1900; reissued, 1909); Henry, *Les littératures de l'Inde* (Paris, 1904); Winternitz, *Geschichte der indischen Literatur* (Leipzig, 1908), the latest and best. Further, Garcin de Tassy, *Histoire de la littérature hindoue* (2d ed., Paris, 1871); Bhandarkar, *Report on . . . the Search for Manuscripts* (Bombay, 1884); Deussen, *Allgemeine Geschichte der Philosophie* (Leipzig, 1894 et seq., 2d ed., 1906), indispensable; D. Chandra Sen, *History of Bengal Language and Literature* (Calcutta, 1911). Of capital importance are the *Encyclopædia of Religion and Ethics* (ed. by Hastings, New York, 1908-) and the series of *Census Reports of India* (Calcutta). The number of works dealing with Hinduism, ancient or modern, is very large. The following are among the best: Horace Wilson, "Sketch of the Religious Sects of the Hindus," in his *Works*, vols. i-ii (London, 1862), out of date but still serviceable; Colebrooke, "On the Religious Ceremonies of the Hindus," reprinted in his *Miscellaneous Essays* (ib., 1873), the earliest work on the subject; Monier Williams, *Indian Wisdom* (ib., 1876); id., *Hinduism* (ib., 1877, introductory); Wilkins, *Modern Hinduism* (ib., 1887); Barth, *Religions of India* (3d ed., trans. by Wood, ib., 1891), very useful; Monier Williams, *Brahmanism and Hinduism: Religious Thought and Life in India* (4th ed., ib., 1891); Guru Prasad Sen, *Introduction to the Study of Hinduism* (Calcutta, 1893); Mitchell, *Hinduism, Past and Present* (2d ed., London, 1897); Nath, *Hinduism* (Meerut, 1899); Lyall, *Asiatic Studies* (2d ed., London, 1894); Hopkins, *Religions of India* (Boston, 1895); Roussel, *Cosmologie Hindoue* (Paris, 1898); id., *Légendes morales de l'Inde* (ib., 1900-01); Wilkins, *Hindu Mythology* (2d ed., London, 1900); Hopkins, *Great Epic of India* (New York, 1901); id., *India, Old and New* (ib., 1901); Slater, *Higher Hinduism in Relation to Christianity* (London, 1902); Barnett, *Hinduism* (ib., 1906); Morrison, *New Ideas in India during the Nineteenth Century* (ib., 1907); Grierson, "Modern Hinduism and its Debt to the Nestorians" and "The Modern Hindu Doctrine of Works," in *Journal of the Royal Asiatic Society* (London, 1907-08); Lévi, "La formation religieuse de l'Inde contemporaine," in *Annales du Musée Guimet*, vol. xxv (Paris, 1907); Kelkar, *Essay on Hinduism* (London, 1911); Farquhar, *Primer of Hinduism* (2d ed., ib., 1912); Dowson, *Classical Dictionary of Hindu Mythology* (5th ed., ib., 1913); Avalon, *Tantra of the Great Liberation* (ib., 1913),

with important introduction written from a sympathetic standpoint; the standard book of Bhandarkar, *Vaisnavism, Saivism, and Minor Religious Systems* (Strassburg, 1913); and, in addition, the following: Bhattacharya, *Hindu Castes and Sects* (Calcutta, 1896), somewhat marred by the rationalistic tendencies of its author; William Crooke, *Popular Religion and Folklore of Northern India* (2d ed., London, 1896); C. W. C. Oman, *Mystics, Ascetics, and Saints of India* (ib., 1903); id., *Brahmans, Theists, and Muslims of India* (2d ed., ib., 1908); id., *Cults, Customs, and Superstitions of India* (ib., 1908); Herbert Risley, *People of India* (Calcutta, 1908); Thurston, *Omens and Superstitions of Southern India* (London, 1912). For translations of original texts, consult *The Sacred Books of the East* (ib., 1879 et seq.; with *Index* by Winternitz, 1910). See BHAGAVAD-GITA; BRAHMANISM; BRAHMO-SOMAJ; BUDDHISM; INDIA; JAINISM; MAHABHARATA; MAHAYANA; PURANA; RAMAYANA; SANKHYA; SIKHS; TANTRA; UPANISHAD; VEDA; VEDANTA; YOGA.

HINDU KUSH, hin'doo kōosh, or INDIAN CAUCASUS. A range of mountains, forming the westward continuation of the Himalaya, being sometimes reckoned a part of that colossal range (Map: Afghanistan, N 5). It extends from the Upper Indus on the east to the Bamian Pass (beyond which the continuing range is generally designated Safed-Koh) on the west, stretching in latitude between 34° and 36° N. and in longitude between 68° and 74° 30' E., with a length of about 500 miles. Nearly the whole of it is contained in Afghanistan. The Oxus, or Amu-Darya, has its source in its northern ridges, and many tributaries of the Indus flow down the south slope. For the first 100 miles west of the Pamirs it is flat-topped with lakes and no peaks and with passes ranging in altitude from 12,500 to 17,500 feet. Farther westward it becomes higher, and its plateau summit breaks up into peaks of which Tirach Mir, on the frontier of Chitral, is the loftiest (25,400 feet in altitude). In this part are many passes over which trails or roads are in use. The range, which consists mainly of granites and schists, was probably uplifted in Tertiary time.

HINDU MUSIC. According to the ancient Hindu belief all arts were bestowed upon man by various gods, and music was the gift of Brahma. The early history of music in India is so beset with fables and reaches back to such remote antiquity that it is impossible to trace its real origin. We have, however, unmistakable evidence that several of the hymns of the *Rig-Veda* (about 1500 B.C.) were intended to be sung to music. The hymns also mention flutes (*vāṇa*), cymbals (*karkari*), drums (*duṇḍubhi*), and trumpets (*bakura*). Not only are the early accounts of the origin of music marked by an exuberance of the imagination, but the strictly scientific treatises on the subject of music are not free from this fault. The Hindu works on music are of uncertain date, but seem to be relatively late. Like much of Sanskrit literature, even when dealing with technical subjects, they are written in verse. They exist for the most part as yet only in manuscript. The most important are the *Samgītadarpaṇa* of Damodara, the *Samgītānārāyaṇa* by Narayana, the *Samgītātātānākara* of Sarṅgadeva (ed. by Telang, Poona, 1897), the *Rāgavibōdha* of Somanatha (ed. by Gharpure, Poona, 1895), the *Rāgamāta* of Kshemakara and many others of less value.

The oldest scale of the Hindus, the *Ṛṇāvali*, consists of only five tones, F, G, A, C, D, and is identical with that of the Chinese. In the course of time two tones were added, and A was taken as the starting point. Thus a scale identical with our A major was obtained. A scale was known as *Svaragāma*, or *Saptaka*, and the different tones were designated by the syllables *Sa*, *Ri*, *Ga*, *Ma*, *Pa*, *Dhai*, *N̄*. Each of these syllables denoted not only the fundamental tone, but was applied equally to all its chromatic alterations. Within any scale three tones were designated by special names. These were the first, third, and fifth, known as *Amśa*, *Graha*, and *Nyāsa* respectively. Their function is stated in the *Samgītānārīyaṇa*: "The note *Graha* stands at the beginning and *Nyāsa* at the end of a song. *Amśa* is the leading note; it gives to the melody its particular character and is used the most frequently, and the other notes are subordinated to it as to a ruler." The seven tones of the scale were repeated three times in succession, and thus a compass of three *Astau*, or octaves, was obtained. The different tones were classified as major tones, minor tones, and semitones. Each major tone consisted of four quarter tones, each minor of three quarters, and each semitone of two quarters. These subdivisions were called *śrutis*, of which each octave had 22. Major tones were the first, fourth, and fifth, minor tones the second and sixth, semitones the third and seventh. The *Rāgaṇibōdha* admits the possibility of no less than 960 modes, but enumerates only 36. Even out of these only 23 are recognized as having practical value. These 36 modes were divided into 6 primary called *Rāgas*, and 30 secondary modes called *Rāgaṇis*. The number of *Rāgas* was determined by the number of seasons, which in India is six. An attempt was made to have each *Rāga* express, as closely as possible, the character of the season to which it corresponded. It also was improper to play a *Rāga* at any other season than the one of which it was the expression. Musical notation by means of a staff was unknown to the Hindus. The different tones were represented by their initial consonants with lines drawn above or below to indicate to which *Astau*, or octave, the particular tone belonged. Embellishments and marks of expression were represented quite definitely by means of small circles, ellipses, chains, curves, horizontal and perpendicular lines. The end of a phrase was indicated by a lotus flower.

Of the musical instruments the *vina* (q.v.) was the principal one and is still used to-day in India. The *magudi* was also a stringed instrument with four strings. Among the varied instruments the principal ones were the *basari*, a flute with seven holes, and the *śankha*, a kind of trumpet made from a sea shell. From the perfection of the *vina* it can easily be inferred that in the art of music India was far in advance of all other Asiatic countries of antiquity. In spite of the complicated theoretical system composers employed chiefly the *śrīrāga*, our modern A major. The minor mode occurs also, but very seldom. In the religious cult of the Hindus music was of primary importance. Music, both vocal and instrumental, was strictly regulated by laws. The former was called *Gaṇa*, the latter *Vādyā*. Pantomimes were known as *Nṛtya*; and a combination of all was designated by the term *Samgīta*.

What strikes a student of the original Hindu melodies is the great discrepancy between mu-

sical theory and actual practice. Evidently the composers disregarded theoretical speculations and wrote according to the dictates of their ear; for all the melodies are found to be written exactly in our major or minor modes and can be harmonized accordingly without the least difficulty.

HINDUSTAN, *hin'dōō-stān'*, or **HINDOOSTAN**. The land of the Hindus. A portion of India situated north of the Vindhya Mountains in the valley of the Upper Ganges. The name has been used loosely as a designation of the Indian peninsula. See **INDIA**.

HINDUSTANI (*hin'dōō-stā'nē*) **LANGUAGE AND LITERATURE**. The *lingua franca* of northern India. This is in structure an Indian language, descended from a sister dialect of the ancient Sanskrit through mediæval Prakrit vernaculars. Hindustani (Mod. Pers. *Hindūstāni*, from *Hind*, India) is divided into nearly 60 subdialects, which in the eastern portion of its district are approximate Bengali and in the south and west closely resemble Marathi and Gujarati. The territory of Hindustani, which is the vernacular of nearly 100,000,000 people, covers some 248,000 square miles. The standard dialect is the Brāj Bhāṣa, spoken in the districts of Delhi, Agra, and Mathura. Hindustani abounds in Turkish, Arabic, and Persian words, as well as in numerous borrowings from Dravidian and Kolarian dialects. In this form it is called *Urdu*, which in Turkish signifies 'camp.' This term is a relic of the Mohammedan invasions of the country around Delhi in the twelfth century, when conquerors and conquered sought to find a speech which they might each understand, and this speech became the official language of the Mogul administration, while a literary form of Urdu, used in poetry and rich in Persian elements, is known as *Rekhta*. During the nineteenth century the vocabulary of the language was purified to a great extent of the foreign element, and the usage of native words as far as possible has since been preferred. Hindustani without these non-Indian importations is called Hindi, or High Hindi.

In structure the language is analytic. In this it resembles the other modern Indian languages as well as Persian, and in many respects English. It forms cases, tenses, etc., by postpositions, periphrases, and the like. Thus, from *ghar*, 'house' (Sanskrit *grha*), is formed the genitive *ghar kā*, ablative *ghar sē*, agent case *ghar nē*, while the plural of the same cases is *gharōn kā*, *gharōn sē*, *gharōn nē*. The agent case is used for the subject of a transitive verb in a tense

derived from the past participle. There are two genders, two numbers, two voices, and nine tenses in common use, e.g., *main dekhtā*, 'I see,' *main dekhtā hūn*, 'I am seeing,' *main dekhtūgā*, 'I am going to see,' *main nē dekhtā hai*, 'I have seen' (lit. 'by me it has been seen'), and so forth. Hindi is written in the Devanagari alphabet, like Sanskrit and Marathi, while Urdu employs the Perso-Arabic script with three additional characters to represent specifically Indian sounds.

Hindustani literature is very abundant, although for the most part it rises little above mediocrity in character. It begins with the *Prithvirāj Rāsau*, by Chand Bardai (about 1200 A.D.), who related in his long poem the history of Prithviraja II, the last Hindu King of Delhi. Much of the literature consists of translations from the Sanskrit as well as from Persian and Arabic. Noteworthy specimens of this particular class of work are the *Rāmāyan* of Tulsīdās, begun 1575 A.D., and the *Būgh o Bahār* (Garden and Spring), which Ammān of Delhi translated from the Persian collection of stories called the "History of the Four Dervishes," at the beginning of the nineteenth century (Eng. trans. by Eastwick, 1851). Religious poetry, often assuming an erotic form, history, and the drama also find their place in this literature, which is the most important in modern India.

HINGE (ME. *henge*, from *hengen*, secondary form of *hangen*, to hang). A device for attaching a door, shutter, box lid, or other swinging member, to one side or edge of an opening. It consists usually of two flaps of metal connected by a pin, or pivot, passing through one or more eyes or perforated knuckles formed on one or both flaps. Any hinge intended to be attached to the edge of the door or lid is called a *butt*; the majority of hinges are of this kind. One from which the pin is removable is a *loose-pin butt*; one in which the pin is a part of one flap, the other having a single long knuckle, is called a *loose-joint* or *lift-off hinge*. Flap hinges and strap hinges are attached to the faces of the door and jamb, or of the lid and side of a box: the common "barn-door" hinge is of this sort. Double-acting hinges have two knuckles and three flaps, allowing a door to swing in both directions through the opening, as a pantry door. Brass, bronze, iron, and steel are the metals commonly used for hinges. In mediæval work the hinges, if of the strap type, were often very ornamental, covering a considerable space with their scrolls of wrought iron. Doors which swing on pivots, like many heavy iron and bronze doors and gates and like many ancient doors and shutters of wood and even of stone (see **DOOR**), are not properly said to be hinged, but pivoted.

HINGHAM, hīng'am. A town in Plymouth Co., Mass., comprising the villages of West Hingham, South Hingham, and Hingham Centre, 17 miles by rail southeast of Boston, on Massachusetts Bay, and on the New York, New Haven, and Hartford Railroad (Map: Massachusetts, F 3). It is purely residential and has Derby Academy, a public library, and an old meeting house which dates from 1681. The harbor here is of importance, the State having dredged, in 1911, an anchorage basin 6 feet deep and a channel 75 feet wide and 6 feet deep to connect this basin and the channel made by the Federal government, which the State widened from 50 to 75 feet. The government is administered by town meetings. Pop., 1900, 5059; 1910, 4965. Hingham was settled in 1633 and was known as Barecove until 1635, when it was incorporated under its present name. It was the home of Gen. Benjamin Lincoln, John A. Andrew, and John D. Long, and the birthplace of James Hall the eminent geologist. Consult Lincoln and others, *History of the Town of Hingham* (Cambridge, 1893), and L. C. Cornish, *Settlement of Hingham, Mass.* (Hingham, 1911).

HINK'SON, MRS. KATHARINE (maiden name TYNAN) (1861-). An Irish novelist and poet, born in Dublin. She was educated at the Dominican convent of St. Catharine of Siena at Drogheda, Ireland, and in 1893, having been married to H. A. Hinkson, she took up her residence in London. She is favorably known for her verse contained in *Louise de la Vallière and Other Poems* (1885); *Shamrocks* (1887); *Bal-lads and Lyrics* (1890); *Cuckoo Songs* (1894); *The Wind in the Trees* (1898); *Collected Poems* (1901). She also portrayed phases of Irish character in a series of pleasant novels, comprising chiefly: *A Cluster of Nuts* (1894), short tales; *The Way of a Maid* (1895); *O, What a Plague is Love* (1896); *The Handsome Brandons* (1898); *The Dear Irish Girl and She Walks in Beauty* (1899); *Three Fair Maids and A Daughter of the Fields* (1900); *The Honorable Molly* (1903); *A Book of Memory* (1906); *Peggy* (1909); *Freda* (1910); *Princess Katharine* (1911); *Honey, My Honey* (1912); *Irish Poems* (1913); *Rose of the Garden, The Romance of Lady Sarah Lennox: A Novel* (1913). Consult her *Twenty-five Years: Reminiscences* (New York, 1914). For an appreciative estimate of Mrs. Hinkson as a poet, consult *Treasury of Irish Poetry*, edited by Stopford A. Brooke and T. W. Rolleston (London, 1900), and William Archer, *Poets of the Younger Generation* (New York, 1902). Mrs. Hinkson was a conspicuous figure in the so-called Irish Literary Revival, a movement which was well under way in the nineties of the last century.

HINLICHE, ên-lê'châ, 'Southern People.' A pastoral tribe of Aracania, wandering over the southern pampas of Argentina. They live in portable tents of skins and subsist entirely upon meat derived from their herds of horses, cattle, and sheep. They are skillful artificers in leather and iron, while the women make rugs of ostrich skins and weave woolen blankets and ponchos of superior quality.

HINNA. See **HENNA**.

HIN'NOM, VALLEY OF. A ravine in or near Jerusalem (Map: Palestine, A 1). The precise location has not been determined. Scholars differ as to which of the three valleys, Kidron, Tyropæon, or Wady el Rababi, is likely to have been called the Valley of Hinnom. Jewish and Arab

tradition favor the first, which runs east of the temple elevation. A majority of recent investigators prefer the last, which is south of the present city. Much probability, however, seems to attach to the Tyropæon. In Enoch xxvi the ravine over which the author marvels is evidently the Valley of Hinnom, and it is unquestionably identical with the Tyropæon, lying between Mount Zion and the western hill. Consequently a writer familiar with Jerusalem and living towards the end of the second century B.C. located the Valley of Hinnom in the Tyropæon. The chief objections are that, if the city did not in preëxilic times extend beyond the Tyropæon, there ought to be some remains of walls there, and that, if the Tyropæon was within the city, the sacrifices of the first-born to Moloch would have been made in the immediate neighborhood of the Yahwe temple. But whatever the extent of the city, it is highly improbable that important sanctuaries were left unprotected outside the walls. That Solomon should build temples to Chemosh and Moloch, the gods of the conquered Moabitish and Ammonitish dependencies, was only natural (1 Kings xi. 7). These shrines would not be far from the royal sanctuary. When even kings like Ahaz and Manasseh offered their first-born, and questions such as those in Micah vi. 6-7 could be asked in Judah touching the expediency of making similar sacrifices to Yahwe, there is no reason to suppose that the inhabitants of Jerusalem objected to having offerings of the first-born made to Moloch near the Yahwe temple. A later addition to 1 Kings xi. 7, found in the Greek version, states that Solomon also built a temple to Ashtaroath. (See *ASTARTE*.) This is not improbable, but it may simply reflect the memory of the actual existence of such a sanctuary in the valley. The sites had probably been occupied long before Solomon by Canaanitish shrines. The name of the valley is quite obscure. Its full title seems to have been either "Valley of the Sons of Hinnom" or "Valley of the Son of Hinnom." The former is found in 2 Kings xxiii. 10 and often in the best manuscripts of the Greek version; the latter in Joshua xv. 8 and xviii. 16, where the abbreviated form "Valley of Hinnom" is also found, and in 2 Chron. xxviii. 3, xxxiii. 6; Jer. vii. 31-32, xix. 2-6, xxxiii. 35. Hinnom was regarded by the Greek translators as a proper name, and many modern authors take the same view. But as the name is changed in Jer. vii. 32, xix. 6, to "Valley of Slaughter," it probably originally suggested a pleasant meaning. It has been conjectured that the name of the divinity worshiped in the valley was *Ben Naaman* (pleasant son), which may have been a descriptive title of Tammuz (q.v.). Another explanation, necessitating no alteration of the consonantal text, is that *hinam* meant in this connection "sexual enjoyment," and that the participants in the licentious rites practiced at the shrines and in the groves of this valley were called "sons of joy." In the Babylonian Talmud (*Erubin*, 19 a) Hinnom is connected with the word *hinam* used in the sense of "levity, licentiousness." The meaning of the root is "to be jocund," and the word *hinnom* should probably be connected with it. At one of the sanctuaries in this valley children were passed through the altar fire to Moloch. It is not evident whether the phrase implies a burnt offering or an ordeal by fire. But Josiah defiled one of the chief sanctuaries,

the Taphet, later pronounced Tophet to suggest *bosheth* (shame). What basis there is for the mediæval rabbinic statement that perpetual fires were kept up in this valley for consuming dead bodies of criminals and carcasses of animals, cannot be ascertained. If Tophet was at the southern end of the Tyropæon, near Siloam, this cremation of refuse would be outside the city limits. The apocalyptic expectation in the second century of a final battle between the nations and Israel outside of the holy city seems to have rested upon this feature of the surroundings. Here the enemy would be consumed, and the pious who should go up to the temple in Jerusalem on Sabbaths and at new moons would look with satisfaction upon the carcasses consumed by fire and worms (Isa. lvi. 23-24). The same idea is found in Enoch xxvii. Gradually the term *Ge Hinnom*, or (Aramaized) *Gehenna*, came to be used, not of this valley in Jerusalem, but of the subterranean Tartarus to which it was the entrance; of the unseen place of final punishment of the impenitent; of the sudden destruction of both soul and body; or figuratively, of the inner condemnation of spiritual loss. On the geographical question, consult: Warren's article "Hinnom," in Hastings, *Dictionary of the Bible*; Conder's article "Jerusalem," in the *Encyclopædia Biblica*; G. A. Smith, *Historical Geography of the Holy Land* (7th ed., London, 1901). See *GEHENNA*; *HELL*; *JUDGMENT, FINAL*; *ESCHATOLOGY*.

HINNY (Lat. *hinna*, *hinmus*, Gk. *lynos*, or *ginnus*, Gk. *lynos*, mule from a stallion and a she-ass). The hybrid produced between a horse and a female ass. It is smaller than a mule, but the body is more bulky in proportion to the legs, and its strength is inferior. It is less valuable than the mule, although more docile. The hinny is rare. It was described by some of the earlier naturalists as a hybrid between the ox and the ass. See *MULE*.

HINOYOSSA, *hē'nō-yōs'sā*, *ALEXANDER D'*. The director of Nieuer Amstel, a Dutch colony established on the east bank of the Delaware in 1656, and afterward Governor of all the settlements on that river until the conquest of New Netherland by the English. Hinoyossa was born and died in Holland, and his activity in the Dutch settlements of America extended from 1656 to 1674. He came to New Amsterdam in 1656 as lieutenant in a small force of soldiers accompanying 150 Dutch emigrants and succeeded Jacob Aldrichs as director of Nieuer Amstel in 1659. His position was a trying one on account of the conflicts of authority which were continually disturbing the colony, especially in regard to taxation. Appeals to Holland were frequent, and Hinoyossa refused to recognize the authority of Director Stuyvesant, of New Amsterdam, who had the supervision of the commissioners composing the government of the colony. As an investment, the latter was not at first profitable, owing to sickness and dissension among its members; but Hinoyossa governed so vigorously and wisely that all attempts by the West India Company to secure control failed. Confident of his own ability and seeing the necessity of a single and undisputed authority, Hinoyossa went to Holland in 1663 to ask for the entire direction of all the Delaware settlements, which was finally given to him. Director Stuyvesant formally transferred his authority, and the Swedes, who had rival settlements there, after a fruitless effort to

resist the change, also became obedient and accepted Hinoyossa's control. On the English conquest of New Netherland Hinoyossa returned to Holland and became a soldier in the Republican army in the great war with Louis XIV. Consult J. R. Brodhead, *History of the State of New York* (2 vols., New York, 1871-74).

HINSCHIUS, hin'shi-us, PAUL (1835-98). A German jurist, known especially as an authority on ecclesiastical law. He was born in Berlin and studied jurisprudence there and at Heidelberg. In 1859 he became a lecturer on law at the University of Berlin, served as professor of law at Halle in 1863, returned to Berlin in 1865, and in 1868 was appointed professor at the University of Kiel, which he represented in the Prussian House of Lords. In 1872 he became professor of ecclesiastical law at Berlin and subsequently took part in the Kulturkampf (q.v.). He served in the Reichstag in 1872-78 and 1881-82 and represented the University of Berlin in the Prussian Upper House after 1889. His fame rests mainly on the *Decretales Pseudo-Isidorianæ et Capitula Angilramni* (2 parts, 1863) and on the incomplete but especially important *Das Kirchenrecht der Katholiken und Protestanten in Deutschland* (6 vols., 1869-77).

HINSDALE, hinz'däl, BURKE AARON (1837-1900). An American educator. He was born in Ohio and was educated at the Western Reserve Eclectic Institute (now Hiram College), where he was a pupil of James A. Garfield. In 1861 he entered the Campbellite ministry, preaching in Cleveland and other places, and in 1866 was chosen assistant editor of the *Christian Standard*. Three years later he became professor of history and English literature in Hiram College and from 1870 to 1882 was its president. After a few years' service as superintendent of schools at Cleveland, Ohio, he was appointed professor of the science and art of teaching in the University of Michigan in 1886. Among his publications are: *Genuineness and Authenticity of the Gospels* (1870); *The Republican Text-Book* (1880); *Garfield and Education* (1881); *The Old Northwest* (1888); *How to Study and Teach History* (1894); *Teaching the Language Arts* (1896); *Horace Mann and the Common-School Revival in the United States* (1898); *American Government, National and State* (4th ed., 1905). He also edited the *Life and Works of James A. Garfield* (2 vols., 1882-83).

HINTERLAND, hin'tér-lánt (Ger., back territory). A term that came into general use at the time of the partition of East Africa between Germany and England in 1890. The doctrine of the hinterland is the claim of German diplomats that, when a power takes possession of a strip of seacoast, its rights extend inland indefinitely, or until its territory reaches the recognized boundary of some other power.

HINTON. A city and the county seat of Summers Co., W. Va., 97 miles southeast of Charleston, on the New River, and on the Chesapeake and Ohio Railroad (Map: West Virginia, D 4). It is a railroad division headquarters with repair shops, and has two hospitals, a high school, and a Carnegie library. Pop., 1900, 3763; 1910, 3656.

HINTON, ARTHUR (1869-). An English composer, born at Beckenham, Kent. He completed a three-year course at the Royal Academy of Music in London under Sauret (violin) and Davenport (composition) and was then

appointed teacher of violin. Having held this position for three years, he went to Munich for a further course in composition under Rheinberger. Here his first symphony, in B flat, was produced under his own direction. After some time spent in Vienna and Rome he returned to London in 1896, where he filled various positions as conductor of theatre orchestras. In 1903 he married the pianist Katharine Goodson (q.v.). His works include two symphonies (the second in C minor); an orchestral fantasy, *The Triumph of Cæsar*; two scenes from *Endymion*; a violin sonata in B flat; a trio in D minor; a piano quintet in G minor; the opera *Tamara*; and the very successful children's operas *The Disagreeable Princess* and *St. Elizabeth's Rose*.

HINTON, JAMES (1822-75). An English surgeon and philosophical writer, born at Reading. He was educated at the hospital of St. Bartholomew and began the practice of surgery in London about 1850 as an ear specialist. Besides lecturing upon his chosen subject in Guy's Hospital, from 1862 to 1874, he published: *Man and his Dwelling-Place* (1859); *Life in Nature* (1862); *The Mystery of Pain* (1865). Two of his books upon similar subjects were issued posthumously. Ellice Hopkins edited his *Life and Letters* (1878).

HINZPETER, hints'pät'er, GEORG ERNST (1827-1907). A German educator, born at Bielefeld, where he taught after his university course at Halle and Berlin (1847-50). The Crown Prince's tutor, Hinzpeter became Privy Councillor and member of several governmental boards after Wilhelm II came to the throne. He strongly influenced the Emperor's educational policy and in 1890 was prominent in the Berlin Conference on Higher Education. He wrote *Kaiser Wilhelm II.* (9th ed., 1889). In 1908 the Emperor contributed towards the monument erected to Hinzpeter.

HIOGO, hyô'gô, or **FIOGO**. A part of the Japanese town of Kôbé (q.v.).

HIONG-NU, hyông'noo'. By this name (also spelt Hun-yü, Hien-yün, Kün, and Hiung-nu) the Chinese chroniclers designate a people of Turkish or Tatar race who, some two centuries B.C., founded a powerful kingdom in Central Asia, conquered Turkestan, and made inroads into China. The kingdom of the Hiong-nu lasted until the middle of the first century A.D., when it split into two sections, of which the northern soon disappeared from history. Early Chinese chronicles are filled with accounts of conflicts with this race. Some identify the Huns with the Hiong-nu. The Chinese account of this people was published (in translation) in the *Journal of the Anthropological Institute* (London, 1874). Many ethnologists see in the Hiong-nu the ancestors of the Turks. Consult Hirth, *The Ancient History of China* (New York, 1911).

HIOUEN-THSANG, hê-wên-tsäng', or **YUAN CHWANG**. A celebrated Chinese Buddhist traveler, who visited 110 places of India in the first half of the seventh century (629-645) and gave an account of the condition of Buddhism at that period in India. He was born in 600 in the Province of Honan. He was a precocious youth, loved learning, and was very fond of the Confucian work on Filial Piety. At the age of 20 he was ordained as a Buddhist monk and soon became famous for his learning and eloquence. His longing to visit the holy land of Buddhism set him on his travels. After an absence of 16 years he returned, bringing

with him 657 sacred Buddhist books and 150 relics of Buddha. He received a great ovation from Emperor, court, and people, and was held in the highest honor. As to the accounts of his travels, his interests being chiefly religious, he did not enter much into details concerning the social and political condition of India. His narrative, however, gives many curious facts which he observed and, possessing a high degree of trustworthiness, is one of the most important documents for the history of India at that time. Apparently he traveled alone or with a few occasional companions and wore the garb of a religious mendicant. It does not appear that the account of his travels was written by himself. The first of the two works relating to them is a biographical notice of him, in which his travels form a principal feature; it was composed by two of his pupils, Hoei-li and Yen-thsong. The latter bears the title of *Ta-thang-si-yu-ki*, or "Memoirs of the Countries of the West," published under the Thang," and was edited by Pien-ki. Both works have been translated by Julien in his *Histoire de la vie de Hiuen-Tsang* (1853) and his *Mémoires sur les contrées occidentales, par Hiuen-Tsang* (1857-58). Consult: *Buddhist Records of the Western World* (2 vols., Boston, 1885); Samuel Beal, *Life of Hiuen-Tsang* (London, 1888); Thomas Watters, *On Yuan Chwang's Travels in India* (2 vols., ib., 1904-05); G. A. Grierson, "Yuan Chwang's Mo-la-p'o," in *Journal of the Royal Asiatic Society* (1906).

HIP JOINT. A ball-and-socket joint, formed by the reception of the globular head of the thigh bone (or femur) into the deep pit or cup in the *os innominatum*, which is known as the *acetabulum* (so called from its resemblance to the vinegar cups used by the Romans). If the variety of the movements of this joint—viz., flexion, extension, abduction, adduction, and rotation inward and outward—and at the same time its great strength are considered, it may well claim to be regarded as the most perfect joint in the whole body.

The ligaments are usually described as five in number: (1) the capsular; (2) the ilio-femoral; (3) the teres, or round; (4) the cotyloid; and (5) the transverse. The capsular ligament extends from the edge of the cup to the circumference of the neck upon which the ball is carried, inclosing the bony parts in a strong sheath. The ilio-femoral, or Y, ligament is merely an accessory band of fibres which give increased thickness to the capsular ligament in front, where strength is specially required. The great use of the capsular ligament is to limit the extension of the hip joint and thus to give steadiness to the erect posture. The only other ligament of importance is the teres, or round, ligament, which is in reality triangular rather than round and has its apex attached to the head of the thigh bone, while its base is connected with the cavity of the acetabulum. Its use is not very clearly known, but probably is to support and protect vessels giving blood supply to the head of the bone. It is sometimes absent in cases in which no special weakness of the joint was observed during life and is of by no means constant occurrence in mammals. The joint is much strengthened by a large number of surrounding muscles, some of which are of considerable power.

In such a joint as this, although the ligaments materially assist in preventing dislocation, it is

obvious that the articular surfaces cannot, under ordinary circumstances, be kept in apposition by them, inasmuch as they must be loose in their whole circumference, to permit of the general movements of the joint. The experiments of Weber have shown that atmospheric pressure is the real power by which the head of the femur is retained in the acetabulum when the muscles are at rest. In spite of its anatomical reinforcements the hip joint is often dislocated. The head of the femur may be forced from its socket downward, forward, or backward, each position producing its characteristic symptoms and deformity.

Disease of the Hip Joint. Hip disease differs in so many points of importance from other joint diseases and is so serious an affection that it requires a special notice. Its connection with the scrofulous or strumous diathesis is more distinctly marked than that of most other joint diseases, and it almost always occurs before the age of puberty. It is essentially a tubercular inflammation of the hip joint. Its beginning may be often associated with some trivial occurrence, such as overexertion in a long walk, a sprain in jumping, or a fall.

In the early stage of the disease the whole of the structures of the joint are inflamed, and by proper treatment at this period the morbid action may be sometimes subdued without any worse consequences than a more or less rigid joint. Usually, however, abscesses form around the joint and often communicate with its interior; and the acetabulum, and the head and neck of the thigh bone, become disintegrated, softened, and roughened. In a still more advanced stage dislocation of the head of the thigh bone commonly occurs, either from the capsular ligaments becoming more or less destroyed, and the head of the bone being drawn out of its cavity by the action of the surrounding muscles, or from a fungous mass sprouting up from the bottom of the cavity and pushing the head of the bone before it. It is of extreme importance that the symptoms should be detected in an early stage of the disease, and surgical aid at once be sought.

As the disease advances, abscesses, as already mentioned, occur around the joint, which sometimes, from the tension they exert on the obturator nerve, occasion extreme pain in the inside of the thigh. True shortening of the limb now takes place, which at the same time becomes adducted and inverted. From this stage, if the general health is good, the patient may be so fortunate as to recover with an ankylosed (or immovable) hip joint; but occasionally a condition of exhaustion comes on, the tubercular process exhibits itself in the lungs and elsewhere, and death finally supervenes from the prolonged septic processes. The duration of the disease may vary from two or three months to 10 or more years. The essential factor in the treatment of these cases is complete immobilization of the joint for a protracted period by means of plaster splints or rigid metal braces. With this must be combined nourishing food, fresh air, and sunlight, with general exercise of the body as early as is practicable.

HIPKINS, ALFRED JAMES (1826-1903). An English connoisseur of musical instruments, born at Westminster. Having entered in 1840 the piano firm of Broadwood and Sons, with which he remained till his death, he made himself master of all the details of technical con-

struction and also turned his attention to the history of the piano. This led him further to a study of all related keyboard instruments, and this, in turn, to the investigation of temperament and pitch. At the same time he made himself an excellent performer on the piano as well as on all the older instruments. Beginning with the Great Exhibition of 1851, he served as expert or juror in connection with almost every important exhibition held in England since then. He participated in the exhibitions in Vienna (1892) and Paris (1900). His principal writings are: *Old Keyboard Instruments* (1887); *Musical Instruments, Historical, Rare, and Unique* (1888); *A Description and History of the Pianoforte and Older Keyboard Stringed Instruments* (1896). Besides, he wrote all the articles relating to his subject for the ninth edition of the *Encyclopædia Britannica* and for *Grove's Dictionary of Music and Musicians*.

HIPPARCHUS, hîp-pär'kûs (Lat., from Gk. Ἱππαρχος) (flourished between 161 and 126 B.C.). A Greek astronomer and mathematician. He was born in Nicæa, Bithynia, but his astronomical work was done on the island of Rhodes and possibly also in Alexandria. Of his personal history nothing is known. He was the founder of genuinely scientific astronomy and also of a part of that science which lies on the borderland of astronomy and geometry, viz., trigonometry. In this field he computed a table of chords which, although lost, is known to us through the works of Theon of Alexandria (q.v.), who wrote about 365 A.D. It is probable, too, that this is the Hipparchus who wrote on combinatory analysis, and that the Arabs were correct in attributing to him a knowledge of the quadratic equation. Certain it is that Ptolemy was indebted to him for much of the *Almagest* (q.v.). According to Fabricius, Hipparchus wrote nine separate works; but of these only the *Commentaries on the Phenomena of Aratus and Eudoxus* has come down to us. The text of these *Commentaries* was edited by Manitius and published, with a German translation, at Leipzig in 1894. From the *Almagest* we learn that it was Hipparchus who first discovered the precession of the equinoxes, determined the place of the equinox among the stars, invented solar and lunar theories, invented the astrolabe (q.v.), determined longitude by means of lunar eclipses, and drew up a catalogue of 1080 stars, determining the longitude and latitude of each (this catalogue has been preserved in the *Almagest*). As Ptolemy was also an astronomer, there is some difficulty in allotting to each his meed of praise for the discoveries mentioned in the *Almagest*, which difficulty has given rise to some discussion. Consult: J. B. J. Delambre, *Histoire de l'Astronomie ancienne* (Paris, 1817); Robert Grant, *History of Physical Astronomy* (London, 1852); Lewis, *Historical Survey of the Astronomy of the Ancients* (ib., 1862); Hugo Berger, *Die geographischen Fragmente des Hipparch* (Leipzig, 1870); Rudolf Wolf, *Geschichte der Astronomie* (Munich, 1877); Paul Tannery, *Recherches sur l'histoire de l'Astronomie ancienne* (Paris, 1893).

HIPPARCHUS (c.555-514 B.C.). The son and one of the successors of Pisistratus (q.v.), tyrant of Athens. On the death of Pisistratus (527 B.C.) Hipparchus and his older brother, Hippias, kept the government of Athens in their hands. Hipparchus interested himself in art and literature, as his father had done. He was mur-

dered by Harmodius and Aristogiton (q.v.), in 514, at the Panathenæa, probably in revenge for a personal insult, though the Greeks of the next century commonly considered the murderers as patriots and saviors of their country. See **HIPPIAS**.

HIPPARION (Neo-Lat., from Gk. ἵππιον, pony, dim. of ἵππος, *hippos*, horse). A fossil horse, somewhat smaller than the Asiatic ass, remains of which have been found in Upper Miocene rocks of North America and in the Pliocene deposits of North Africa, Asia, and Europe.

HIPPEASTRUM, or **LILY OF THE PALACE**. See Plate of **AMARYLLIDACEÆ**.

HIPPEL, THEODOR GOTTLIEB VON (1741-96). A German humorist and satirist, born at Königsberg. After traveling in Russia he settled in his birthplace, first as tutor and then as zealous student of law, and in 1786 became Privy Councillor of War and president of the town. He was a strange man, full of inconsistencies. He published, all anonymously, *Ueber die Ehe* (1774, ed. by Brenning, 1872); *Ueber die bürgerliche Verbesserung der Weiber* (1792); *Lebensläufe nach aufsteigender Linie, nebst Beilagen A. B. C.* (1778-81, ed. by Oettingen, 1883), his most important work; and *Ueber weibliche Bildung* (1801). In these works he attempted to express and popularize the philosophy of Kant's *Kritik*, then unpublished. Of a more satiric and political nature are: *Zimmermann I. und Friedrich II., von Johann Heinrich Friedrich Quittenbaum Bildschnitzer in Hannover* (1790) and *Kreuz und Querzüge des Ritters A bis Z*. His other works include some hymns, the idyllic *Handzeichnungen nach der Natur* (1790); the drama *Der Mann nach der Uhr* (2d ed., 1771); and *Ueber das Königsberger Stapelrecht* (1791). His collected works were published at Berlin in 14 volumes (1827-38). Consult his autobiography (Gotha, 1801); M. von Hippel, *Die Geschichte der Familie von Hippel* (Leipzig, 1899); Johann Czerny, *Sterne, Hippel, und Jean Paul* (Berlin, 1904).

HIPPIAS, hîp'î-ās (Lat., from Gk. Ἱππίας) (?-c.490 B.C.). A tyrant of Athens, son of Pisistratus (q.v.), upon whose death (527 B.C.) he assumed the government in conjunction with his brother Hipparchus (q.v.). According to Thucydides, the government of the brothers was conducted on the same principle as that of their father, and many distinguished poets, including Simonides of Ceos and Anacreon of Teos, lived at Athens under their patronage. After the assassination of Hipparchus, in 514 B.C., Hippias governed alone and avenged the death of his brother by imposing extraordinary taxes, selling offices, and putting to death all of whom he entertained the least suspicion. At length, however, his despotism was overthrown. The Delphic oracle was bribed to enjoin the Lacedæmonians to free Athens from the Pisistratidæ, and after one or two unsuccessful attempts the tyrant's old enemies, the Alcæonidæ (q.v.), to whom Megacles belonged, supported by a Spartan force under Cleomenes, defeated Hippias in the field, captured his children, and compelled him and all his relatives to leave Attica (510 B.C.). As soon as they had departed, a decree was passed condemning the tyrant and his family to perpetual banishment, and a monument commemorative of their crimes and oppression was erected in the Acropolis. After spending some time at Sigeum, Hippias went to the court of Darius and

incited the first war of the Persians against the European Greeks. He accompanied the expedition sent under Datis and Artaphernes and persuaded the Persians to land at Marathon. It cannot be determined whether he was killed during the battle or whether he died at Lemnos on his return.

HIPPIAS OF ELIS (c.460-? B.C.). A Greek mathematician, writer, diplomat, and philosopher. He was a teacher of renown, a man of great pretense, but a scholar of little originality. His teaching, for which his pupils were compelled to pay heavily, was directed to the practical end of success in a worldly way, to display, and to ability in public address. It is probable that he is the Hippias mentioned by Proclus (on the authority of Geminus) as the inventor of the quadratrix—a curve originally designed, it is thought, for dividing an arc in a given ratio, but which also lends itself readily to the quadrature of the circle. (See QUADRATURE.) This curve, however, usually bears the name of Dinostratus, since he studied it with so much care.

HIPPID/TUM. An extinct ancestor of the horse. See HORSE, FOSSIL.

HIP'PO (Lat., from Gk. ἵππον, *Hippōn*), or **HIPPO REGIUS**. A Phœnician colony in north Africa, later a favorite residence of Masinissa, King of Numidia, of which the scanty ruins are yet to be seen near Bona (Bone), Algeria. Hippo was a flourishing trading city under the Roman rule and in later years the see of St. Augustine, who died here in 430 A.D., just before the destruction of the city by the Vandals.

HIP'POBOS/CIDÆ (Neo-Lat. nom. pl., from Gk. ἵπποβοσκός, *hippoboskos*, feeding horses, feeding on horses, from ἵππος, *hippos*, horse + βόσκειν, *boskein*, to feed). A strange and important family of dipterous insects which are parasitic upon birds and mammals and which are popularly known by the name of bird ticks. This is misleading, since they are not ticks, and are not confined to birds, although the adults live and move quickly about among the feathers and hair of birds and mammals. Unlike most other external parasites of the higher animals, many of them possess wings, although they are otherwise modified as the result of their parasitic life. Their development is very abnormal and differs from that of all other insects. The eggs hatch and the larvæ develop within the mother and are extruded only after they have become pupæ. *Hippobosca equina* is a winged species which occurs on the horse and is known in England as the forest fly. *Melophagus ovinus* is a wingless form and occurs on the sheep. One of the commonest of the North American species is *Olfersia americana*, which is found upon certain birds, like the horned owl, certain hawks, and the ruffed grouse. The species of the genus *Lipoptena* may, while still winged, live on birds, but afterward they lose their wings and are then found on mammals.

HIP'POCAM'PUS. See SEA HORSE.

HIP'POCRAS (from Fr. *hippocras*, *hypocras*, from Lat. *Hippocrates*, Gk. Ἱπποκράτης, *Hippokratēs*, a famous Greek physician). An aromatic medicated cordial, formerly much used in Great Britain. It was made of spiced wine, mixed with sugar, lemon, aromatic tincture, or other ingredients.

HIPPOCRATES (Lat., from Gk. Ἱπποκράτης, *Hippokratēs*) (c.460-357 B.C.). A Greek physician, the most celebrated of antiquity and justly

called "the father of medicine." He was the son of Heraclides, also a physician, and belonged to the family of the Asclepiadæ, being either the nineteenth or seventeenth in descent from Æsculapius. His mother, Phænarete, was said to be descended from Hercules. He was born in the island of Cos. He is said to have been instructed in medicine by his father and by Herodicus, and in philosophy by Georgias of Leontini, the sophist, and Democritus of Abdera, whom he afterward cured of insanity. After spending some time in traveling through different parts of Greece, he settled and practiced his profession at Cos and finally died at Larissa in Thessaly. He is said to have passed the age of 100. We know little more of his personal history than that he was highly esteemed as a physician and an author, and that he raised the medical school of Cos to a very high reputation. His works were studied and quoted by Plato. Various stories are recorded of him by Greek writers, which are undoubtedly fabulous; and legends regarding him are found in the works of Arabic writers, who term him Bukrat, while the European story-tellers of the Middle Ages celebrate him under the name of Ypocras. The works bearing the name of Hippocrates, and termed the Hippocratic collection, are 72 in number and include many treatises by his sons Thessalus and Draco, by his son-in-law Polybus, and by others. The following are considered authentic: *Epidemics*; *Regimen in Acute Diseases*; *On Air, Water, and Places*; *On Wounds of the Head*; parts of the *Aphorisms* and parts of the *Prognostics*; the work on *Ancient Medicines*; *Joints*; *Fractures*; *The Use of the Lever*; *Laws*; *Ulcers*; *Hæmorrhoids*; *The Sacred Disease*; *Fistulæ*; and *On the Duty of the Physician*, as well as the *Oath*. Hippocrates divides the causes of disease into two principal classes—the first consisting of the influence of seasons, climates, water, situation, etc., and the second of more personal causes, such as the food and exercise of the individual patient. His belief in the influence which different climates exert on the human constitution is very strongly expressed. He ascribes to this influence both the conformation of the body and the disposition of the mind and thus accounts for the difference between the Greek and the Asiatic. The four fluids, or humors, of the body (blood, phlegm, yellow bile, and black bile) were regarded by him as the primary seats of disease; health was the result of the due combination (or *crasis*) of these, and illness was the consequence of a disturbance of this *crasis*. When a disease was proceeding favorably, these humors underwent a certain change (or *cocction*), which was the sign of returning health, as preparing the way for the expulsion of morbid matter, or *crisis*, these crises having a tendency to occur at definite periods, which were hence called "critical days." His treatment of diseases was cautious and what we now term expectant; it consisted chiefly in attention to diet and regimen. Thus, he was the inventor of the humoral pathology, so long in vogue in medical schools. He must be judged by the standards of his day. A most careful and keen observer and exact chronicler of symptoms, he was also the possessor of a remarkable mental equipment and a man of great nobility and morality. See HIPPOCRATIC OATH.

The works of Hippocrates were translated at an early period into Arabic. They were first printed in a Latin translation in 1525 at Rome,

Galen's commentaries on his works being of special value. The first Greek edition (the Aldine) appeared the following year at Venice; an edition by Mercurialis appeared in 1588, one by Foesius in 1595, and one by Van der Linden (still much esteemed) in 1665. An edition under the editorship of Kuhn appeared in three volumes at Leipzig in 1825-27. The best French edition is that of Littré, in 10 volumes, the first of which appeared in 1839 and the last in 1861. An excellent English translation of *The Genuine Works of Hippocrates* was published in 1849 in two volumes by Dr. Adams.

HIPPOCRATES OF CHIOS, κῤῥῶς (c.450 B.C.). A Greek geometer, possibly related to the family of the celebrated physician. His early life was devoted to maritime commerce, and the seizure of a vessel by the Athenian customs called him (c.430) to Athens to obtain redress. Failing in his mission, he betook himself to the study of philosophy and to teaching geometry. He wrote the first elementary textbook on geometry, and his name is often connected with the quadrature of certain figures which are com-

LUNES OF HIPPOCRATES.

monly called the lunes of Hippocrates. The theorem is not found in the works of Hippocrates; but Pardies, in his *Elémens de géométrie* (1671), assigns it to him, and most subsequent writers have done the same without stopping to confirm the statement. Simplicius quotes Eudemus as saying that Hippocrates first showed that similar segments of circles are proportioned to the squares of their bases, and the proposition regarding them can easily be deduced from it. In its simplest form the proposition asserts that if semicircles be described upon the three sides of an isosceles triangle, as shown in the accompanying figure, the area of the triangle equals the sum of the areas of the lunes—i.e., $T = A + B = 2A$. It is easily proved that $T = A + B$ even if the triangle is not isosceles. These propositions on the lunes are further interesting as being the oldest extant specimens of geometric proofs by reasoning.

Hippocrates attempted the problem of duplicating the cube and reduced it to that of finding two means between one line and another of double its length. He is also credited by Proclus with inventing the process of geometric reduction, consisting in passing from one proposition to another, which being mastered, the one proposed necessarily follows. Consult Paul Tannery, "Hippocrate de Chios et la quadrature des lunes," in the *Mémoires de Bordeaux* (Bordeaux, 1878).

HIPPOCRATIC OATH. An oath taken by young men in the early days on entering upon the practice of medicine. In ancient times the oath was ascribed to Hippocrates and is probably authentic. It runs as follows: "I swear by Apollo, the physician, by Æsculapius, by Hygieia, Panacea, and all the gods and goddesses, that according to my ability and judgment I

will keep this oath and stipulation: to reckon him who teaches me this art equally dear with my parents; to share my substance with him and to relieve his necessities if required; to look upon his offspring upon the same footing as my own brothers; and to teach them this art if they shall wish to learn it, without fee or stipulation; and that by precept, lecture, and by every other mode of instruction I will impart a knowledge of this art to my own sons, to those of my teachers, and to disciples bound by a stipulation and oath, according to the law of medicine, but to no others. I will follow that system of regimen which, according to my best judgment, I consider best for my patients and abstain from whatever is injurious. I will give no deadly medicine to any one if asked nor suggest any such counsel. Furthermore, I will not give to a woman an instrument to procure abortion. With purity and holiness will I pass my life and practice my art. I will not cut a person who is suffering with stone, but will leave this to be done by those who are practitioners of such work. Into whatever houses I enter I will go for the advantage of the sick and will abstain from every voluntary act of mischief and corruption, and, further, from the seduction of females or males, bond or free. Whatever in connection with my professional practice, or not in connection with it, I may see or hear, I will not divulge, holding that all such things should be kept secret. While I continue to keep this oath inviolate, may it be granted to me to enjoy life and the practice of my art, respected always by all men; but should I break through and violate this oath, may the reverse be my lot." It is said that a similar oath was used in the Middle Ages, after the discontinuance of the use of the Hippocratic oath. Some medical colleges of to-day impose a simpler obligation in the form of an admonition and an affirmation, to which the graduating class assents.

HIPPOCRENE, hîp'pō-kre'nē (Lat., from Gk. ἵπποκρήνη, *Hippokrenē*, horse spring, from ἵππος, *hippos*, horse + κρήνη, *krēnē*, spring). A fountain on Mount Helicon (q.v.), about 20 stadia above the Grove of the Muses, and, according to the mythical account, produced by a stroke from the hoof of the horse Pegasus (q.v.). It was sacred to the Muses. It is probably to be identified with the *Kryopēgadi* (cold spring), on the north side of the southeast (and highest) peak of Mount Helicon.

HIPPODAMIA, hîp'pō-dā-mī'ā (Lat., from Gk. Ἴπποδάμεια). 1. Daughter of Enomaus (q.v.), King of Pisa in Elis, and Sterope, one of the Pleiades. As an oracle had declared that Enomaus should be killed by his son-in-law, the King required that each suitor should engage with him in a chariot race, from Pisa (Olympia) to the altar of Poseidon at Corinth. The suitor, with Hippodamia in his chariot, was allowed as a handicap so much time as Enomaus needed for a sacrifice to Poseidon. As his horses were a gift of the god, the King always caught the luckless suitor, whom he slew in passing with his spear, until Pelops (q.v.) bribed Mytilus, the King's charioteer, to weaken the linchpin, and Enomaus was dragged to death by his own horses. After his victory Pelops threw Mytilus into the sea and was cursed by the drowning man for his faithlessness. Hippodamia became the wife of Pelops and the mother of Atreus and Thyestes. She afterward induced them to murder their half brother, Chrysippus, and then

fled to Midea in Argolis, where she died. Her body was brought by Pelops to Olympia and interred in the sacred inclosure of the Altis, where she was worshiped in later times. The preparations for the chariot race formed the subject of the sculptures in the east pediment of the great temple at Olympia. (Consult Karl Baedeker, *Greece*, pp. 304-305, 4th Eng. ed., Leipzig, 1909.) Hippodamia appears not infrequently on vases. 2. The wife of Pirithous, at whose wedding occurred the conflict between the Centaurs and Lapithæ (q.v.).

HIPPODAMUS, hip-pōd'a-mūs (Lat., from Gk. Ἰππόδαμος), OF MILETUS. A Greek architect of the fifth century B.C., famed as the first to lay out cities with broad, straight streets intersecting at right angles. At the invitation of Pericles he laid out the Piræus (q.v.). He went as architect with the colonists to Thurii (q.v.). In 408 B.C. he laid out the town of Rhodes. Consult F. J. Haverfield, *Ancient Town-Planning* (Oxford, 1913).

HIPPO DI'ARRHY'TUS. See BIZERTA.

HIPPODROME (Lat. *hippodromus*, from Gk. ἵπποδρόμος, horse-race course, from ἵππος, *hippos*, horse + δρόμος, *dromos*, running, course, from δραπεῖν, *dramein*, to run). The Greek name for the place set apart for horse and chariot races. The dimensions seem to have varied at different places. Frequently the hippodrome was but a level space, fitted out at the actual time of the races with proper turning posts. The dimensions of the hippodrome at Olympia, which was larger and far more elaborate than the ordinary hippodrome, have recently come to light in a Greek manuscript found in the old Seraglio in Constantinople. The total circuit was 8 stadia (about 0.95 mile), but the length of the actual race course was only 6 stadia. The breadth was about 320 feet. It is also said that pairs of colts made three circuits, pairs of grown horses or four colts made eight rounds, and the four-horse chariots twelve. Riding races consisted of but one lap (6 stadia). From about 500 to 444 B.C. there was a mule chariot race at Olympia. As the figures given above make the four-horse chariot race cover about 8½ miles, some modern scholars believe that not the circuit, but merely the length of the hippodrome, is meant, and that therefore the length of the contests should be reduced one-half. A race of over 8 miles must have been a contest of endurance rather than of speed. At Olympia the starting was effected by means of the *aphesis*, a system of stalls arranged along the two sides of a triangle, the apex of which was to the right of the centre line, and apparently so arranged that the distances from the turning point to the angles at the base of the triangle were equal; a rope was stretched before each chariot. The start was effected by setting free the chariots on the extreme right and left, nearest the base of the triangle, and when they came abreast of the next two, by setting them free also, and so on till all were in motion. The total number of starters seems at times to have been very large, as Pindar speaks of 41 chariots as competing at the Pythian games, and Alcibiades alone sent seven chariots to Olympia; hence each side of the *aphesis* was 400 feet long. The *aphesis* does not seem to have been used elsewhere. The golden age of the hippodrome was during the Byzantine Empire. The blue and green factions in the hippodrome carried their animosity into all departments of the public service, and the Nika riots in Constantinople

threatened to dethrone Justinian. The site of the great hippodrome at Constantinople is still called Atmeidan (the horse place) by the Turks, and the line of the central barrier is marked by the obelisk of Theodosius, the bronze serpents that supported the Platean tripod, and the column erected by Constantine VII. Consult: G. H. A. Lehndorff, *Hippodromos* (Berlin, 1876); Ervinus Pollack, *Hippodromica* (Leipzig, 1890); William Smith, *A Dictionary of Greek and Roman Antiquities*, vol. i (3d ed., London, 1890); Wernicke and Schöne, in *Jahrbuch des archäologischen Instituts*, ix (Berlin, 1894) and xii (ib., 1897); the elaborate article by A. Martin, "Hippodromos," in Daremberg and Saglio, *Dictionnaire des antiquités* (Paris, 1897); E. N. Gardiner, *Greek Athletic Sports and Festivals* (London, 1910).

HIPPOGRYFF, or **HIPPOGRYPH** (from Fr. *hippogriffe*, Gk. ἵππος, *hippos*, horse + Lat. *gryphus*, griffin, from Gk. γρύψ, *gryps*, from γρυπός, *grypos*, hook-nosed). A fabulous animal, represented as a winged horse, with the head of a griffin, invented, probably in imitation of Pegasus, by the romancers of the Middle Ages for the purpose of transporting their heroes through the air.

HIPPOLITA. The Queen of the Amazons and the betrothed of Theseus, in Shakespeare's *Midsummer Night's Dream*.

HIPPOLYTA. See AMAZONS; HERCULES.

HIPPOLYTUS (Lat., from Gk. Ἴππόλυτος). In Greek legend, the son of Theseus (q.v.) and the Amazon Antiope, or Hippolyte, a mighty hunter and devoted servant of Artemis, but a despiser of Aphrodite, who wreaked a terrible vengeance on him. Brought up in Troezen, he was first seen by his stepmother Phædra when he was a young man. She fell in love with him and, when he repulsed her advances, committed suicide, leaving a letter to Theseus accusing Hippolytus of an attempt upon her virtue. (Of the similar stories told of BELLEROPHON and PELEUS.) Theseus cursed Hippolytus and drove him from home and besought his father, Poseidon, to avenge him. Poseidon sent a sea monster, who frightened the horses of Hippolytus, as he was driving along the shore near Troezen, so that they ran away and dragged him to his death. Hippolytus was worshiped at Troezen. One version of the Hippolytus story told how Artemis persuaded Asclepius to restore her favorite to life, and this led the Romans to identify him with the deity Virbius of Aricia. The story of Hippolytus is best known to us through the *Hippolytus* of Euripides (the extant *Hippolytus* is the later of two plays on the subject by Euripides), which has been imitated by Seneca in his *Hippolytus* and by Racine in his *Phèdre*. Consult: Euripides, *Hippolytos*, edited by Wilamowitz-Möllendorf (Berlin, 1891), and Harry (Boston, 1899); Kalkmann, *De Hippolytis Euripideis* (Bonn, 1882). On the numerous representations, especially on sarcophagi, consult: August Kalkmann, "Ueber Darstellungen der Hippolytos-Sage," in the *Archäologische Zeitung*, xli (Berlin, 1883); Karl Robert, *Antike Sarkophagreliefs*, ii (ib., 1902); J. E. Harry, Introduction to his edition, pp. xxxviii-xlv. For interpretation of the myth, consult Harry, pp. xxxiv-xxxvii.

HIPPOLYTUS. The name of several saints and martyrs of the early Church, of whom the most interesting flourished in the early part of the third century. Although a very prominent

man in his day, the known facts of his life are few. He was of Greek ancestry and possibly born in Rome, became a presbyter of Rome under Bishop Zephyrinus (199-217?), and attracted attention by his great learning. He headed a party in opposition to Zephyrinus and especially to his successor Calixtus, and was chosen by it their Bishop. But as his opposition was probably mostly personal and on questions of policy, when Urban I succeeded Calixtus, he was reconciled with the Roman church. However, in 235 he went into exile in Sardinia with Pontianus, Urban's successor, and died there. The bodies of both were brought back to Rome for burial. He is a saint in the Roman calendar, and his day is August 13. He was a voluminous author, but his works are now known only by fragments. Of these the most interesting is the so-called *Philosophoumena*, formerly attributed to Origen, but now thought to be the first book of a work by Hippolytus, *The Refutation of All the Heresies*. A manuscript giving books iv-x, previously unknown, was discovered at Mount Athos in 1842. In them Hippolytus gave details which threw new light upon his life. This manuscript was first printed in its entirety by Emmanuel Miller (Oxford, 1851), who, however, attributed it to Origen. Baron Bunsen was the first (1852) to assign it to Hippolytus. Hippolytus' works are given in Migne, *Patrol. Græca*, x, and much better by Bonwetsch and Archelais (Leipzig, 1897 et seq.); they are translated in *Ante-Nicene Fathers*, v. Consult: C. K. J. Bunsen, *Hippolytus and his Age* (London, 1852); Hans Achelis, "Hippolytstudien," in *Texte und Untersuchungen* (Leipzig, 1897); K. J. Neumann, *Hippolytus von Rom in seiner Stellung zu Staat und Welt* (ib., 1901); A. d'Ales, *La théologie de Saint Hippolyte* (Paris, 1906).

HIPPOLYTUS, CANONS OF. A book of ecclesiastical instructions, written in Greek, but now known in an Arabic version from a Coptic translation, which ascribes it to "Hippolytus, chief of the bishops of Rome." While this authorship is doubtful, the book probably belongs to the third century and may have taken its present form in Egypt. It is connected with a group of works whose nucleus is the *Egyptian Church Order*. This book exists in Coptic and Ethiopic and is expanded in the Syriac *Testament of the Lord* and in the *Apostolic Constitutions*, a compilation from about the end of the fourth century. The *Canons of Hippolytus* and the *Egyptian Church Order* are evidently related, but which is the basis of the other has been disputed. The growing opinion, however, is that the *Canons of Hippolytus* is the earlier collection. The importance of these works lies in their aid in reconstructing the life and order of the early Church. The *Canons* contain directions for the ordination of the orders of the clergy, for the admission of converts to the Church, for the Eucharist and its preceding fast, for the visitation of the sick, for worship in the church and in private, and for the life of the ordinary Christian and of the ascetic. They show the progress ritualism and asceticism had made in the Church, but also lay stress on moral life and personal religion. Consult: Achelis, in *Texte und Untersuchungen*, vol. vi (Leipzig, 1891); Funk, *Die apostolischen Constitutionen* (Rottenburg, 1891); Riedel, *Kirchenrechtsquelle des Patriarchats Alexandrien* (Leipzig, 1900); O'Leary, *The Apostolic Constitutions and Cognate Documents* (London, 1906).

HIPPOMANE, hip-pōm'ā-nē. See MANCHINEEL.

HIPPOM'EDON (Lat., from Gk. Ἴππομέδων). In Greek mythology, the son of Aristomachus of Argos, and one of the seven leaders in the expedition against Thebes, in which he was killed by Ismarus. Consult Æschylus, *Seven against Thebes*, 475 ff. See SEVEN AGAINST THEBES.

HIPPOM'ENES (Lat., from Gk. Ἴππομένης). The son of Magareus and descendant of Poseidon. He was the lover of the Boeotian damsel Atalanta. See ATALANTA, 1.

HIPPONAX (Lat., from Gk. Ἴππώναξ). A Greek poet of the sixth century B.C.; next to Archilochus and Simonides, the greatest iambic poet of Greece. Expelled from Ephesus about 542 B.C. by the tyrant Athenagoras, he took refuge in Clazomenæ. There his deformed figure and malicious disposition exposed him to the caricature of the Chian sculptors Bupalus (q.v.) and Athenis; but he avenged himself by issuing against them a series of such bitter satires that tradition says they hanged themselves. These are in thought and execution inferior to the similar works of his predecessor, Archilochus. His coarseness of thought and feeling, his rude vocabulary, his want of charm and taste, and his numerous allusions to matters of merely local interest make him a unique figure in Greek literature. He invented epic parody; the four opening lines of his parody on the *Iliad* have been preserved in *Athenæus* (p. 698 f.). He also invented the choliambic or Hipponactean measure, in which a trochee or spondee is substituted for the final iambus in an iambic trimeter. (See VERSIFICATION, *Greek and Latin: Iambic Rhythms*.) The substitution of the trochee or spondee for the final iambus gives to the verse, at least at times, a limping or halting effect, which adds much to the force of verse scornful in itself. The fragments of the poems of Hipponax are edited by Bergk, *Poete Lyrici Græci*, vol. ii (Leipzig, 1914). Consult Christ-Schmid, *Geschichte der griechischen Litteratur* (2 vols., 5th ed., Munich, 1908-13).

HIPPOPH'AGY (from Gk. ἵπποφάγος, *hippophagos*, horse eating, from ἵππος, *hippos*, horse + φαγεῖν, *phagein*, to eat). The eating of horseflesh. That semicivilized nations eat horseflesh is well known.

In 1855 and 1856 there was a good deal of discussion in Paris relative to the formal introduction of horseflesh into the meat markets, and some of the more enthusiastic advocates of the plan formed themselves into a society. French skill was exercised abundantly in disguising the somewhat coarse taste and odor of horseflesh.

In 1866 there was official recognition of the introduction of this kind of food into the market under such restrictions as were deemed suitable. The prefect of the Seine issued an ordinance in June of that year, recognizing horseflesh as human food, establishing special slaughterhouses or abattoirs for slaying horses under specific regulations. The animals were to be killed by those specially appointed in presence of a veterinary inspector, who was also to stamp or seal every joint of meat after inspection. All restaurateurs who used horseflesh were to acquaint their customers with the fact. During the French International Exhibition of 1867 some of the humbler restaurants of Paris made great use of horseflesh; and during the siege of Paris, in 1870-71, horseflesh was extensively used as

food. At the present time the eating of horseflesh is not at all uncommon in European countries. It is very largely employed in the manufacture of sausages, and in Paris there are a considerable number of places where the meat of horses, mules, and donkeys is for sale. The objection to the use of good horseflesh for food is wholly sentimental, and its cheap price is of great advantage.

HIPPOPOTAMUS (Lat., from Gk. ἵπποπόταμος, *hippopotamos*, river horse, from ἵππος, *hippos*, horse + ποταμός, *potamos*, river). A huge, thick-skinned, almost aquatic, kind of mammal of tropical Africa, two living genera and many fossil species of which constitute the family Hippopotamidae. This family is closely allied to the swine, and it would be more nearly accurate to call them river hogs rather than river horses. They differ from the swine and peccaries, however, in having a broad rounded muzzle, with the nostril superior and no trace of a terminal disk (see SWINE); in having all the toes touch the ground and nearly equal in size; in the continual growth of the lower incisor teeth; and in other anatomical details. The family seems always to have been confined to the Old World; but remains of various species have been found in the Upper Tertiary rocks of Burma and Algeria, and others, nearer the modern type, in the Pliocene and later formations of India and of southern Europe. Within the historic period, at least, the hippopotami have been restricted to Africa—unless one may believe, from biblical references to the behemoth (q.v.), that it has inhabited Palestine since the origin of tradition—where it seems to have occupied all the larger lakes and rivers until locally exterminated by man. Anciently it possessed the whole Nile and was killed by the early Egyptians by means of harpoons; but for centuries none have been seen below the cataracts. When white settlements began at the Cape of Good Hope, “hippos” lived in the most southern of African rivers, but gradually disappeared, until now the upper Limpopo marks the southern boundary of their habitat. They are likely to die out of the East African rivers speedily, but the endless marshes of the upper Nile and its tributaries and the vast swamps and waterways of the Congo basin will preserve the animal indefinitely. These remarks refer to the familiar species (*Hippopotamus amphibius*), in addition to which a species, placed in a genus of its own (*Choropsis*), small in size and more swinelike in appearance, is found in Liberia.

The Common Hippopotamus. This is, next to the elephant, the bulkiest of land mammals. Old males are from 12 to 14 or more feet long, stand nearly 4 feet high at the shoulder, and weigh about four tons. The body is elongated, barrel-shaped, and the belly nearly touches the ground, while the swollen, ugly head seems too heavy even for the massive neck, and the animals, when out of the water, usually rest the chin upon each other or some support. The body is carried upon short piglike legs, having four toes upon each foot, each covered with a round black hoof and resting flat upon the ground, but connected by webs. The skin is two inches thick in some places, is spongy, like that of a walrus, rough, warty and covered with a network of fine wrinkles, and it varies in color in the male from dark leather brown to bluish gray, more or less spotted. The females usually are of lighter tint, and both sexes are lighter on the belly. The skin

is naked except for the bristles on the muzzle, and a few tufts of short hair upon the sides of the head and neck and on the ears and tail. It contains a great quantity of an oily substance which exudes from the pores; and under excitement this flows out copiously and is tintured with blood, producing the “bloody sweat” for which this beast is famous. The tail is short and laterally compressed.

Habits and Food. The hippopotamus is most at home in the water, and aquatic vegetation is its natural fare. To this its organization has become particularly adapted. It swims well, makes long excursions, sometimes into open water, and even goes some distance out into the salt estuaries of rivers. It is able to dive quickly, but its ordinary method of submergence is quietly to sink to the bottom, where it is said that it may walk about, browsing, for several minutes. To this end not only its nostrils but its small ears are closed by sphincter muscles, keeping out the water; and its infolded lips prevent an inrush of water in feeding. The nostrils and eyes are so high that it need only expose an unnoticeable fraction of the face in order to breathe and look about, while its entire body is safely hidden beneath the surface. The peculiar dentition and digestive organs have reference to this manner of life and to a diet of coarse herbage. The enormous mouth, which may open to the extent of 4 feet, is furnished with numerous ivory-capped grinders, and with powerful rooting and biting teeth in front. The larger teeth are the tusks or canines, which are

SKULL AND TEETH OF HIPPOPOTAMUS.

curved backward and have their ends obliquely leveled off by mutual attrition. These tusks and the incisor teeth continue to grow during the life of the animal, and their points turn downward. In this respect these teeth differ from the pig's, which form roots.

The hippopotamus cuts grass or corn as if it were done with a scythe, or bites with its strong teeth a stem of considerable thickness neatly through; it also tears up the marsh growth by means of its great tusks. Its food consists chiefly of the plants which grow in shallow waters and about the margins of lakes and rivers; and probably it renders no unimportant service in preventing slow streams from being choked up by the luxuriance of tropical vegetation. It often, however, leaves the water, chiefly by night, to feed on the banks and makes inroads on cultivated fields, devouring and trampling the crops. As considerable quantities of such fare must be consumed in order to obtain sufficient nutrition, the hippopotamus possesses an enormous stomach, the axial length of which is 11 feet, while the greater curvature measures 15 feet. It fills nearly the entire length of the body and is divided into three distinct compartments, of which the third is cylindrical, with the pylorus almost in the pelvis. It is mainly

in this third compartment that assimilation occurs.

These beasts are gregarious; herds of 12 or 20 gather where food is plentiful, and they seem to remain in one locality all their lives unless much disturbed. During the day they lie hidden, usually asleep, on some marshy islet and betray their presence, if at all, by their snorting, coughing, or grunting, which in anger becomes a hoarse roar. It is at night that they are most active, feed most, and leave the water to graze on shore or invade neighboring fields of millet and the like. Their excursions sometimes extend 7 or 8 miles in a night, and regular paths are trodden through the waterside jungle, in which the negroes dig pits or arrange deadfalls for the capture of the animal. Usually only one offspring is born annually, after a gestation of seven and a half months. The mother takes it into the water immediately, but, as it is unable to swim, supports it upon her neck until it learns how to take care of itself; she also protects it most assiduously, not only from crocodiles and other enemies, but from the rage of the males, who will kill infants unless prevented. The young nurse under water and continue to grow for five years, after which they may live 25 or more years.

Though the brain of this animal is very small and its life a dull one, it is by no means stupid. It quickly learns, when much hunted, not to expose itself nor to indulge in a whalelike snort when it rises to breathe. Its scent apparently is very keen and its vigilance great. Captives learn the names and faces, voices and customs, of their keepers and exhibit much general intelligence. They are naturally very timid, yet curious, and subject to fits of panic or rage. Hence small boats are always endangered by going near them, and even large steamboats have been attacked. A wounded or enraged hippopotamus is regarded by sportsmen as perhaps the most dangerous beast to be encountered. Pure malice seems frequently to dictate their actions. The natives more often get them by strategy than by bold attack. The negroes eat the flesh and fat and make some use of the hide. By white men the animals are shot mainly for sport and near the coast for the sake of the hide, out of which coverings for handles (shrunken on), bull whips, and polishing wheels are made; also for the ivory of the great canine teeth, which sometimes exceed 30 inches in length; but this ivory is not so much valued now as it was early in the nineteenth century, when it was in demand for the making of artificial teeth.

The Pygmy or Liberian Hippopotamus. Concerning this small species not much is known. It appears to be restricted to the Guinea coast and to be much less aquatic than its large relative. It wanders and seeks its food in swampy woods, after the manner of a pig, but never gathers in herds. It is about 6 feet long, 2½ feet tall, and weighs from 400 to 600 pounds. In color it is bluish black along the back, paling gradually to greenish white on the ventral parts. The fact that it sometimes has only one pair of incisor teeth, instead of two, in the lower jaw, has led to its being placed in a separate genus (*Cheropsis*).

In 1912 three of these exceedingly rare animals were received alive at the New York Zoological Park, where in 1914 they were living in good health. For a full account of these, consult Hornaday and Schomburgk, *Zoological Society Bulletin*

(New York, 1912), also G. Rensham, *Natural History Essays* (London, 1904).

Fossils. Remains of the hippopotamus have been found in the Pliocene and Pleistocene deposits of India, Burma, Algeria, and Europe. Hippopotami roamed in herds over England not very long before the period of the earliest human occupation, and the remains of individuals of all sizes have been found in the gravels near Cambridge. Remains of dwarf species, associated with those of dwarf elephants, are found in the cave and fissure deposits of the islands of Sicily and Malta. No remains of fossil hippopotami have yet been found in America.

Bibliography. W. Baker, *Wild Beasts and their Ways* (ib., 1890); Richard Lydekker, *Game Animals of Africa* (ib., 1908); Roosevelt and Heller, *Life-Histories of African Game Animals* (New York, 1914).

See Plate of TAPIRS and HIPPOPOTAMUS; and Colored Plate of PACHYDERMS.

HIPPO REGIUS. See HIPPO.

HIPPOTHŌŌN (Lat., from Gk. ἵπποθών). The hero of the Attic tribe Hippothōntis. He was the son of Poseidon and Alope, the daughter of Cercyon of Eleusis, and was exposed as a newborn infant, but was suckled by a mare and brought up by shepherds. When Theseus overcame and killed Cercyon, he transferred the government to Hippothōn.

HIPPU'RIC ACID (from Gk. ἵππος, *hippos*, horse + οὔρον, *ourom*, urine), $\text{CH}_2\text{NH}(\text{C}_6\text{H}_5\text{CO})\text{COOH}$. A compound of great interest, both to the chemist and to the physiologist. It derives its name from its having been first discovered in the urine of the horse, and that fluid, or the renal secretion of the cow, affords us the best and readiest means of obtaining it. The fresh urine is boiled with a slight excess of milk of lime and filtered; the filtrate is evaporated to a small volume, cooled, and acidified with hydrochloric acid, when hippuric acid separates out in the form of fine needle-like crystals. It may be purified by dissolving it in hot water, passing a stream of chlorine gas into the solution, and filtering hot. When obtained by a process of slow crystallization, the crystals of hippuric acid are moderately large, at first colorless, but subsequently becoming milk-white four-sided prisms, which are devoid of odor, but have a faintly bitter taste. They dissolve readily in boiling water and in spirit, but are only sparingly soluble in cold water and in ether. The melting point of the pure acid is 187.5° C. (369.5° F.). Its chemical name is benzoyl-aminoacetic acid, and it may be prepared artificially from benzoic acid, $\text{C}_6\text{H}_5\text{COOH}$, and glycine, $\text{CH}_2\text{NH}_2\text{COOH}$. When boiled with strong mineral acids, hippuric acid takes up water and splits up again into its chemical components, benzoic acid and glycine. It is a normal constituent of the urine of the horse, cow, sheep, goat, hare, elephant, etc., and most probably is to be found in the urine of all vegetable feeders. In normal human urine, if the food is an ordinary mixed diet it occurs in very small quantity, but is increased by an exclusively vegetable

diet and in the well-known disease diabetes. Although hippuric acid usually occurs in mere traces in human urine, we can artificially produce it at will in the body and cause it to be eliminated in comparatively large quantity. If we swallow benzoic acid, it seems to take up the elements of glycine in its passage through the system and thus to form hippuric acid, which appears abundantly in the urine. Hippuric acid is formed in the animal body not only from benzoic acid itself but from any substance that may be readily transformed into benzoic acid. Some such substances are contained in grass, hay, and in many berries, and are also found among the products of the putrefaction of proteids, especially those of vegetable origin. In carnivora the formation of hippuric acid has been shown to take place chiefly in the kidneys; in the herbivora, however, benzoic acid is largely transformed into hippuric acid even if the kidneys have been removed. In birds the ingestion of benzoic acid causes the formation, not of hippuric, but of *cananthylic* acid. The hippuric acid which occurs in the animal organism exists in combination with bases, chiefly as hippurate of sodium and hippurate of calcium. The last-named salt can be obtained by the mere evaporation of the urine of the horse. As shown by Dehn in 1908, the presence of hippuric acid in urine may be demonstrated by adding enough of a solution of sodium hypobromite to color the urine yellow; if hippuric acid is present, a characteristic brownish-red precipitate is formed.

HIPPURITIDÆ (Neo-Lat. nom. pl., from Gk. *ἵππουρις*, *hippouriis*, horse-tailed, from *ἵππος*, *hippos*, horse + *οὐρά*, *oura*, tail). A family of pelecypods, representing the most extreme development of the highly aberrant branch of the Rudistæ. In this family, which is typically represented by the genus *Hippurites*, the lower valve has become a cylindroconic body, attached by the apex, of columnar appearance, through deep sutures representing the anal, branchial, and ligamentary inflections. The other valve is developed into a flat cover, bearing three long toothlike processes, which fit so closely into corresponding sockets of the lower shell that they are difficult to prepare. The living chamber of the animal is extremely small, since the lower valve is filled with a porcelaneous white inner layer that forms septa and interseptal spaces, as in a cephalopod. The shells of *Hippurites* reach a meter or more in length, and like the other Rudistæ they occur in vast numbers in the Middle and Upper Cretaceous beds of the Mediterranean countries and of western Asia and became extinct at the end of Cretaceous time. An American form is *Hippurites barretii*, which is found in the Cretaceous of Jamaica and Guatemala. See RUDISTÆ; PELECYPODA.

HIPURINA, ē-pō'rē-nā'. A tribe of the middle Purus of western Brazil, one of the most warlike on the river, and estimated at perhaps 2500 souls. They live in long, low houses, built of converging poles, and use poisoned arrows with heads notched so as to break off in the wound. They wear only the breechcloth, but are clean and self-respecting.

HIRADO, hē-rā'dō (in old books *FIRANDO*). An island in the northwest of the entrance to the Bay of Omura, off the coast of Hizen, Japan, with a capital of the same name containing 10,600 inhabitants. It was made famous in the sixteenth century as the place of welcome to the Portuguese (the first foreigners to visit Japan),

and later, in 1600, to the Dutch, and in 1609 to the English. From 1609 to 1611 the English, and from 1609 to 1640 the Dutch, had a trading station here, the latter in 1640 being transferred to the little artificial island of Deshima (q.v.) at Nagasaki. Consult *The Diary of Richard Cocks* (Hakluyt Society, London, 1883).

HIRAM, or **HURAM** (perhaps an abbreviation of *Ahram*, brother of the High One, or, *Ahi* is exalted). 1. King of Tyre. He is represented as David's friend and ally and assisted him in the building of his palace by contributions of timber and labor (2 Sam. v. 11; 1 Chron. xiv. 1). Upon Solomon's accession Hiram sent cedar and other timber and skilled workmen for the building of the temple, in return for which Solomon paid a yearly tribute (1 Kings v. 1-12). The two kings remained constant friends, and Hiram supplied Solomon with a navy (1 Kings ix. 26-28, x. 22). Hiram waged a successful war against Cyprus and fortified the island of Tyre. The question has been raised whether the same King of Tyre could have been the contemporary of both David and Solomon, both of whom had long reigns. If we assume, however, that David undertook his building operations during the latter part of his reign, there is no reasonable ground for doubt; though it is, of course, possible that for David's reign we should substitute the name of Abibaal, the father of Hiram. 2. According to 1 Kings vii. 13 et seq., a Tyrian artificer who was sent by Hiram, the King of Tyre, to assist in the building of Solomon's temple.

HIRAM COLLEGE. A coeducational institution of higher education at Hiram, Ohio, founded in 1850 as the Western Reserve Eclectic Institute, of which James A. Garfield was a student, teacher, and principal. It became a college in 1867 and had, in 1914, 242 students, of whom 233 were enrolled in the college proper, the preparatory school having been discontinued in 1911. The library contains about 13,000 volumes. The equipment includes women's dormitories, observatory and telescope, museum, gymnasium, athletic field, and laboratories. Besides dwellings, the college owns six buildings wholly devoted to college purposes. The endowment fund is about \$300,000. The president in 1914 was Miner Lee Bates, A.M., Ph.D.

HIRE, E. and L. DE LA. See **LA HIRE**.

HIRE-PURCHASE AGREEMENT. A contract which combines the elements of hiring and of sale of a chattel. Its usual form is the hiring of a chattel to a would-be purchaser, the purchase price to be paid in fixed installments, the chattel continuing to be the property of the vendor until the last installment is paid. The real object of the transaction being the sale of the property, it is more frankly described by the title which it usually bears in the United States, of an installment sale; but the hiring provision, which preserves the title in the vendor, while at the same time giving the purchaser the possession and use of the property, is legally binding and is sustained by the courts. This feature of the agreement takes it out of the category of contracts of sale and exempts it from the operation of the Bills of Sale acts in England and the United States which require registration of such contracts. The form of a hire-purchase agreement is sometimes employed as a cover for a contract of sale or a loan on the security of chattels, and the court will look into the real nature of the transaction to de-

termine whether it is what it purports to be, viz., a real contract of hiring with an option of purchase, or a sale, mortgage, or pledge. Under the terms of the agreement the lender or vendor is generally permitted to retake the chattel on default of payment of an installment when it falls due, the payments previously made being retained by the lessor as compensation for the hire of the property. The hardships which often result from such default have led to attempts to avoid the forfeiture or to secure for the defaulting hirer a further period of redemption, but these efforts have met with no success. Where the agreement is found to be in reality a hire and purchase agreement and not a mortgage or pledge, it is invariably enforced in accordance with its terms. More difficult questions present themselves where the hire-purchase agreement contemplates the annexation of the chattels to the freehold of the hirer or purchaser, as where machinery is sold to a manufacturer, or plumbing to a builder for installation in a building under an agreement that the articles are to remain the property of the vendor until paid for. Such a transaction is more in the nature of a sale and purchase-money mortgage than of a hiring agreement, but it is nevertheless sustained by the courts in accordance with its terms. See BAILMENT; HIRING; SALE.

HIRING. A transaction whereby the owner of a chattel transfers its possession to another under an agreement by the latter, known as the hirer, to pay a specified sum for the use of the same, the goods to be returned to the owner or lender at a specified time or on demand. Hiring a chattel is a recognized form of bailment, vesting in the bailee, the hirer, the complete right of possession during the period of the bailment and imposing on him certain definite obligations as to the use of the property bailed and the degree of care to be exercised by him while it is under his control. His possession is exclusive during such period and may not be interfered with, either by the bailor or by any one else, without subjecting the wrongdoer, even if the owner, to an action of trespass or of trover at the instance of the bailee. In the meantime the owner, having parted with the possession and the right to the possession of the chattel, is deprived of the right to maintain any possessory action (replevin, trespass, or trover) against a third person who may interfere with, injure, or destroy the property, though he may, if the act of such wrongdoer results in permanent injury to the chattel, sue him in an action on the case for the injury to his so-called reversionary interest. As against the bailee, the owner can never maintain trespass, though for a wanton destruction, sale, or other act of conversion committed by the latter, which has the effect of terminating the bailment and thus of reviving the owner's right of possession, he may have an action of trover. Indeed, any unwarranted use or abuse of the property by the bailee gives the owner the immediate right to demand its return and, if the demand be refused, to vindicate his right by an action of trover.

The bailee is bound to exercise ordinary care, such as a prudent man exercises in the case of his own property, and at the end of the bailment to restore the property to the owner without unnecessary delay. He is not liable for ordinary wear and tear, nor for injury or destruction caused by inevitable accident or resulting from the wrongful acts of others which could not in

the exercise of ordinary care have been prevented by him. If the article when returned is not in good condition, the law places in the bailee the duty of showing that its impairment of value was not due to his fault under the rule of liability above laid down. See BAILMENT; TRESPASS; TROVER.

HIRLAS (hêr'làs) **HORN**, THE. A long, blue, silver-rimmed drinking horn, mentioned in a Welsh poem of the same name, written by Owain, Prince of Powys, in the twelfth century.

HIRN, ern, **GUSTAVE ADOLPHE** (1815-90). A French physicist, born at Logelbach, near Colmar. When he was 19, he entered his grandfather's cotton factory as dye chemist; afterward he acted as engineer (1842) and began his valuable researches on mechanics and especially on heat. He was made a member of the French Academy of Science in 1867, in 1880 founded a meteorological observatory near Colmar, and later devoted himself to astronomy. Hirn was educated in the shop, and his works are marked by much practical criticism of mere academic theory. They include: *Théorie mécanique de la chaleur* (3d ed., 1875-76); *Analyse de l'univers* (1869); *Mémoire sur les anneaux de Saturne* (1872); *Les pandynamomètres* (1876); *Etude sur une classe particulière de tourbillons* (1878); *Recherches expérimentales sur les relations entre la résistance de l'air et sa température* (1882); *La vie future et la science moderne* (1882); *Constitution de l'espace céleste* (1889).

HIRN, Yrjö (1870-). A Finnish educator and writer on aesthetics. He was born in Villmanstrand and was educated at the University of Helsingfors, where he became professor of aesthetics and of modern literature in 1898. His works, of great importance for aesthetic theory and for their presentation of primitive art, include: *Forstudier till en Konstfilosofi* (1896); *Pueblo Folkens Konstliv* (1901); *The Origins of Art* (1900; in Swedish, 1902; in German, 1904); *Det heliga Skrinet* (1908; in English, *The Sacred Shrine*, 1912), a study of the art and poetry of the Catholic church; *Det estetiska Livet* (1913).

HIROSAKI, hêrô-sâ'kê. A town of Japan, situated in the northern part of Honshu, 22 miles by rail from Asmori (Map: Japan, G 3). It contains ruins of an old castle and a museum. The chief product is lacquered ware. Pop., 1898, 34,771; 1908, 37,487.

HIROSHIGE, hêrô-shê'gê, **ANDO** (1797-1858). A Japanese landscape painter for color printing from wood blocks, of the *Ukiyô* (Popular) school. He was born of a Samurai family in Yeddo (Tokyo), and when only 10 years old painted the procession of the embassy from the Riu-Kiu (Loo-choo) islands in such a lifelike manner and with such good colors as to attract attention. At 15 he sought instruction from Toyokuni, who had so many pupils that he refused him. But Toyohiro received him, and in recognition of this the pupil assumed the name of Hiroshige in place of his original name of Tokutaro. On his teacher's death, in 1828, he opened his own studio, but, on account of the popularity of Toyokuni's prints of actors and figure groups, had a hard struggle. His first great success was with pictures of the Tokaido, the wonderful highway between Yeddo and Kyoto. These and other landscapes by him were so much admired that soon many other artists forsook the figure school and imitated him. What brings Hiroshige close to us of the Occi-

dent is that his method of representation shows European influence, though his work remains always completely Japanese. He observes the rules of perspective to a certain extent, aspires to correct composition, with proper adjustment of foreground and background; and his designs have both inner unity and outer finality, as contrasted with those of the Chinese, which seem to float in the air. While his technique is of architectural precision, he always sees nature with his own eyes and renders with his brush the mood of a landscape seen in a certain light and from a certain point of view. In the Metropolitan Museum, New York, are important prints by Hiroshige from the Francis Lathrop and other collections. One of his pupils took the name of Hiroshige II, another, that of Hiroshige III. Consult: E. F. Fenollosa, *The Masters of Ukiyo* (New York, 1896); Wolde-mar von Seidlitz, *History of Japanese Colour-Prints* (ib., 1910); Amsden-Happer, *The Heritage of Hiroshige* (San Francisco, 1912).

HIROSHIMA, hē'rō'shē-mā. The capital of the Japanese Province of Aki and of the Prefecture of Hiroshima, situated at the southwest end of Hondo, about 3 miles inland (Map: Japan, C 6). It lies in a beautiful region at the foot of a hill and contains a number of fine temples, a park, and tea houses. Opposite the city is situated the sacred island of Miyajima, or Itsukushima, with its celebrated Shinto temple. Commercially Hiroshima is considered the most important place west of Kobe and forms the centre of the trade in lacquered ware, bronze, and other objects of art. Pop., 1898, 122,306; 1908, 142,763.

HIRPINI, hēr-pī'nī (from Sabine *hirpus*, wolf). A people of ancient Italy, who inhabited the southern portion of Samnium. They have been considered by some authorities as merely a Samnite tribe. (See ITALIC LANGUAGES, *The Italic Dialects in Detail*; SAMNITES.) By others they are looked upon as an independent nation. The country they inhabited was the wild and mountainous district traversed by the Sabatus, the Calor, and the Tamarus, tributaries of the Vulturinus, and, on the east side of the Apennine ridge, by the upper course of the Aufidus. In the early history of Rome the Hirpini are found identifying themselves with their Samnite neighbors against the Romans. They seem to have been subdued in the early part of the third century B.C., as in 268 B.C. Beneventum (see BENEVENTO), the key of all their military positions, was colonized by Romans. In the Second Punic War, revolting from their conquerors, they joined the Carthaginian invaders, and, though they were unable to recapture their stronghold of Beneventum, they remained faithful to Hannibal till the defeat of Hasdrubal at the Metaurus restored the Empire of Italy to the Romans. In this year (207 B.C.) the Hirpini made peace with the Romans by betraying into their hands the garrisons of the Carthaginians. From this time till the outbreak of the Social War (q.v.), the Hirpini seem to have continued steadfast in their allegiance to Rome. On that occasion, however, they set the example of revolt and might have become formidable enemies had not the rapid successes of Sulla induced them to repair their error by a complete submission. At the close of this war the Hirpini obtained the franchise and do not again appear in history as an independent people. Consult R. S. Conway, *Italic Dialects* (Cambridge, 1897).

HIRSCH, hērsh, AUGUST (1817-94). A German physician, born at Danzig, where he practiced after studying at Berlin and Leipzig. In recognition of his studies on malarial fever and his work, *Handbuch der historisch-geographischen Pathologie* (2d ed., 1881-86), he was in 1863 made professor of the history of medicine at Berlin. In 1873 he was a member of the German Cholera Commission, studied the conditions of Posen and West Prussia, and published a valuable report (1874). He studied the plague in Astrakhan in 1879 and 1880 and in the latter year wrote a report to his government. His more important writings are: *Die Meningitis Cerebro-spinalis Epidemica* (1866); *Geschichte der Augenheilkunde* (1877); *Geschichte der medizinischen Wissenschaften in Deutschland* (1893); a revision of Hecker's collected writings, under the title *Die grossen Volkskrankheiten des Mittelalters* (1865). He edited *Biographisches Lexikon der hervorragenden Aerzte aller Zeiten und Völker* (1884-88) and, with Virchow, *die Jahresbericht über die Fortschritte und Leistungen der Medizin* (1866 et seq.).

HIRSCH, CARL (1858-). A German composer, born at Wemding, Bavaria. He began life as a school-teacher, but soon abandoned that career for music. He was church music director at Munich (1885-87); music director at Mannheim (1887-92), at Cologne (1892-93), at Elberfeld (1893-); and director of the Gesangschule, the Liedertafel, the Philharmonic concerts at Elberfeld. But it is as a composer that Hirsch is best known, his *a-cappella* male choruses, which are very numerous, and his cantatas being widely known and used. Of the latter *Die Krone im Rhein* and *Landknechtsleben* are representative. His songs and ballads are scarcely inferior to his male choruses.

HIRSCH, EMIL GUSTAV (1852-). An American rabbi, born in Luxemburg, the son of a prominent Jewish theologian who in 1866 became minister of the Reformed Congregation in Philadelphia. He graduated at the University of Pennsylvania in 1872 and studied at Berlin in 1872-76. He was rabbi in Baltimore (1877) and in Louisville, Ky. (1878-80), but did his greatest work in Chicago, whither he went in 1880 as minister of the Sinai Congregation. He took some part in politics as a member of the Republican party, was president of the Chicago Public Library Board (1888-97), in 1892 became professor of rabbinical literature and philosophy in the University of Chicago, and in 1902 was Trumbull lecturer at Johns Hopkins. From 1880 to 1887 he edited the Milwaukee *Zeitgeist* and in 1894 undertook the editorial charge of the *Reform Advocate*. As a lecturer and writer, he is closely connected with advanced Judaism and with philanthropy. He translated and edited Dr. Einhorn's *Ritual for Jewish Reform Congregations*.

HIRSCH, JENNY (1829-1902). A German reformer and author, born at Zerbst, where she was a tutor for several years. She went to Berlin in 1860, wrote for the *Bazar*, under the pseudonym J. N. Heynrichs, until 1864, and about that time became interested in woman's rights and female education. A member of the Women's Congress of 1865 at Leipzig and for many years a leader in the Lette-Verein, she edited *Der Frauenmooalt* (1870-82) and, with Lina Morgenstern, *Deutsche Hausfrauenzeitung* (1887-92); with Mary Wall she wrote *Haus*

und Gesellschaft in England (1878); in 1881 published *Fürstin Frau Mutter*, and after it many other tales, artistically unimportant. Among them are the following titles. *Die Erben* (1889); *Der Amerikaner* (1894); *Vermisst* (1894); *Löwenfelde* (1896); *Der Amtmann von Rapshagen* (1890); *Schuldig* (1899); *Camilla Feinberg* (1901). Under the title *Hörigkeit der Frau* (3d ed., 1891), she translated into German Mill's *Subjection of Woman* and wrote a *Geschichte der 25 jährigen Wirksamkeit des Lette-Vereins* (1892).

HIRSCH, JOSEPH (1836-1901). A French engineer, of Jewish family, born at Lyons. Educated there, at the Ecole Polytechnique and the Ecole des Ponts et Chaussées, he worked on the canal at Sarrebourg (1866) and there invented the Mittersheim siphon for the automatic control of reservoirs. From 1876 to 1898 he was professor of steam machinery at the Ecole des Ponts et Chaussées, and from 1886 until his death at the Conservatoire des Arts et Métiers. He contributed to the *Annales* of the former school; as member of the juries of award at the expositions of 1878 and 1889 and as president of the jury of 1900, he wrote valuable reports and lectured on the machinery exhibited at these expositions; and was the author of many treatises on machinery, including *Théorie des machines aéro-thermiques* (1874-75). His contributions to Lechals's *Encyclopédie* should also be mentioned, as well as his *Traductions de notes sur l'Amérique* (1875).

HIRSCH, MAURICE, BARON DE (MAURICE DE HIRSCH DE GEBEUTH) (1831-96). An Austrian Jewish financier and philanthropist. He inherited his father's wealth in 1869 and greatly increased his fortunes by his marriage to the daughter of the senior partner of the banking firm of Bischoffsheim and Goldsmid, Brussels, with whom he had become associated. He also made large sums by building railways in Rumania and Turkey, from which countries he obtained vast concessions, whose money value he doubled by fortunate speculations. His fortune was estimated at \$200,000,000, and his income at from \$15,000,000 to \$20,000,000 a year. He gave to charity about \$100,000,000 during his life, and the Baroness de Hirsch on her death, in 1899, bequeathed about \$15,000,000 to charities. These benefactions were chiefly for the alleviation of the condition of the Jews. He gave not less than \$50,000,000 to the Jewish Colonization Association, by which colonies were established in the Argentine Republic. He endowed the Galician schools with \$5,000,000 and in 1888 offered \$10,000,000 to the Russian government for schools, provided no distinctions of race or religion should be made in its distribution. His offer was declined. He gave \$2,500,000 to establish a fund in New York for educating and Americanizing Russian and Rumanian Jews. The sum of \$1,200,000 was added to this fund by the Baroness, who died in Paris, April 1, 1899.

HIRSCH, MAX (1832-1905). A German political economist and politician, born at Halberstadt in Prussian Saxony. He studied political economy and jurisprudence at the universities of Tübingen, Heidelberg, and Berlin, and then traveled through France and north Africa. As the result of his observations during these travels, he published *Skizze der volkswirtschaftlichen Zustände in Algerien* (1857) and *Reise in das Innere von Algerien, durch die Ka-*

bylie und Sahara (1862). In 1859 he established a publishing house in Berlin, but soon gave it up for political and club life. After a journey through England and Scotland (1867-68), he returned home to organize trades-unions among his countrymen. These soon spread all over Germany, and through them and their organ, *Der Gewerksverein*, he wielded great influence. He was several times a member of the Reichstag and was the leading spirit in a number of societies for the benefit of the laboring classes. His publications include *Was bezwecken die Gewerksvereine?* (15th ed., 1891) and *Das Invaliditäts- und Altersversicherungsgesetz* (3d ed., 1890).

HIRSCHBERG, hêrsh'bêrk. A manufacturing town in the Prussian Province of Silesia, situated at the foot of a mountain, 30 miles southwest of Liegnitz (Map: Germany, F 3). The town is ancient and still girt about by a double line of walls. Its large Protestant church, a Gothic edifice, is known for its excellent organ. Hirschberg has manufactures of linen, lace, yarn, cotton goods, Venetian blinds, strawboard, cement, porcelain, machinery, paper, metal, and tobacco. Much wine is made, and there is trade in grain, wine, cement, linen, and butter. The town was founded at the beginning of the eleventh century. Pop., 1900, 17,865; 1910, 20,564, mostly Protestants.

HIRSCHBERG, JULIUS (1843-). A German ophthalmologist. He was born in Potsdam and was educated at the University of Berlin, where he graduated as M.D. in 1866, became assistant to Von Graefe, lecturer (1869), and professor (1879). His works cover nearly every branch of ophthalmology, but are particularly valuable for the history of this branch of medicine. They include: *Markschwamm der Netzhaut* (1869); *Beiträge zur praktischen Augenheilkunde* (1876-78); *Der Elektromagnetismus in der Augenheilkunde* (2d ed., 1899); *Wörterbuch der Augenheilkunde* (1887); *Einführung in der Augenheilkunde* (1892-1901), a history of ophthalmology—in antiquity (1899), among the Arabs (1905), in the Middle Ages (1906), from the Renaissance to the eighteenth century (1908), in the eighteenth century (1909-11), in Germany in 1800-50 (1912), in France (1912); *Behandlung der Kurzsichtigkeit* (1910, and in English). He also wrote sketches of travel—*Tunis* (1885), *Von New-York nach San Francisco* (1888), *Aegypten* (1890), *Um die Erde* (1894), *Hellas-Fahrten* (1910).

HIRSCHFELD, GEORG (1873-). A German novelist and dramatist. He was born in Berlin, left a Berlin Gymnasium at the age of 17 to go into business, but in 1893, under the patronage of Hauptmann and Wildenbruch, began his literary career and studied at the universities of Munich and Berlin. In Berlin he was as Hauptmann's pupil a member of the group that figured in the Freie Bühne movement, and his first novel, *Damon Kleist* (1895), and his one-act play, *Zu Hause* (1896), were first printed in the *Freie Bühne*, an organ of the movement, and his most successful play, *Die Mütter* (1896), had a long run in 1895 at the Free Theatre of Berlin. At the Vienna Burg-Theater in 1898 appeared his *Agnes Jordan*, a play in five acts, which, with a fine disregard for unities, presents in each act a different period in a woman's life, and which more than most of his other work shows the influence of Ibsen. At Munich, where Hirschfeld definitely

settled in 1912, he was a member of the circle of Halbe and the Intimes-Theater. His works, besides those already mentioned, include the novels and romances *Die Bergsee* (1896), *Freundschaft* (1902), *Das grüne Band* (1905), *Das Mädchen von Lille* (1906), *Der Wirt von Velduz* (1907), *Hans aus einer anderen Welt* (1909), *Die Niwe vom Güldensee* (1910), *Angst und Emma* (1911), *Der Kampf der weissen und der roten Rose* (1912), *Onkel und Tante Vante* (1913), and *Pension Zweifel* (1913); and the plays *Pauline*, a "Berlin comedy" (1899), *Der junge Goldner* (1901), *Der Weg zum Licht* (1902), *Nebeneinander* (1904), and *Ueberwinder* (1913).

HIRSCHFELD, hêrsh'fêlt, GUSTAV (1847-95). A German archaeologist, born at Pyritz in Pomerania. He was educated at Tübingen, Leipzig, and Berlin, and was sent by the Prussian Archaeological Institute in 1870 to Greece, Italy, and Asia Minor. From 1875 to 1877 he had charge of the excavations at Olympia (q.v.) and in 1882 traveled again in Asia Minor. He was appointed professor of archaeology at Königsberg in 1878. Besides many articles in the archaeological journals, he wrote: *Tituli Statuariorum Sculptorumque Graecorum* (1871); *Athena und Marsyas* (1872); *Paphlagonische Felsen-gräber* (1885); *Berichte über alte Geographie* (1885); *Die Felsenreliefs in Kleinasien und das Volk der Hittiter* (1887); *Griechische Inschriften des Britischen Museums* (1893). He contributed also to the first two volumes of *Ausgrabungen zu Olympia* (1877-78). His *Aus dem Orient* was posthumously published (1897).

HIRSCHFELD, Otto (1843-). An eminent German classical scholar and historian, born at Königsberg. After having taught at Göttingen, Prague, and Vienna, he was in 1885 appointed to the chair of ancient history in the University of Berlin. Of his historical writings the most important is his *Untersuchungen auf dem Gebiete der römischen Verwaltungsgeschichte* (1876; 2d ed., 1905). He rendered especial service to classical learning as editor of Latin inscriptions: *Inscriptiones Galliae Narbonensis Latinae* (1888); supplement to the *Corpus Inscriptionum Latinarum*, vol. iii (1893); *Inscriptiones Aquitaniae et Lugdunensis* (1899); *Inscriptiones Belgicae* (1904). In 1913 he collected his minor papers under the title *Kleine Schriften*. Consult the *Berliner philologische Wochenschrift*, vol. xxxiv, pp. 812-816 (1914).

HIRST, FRANCIS W (RIGLEY) (1873-). An English economist. He was educated at Clifton College and at Wadham College, Oxford, studied law, and in 1907 became editor of the *Economist*. He was prominent, especially in 1913, in the English movement for an international agreement for disarmament. He wrote: *Essays in Liberalism* (1897), with others; *Liberalism and the Empire* (1900), with others; the very valuable *Local Government in England* (1903), with Redlich; *Adam Smith* (1904); *Monopolies, Trusts, and Kartells* (1905); *The Arbitrator in Council* (1906); *The Stock Exchange* (1911); *The Siam Panics and Other Essays* (1913).

HIRT, hêrt, HERMANN (1865-). A German philologist. He was born at Magdeburg, wrote on German metres (*Untersuchungen zur westgermanischen Verskunst*, 1889), edited Schopenhauer's *Parerga* (1890), and then, devoting himself to Indo-Germanic philology, made special studies on accent, writing *Der indogerman-*

ische Akzent (1895) and *Der indogermanische Ablaut, vornehmlich in seinem Verhältnis zur Betonung* (1900). Hirt, who became professor at Leipzig, made valuable contributions to Brugmann and Streitberg's *Indogermanische Forschungen*, on the morphology of case endings. In 1902 he published *Handbuch der griechischen Laut- und Formenlehre* (2d rev. ed., 1912), and in 1905-06 *Die Indogermanen*, on the primitive culture of the Indo-Germanic peoples. He also edited Weigand's *Deutsches Wörterbuch* (5th ed., 1909-10).

HIRTH, hêrt, FRIEDRICH (1845-). A German-American sinologue, born at Gräfen-tonna, Saxe-Gotha. He was educated at the universities of Leipzig, Berlin, and Greifswald (Ph.D., 1869) and from 1870 to 1897 was in the Chinese maritime customs service. He was consulted by Count von Bülow in 1900 on the question of the Boxer indemnity. In 1902 he was appointed to the professorship of Chinese in Columbia University (New York City). A collection of Chinese manuscripts and printed books made by him is in the Royal Library at Berlin, and another of porcelains of considerable historical importance in the Gotha Museum. As an investigator, he conducted researches in Chinese literature by imitation of the methods of classical philology. His chief publications include: *China and the Roman Orient: Researches into their Ancient and Medieval Relations as Represented in Old Chinese Records* (1885); *Ancient Porcelain: A Study in Chinese Medieval Industry and Trade* (1888); *Text-Book of Documentary Chinese* (2 vols., 1885-88); *Chinesische Studien*, vol. i (1890); *Ueber fremde Einflüsse in der chinesischen Kunst* (1896); *Scraps from a Collector's Note-book, Being Notes on Some Chinese Painters of the Present Dynasty, with Appendices on Some Old Masters and Art Historians* (1905); *The Ancient History of China* (1908); *Chau Ju-kua* (1911), with W. W. Rockhill; and many papers on subjects connected with Chinese literature. He contributed to the second edition of the NEW INTERNATIONAL ENCYCLOPÆDIA.

HIRTIUS, hêr'shî-ûs, AULUS (90-43 B.C.). A personal friend of Julius Cæsar, under whom he served in Gaul, and who in 46 B.C. nominated him as one of the 10 prætors. After the death of Cæsar he became consul, declared against Antony, and headed a reinforcement for Octavius. While leading an assault on Mutina (Modena), he was killed. It is said that he was the author of the eighth book of Cæsar's *Commentaries on the Gallic War*. See CÆSAR, GAIUS JULIUS; COMMENTARIES, CÆSAR'S; COMMENTARII. Consult Martin von Schanz, *Geschichte der römischen Litteratur*, § 122 (3d ed., Munich, 1909).

HIRUDO, hî-rûd'ô, HIRUDINEA. See LEECH.

HIRUNDINIDÆ (Neo-Lat. nom. pl., from *hirundo*, swallow). The swallow family. See SWALLOW.

HIRZEL, hêr'tsel, RUDOLF (1846-). A German classical scholar, son of Salomon Hirzel. He was educated at the universities of Heidelberg, Göttingen, and Berlin, and became professor of classical philology at Jena. He wrote: *Untersuchungen zu Ciceros philosophischen Schriften* (1871-83); *Der Dialog* (1895); *Der Eid* (1902); *Themis, Dike, und Verwandtes* (1907); *Plutarch* (1912).

HIRZEL, hêr'tsel, SALOMON (1804-77). A German publisher and an authority on Goethe.

He was born in Zurich, was a member of the firm of Weidmann in Leipzig until 1853, and then with his brother-in-law, Karl Reimer, founded an independent publishing house, which brought out Freytag's works, Grimm's *Wörterbuch*, and the publications of the Saxon Royal Academy, the Jablonowski Association, and the Prussian archives. Hirzel made a valuable collection of Zwingliana, which he left to the University of Strassburg. His valuable library on Goethe was willed to Leipzig University. Hirzel wrote *Der junge Goethe, 1764-76* (with an introduction by Bernays, 1875) and *Verzeichnis einer Goethe-Bibliothek* (1874). Consult article by Alfred Dove in the *Allgemeine deutsche Biographie*, vol. xii (Leipzig, 1880).

HIS, hēs, WILHELM (1831-1904). A German anatomist and physician. He was born in Basel, studied medicine there, in Berlin, Würzburg, and Vienna. He was professor at Basel (1857-72) and at Leipzig. His earlier researches were histological; afterward he devoted himself to anatomy and in a less degree to embryology. He edited with Braune the *Zeitschrift für Anatomie und Entwicklungsgeschichte* (1875-92) and in 1877 took charge of the anatomical department of the *Archiv für Anatomie und Physiologie*. Among his more important publications are: *Crania Helvetica* (1864), with Rüttimeyer; *Unsere Körperform* (1875); *Anatomie menschlicher Embryonen* (1880-85); *Die anatomische Nomenklatur* (1895); *Die Entwicklung des menschlichen Gehirns während der ersten Monate* (1904); and a reconstruction of the physiognomy of Bach after the discovery of his remains (1895), with Seifner.

HIS/COCK, FRANK (1834-1914). An American lawyer and legislator, born at Pompey, N. Y. He was admitted to the bar in 1855, served as district attorney of Onondaga County in 1860-63, and was a member of the State Constitutional Convention in 1867. Elected to Congress as a Republican Representative in 1877, he won repute as a debater and leader. From 1887 to 1893 he was a member of the United States Senate, being chairman of the Appropriations Committee. After his retirement he became connected with a large law firm and director of several banks.

HISGEN, hīz'gen, THOMAS LOUIS (1858-). An American manufacturer and political reformer. He was born at Petersburg, Ind., and was educated in the public schools. With his father and brothers he erected at Albany, N. Y. (1898), one of the largest axle-grease factories in the world. A bitter competitive struggle followed the refusal to sell their plant to the Standard Oil Company and resulted in the formation of Hisgen Bros., and the Four Brothers Independent Oil Company, with T. L. Hisgen as president. He was Democratic and Independence League candidate for State Auditor of Massachusetts in 1906, Independence League candidate for Governor of Massachusetts in 1907, and candidate of the National Independence party for President of the United States in 1908. He became president of the Independent Petroleum Marketers Association of the United States.

HISHAM, hēsh-ām'. The name of several Omniad rulers of Spain.—HISHAM I was Emir of Cordova from 788 to 796. He was a vigorous ruler and put down revolts with a firm hand. He also was successful in some expeditions against the Franks. He is, however, remembered chiefly for his personal habits. In

disguise he wandered incognito about the capital, succoring the poor and oppressed, caring for the sick, and inquiring into the administration of justice. His charity and justice endeared him to his subjects.—HISHAM II, Omniad Caliph of Cordova from 976 to about 1009, succeeded to the throne before he was 12. He had little ability and lived in seclusion, while his chief officer, Almanzor, made conquests from the Christians. Hisham was deposed and probably murdered.—With HISHAM III, who was deposed in 1031, the Omniad caliphate in Spain came to an end. Consult Stanley Lane-Poole, *The Moors in Spain* (New York, 1886; 7th ed., London, 1904).

HISPALENSIS, JOHANNES. See JOHN OF SEVILLE.

HISPA'NIA. The name by which the Spanish Peninsula, including the modern Spain and Portugal, was known to the Romans. The Greeks called it Iberia. The Roman poets sometimes called it Hesperia (the western land). The earliest inhabitants of whom we have any knowledge were the Iberians (q.v.), a race apparently unconnected ethnically or linguistically with any other race of Europe, of which the modern representatives are the Basques of northern Spain. But in very early times hordes of Celts crossed the Pyrenees and occupied almost the whole peninsula, pushing back or assimilating the Iberians, whence the natives were generally called Celtiberians by the ancients. (See CELTIBERI; GAUL; SPAIN, *History*.) The natural wealth of the country, especially its silver deposits, early attracted traders and colonists. About the middle of the fourth century B.C. the Greek colony of Emporiæ (Ampurias) was founded on the northeast coast. Phœnician traders early made the circuit of the coasts, and Gades (Cádiz) was one of their permanent trading stations. The Carthaginians, driven from Sicily, Corsica, and Sardinia by the Romans, determined to conquer Spain both as a source of wealth and as a base of operations against Italy. (See HAMILCAR, 7; HASDRUBAL, 2, 3; HANNIBAL.) Carthago Nova (see CARTAGENA) was their principal town, and they soon brought almost the entire country under their sway. From this city Hannibal set out to cross the Alps (218 B.C.); but his downfall at the end of the Second Punic War caused the loss of the country to the Carthaginians. The Romans now sought to subdue the country, but the task proved very difficult. (See SPAIN, *History*.) For a century or two the native tribes continued semi-independent, until the time of Augustus, who founded many colonies in Spain, through which the country was Romanized so completely that Spain contributed to the history of Latin literature such distinguished names as those of Seneca the rhetorician, Seneca the philosopher and writer of tragedies, Lucan, Quintilian, and Martial (the century in which these authors worked has been called the Spanish Period of Latin Literature). The peninsula was divided into three provinces: *Hispania Tarraconensis*, with its capital Tarraco (Tarragona) in the north and east; *Betica* in the south; and *Lusitania*, corresponding nearly to the modern Portugal. Consult M. F. Hübner, *La Arqueología de España* (Barcelona, 1888), and E. S. Bouchier, *Spain under the Roman Empire* (Oxford, 1914).

HISPANIOLA, his'pān-yō'lā. The Latinized name for Española, the island of Haiti (q.v.).

HISS, PHILIP HANSON (1868-1913). An

American bacteriologist. Born at Baltimore, Md., he graduated from Johns Hopkins University in 1891, and four years later from the College of Physicians and Surgeons (Columbia), where he was assistant bacteriologist (1895-99), instructor in hygiene and bacteriology (1899-1903), adjunct professor of bacteriology (1903-06), and professor thereafter until his death. He served also as assistant bacteriologist in the department of health of New York City in 1896-99. The results of his researches were presented to the Congress of Hygiene at Washington in 1912. He is coauthor with Hans Zinssner of *A Text-Book of Bacteriology* (1910).

HISSAR, his-sär'. The capital of a district of the Delhi division, Punjab, British India, on the West Jumna Canal, 102 miles northwest of Delhi by rail (Map: India, C 3). It is the seat of a governmental cattle farm with 43,287 acres devoted to pasturage; trade is carried on in cotton and cayenne pepper, and there is a cotton gin and compress here. Hissar was founded in 1356 and has interesting archaeological and historical remains. Pop., 1901, 17,647; 1911, 17,162.

HISSARLIK. See **TRÖY**.

HISTIAEA, his'ti-ä'a (Lat., from Gk. *Ἱστιαία*, *Histiāia*, dialect form of *Ἑστία*, *Hestia*, Lat. *Vesta*), or **OBEUS**. An ancient and important city of Euboea, on the north extremity of the island, in the District of Hellöpia. It was probably founded by settlers from the Histiaotis, on the mainland, driven out by the advance of the Thessalians. In the period following the invasion of Xerxes it passed into the hands of the Athenian League, but in 446 B.C. joined the rest of Euboea in a revolt. When the island was reduced by Pericles, the old inhabitants of the town were expelled, and Athenian colonists were settled in the neighboring village of Oreus, which soon developed into a flourishing city and gave the popular name to the colony, though officially it was still called Histiaea. At the end of the Peloponnesian War the descendants of the old inhabitants and other Euboeans replaced the expelled Athenians, and the city remained loyal to Sparta till after the battle of Leuctra, when it joined the second Athenian League. In the war between Philip of Macedon and the Athenians, Oreus was one of the centres of Macedonian intrigue, and in the confusion after Alexander's death, and later during the Roman wars, it was of considerable strategic importance. In 200 B.C. it was stormed by the Romans. After this it fell into decay.

HIS'TIAE'US (Lat., from Gk. *Ἱστιαῖος*, *Histiaios*) (?-494 B.C.). A tyrant of Miletus (q.v.), who guarded the bridge of boats by which the Persians had crossed the Danube when Darius (q.v.) invaded Scythia (513 B.C.). He refused to follow Miltiades' suggestion to destroy the bridge and in consequence was rewarded by Darius with the rule of Mitylene and with a district in Thrace. Afterward, however, when his growing power was viewed with suspicion by the Persians, he was invited to the Persian court at Susa and was detained there for 13 years. Tired of this restraint, he secretly instigated, says Herodotus, the revolt of the Ionian Greeks (see **IONIA**), but was sent by Darius to suppress it, because Histiaeus persuaded the King that he alone could crush the revolt. With his freedom thus recovered he openly made war against the Persians, but was defeated, and finally beheaded by Artaphernes.

His head was sent to Darius, who received it with sorrow and buried it with honors. Herodotus' statement that Histiaeus alone caused the Ionian revolt has been met by evidence that as early as 512 B.C. the Ionians had been preparing for the revolt. Consult Heinlein in *Klio* (1909).

HISTOGENESIS. See **HISTOLOGY**.

HISTOIRE COMIQUE DE FRANCION, è'stwär' kō'mèk' de frän'syōn' (Fr., Comic History of Francion). A romance by Charles Sorel de Sauvigny (1622), published under the pseudonym of Nicolas du Moulinet. The chief interest of the story is in the information which it supplies of contemporary customs and in the fact that it is one of the few realistic novels of the seventeenth century. It met with much success, but was always disavowed by its author.

HISTOL'OGY (from Gk. *ἱστός*, *histos*, web, from *ἱστάναι*, *histanai*, to stand + *-λογία*, *-logia*, account, from *λέγειν*, *legein*, to say). That branch of biological science which treats of the microscopical structure of living organisms, both animal and vegetable. The histology of plants belongs to the domain of botany, that of animals to the domain of human and comparative anatomy. Just as gross anatomy is subdivided into normal anatomy and pathological anatomy, so histology may be subdivided into normal histology and pathological histology. The term "histology" when unqualified is usually accepted as referring to normal histology.

History. Although the study of the microscopic structure of plants and animals may be traced to the times of Malpighi (1628-94), who discovered the blood corpuscles, Robert Hooke, who was the first (1667) to describe plant cells, and Leeuwenhoek (1632-1723), who with comparatively imperfect optical means practically laid the foundations of our knowledge of the minute structure of the tissues, no definite progress in histology as a science was made until the beginning of the nineteenth century, when the compound microscope began to assume its present improved form. The great work of Bichat, entitled *Anatomie générale appliquée à la physiologie et à la médecine* (1801), marked an epoch in the development of the science of histology. Although he apparently did little actual work with the microscope, he brought to bear upon the achievements of other investigators the power of his generalizing mind and was the first to classify tissues according to their structure. After Bichat came an epoch of histological research, during which the microscopic observations of Malpighi and Leeuwenhoek were extended in accordance with the general system of Bichat. The next great step forward was made by two botanists, Hugo von Mohl and Schleiden, who discovered the cellular basis of all plant structure. The discovery of the method of combining lenses so as to render them achromatic gave a new impulse to the study of histology, and a more perfect classification of the tissues of the body was the result, as it placed in the hands of Schwann an instrument which enabled him to demonstrate the law that all animal as well as plant tissues are composed of and develop from cells. Schleiden had already demonstrated this, which may be called the greatest discovery in histology, and therefore he and Schwann are often called the founders of the science of histogenesis, or the study of the origin of tissues, more recently pursued with great success by Reichert, Kölliker, Remak, and others. Then the microscopic

anatomy of diseased structures and their mode of development came to be investigated, and the science of pathological histology took its rise. Johannes Müller is regarded as the father of this branch of histology, as he indicated the general direction in which the investigation of diseased growths should be pursued. Afterward Virchow published his celebrated *Cellular Pathology*, and later the science was still further enriched by the labors of Billroth, Rindfleisch, Von Recklinghausen, Cohnheim, and others.

HISTOLOGY OF ANIMALS

Cells. The histological basis of the body structure is the cell. In general terms all tissues may be said to be composed of cells of one kind or another, and these cells are always combined with more or less intercellular substance. This intercellular substance may be very small in amount, as in the epithelial tissues, where it amounts to nothing more than a cementing material holding the cells together, or it may make up the greater part of the tissue, as in some forms of connective tissue. Cells differ in shape. They may be round, oval, cuboidal, spindle-shaped, or irregularly stellate. The intercellular substance differs greatly in structure, and it is upon the differences in density of the intercellular substance that the different degrees of hardness depend. Thus, in mucous tissue the intercellular substance is soft and gelatinous, in cartilage it is dense and firm, in bone it is infiltrated with lime salts and is extremely hard. It was at first believed that a cell was a little bag filled with fluid; hence its name. Most animal cells are, however, small masses of living matter, called protoplasm, having, as a rule, no cell wall. Cells may or may not have nuclei. It is probable that nonnucleated cells are incapable of performing certain of the higher functions of cells, e.g., that of reproduction.

All adult tissues and organs originate in the elementary layers of the embryo. What determines the lines of growth of these different cells, and why some develop to form one kind of tissue, others to form other kinds of tissues, is as yet beyond our knowledge. There are two modes of cell growth or reproduction—direct cell division and indirect cell division, or mitosis.

Tissues. The tissues of the body fall into four great groups: (1) epithelial tissue; (2) connective tissue; (3) muscular tissue; (4) nervous tissue. It is by combinations of these tissues that the different organs of the body are formed. The most widely distributed of the tissues is connective tissue, which in its various forms, as fibrous tissue, elastic tissue, cartilage, bone, etc., makes up the framework of the body. In combination with one or more of the other tissues it forms the various organs of the body, acting as their supporting framework. Thus, in the nervous system such organs as the brain and cord consist of nervous tissue held together and supported by the peculiar form of connective tissue known as neuroglia. A muscle consists of muscle tissue bound together by connective tissue; and the various glands of the body, such as the liver or pancreas, consist of a glandular epithelium peculiar to the particular organ held together by connective tissue. See **CONNECTIVE TISSUE**.

Consult Delafield and Prudden, *A Text Book of Pathology* (9th ed., New York, 1911). The

histology of the different tissues and organs may be found described under such titles as **CONNECTIVE TISSUE; MUSCLE; EPITHELIUM; NERVOUS SYSTEM; LIVER; KIDNEY; ETC.** See also **CELL; BLOOD**.

HISTOLOGY OF PLANTS

Cells. Many plants consist of only a single cell; nevertheless such plants show almost infinite variety in form. The simplest are nearly spherical, but in the desmids and diatoms almost every conceivable shape is to be found, and a high degree of differentiation is attained. When cells divide in only one plane and do not separate after each division, a chain of cells results; when division takes place in two planes, a plate of cells is formed; divisions in three planes give rise to a body several cells in thickness. In the last case considerable differentiation is likely to follow; the cells on the outside become adapted to the work of protection and absorption, some of those on the inside perform the nutritive functions, and others are specially modified for conducting materials. Even in the algae and fungi there is a division of labor—some cells being modified for the work of protection and absorption, others for conduction, still others for reproduction. In the liverworts and mosses the specialization is carried still further, but it is in the ferns and flowering plants that difference in structure and division of labor finds its highest expression. Such differentiation of cells in form and function gives rise to tissues.

Tissues. A tissue is a group of connected cells of like origin and structure. Tissues are therefore classified according to the form of their component cells, the thickness and chemical composition of the cell walls, the character of their contents, etc. All cells of a very young plant are alike in having thin walls, abundant protoplasm, minute vacuoles or none, and relatively large nuclei. Such cells constitute embryonic, formative, or meristematic tissue, which is found in the higher plants in three places: (1) at the tips of the shoots and roots, where it constitutes the "growing points," protected in the shoot by overarched leaves which form a bud, and in the root by the root cap; (2) one or more thin layers concentric with the stem, by which new layers of wood, cork, and bast are added to it internally; (3) where wounds are made, in which cases the meristem produces tissues that heal the wound.

In all the higher plants tissues are grouped in such a way as to form tissue systems. (See **MORPHOLOGY IN PLANTS**.) Those there described are reduced to three by some: viz., (1) the tegumentary (equivalent to the protective); (2) the vascular (equivalent to the conducting and in part the mechanical); (3) the fundamental, a sort of limbo to which are assigned all the tissues not included in the other two systems. Of all tissues it may be remarked that the cell walls are subject to thickening as they grow older. This thickening consists of material added to the surface of the primary wall. The successive additions are frequently unlike and in the mature wall are apt to be distinctly stratified. The thickening is seldom uniform. Sometimes minute regions escape thickening and remain as small pits in the added layers. These pits occur at points where the protoplasm of one cell has not been com-

pletely separated from that of the other by the formation of a partition wall, but remains connected there by many very slender strands. In other cases the thickening is absent from wider areas. This leaves broader and shallower pits, which are symmetrically or irregularly distributed and give the appearance of sculpturing of the wall (2, Fig. 1). When the thicken-

FIG. 1. TRACHEAE.

1, annular; 2, pitted; 3, spiral.

ing is restricted to spiral lines or rings, the thin walls seem to be merely supported by the thickened portions, as in spiral and annular vessels (1, 3, Fig. 1).

Only the more important kinds of tissues are here described. 1. *Parenchyma*. Cells of very various form, but mostly nearly equal in the three dimensions, usually with a thin cellulose wall containing (so long as they are functional) living protoplasm, and almost invariably separating more or less from one another to form intercellular spaces. In elongated organs parenchyma cells are likely to become elongated. The parenchyma of the leaf and the cortex of the stem may develop into very irregular forms (Fig. 2). In water plants and others in which the parenchyma develops extensive in-

FIG. 2. IRREGULAR PARENCHYMA.

From a leaf, with only chloroplasts and nuclei shown.

tercellular spaces (aërenchyma) the cells may become branched, some even being regularly stellate (Fig. 3). Parenchyma cells sometimes have thick walls and thus form a transition to the sclerenchyma (see below), from which, however, they may be distinguished by the presence of living cell contents and sometimes reserve

food. Such parenchyma occurs in the rhizome of many ferns. Parenchyma forms the chief nutritive and storage regions of all plants and is especially abundant in herbaceous plants. In fleshy leaves, fruits, stems, etc., the parenchyma is greatly developed at the expense of other

FIG. 3. STELLATE PARENCHYMA.

From stem of *Juncus*.

sorts of tissue and is there used for storage of reserve food. The outer walls of parenchyma cells, which form the surface (i.e., the epidermis), undergo a peculiar change, being infiltrated with cutin, by which they are rendered almost impervious to water. Parenchyma cells of tabular form arise from the phellogen, which have all their walls cutinized. They constitute a tissue known as *cork* (Fig. 4).

2. *Collenchyma* differs from parenchyma, of which it is hardly more than a variety, in the

FIG. 4. CORK TISSUE.

Longitudinal section from bottle cork.

elongation of the cells, the absence of intercellular spaces, and the thickening of the angles of the cells where three or more walls join (Fig. 5). These thickened parts are more highly refractive than other parts of the wall and have a very peculiar bluish-white lustre. Collenchyma occurs only in elongated organs (stems, petioles, etc.), where it forms a strengthening tissue beneath the epidermis.

3. *Sclerenchyma* occurs in two forms, in one of which the cells have their three dimensions almost equal; in the other they are greatly elongated (Fig. 6). In both the wall is excessively thickened, sometimes so much so that the lumen is nearly obliterated. In all cases the proto-

FIG. 5. COLLENCYMA.

1, longitudinal section; 2, transverse section.

plasm disappears at maturity, and the tissue is of use to the plant only by its mechanical strength. The short-celled sclerenchyma is common in the stone fruits (peach and cherry), in the shell of various nuts, in the gritty parts of the flesh of pears, quinces, etc., and in the hard portions of bark, many dry fruits, and seeds. Elongated sclerenchyma cells are most abundant in stems and leaves, in which they form continuous strands or bands, closely associated with the vascular bundles. They are often called bast fibres, but do not always belong to the bast or phloem bundles. The individual cells taper

FIG. 6. SCLERENCHYMA.

1, irregular form (idioblast) from leaf of tea; 2, surface view of a fibre showing tapering end and oblique pits; 3, transverse section of a fibre showing concentric structure of wall with pore pits.

at each end, the ends of adjacent cells above and below overlap, and thus give to the strands great flexibility and a tensile strength which in many cases exceeds that of the best steel. The cells are relatively very long, 1 to 4 millimeters in jute, 10 millimeters or more in hemp, 20 to

40 millimeters in flax, and as much as 220 millimeters in ramie, with diameters from 0.01 to 0.4 millimeter. The strands of sclerenchyma fibres constitute the so-called fibres of commerce, the finer ones of which are used for textile fabrics and the coarser for cordage, etc.

4. *Tracheæ* and *tracheids*. Tracheids are usually elongated cells, whose walls have become lignified (by which they are made very

FIG. 7. TRACHEIDS.

a, from stem of pine; b, forming the termination of a xylem bundle in a leaf of *Impatiens parviflora*.

pervious to water) and thickened in spiral or annular lines or in reticulate patterns (Fig. 1). At maturity the protoplasm disappears, leaving only the cell wall of service to the plants. Tracheæ are similar to tracheids in the sculpturing of their walls, but instead of being single cells they are formed by the fusion of a row of cells lying originally end to end, the end walls being resorbed as the lateral walls thicken and the protoplasm disappears. At maturity the long empty tubes thus formed show little trace of the cells from which they originated. In angiosperms they constitute the greater part of the xylem bundles, changing to tracheids as the bundles grow smaller and come to an end (Fig. 7, b). But in gymnosperms (pines and their allies) tracheæ are formed only in the primary xylem, almost all the secondary xylem being tracheids with characteristic circular-bordered pits (Fig. 7, a). Tracheæ and tracheids are the most efficient tissues for the transport of water in the larger plants.

5. *Sieve tubes* are cell fusions formed by the partial resorption of the end walls of a row of young cells. The end partitions and sometimes the lateral walls which adjoin other sieve tubes become perforated, forming a so-called "sieve plate," through which the contents of the sieve tubes (a slimy mixture of soluble proteins, carbohydrates, and other foods) pass freely. Sieve tubes are found in the phloem bundles, in which they constitute the most efficient tissue for the transport of foods (Fig. 8). See SIEVE VESSELS.

6. *Latex tubes* are long, much-branched tubes,

with free or anastomosing branches, which contain the milky or colored sap in certain plants. There are two sorts, articulated and nonarticulated. A nonarticulated tube arises by early differentiation of certain cells in the embryo, which push their way among the other develop-

FIG. 8. SIEVE TUBE AND COMPANION CELL.

1, in longitudinal section; 2, in transverse section showing a sieve plate.

ing tissues by independent growth. The articulated tubes arise by the fusion of rather indefinite rows of cells, either longitudinal or transverse, which form a network of irregular tubes. Latex tubes are found in the phloem bundles, or just outside these bundles in the cortex of stems, and accompany them into the leaves, where they ramify widely. Their terminals come into close relation with the nutritive cells. (See Illustration under LATEX.) They seem to constitute a transportation system for foods. See GROWTH, IN PLANTS; ANATOMY OF PLANTS; CELL, IN PLANTS; ROOT; STEM; CONDUCTION; LATEX.

HISTOLOGICAL TECHNIQUE

The methods of histological observation were at first extremely crude, consisting merely in tearing apart the tissues and examining them under the microscope. Such handling, of course, largely destroyed the relations of the different elements of the tissues to one another. The cutting of thin sections of tissue with a razor was soon introduced, this being much facilitated by the previous hardening of the tissues in some suitable solution. Such sections were, however, difficult to study, owing to their transparency and the fact that the different tissue elements possess nearly the same index of refraction. The staining of sections was the next great improvement in technique. At first a single stain was used, the denser elements taking a darker shade than those of less dense structure. The discovery of what is known as differential staining, whereby the different tissue elements are stained different colors, and the introduction of an instrument for section cutting, known as the microtome (see further below), together with improvements in the microscope, have been the main factors in the recent rapid development of the art. At present the most commonly used technical procedure in the examination of tissues and organs is as follows:

The first step is *fixation*. By this is meant a rapid killing of the tissue in such a way as to allow it to retain as nearly as possible the same form and relation as does the living tissue. Among the more common fixatives may be mentioned alcohol of various strengths, formalin in from 5 to 20 per cent solutions, osmic acid, usually in 1 per cent solution, Müller's fluid (2.5 grams of potassium bichromate and 1 gram of sodium sulphate, dissolved in 100 cubic centimeters of water), Fleming's fluid (a mixture of osmic, chromic, and acetic acids in water), chromacetic acid (1 per cent solution in water), and corrosive sublimate in saturated aqueous solution. Many other fixatives are used for special purposes; thus, osmic acid is employed for the demonstration of fat and myelin. The small slices of tissue employed are allowed to remain from 12 to 48 hours in a large amount of fixative. Tissues which have been fixed by any other agent than alcohol are then subjected to prolonged washing with running water. The next step is *hardening*. Fixing solutions are also hardening agents if allowed to act sufficiently long. Many fixatives, however, have a detrimental effect upon the tissues if their action is too prolonged. It is, therefore, quite common to transfer the tissues after proper fixation to some new fluid for the purpose of hardening and preservation. The almost universal hardening and preserving agent is alcohol, but formalin, too, in from 5 to 10 per cent aqueous solution, is now extensively used. The first alcohol bath for plant tissues should be 35 per cent or weaker, while many animal tissues will stand 50 per cent. This should be followed consecutively by 50, 70, 90, and 97 per cent alcohol. For long preservation 80 per cent alcohol is the most satisfactory. Next in the process is *embedding*. By this is meant the impregnation of the tissues with a liquid which afterward hardens, thus holding the tissues in a firm mass, which can be easily cut. For this purpose paraffin and celloidin are most commonly used. In paraffin embedding the tissue is first immersed in any pure solvent of paraffin, then passed to a warm solution of paraffin in the solvent, and finally left in pure melted paraffin until thoroughly impregnated. In celloidin embedding the tissue is transferred from alcohol to a mixture of alcohol and ether and then placed in a solution of celloidin in a mixture of equal parts of alcohol and ether. After impregnation the paraffin is allowed to harden by cooling, or the celloidin to thicken by exposure to the air and consequent evaporation of the alcohol and ether, after which it is immersed in chloroform for hardening. The operator then proceeds to cut sections by means of the microtome. This instrument consists essentially of a knife carrier, which can be made to slide back and forth past a clamp to which the specimen is attached. The embedded specimen is fastened to a block, usually of wood, clamped in the microtome. The clamp is so arranged that the blocked specimen can be raised any desired fraction of a millimeter, thus bringing any thickness of it above the knife. In paraffin cutting the knife is kept dry; in celloidin section cutting it is kept flooded with alcohol. The sections are then stained for the purpose of bringing out sharply the different tissue elements. For staining the nuclei, carmine, hæmatoxylin, and various aniline dyes are commonly used. For demonstrating the other tissue ele-

ments other dyes may be used, eosin being much employed. The procedure in staining celloidin sections with hæmatoxylin and eosin is as follows: The sections are first allowed to remain for several minutes in an aqueous solution of hæmatoxylin; then they are thoroughly washed with 97 per cent alcohol and placed for several minutes in an alcoholic solution of eosin; they are then again washed in alcohol and cleared in oil of origanum or bergamot containing a little eosin. From the clearing bath the specimen is lifted to a glass slide, the excess of oil is removed by means of blotting paper, a drop of a solution of Canada balsam is placed upon the specimen, and the whole is covered with a thin glass, called the cover glass. By the drying and hardening of the balsam a permanent "mount" of the specimen is secured.

The above methods of procedure are illustrative of those applicable to general histological material. The examination of special tissues and organs requires the use of special methods of technique. This is especially true in regard to the nervous tissues, for the study of which some very elaborate methods have been devised, some of which will be found described in the article NERVOUS SYSTEM.

For histological methods as applied to plant tissues, consult C. J. Chamberlain, *Methods in Plant Histology* (2d ed., Chicago, 1905), and Eduard Strasburger, *Handbook of Practical Botany* (7th ed., New York, 1911); for methods in animal histology, consult A. B. Lee, *Microtome's Vademecum* (6th ed., Philadelphia, 1905), and F. R. Bailey, *Text-Book of Histology* (4th ed., New York, 1913).

HISTONIUM. See FRENTANI; VASTO.

HISTORIA AUGUSTA. See AUGUSTAN HISTORY.

HISTORICAL ASSOCIATION, AMERICAN.

A society of historical students and writers, founded at Saratoga, N. Y., in September, 1884, at the suggestion of Herbert B. Adams, of Johns Hopkins University. Its original membership was 40, but within a year it had increased to 250, and in 1889 it received a definite standing and recognition by an Act of Congress incorporating it in the District of Columbia. The society has exerted wide influence in directing and stimulating historical research, and its publications and monographs have covered a broad field of historical study. The American Society of Church History, founded in March, 1888, became in 1896 the Church History Section of the American Historical Association, but regained its independence in 1904. Important committees of the society are the Historical Manuscripts Commission, which prepares valuable manuscripts for publication, and the Public Archives Commission, concerned in the preservation of public records. The society holds annual meetings, publishes an annual report through the Smithsonian Institution, and appoints a board of editors for the *American Historical Review*, published quarterly. The society has published five volumes of *Papers*, some 40 volumes of *Annual Reports*, a series of prize essays, two volumes on *The Study of History in Schools*, secondary and elementary, and a series of reprints of *Original Narratives of American History* in 20 volumes.

HISTORIC GEOLOGY. See GEOLOGY.

HISTORY (Lat. *historia*, Gk. *ιστορία*, history, from *ιστωρ*, *histōr*, learned, from *εἰδέναι*, *eidenai*, Skt. *vid*, OHG. *wizzan*, Ger. *wissen*, to

know). A systematic narrative of past events, or, in the light of modern historical scholarship, the science of the progressive development of human society. The social and economic conditions of peoples, their racial affinities and physical environment, exercise determining influences upon their history and find expression in their thought, their art, and their politics. History deals with the social structure in its successive forms and recognizes as inseparable allies all sciences which contribute to a knowledge of man as a social being and in his relation with the physical world.

As a science, history is primarily inductive. It proceeds from a body of concrete facts, which critical study links together according to the sequences of time and causation. Afterward deductive processes may be used, but always sparingly and cautiously.

Historical method comprises four processes: the collation of facts; the arrangement of these facts according to the sequences of time and causation; criticism, by which the value of the facts is determined; and their interpretation in accordance with the results of arrangement and criticism. These processes are all simple; they are the ordinary processes of scientific research, but in carrying them out the human equation becomes so large an element of the problem as to make it essentially different from the problems of the physical world, and for this reason history can never be an exact science.

History depends upon human evidence, and its investigation must follow the laws governing the reception of human evidence. These are found to a considerable extent in the body of principles developed by jurisprudence for the reception of evidence in the courts. The historical material is contained in several categories: (a) Remains, such as buildings, walls, roads, statues, pictures, medals, coins, implements—whatever, indeed, man has made and used and which may thus throw light upon his civilization and his deeds. These may be studied directly, when accessible, or through the reproductions easily obtainable by means of modern processes.

(b) Documents. Under this head are included official and business papers and letters written with an immediate practical purpose.

(c) Literatures. This class includes a great body of material of the highest value—the writings through which are expressed the ideas of the peoples, their philosophy, poetry, science, and religion.

(d) Traditions. Much of this class is preserved in the literatures; much of it must be gathered from other sources.

(e) Laws. These, especially public law, are found in codes and treatises and are of great value in determining many questions.

(f) Contemporary writings with historical purpose—annals, chronicles, biographies. Under these heads can be classified the original material on which secondary historical work, the written history of a nation or an age, is based and by examination of which its accuracy must be tested.

This material may also be divided into two great classes of evidence—conscious and unconscious. It will be seen that some of this material must have been prepared consciously to influence the opinion of contemporary or succeeding generations. In this class are proclamations, statements, writings, narratives, told with intention concerning events within the narrator's own knowledge, or reported to him by others.

Such evidence must be taken with qualifications attaching to all *ex parte* testimony. On the other hand, the evidence may be given unconsciously, as in documents of record, writings or other remains, prepared with no other purpose beyond that of direct utility. A striking example of this class of evidence is found in the little cylinders and tablets of clay, preserving in the business records, impressed upon them in cuneiform characters, so much of the social history of the Babylonians of thousands of years before the Christian era. All these materials of human history must be subjected to searching inquiry as to their original purpose and the circumstances under which they were made. The development of history into scientific form has been the work of ages and owes its final impulse to the great improvements in methods in the physical sciences during the eighteenth and nineteenth centuries, although it developed along with the development of the human society whose life it records. The historical idea requires for its existence a background and a consciousness on the part of society of itself and of its continuity; of its relations to a past and a present. The growth of this social self-consciousness has been a matter of time. It is interesting to notice, on the other hand, how the study of their history has sometimes aroused in a people the consciousness of their own national life, which before was dormant. An example of this may be found in the Balkan states, which were roused not many years ago into determined revolt against Turkish rule by the teaching of their national history through the efforts of a few patriotic scholars.

The new outlook upon the natural world given by the physical sciences and the change in historical methods gave rise to a controversy in the last century, in which certain philosophical thinkers of the highest ability undertook to maintain that "human actions are governed by laws as fixed and regular as those which rule in the physical world." Auguste Comte, Henry Thomas Buckle, and Herbert Spencer are the distinguished sponsors of this theory. Buckle, in his *History of Civilization in England*, the first volume of which was published in 1857, elaborated this idea with a profundity of learning, but with much inconsistency of reasoning. Such literary historians as Charles Kingsley and James Anthony Froude entered the discussion on the other side, and John Stuart Mill, in his *System of Logic*, made a very sane and able contribution to it. The strongest and most extreme presentation of the opposite side of the controversy is, perhaps, that made by Froude in his lecture of 1864 on "The Science of History." He maintained with great eloquence that the determination of human movements upon any basis of scientific accuracy was impossible. This old controversy is closed now in the light of a better understanding of what the science and scientific method really are, but it is of interest historically as marking one stage in the development of the science of history.

The development of history down to the nineteenth century may be traced through the work of a very few writers and scholars. The first of all historians was the Greek Herodotus, who lived in the fifth century B.C. He was, however, only a narrative writer, recording with great accuracy those events which came within the scope of his personal knowledge, but mingling with his narratives much which came to him only by

hearsay, and to which he applied no critical canons. Thucydides, the next of the great historians, is justly estimated as one of the greatest historians of all time. He recorded events with remarkable conciseness and first applied philosophical reasoning to the historical narrative. Among narrative historians the accomplished Xenophon deserves a place. Polybius, with a wider outlook, followed in the footsteps of Thucydides. Of the Romans, Cæsar, Livy, and Tacitus show a high development of the historical sense—the two former confining themselves to the narrative field, and the last claiming a place in the class of historians like Thucydides, who endeavored to find the meaning of history beneath the mere sequence of events. The historians of the later Roman Empire were for the most part apologists for or eulogists of the emperors who were their masters and establish no landmark of importance. During the Middle Ages there was no historical writing worthy of the name in Europe. The historical writing of the time is contained in the annals and chronicles preserved in the monasteries, which were very little more than diaries from day to day, kept without any discrimination by men whose outlook upon the world was of the narrowest. Einhard in the reign of Charlemagne, Otho of Freising in that of Frederick Barbarossa, and a few others, alone rise a little above the dead level, which offers material for historical research, but no true history. The awakening of a broader and more vigorous scholarship in the period of the Renaissance produced a new school of political and historical thinkers, who built upon the revived classical models. They are found in Italy, where Machiavelli and Guicciardini wrote historical works that are admirable in thought and style, and in France, Spain, and England, where the example of Italy was followed as in other fields of culture. In the eighteenth century the Englishman Gibbon, who devoted his life to his great work, *The Decline and Fall of the Roman Empire*, left one of the masterpieces of historical scholarship—a work that stands to-day as the most thorough and scholarly presentation of the history of the later Empire and of the Middle Ages. Voltaire, Hume, Montesquieu, and Robertson are brilliant names in the progress of historical thought of the same century. It remained, however, for the nineteenth century to develop history into a systematic science. With Niebuhr began a rational study of classical history, which has been carried on by Mommsen and Curtius for Roman and Greek history respectively. The greatest impulse, however, for the study came from the classrooms of Leopold von Ranke (1795–1886). Ranke grasped the fundamental idea of historical science with a rugged sincerity, both of theory and practice, and impressed his spirit upon a large body of enthusiastic students in Germany and America. Waitz, Droysen, Von Sybel, Von Holst, Treitschke, and others have followed with greater or less ability along the path over which he led the way. In France within the last half century historical work and instruction have developed with great rapidity, and Monod, Duruy, Henri Martin, Lavis, Rambaud, and many others have exemplified the French genius for clear and scientific thinking and for condensed lucidity of statement. In less degree the other continental countries have contributed to the development of the science. In England, along with such brilliant literary historians as Macau-

lay, Kingsley, and Froude, we have a body of eminent scientific scholars, of whom Freeman, Green, Stubbs, Creighton, and Gardiner are distinguished representatives. In America, whose scholars have drawn largely from the German and French schools, there has also been a noticeable development in historical writing and in critical scholarship. Succeeding the earlier school, which included Bancroft, Prescott, and Motley, there has grown up in the United States a modern school, trained in the best university methods of research, and enrolling in different kinds of historical work hundreds of vigorous and enthusiastic scholars. Francis Parkman, Justin Winsor, and John Fiske left behind them a body of historical writings of a very high order. Henry Adams, James Schouler, Captain Mahan, John Bach McMaster, and James Ford Rhodes are contemporary American historians whose studies in the history of their own country are of permanent value, and many more names might be added. From the lecture rooms and seminaries of Europe and America a constant impulse to wise and thorough study and use of historical material goes forth from earnest and able teachers. Numerous periodicals are devoted to the advancement of historical research. Most noteworthy of these are the *Historische Zeitschrift* in Germany, the *Revue Historique* in France, the *English Historical Review* in England, and the *American Historical Review* in the United States.

It is the tendency of the modern school of historical students to rely more upon the thorough study of true sources of history, rejecting the myths, traditions, and second-hand accounts, which have so often formed much of the material of writers of so-called history. Collections of written sources form a very considerable part of the historical publications of to-day, and guides and commentaries to these collections of sources are constantly being issued to enable the student to find his way intelligently through the mass of material which the source collections present. In this direction Germany, under the leadership of Ranke, led the way. The massive and constantly growing collection of sources of German history, known as the *Monumenta Germaniae Historica*, is in itself a monument of scholarship and research, and in France, England, and the United States similar collections have been published and are in process of publication from year to year. The well-known *Rolls Series* in England is nearly as notable a collection as the German *Monumenta*. Even in historical instruction in the schools, the simpler and more interesting sources have been put in available form for elementary students and are used with great success to enliven the historical narrative and to give an appreciation of the true nature of historical research. This tendency to explore the actual evidence critically has done much to clear history of the fables, myths, and traditions which made much of it unreliable and to render it real to the student. However, the mere application, no matter how arduous, of the scientific method to great masses of material is inadequate for writing history; but with this application the success of the writer will be in proportion to his own measure as a man, which will be reflected in his power to image the thoughts, feelings, beliefs, hopes, and pleasures of the people of the past. This is only another way of saying that history should partake of both science and literature.

Divisions of History. History is commonly divided chronologically into three great periods—Ancient, Mediaeval, and Modern. While there is complete continuity in the course of history, each one of these periods has certain characteristics distinguishing it from the others and making it convenient to treat each as a unit. In the first period the beginning and growth and decline of the great civilizations of antiquity are comprised. Here are considered the old East, Egypt, Mesopotamia, and Syria, Greece, and Rome. In these remote ages were laid the foundations of civilization, the elements of which were handed on from the valleys of the Nile and Euphrates to the Greeks and Romans, who fashioned them into instruments available for later generations. The Roman Empire welded together all the diverse elements of the ancient world. Ancient history is usually regarded as ending when the irruption of the Germanic barbarians from northern and central Europe into the highly developed Roman civilization caused the downfall of the old Empire in the fifth century of our era and ushered in several centuries of confusion. The world that had been so thoroughly organized by the Roman was materially modified in its structure by the individualism for which the German stood, in contradistinction to the principle of Imperial unity emphasized in the Roman world. Out of this stormy mingling of conflicting ideas in the Middle Ages came modern Europe, which rests politically upon a combination of the German and Roman principles. The Middle Ages are regarded as closing about the end of the fifteenth century, when the fall of Constantinople had removed the last shadow of the old Roman world, when the discoveries of Columbus had immeasurably widened the European horizon, and the revolt was beginning against ecclesiastical imperialism. The national idea slowly took form out of the feudalism of the Middle Ages, and modern nations gradually arose, with the result of bringing into being a legal code for the regulation of international relations. The internal confusion of the Middle Ages had separated Europe from the rest of the world, but with the revival of learning and the interest in new things, known in history as the Renaissance, came a larger acquaintance with that older world of the East which, while less progressive, had its own civilization, institutions, and history. The conflict of the religions and civilizations of the East and West produced the Eastern Question, in which are contained so many of the most difficult problems of modern international politics. The opening of the New World in the period of discovery introduced a new factor of the greatest importance in the world's history—the future great power of the Western Hemisphere, which had as its heritage the civilization of Europe, but was unhampered by immemorial traditions and institutions and by conflicting national interests. The same pregnant era that saw these new elements thrown into the world's life saw also the renewal of the old conflict between the German idea of liberty and the Roman idea of unity in the Protestant revolt against the control of the Roman church. This conflict shaped much of the world's history for three centuries. The expansion of population in the older countries, the development of commerce, the increasing knowledge of the world, and the growing ambition of nations conscious of their own possibilities and increas-

ing rapidly in power and wealth, together with the religious persecutions generated by the Protestant revolution, brought about the opening and settlement of new and hitherto inaccessible regions, resulting in the widening of national interests, enormous increase in the power and resources of the great nations, and a development of national rivalries on a scale hitherto unknown. There has also come an insistence on the part of civilized peoples that barbarian races shall submit to civilization and not obstruct the progress of world development. History has until recently concerned itself almost exclusively with the Occidental nations, regarding the Orient only as it has come in contact with the West. Now, however, the histories of India, China, Japan, and all other peoples that have enjoyed organized life have assumed importance in view of their bearing upon the larger problems of the age. Such has been the movement of the great current of history which has expanded in volume with the expansion of the race. Within these wide boundaries the histories of different countries may be studied in detail; and the study of history may be still further specialized along the lines of social, economic, political, or constitutional fields, or in those of art, literature, or thought. These special fields become increasingly important as history grows in complexity, so that light is needed upon its phases in detail.

Bibliography. The true spirit of history is nowhere better expressed than in R. W. Emerson's essay on *History*. See also Frederic Harrison, *The Meaning of History* (London, 1894); Lord Acton's inaugural address as regius professor at Oxford (ib., 1895); C. W. Smith, *Lectures on the Study of History* (Oxford, 1865); G. S. Hall (ed.), *Methods of Teaching History* (Boston, 1883-85); E. A. Freeman, *Methods of Historical Study* (London, 1886); J. G. Droysen, *Grundriss der Historik* (Boston, 1893); J. A. Froude, *Short Studies on Great Subjects* (New York, 1893); Ernst Bernheim, *Lehrbuch der historischen Methode* (Leipzig, 1894); Langlois and Seignobos, *Introduction to the Study of History* (New York, 1898); William Stubbs, *Lectures on the Study of Medieval and Modern History* (3d ed., Oxford, 1900); K. G. Lamprecht, *What is History?* (New York, 1905); J. F. Rhodes, *Historical Essays* (ib., 1909); W. E. H. Lecky, *Historical and Political Essays* (new ed., ib., 1910); J. H. Robinson, *The New History, Essays Illustrating the Modern Historical Outlook* (ib., 1912); G. M. Trevelyan, *Olio, A Muse and Other Essays* (London, 1913); John Morley, *Notes on Politics and History* (New York, 1914). The publications of the American Historical Association contain many papers relating to history in general in its different aspects.

HISTRIA. See **ISTRIA**.

HISTRIOMASTIX (Neo-Lat., from Lat. *histrio*, actor + Gk. *μάστιξ*, *mastia*, scourge). A comedy produced not later than 1599, of which John Marston was at least a collaborator, and printed in 1610.

HISTRIOMASTIX, THE PLAYER'S SCOURGE, or **ACTOR'S TRAGÆDIE**. A tract violently attacking the drama, by William Prynne, a Puritan, published in 1632.

HIT (Gk. *ἴς, ἰς*). A town of Asiatic Turkey, situated among deserts and salt marshes on the right bank of the Euphrates, in the Vilayet of Bagdad, and 80 miles northwest of the city of

that name (Map: Turkey in Asia, E 4). It is remarkable for the asphalt and naphtha pits in the neighborhood, from which asphalt is believed to have been obtained for the construction of the walls of Babylon. The chief products of the place are asphalt, naphtha, salt, lime, and gypsum. It has a shipyard and is the head of navigation of the Euphrates. Pop., about 5000.

HITA, *é'tá*, GINES PÉREZ DE. See PÉREZ DE HITA, GINES.

HITCH. See **KNOTTING AND SPLICING**.

HITCH'COCK, ALBERT SPEAR (1865-). An American agrostologist. He was born at Owosso, Mich., and was educated at the Iowa State Agricultural College (B.S., 1884; M.S., 1886). He served as an instructor at the State University of Iowa in 1886-89, as an assistant at the Missouri Botanical Garden, St. Louis, in 1889-91, and as professor of botany at the Kansas Agricultural College from 1892 to 1901. He became assistant agrostologist in 1901 and agrostologist in 1905 of the United States Department of Agriculture. His investigations deal especially with the taxonomy of grasses. He was president of the Botanical Society of America in 1914.

HITCHCOCK, CHARLES HENRY (1836-). An American geologist, the son of Edward Hitchcock. He was born at Amherst, Mass. After graduating at Amherst College (1856), he was assistant to the Geological Survey of Vermont (1857-61); State geologist of Maine (1861-62) and of New Hampshire (1868-78). His three-volume report on his work in New Hampshire, containing a folio atlas of maps, profiles, and sections, is considered his most important publication. Incidental to the survey was the maintenance of a meteorological station throughout the year on the summit of Mount Washington, whence daily statements of the weather conditions were issued before the United States Signal Service had begun its weather predictions. From 1868 to 1908 he was professor of geology at Dartmouth College. He was vice president of the American Association for the Advancement of Science (1883), a member of the Imperial Geological Institution of Vienna, and one of the original and most active members of the Geological Society of America. He was the first to suggest the locality of the great terminal glacier in the United States. Besides some 150 papers chiefly on New England geology, he is author of *Elementary Geology* (1861), with Edward Hitchcock; *Mount Washington in Winter* (1871); *Hawaii and its Volcanoes* (1909; 2d ed., 1911).

HITCHCOCK, EDWARD (1793-1864). A scientist and educator who contributed greatly to the development and popularizing of geological science in America. He was born in Deerfield, Mass., where for a time he served as principal of the academy. From 1814 to 1818 he published the *Country Almanac* and in the latter year entered Yale Theological Seminary, from which he was graduated in 1820. After serving as pastor of the Congregational Church in Conway, Mass., he was appointed professor of chemistry and natural history in Amherst College. As president of that institution from 1845 to 1854, he improved its financial condition and greatly extended its usefulness. When he resigned the presidency, he retained the professorship of natural theology and geology, holding this office until his death. Throughout the latter part of his life he devoted much

time to geological research. In 1830 he was appointed State geologist of Massachusetts, and under his direction the first geological survey of any extensive area was completed. The results of this work were published by the State government in several voluminous reports. In 1836 he received the appointment of geologist of New York, but resigned the position. He served as geologist of Vermont from 1857 to 1861 and in 1850 was commissioned by the State of Massachusetts to examine the agricultural schools of Europe. He was one of the founders of the Massachusetts Agricultural College and of Mount Holyoke Seminary and was the first president of the American Geological Society. His extensive collection of fossil footprints of the Connecticut valley was presented to Amherst College. The most important of his works are: *Economic Geology* (1832); *Report on the Geology, Mineralogy, Botany, and Zoology of Massachusetts* (1833); *Elementary Geology* (1840); *Geology of Massachusetts* (1841); *History of a Zoological Temperance Convention in Central Africa* (1850); *Religious Lectures on Peculiar Phenomena of the Four Seasons* (1850); *Religion of Geology and its Connected Sciences* (1851); *Religious Truth, Illustrated from Science* (1857); *Ichthyology of New England* (1858); *Report on the Geology of Vermont* (1861); *Reminiscences of Amherst College* (1863).

HITCHCOCK, ETHAN ALLEN (1798-1870). An American soldier. He was a grandson of Ethan Allen, of Ticonderoga fame, was born at Vergennes, Vt., and graduated at West Point in 1817. After garrison service he was instructor in tactics at West Point (1824-27) and commandant there (1827-29). He served against the Indians in Florida in 1836 and 1840 and in the last campaign of the Mexican War. For his service in Mexico he was brevetted brigadier general (1847). He commanded the Pacific Division from 1851 to 1854 and in the next year resigned because of a quarrel with Jefferson Davis, then Secretary of War. At the outbreak of the Civil War he was appointed major general and served at first on special duty under the Secretary of War and later as commissioner of exchange. He was also confidential adviser to the President. Hitchcock was a scholar of great attainments and in expression of his peculiar philosophy wrote: *Remarks upon Alchemy and the Alchemists*, arguing that they were religious philosophers, and that truth was the philosopher's stone (1857); *Swedenborg, a Hermetic Philosopher* (1858); *Christ, the Spirit*, in which the Gospels are treated as symbolical writings of the Essenes, a Jewish secret society (1860); *Red Book of Appin, and Other Fairy Tales* (1863); *Remarks on the Sonnets of Shakespeare* (1865 and 1867); *Spenser's Colin Clout Explained* (1865); *Notes on the Vita Nuova of Dante* (1866), in all of which he gives hermetic explanations of the matter of these books.

HITCHCOCK, ETHAN ALLEN (1835-1909). An American politician and cabinet officer, born in Mobile, Ala., and educated at New Haven, Conn. He was in business for a while in China and for several years in St. Louis. In 1897 he was sent as United States Minister to Russia and subsequently was made Ambassador upon a corresponding change in the Russian diplomatic service. In 1898, upon the retirement of Cornelius M. Bliss, he was appointed Secretary of

the Interior, serving until 1907. During his term, and largely through his efforts, the gigantic system of public land frauds in the West was uncovered, and many of its participants were punished.—His brother HENRY (1829-1902) was born near Mobile, Ala., and was one of the foremost lawyers and citizens of St. Louis.

HITCHCOCK, FRANK HARRIS (1867-). An American cabinet officer, born at Amherst, Ohio. He graduated from Harvard University in 1891 and from the law department of Columbian (now George Washington) University in 1894. After practicing law and holding various less important posts in several government departments, he was First Assistant Postmaster-General from 1905 to 1908. In the latter year he managed William H. Taft's campaign for the presidential nomination, and as chairman of the Republican National Committee (1908-09) he also had charge of the campaign resulting in Taft's election. His administration of the postal system (Postmaster-General, 1909-13) resulted in a surplus of revenue over expenditures; the postal savings bank and parcel post were introduced during his term of office, and near the close of his administration he recommended government ownership of the telegraphs. He resumed the practice of law in New York City in 1913.

HITCHCOCK, GILBERT MONELL (1859-). An American legislator. He was born at Omaha, Neb., where, after studying at Baden-Baden, Germany, and graduating from the University of Michigan Law School (1881), he practiced law. He founded the *Omaha Evening World* in 1885 and in 1889, having bought the *Morning Herald*, consolidated it with the *World* under the title of the *World-Herald*. He was a Democratic member of the Fifty-eighth (1903-05) and of the Sixtieth and Sixty-first congresses (1907-11), and he became United States Senator for Nebraska for the term 1911-17.

HITCHCOCK, HENRY (1829-1902). An American lawyer, born at Spring Hill, Ala., and educated at the University of Nashville (A.B., 1846) and at Yale University (A.B., 1848). He studied law, taught in the Worcester (Mass.) High School in 1848-49, and was admitted to the bar at St. Louis, Mo., in 1851. During the Civil War he served in the Union army as assistant adjutant general, and was judge advocate on the staff of General Sherman. In 1867 he helped to organize the law department of Washington University (known as the St. Louis Law School), of which he was dean until 1881. He served also as professor in the school and continued his lectures after resigning the deanship. He was president of the St. Louis Bar Association (1880), of the Missouri State Bar Association (1892), and of the American Bar Association (1889).

HITCHCOCK, ROSWELL DWIGHT (1817-87). An American clergyman and educator, born in East Machias, Me. He graduated at Amherst College in 1836 and at Andover Theological Seminary in 1838. He preached a year in Waterville, Me., and in 1845 was installed over the First Congregational Church in Exeter, N. H. He resigned in 1852 to accept the professorship of revealed religion at Bowdoin College. Three years later he resigned at Bowdoin to become professor of Church history at Union Theological Seminary, of which he was elected

president in 1880. He was on the editorial staff of the *American Theological Review* for seven years, traveled in Egypt and Palestine, and was elected president of the Palestine Exploration Society in 1871 and vice president of the American Geological Society in 1880. He published: *The Life, Character, and Writings of Edward Robinson* (1863); *Complete Analysis of the Holy Bible* (1869); *Socialism* (1879); *Carmine Sanctorum*, with Dr. Zachary Eddy and Rev. Lewis W. Mudge (1885). A collection of sermons, *Eternal Atonement*, was published posthumously (1888).

HITCHIN, hīch'in. A market town in Hertfordshire, England, 14 miles northwest of Hertford, on the river Hiz (Map: England, F 5). It was the original seat of Girton College: it has a free school, founded 1622; and its fine old parish church of St. Mary contains an historical crypt, an excellent porch, interesting monuments, and an "Adoration of the Magi" by Rubens. The town hall and corn exchange are fine modern buildings. Hitchin has large breweries and a trade in corn, malt, and flour. Straw plaiting is carried on, and the cultivation of peppermint and of lavender for its perfumery dates from 1568. It is a large cattle market. Hitchin is recorded in the Domesday Book. It was given to Harold by Edward the Confessor and came into the possession of William the Conqueror. Pop., 1901, 10,072; 1911, 11,905.

HITOPADESA, he-tō'pā-dā'shā (Skt., salutary instruction), or Book of Good Counsel. The name of a celebrated Sanskrit collection of fables, the contents of which have passed into almost all the civilized literatures of the world. The collection itself, in the form in which we possess it, is founded on older works of a kindred nature; and its preface expressly mentions "the *Panchatantra* and another work." For a convenient list of editions and translations and a sketch of the subject, consult C. R. Lanman, *Sanskrit Reader* (Boston, 1888), and Hertel, *Ueber Text und Verfasser des Hitopadesa* (Leipzig, 1897). Two good editions with English notes are published in India by Godabole and Parab (Bombay, 3d ed., 1890) and by Peterson (ib., 1895). See PANCHATANTRA; SANSKRIT LITERATURE.

HITOTSUBASHI. See KÉIKI.

HITTEREN, hīt'er-en. An island off the west coast of Norway, situated at the entrance to the Trondhjem Fjord (Map: Norway, D 5). It covers an area of nearly 200 square miles (including some adjacent islets) and has a population of about 2500. It is covered with low but rugged hills, reaching 1000 feet, among which are numerous lakes and streams. The inhabitants are mostly engaged in fishing.

HITTITES (Heb. *Heth*, pl. *Hittim*; Bab. *Hatti*; Egypt. *H't*). An ancient Asianic people whose home seems to have been in Cappadocia, but who not only made their power felt in all parts of Asia Minor but also established themselves in Syria and Mesopotamia. Until recent times they were known only through various allusions in the Bible. The eponymous ancestor of the people, Heth, appears in Gen. x. 15 as the son of Canaan, the brother of Sidon, the Amorite, etc., indicating that the Hittites belonged to the earlier population of Syria found by the invading Hebrews, and that they were regarded as akin to the Phœnicians and the Amorites. In the list of the peoples of Canaan the Hittites are regularly mentioned; the city of Luz is

said to be in "the land of the Hittites" (Judg. i. 26); Abraham buys the Machpelah from Ephron the Hittite (Gen. xxiii. 3 ff.); Esau's wives Jehudith and Bashemath were Hittites (Gen. xxvi. 34); Ahimelek the Hittite is mentioned in 1 Sam. xxvi. 6; Uriah and probably his wife Bathsheba were Hittites (2 Sam. xi. 3 ff.); Solomon had commercial relations with the kings of the Hittites (1 Kings x. 29); there were Hittites among the foreign wives of Solomon (1 Kings xi. 1); the Aramæans besieging Samaria were afraid of the kings of the Hittites; in Ezekiel xvi. 3, 45, Jerusalem's mother is said to be a Hittite; and in Josh. i. 4 the promised land is designated as "the whole land of the Hittites." It has been questioned whether there could have been Hittites in Hebron or among the Edomitish clans, but in the light of recent discoveries there is no valid reason to doubt it.

The earliest datable reference to the Hittites in cuneiform literature comes from the Chronicles of Babylonian Kings, published by King in 1907, recording that in the time of Samsuditana (c.1932 B.C.) "the Hittites came to the land of Akkad." The dynasty was probably overthrown by the Hittites, under whose suzerainty the first kings of the next dynasty of Babylon seem to have ruled. (See BABYLONIA.) But several centuries before this time the earliest-known rulers in Assur, Uspia and Kakkia, seem to have Hittite names, and the Assyrian invasion of Asia Minor of which the Cappadocian tablets give testimony is likely to have been a reaction against this early occupation of Assur by the Hittites in the third millennium B.C. (See ASSYRIA.) Whether Hatti (the modern Boghazkeui) was already at this time the capital of the Hittite power cannot yet be determined, but is altogether probable. It has been suggested that the advance of the Hittites from Asia Minor into Syria and Mesopotamia, where the State of Hani was founded by them on the middle Euphrates, was connected with the Hyksos invasion of Egypt, and that long before the eighteenth dynasty Palestine to its southern border was overrun with Hittites. This seems to be borne out by the traditions of the Hebrews. Statues of Marduk and Zarpanit were carried away to Hani probably in the days of Samsuditana; these were not brought back to Babylon until the time of Agum II Kakrime (c.1655-1625 B.C.). An oracle speaking of Marduk's deportation to the land of the Hittites probably refers to the same event. In 1470 and 1463 Thothmes III declared that he received tribute from the land of the greater Hatti. He seems to have taken the Hittite cities of Kadesh, Carchemish, and Nii. An Assyrian king sought the aid of Thothmes IV against the Hittite State of Marash, and in 1446 the Egyptian King fought against the Hittites. The Amarna letters (q.v.) show the growth of Hittite power in northern Syria. The Hittites were in alliance with the Kassites (q.v.) in Babylon, and Amorite chiefs like Abdasirta and Aziru (see AMORITES), while protesting fidelity to Egypt, were seeking the protection of the great King in Hatti. Subbiluliuma, the first of these monarchs known to us by name and possibly the founder of a new dynasty, sent a message to Amenhotep IV, probably to congratulate him on his accession to the throne (c.1389). The Mitannians (q.v.) in Mesopotamia and the Arzawi, probably in Armenia, who appear to have been Hittites in

the wider sense, maintained their independence, and the former were in alliance with Egypt. A complete list of the Hittite kings from about 1400 to 1250 has been obtained from the Babylonian Boghazkeui letters. Subbiluliuma was succeeded by Arandas, Mursil, Mutallu, Hattusil, Dudhalia, and Arnuanta. The greatest of these was Hattusil, the contemporary of Ramses II (1310-1244 B.C.). After the battle of Kadesh a treaty was concluded between them, and in 1290 an offensive and defensive alliance was established. Ramses II married Hattusil's daughter in 1277. Hattusil also made an alliance with Kadashman Turgu of Babylon and subsequently threatened to sever their relations if the son of this King was not given the crown. The good relations with Egypt seem to have continued after the death of Ramses II. But in the days of Ramses III the Hittites appear to have joined the confederacy of peoples that attacked Egypt, as the Egyptians declare that the Prince of the Hittites was captured in battle. Egypt was saved, but lost her influence in Syria; and the Hittite Empire came to its end through the invasion of new peoples into Asia Minor. For some time this Empire, which once, as the monuments show, held sway over the Troad, Lydia, and Cilicia, had evidently lost much of its power.

But strong Hittite city kingdoms still continued to exist for several centuries. Against these the Assyrians kept up a persistent warfare. Tiglath-pileser I made expeditions against the Hittites in Commagene (c.1120). Shalmaneser III (860-825 B.C.) fought against a confederacy of Syrian kings, led by Sangara of Carchemish, at the battle of Karkar in 854 B.C. The Chaldeans (q.v.) also waged wars against Hittite kingdoms. Menuas made a raid against Surisilis and Tarchigamas in the territory of the Hittite ruler Sadahalil. In another expedition he defeated the King of Gupis; and his son Argistis I likewise fought with Hittite rulers. Tiglath-pileser IV (745-728 B.C.) put a stop to the expansion of Chaldean power in this direction. Pisiris of Carchemish paid tribute to Tiglath-pileser IV in 739, but the city was afterward independent. It was Sargon II (722-705 B.C.) who finally conquered this important Hittite stronghold in 717 B.C.

The Hittites evidently belonged to the stock that inhabited Asia Minor before the invasion of Aryo-European nations. They are represented on the monuments with receding foreheads, large noses, marked cheek bones, and protruding upper jaws. Characteristic of their dress are the high peaked caps, the tunics reaching to the knees, and the shoes with ends turned up. From the type of personal names it may be inferred that the Hittite language belonged to the same family as some other early Asianic tongues. Unfortunately it has not yet been possible to decipher the native inscriptions. Of these a considerable number is now known. They have been found at Ibreez, Gaur Kalessi, Boghazkeui, Eyuk, Mount Sipylus, the Pass of Karabel, Mazaka, and elsewhere in Asia Minor, at Hamath, Aleppo, Carchemish, Nineveh, and Babylon. The hieroglyphic writing runs boustrophedon, as the ox plows—one line from right to left, the next from left to right. This is indicated by the direction of the faces. But the value of the signs has not yet been ascertained. A bilingual inscription on the so-called Tarkondemos boss, in Babylonian cuneiform and Hittite, is probably of

Mitannian origin, but has not furnished a sufficient clew. Among the many tablets discovered by Winckler at Boghazkeui in 1906 there were many in which the native language was written in cuneiform signs, while others were in Babylonian script and speech. The former may prove of great value to scholars; but they have not yet been published, and they are not so likely to throw light on the hieroglyphics as to give some knowledge of the language that will be available when the value of the signs shall have been correctly guessed. The attempts at decipherment by Wright, Conder, Sayce, Feiser, Jensen, Messerschmidt, and Gleye have not yet been crowned with success. In Syria the Hittites, like the Hebrews, probably adopted the language of Canaan, and later Aramaic. Among the Mitannians the Iranian element in the population seems to have affected to some extent their Hittite speech. As the system of hieroglyphics is entirely independent of the Cretan and the Egyptian as well as of the early Sumerian pictographs, so Hittite architecture and sculpture may have been more original creations than is generally supposed. The similarity to Sumerio-Akkadian motives on the one hand and Egyptian on the other is obvious and has naturally led to the assumption of borrowing. A strong influence exerted by the great rival civilizations at various times is also intrinsically probable. But only a more extensive knowledge of the earliest phase of Hittite history than we now possess can settle such questions as whether the Assyrian temples were built on Hittite models, and how far the sculpture of the Amoritical dynasty in Babylon reflects Hittite influence. On some of the finest specimens of Hittite art, see *EXUK*.

The chief sources of our knowledge of Hittite religion are the treaty between Hattusil and Ramses II, of which an Egyptian copy has long been known, and a résumé in Babylonian language and script was found by Winckler in 1906; a treaty between Hattusil and a Mitannian ruler, also discovered at Boghazkeui; allusions in other texts; and pictorial representations. There were gods of earth and heaven; and each river, mountain, land, and city had its male or female sutekh, its genius loci. Foremost among the gods were Hatti, Teshub, Tarchu, Chipa, and apparently Sandan and Ma. Hatti is represented at Yazyly Kaya in such a manner as to leave no doubt that he is the same god as the Phrygian Attys; and it is not improbable that the two names are identical. Teshub was worshiped by a number of peoples who may have been connected in some way with the Hittites. Tarchu has been thought to be identical with Terah, represented as the father of Abraham. Chipa occurs in Mitannian names like those of the princesses Tadu Chipa and Gilu Chipa, and of the Governor of Jerusalem, Arta Chipa. Sandan seems to have been especially connected with Cilicia, and Ma was the great mother goddess. In the Mitannian treaty Babylonian gods are mentioned, but also Iranian, such as Varuna, Mithra, and the Nasatyas. Survivals of the ancient Hittite religions may be found in Strabo's description of Cappadocia (XII, ii, 3, 6, 7) and possibly in Lucian's *De Dea Syria*, as the worship at Hierapolis-Mabug is likely to have been a continuation of that carried on at Carchemish (q.v.) until the destruction of this city.

HITTORF, hit'torf, JOHANN WILHELM (1824-). A German physicist, born at Bonn. In 1852 he became professor of chemistry and physics at Münster, where he remained in active service for half a century. Hittorf's earliest important researches were in electrolysis, and he was able to extend Faraday's work, his method of determining the mobility of ions being of the greatest importance to physical chemistry. In addition to his work in electrolysis he made elaborate investigations of the various phenomena attending the passage of electricity through gases. In 1862, with Plücker, he discovered that different spectra could be obtained from the same substances under different conditions of temperature. Later (1869), in studying the passage of electricity through tubes containing a rarefied gas, he observed that by increasing the exhaustion of the tube the dark space between the negative pole and the negative glow became wider, and that when the discharge from the cathode struck against the glass considerable fluorescence was produced. Hittorf also ascertained that these rays could be deflected by a magnet and anticipated Crookes, who in 1878 published his famous researches with the vacuum or Crookes tubes and named the rays thus produced radiant matter. He investigated the allotropic occurrence of selenium and phosphorus, and in the case of the latter substance he was successful in producing a crystallized form, black in color and with a metallic lustre. He was a foreign associate of the Berlin Royal Academy of Sciences. Hittorf's many valuable papers on physics and chemistry are to be found for the most part in Poggendorff's and Wiedemann's *Annalen der Physik* (Leipzig, current). This paper "On the Migration of Ions during Electrolysis" is contained in *The Fundamental Laws of Electrolytic Conduction* (New York, 1899), translated

from Poggendorff's *Annalen* and reprinted in German in *Ostwald's Klassiker*, No. 21 (Leipzig, 1891).

HITTORFF, è'torf', JACQUES IGNACE (1793-1867). A French architect, born in Cologne. He went to Paris in 1810, studied architecture under Ch. Percier (q.v.), and between 1819 and 1825 traveled extensively in England and Germany and in Sicily, where he studied the Greek ruins with particular reference to their polychromy. On his return he was appointed architect to the King, and with the assistance of Lepère built in Paris the fine Neo-Greek church of St. Vincent de Paul, applying to it the results of his researches in Greek polychromy. The exterior color decorations and paintings, however, failed to resist the climate and were removed a few years later. He was the chief designer of the embellishments for the Place de la Concorde, including its two fine fountains, and for the Champs Elysées and other avenues and squares. In 1864 he was made general inspector of the Conseil des Bâtiments. He published *Architecture antique de la Sicile* (1826-30), *Architecture moderne de la Sicile* (1826-35), *Architecture polychrome chez les Grecs* (1851)—all of which are still highly valued.

HITZIG, hits'ik, EDUARD (1838-1907). A German alienist, grandson of the biographer and criminologist Julius Eduard Hitzig. He was born in Berlin, studied medicine there and in Würzburg, and in 1875 became professor of psychiatry at Zurich. Four years afterward he became professor in Halle, where he established an independent clinic for nervous and mental disorders, the first in Prussia. Failing eyesight compelled him to give up his professorship in 1903. He wrote: *Physiologische und klinische Untersuchungen über das Gehirn* (1904), the result of long research on cerebral physiology and pathology, and especially on localization of the various functions; *Ueber traumatische Tabes* (1894); *Der Querulantenwahnsinn* (1895).

HITZIG, FERDINAND (1807-75). A German biblical scholar. He was born June 23, 1807, at Hainingen, Baden, and educated at Heidelberg, Halle, and Göttingen. In 1833 he was called to Zurich as professor of theology, with a special view to the exegesis of the Old Testament; but his lectures embraced also the New Testament and the languages of the East. In 1861 Hitzig returned to Heidelberg as professor. The first work which established his fame was his *Der Prophet Jesaja übersetzt und ausgelegt* (1833). Besides a translation of the Psalms, with a commentary (1835-36), he furnished for the *Exegetisches Handbuch zum alten Testament* the commentaries on the minor prophets (1838), on Jeremiah (1841), Ezekiel (1847), Ecclesiastes (1847), Daniel (1850), the Song of Solomon (1855), and Proverbs (1858), with a translation of all the prophetic books as a supplement (1854). He also published works on the New Testament and various archaeological subjects, and *Geschichte des Volkes Israel* (1869-70). His work is important in the progress of modern biblical scholarship. He died at Heidelberg, Jan. 22, 1875. Consult T. K. Cheyne, *Founders of Old Testament Criticism* (London, 1893), and, for his biography, H. Steiner (Zurich, 1882).

HITZIG, JULIUS EDUARD (1780-1849). A German criminal jurist and biographer. He was born in Berlin, studied law at Halle and Erlangen, and from 1799 to 1835 was connected more or less closely with the criminal courts of

Warsaw and Berlin. To this period belong the *Zeitschrift für die preussische Kriminalrechtspflege* (1823) and *Annalen für deutsche und ausländische Kriminalrechtspflege* (1828), both founded by him. At Warsaw he had been intimate with the poets Mnioch and Werner, and in Berlin he was even more prominent in literary circles as founder of the *Mittwochsgesellschaft*, a literary club. Hitzig was editor of the *Presszeitung* (1840-44) and author of biographies of Z. Werner (1823), of E. T. A. Hoffmann (1823; 3d ed., 1839), and, at his request, of Chamisso (1839-40). With Häring, in 1842, he began to publish *Der neue Putaval*; in 1826 he had brought out *Gelehrtes Berlin im Jahre 1825*.

HIVE BEE. The honeybee. See BEE.

HIVES. A name popularly given to the eruption known as urticaria, or nettle rash (qq.v.). The eruption appears as white rounded elevations or long wheals, which turn red later, especially after scratching or rubbing, for the itching and burning are intense. Eating lobsters or crabs has caused hives in some people. Certain drugs, such as the balsams, often cause it. After unloading the bowels, local treatment with dilute acids or bichloride of mercury will give relief. Alkalies and salicylates, taken internally, cut an attack short. In Great Britain the term is loosely applied to laryngitis and croup. See HIVE SIRUP.

HIVE SIRUP. *Syrupus Scillæ compositus*. The compound sirup of squills, a plant growing on the northern coast of the Mediterranean Sea. The bulb is the officinal portion. It is generally dried for use, but is sometimes imported packed in sand in a partially undried state. The sirup is prepared usually by taking of squill a moderately coarse powder, senega a moderately fine powder, tartrate of antimony and potassium, sugar, diluted alcohol, and water. The whole is carefully mixed according to formulæ laid down in the *Pharmacopœia*. In its action it is an emetic and combines the virtues of senega, squill, and tartar emetic, of the last of which it contains but one grain to the fluid ounce. It is also diaphoretic, expectorant, and in large doses cathartic. It was originally devised for the treatment of spasmodic croup, which is loosely known as hives in Great Britain, whence comes its popular name. Great care must be taken, in employing it, not to allow its sedative operation to proceed too far. In overdoses it has been known to produce a fatal inflammation of the stomach and bowels, since tartar emetic is highly poisonous.

HIVITES. One of the peoples mentioned in the lists of nations dispossessed by the Hebrews when they entered Palestine (Ex. iii. 8 et al.). In Gen. x. 17 they are placed among the sons of Canaan. They are especially connected with the Amorites and seem to have been a branch of this people. In Gen. xxxiv. 2 Shechem is a Hivite; in Gen. xlviii. 22 the city is inhabited by Amorites. Similarly the inhabitants of Gibeon are said to be Hivites in Josh. ix. 7; xi. 19, and Amorites in 2 Sam. xxi. 2. In Josh. xi. 3; Judg. iii. 3, Hivites appear in the Lebanon region. Consult Böhl, *Kanaanäer und Hebräer* (Leipzig, 1911).

HIZEN, hē'zēn'. One of the nine provinces of the island of Kyushu, Japan, famous in history and for its kaolin and the production of porcelain. It is rich in tea, tobacco, vegetable wax, and coal, but not in cereals, though in quality its rice is reckoned the best. Its chief towns are Saga and Nagasaki (q.v.). Arita and Imari,

both situated in this province, are famed for their ceramic ware. It was formerly divided among 10 daimyos (q.v.). It is now mostly within the Nagasaki-ken. Consult J. J. Rein, *Japan* (London, 1884), and for the ceramic industries of the province, Frank Brinkley, *Japan: Its History, Arts, and Literature* (8 vols., Boston, 1910).

HJÄRNE, yår'nē, HARALD GABRIEL (1848-). A Swedish historian, born at Klastorp, Vestergötland. He was educated at Upsala, where he obtained his doctor's degree and became lecturer (1872) and professor (1889). He published numerous articles on history and several large works. His studies on the relations between Russia and Sweden are of particular importance. He wrote: *Polens nordiska politik närmast före kongressen i Stettin 1570* (1884); *De äldsta svensk-ryska legationsakterna* (1884); *Från Moskva till Petersburg* (1888-89); *Sveriges statsskick under reformationstiden 1520-1611* (1893); *Gustaf Adolf, protestantismens förkampe* (1901; Ger. trans. in *Der Protestantismus am Ende des 19ten Jahrhunderts*, 1900-02); *Medeltidens statsskick* (1895); *Karl XII* (1902); *Blandade spörmål* (1903). In 1902-08 he was a member (Liberal) of the Lower House of Parliament. He also wrote *Ostanifrån; minnen och utkast* (1905); *Svenskt och frammande* (1908); *Ur det förgångna* (1912); *Stat och kyrka* (1912). Consult A. Grape, *Bidrag till en Hjärne-Biografi*, by 27 authors (Stockholm, 1908).

HJELT, hyëlt, EDVARD IMMANUEL (1855-). A Finnish chemist and educator, born in Wichtis, the son of a professor of medicine. He was educated at the University of Helsingfors, where he became lecturer in chemistry in 1880, was professor of chemistry in 1892-1907 and rector from 1899 to 1907, and then vice chancellor. In 1907-09 Hjelt was Vice President of the Senate of Finland. He was one of the revisers of Roscoe and Schorlemmer's *Treatise on Chemistry*, and wrote, besides many technical papers, biographical studies of great chemists, especially Berzelius. *Principles of General Organic Chemistry*, an English version from Hjelt's German book, appeared in 1890.

HJORT, hiört, JOHAN (1869-). A Norwegian zoölogist, oceanographer, and fisheries expert. He was born in Christiania and there studied medicine and zoölogy and became (1892) conservator of the zoötomical museum and (1893) government representative at the salt-water fisheries. After taking his doctor's degree at Munich, he was appointed, in 1906, fisheries director for Norway. The government furnished him with a staff of scientists and with the *S. S. Michael Sars*; in this vessel in 1910 he headed, with Sir John Murray, an expedition to Africa and America. Afterward he published, with Murray, *The Depths of the Ocean* (1912), and *Report on the Scientific Results of the Michael Sars North Atlantic Deep Sea Expedition, 1910* (1914). As member for Norway of the International Council for the Study of the Sea, he did much pioneer work. He wrote *Report on Norwegian Fishery and Marine Investigations* (vol. i, Christiania, 1900; vol. ii, Bergen, 1909); *Report on International Herring-Investigations in 1910* (Copenhagen, 1911), with E. Lea, and many other books and articles. In 1914 he visited Canada, upon the invitation of the government, to investigate the Canadian fish and fisheries.

HLADÍK, klád'ek, VÁCLAV (1868-). A Czech writer, born in Prague and educated at Českoslov and Prague. He repeatedly visited France and England and was strongly influenced by the French Naturalist school. Hladík occupies a prominent place in Czech journalism, having been editor of the *Národní Politický* and *Lumír*. Many of his writings were first published in periodicals and then collected in book form. They include: *Z lepší společnosti* (1892), sketches from the life of Prague; *Z pražského ouzduší* (1894); *O Současné Francii* (1909), a book of observations on French life; novels, *Trest* (1901), *Vasěň a sílka* (1902), *Valentinovy ženy*; and dramas, *Nový Život* (1896), *Závrat* (1902), etc. He is the chief representative of French literary ideals in modern Czech literature.

HOADLY, hōd'li, BENJAMIN (1676-1761). A Church of England prelate. He was born at Westerham, Kent, Nov. 14, 1676. He graduated B.A. at Cambridge, 1696, became preacher in London in 1701, Bishop of Bangor in 1715, of Hereford in 1721, of Salisbury in 1723, and of Winchester in 1734. He attracted attention by controversies with the Nonconformists and with the High Church party of the Church of England. His principles were developed in his *Essay on the Origin of Civil Government* (1709). The accession of George I in 1714 brought Hoadly's views into favor with the court, and he received advancement. In 1717 the so-called Bangorian Controversy arose. It began by Hoadly's publication of a pamphlet, and of a sermon on the text, "My kingdom is not of this world." He maintained that Christ had left behind Him no such authority as that claimed by churches, and that this was the best way of answering the pretensions of the Church of Rome. These views gave great offense both to High Church and Dissenters. He was attacked from all quarters, and the controversy raged for three years. He died at Chelsea, London, April 17, 1761. His works were published with a life by his son, John Hoadly (London, 1773). Consult Leslie Stephen, *History of English Thought in the Eighteenth Century* (3d ed., New York, 1902).

HOADLY, hōd'li, GEORGE (1828-1902). An American lawyer, and Governor of Ohio, born in New Haven, Conn. He was educated in the public schools of Cleveland, whither his father had moved in 1830. He graduated from Western Reserve College, then at Hudson, Ohio, in 1844, studied at Harvard Law School, was admitted to the bar in 1847, and two years later became a partner in the law firm of Chase and Bull at Cincinnati, in which Salmon P. Chase was the senior member. In 1851 he was chosen by the Legislature judge of the Superior Court of Cincinnati, in 1855 became city solicitor, and in 1859, upon the reorganization of the new Superior Court, was elected judge and was re-elected in 1864. He refused a seat on the supreme bench offered him by Governor Chase. Originally a Democrat, he took a prominent part in the "Barnburner" movement, was a War Democrat, and finally during the war allied himself with the Republican party. He resigned from the bench in 1866 to resume his law practice. In 1872 he was active in the Liberal Republican revolt, but dissatisfaction with the nomination of Greeley caused him to remain in the party. In 1876, however, he allied himself with the Democratic party on the tariff issue and was one of the counsel for Tilden before the Electoral Commission and argued the cases of

Florida and Oregon. In 1883 he was the party's candidate for Governor of Ohio, being elected over Joseph B. Foraker by 12,000. Two years later he was in turn defeated by Foraker for reelection to the same office. During 20 years of this period he was a professor in the Cincinnati Law School. From 1887 until his death he practiced law in New York City.

HOANG-HO, HUANG-HO, HWANG-HO, hwāng'hō', or YELLOW RIVER. Next to the Yang-tse-kiang, the largest river of China (Map: China. J 3). Its sources are two mountain torrents on the Odontala Plain, altitude 14,000 feet, south of the Buhhan Bota Mountains in Tibet, only a short distance north of the upper course of the Yang-tse-kiang. Its course is exceptionally tortuous. After flowing eastward to near the boundary of Tibet, it changes its direction first to the northwest and then to the northeast, in which latter direction it flows through the Chinese Province of Kansu. Leaving the Province of Kansu, it crosses the Great Wall into Mongolia. There it flows at first northeast and then east as far as the western boundary of the Chinese Province of Shansi, where it turns sharply to the south, and, passing the Great Wall again, flows between the provinces of Shensi and Shansi, forming their boundary line. At about lat. 35° N. it turns sharply east, which direction it maintains as far as the city of Kaifeng, in the Province of Honan. From that point it flows in a northeastern direction until it falls into the Gulf of Pechili about lat. 38° N. Its total length is probably over 2700 miles, and its basin is estimated at 400,000 square miles. The chief tributaries of the Hoang-ho are the Tao-ho from the south, the Wei-ho from the west, and the Tatum-ho from the north. The Hoang-ho is navigable for small vessels for a short distance from its mouth and in some parts of its middle course. The course of the river has changed repeatedly, and the present mouth was that of the Tatsin until 1853. Prior to that time the course of the river below Kaifeng was southeasterly, and its mouth in the Province of Kiangsu in about lat. 34° N. The sediment which is transported in large quantities by the Hoang-ho raises its bed, thereby causing inundations. These have been so frequent and so disastrous that the river has come to be known as "China's sorrow." Chinese history is filled with the vagaries of the Hoang-ho, disastrous changes in the channel having occurred in 1194, 1209, 1324, and 1853. In 1898, because of a destructive flood, silt and sand were deposited over an area of about 200 square miles, at a depth of from 2 to 10 feet, amounting in all to 16,000,000 cubic feet. The distress caused by this calamity was one of the causes of the Boxer Rebellion. It is estimated that the river will not keep to part of its present bed more than 15 years, as the flood level is now from 15 to 20 feet above the level of the plains below the city of Tungahsien. From time immemorial a vast system of dams and dikes has been maintained to keep the river in check. The river causes an annual expense and loss of about \$3,750,000 to the government and the provinces.

HOAR, hōr, EBENEZER ROCKWOOD (1816-95). An American jurist. He was born at Concord, Mass., the son of Samuel Hoar, graduated from Harvard College in 1835 and from Harvard Law School in 1839, and was admitted to the bar in 1840. He was a judge of the Court of Common Pleas from 1849 to 1855 and of the State

Supreme Court from 1859 to 1869. In 1869-70 he was Attorney-General of the United States in President Grant's cabinet. His zeal for civil-service reform aroused the hostility of "machine" politicians, and not only cost him his portfolio, but was responsible for the Senate's failure to confirm his nomination as associate justice of the Supreme Court. He was a member of the Joint High Commission that framed the Treaty of Washington in 1871 and was a Republican member of Congress in 1873-75. From 1878 to 1887 he was president of the board of overseers of Harvard University.

HOAR, GEORGE FRISBIE (1826-1904). An American legislator, born at Concord, Mass., Aug. 29, 1826. He graduated at Harvard in 1846, studied law in Harvard Law School, and in 1849 opened an office in Worcester. He was an ardent member of the Free Soil party and later of the Republican party, almost from the time of its organization, and in 1852 he was elected one of its representatives in the Massachusetts Legislature. Though his ambition at this time was for a legal rather than a political career, he was induced to accept other nominations, which resulted in his serving in both branches of the State Legislature and in the United States House of Representatives, of which he was a member from 1869 until 1877, when he was chosen Senator by his State. During his last year in the House he was a member of the Electoral Commission (q.v.), chosen in 1877, which decided that Hayes had been elected President over Tilden. He presided over the Republican National Convention of 1880, which nominated Garfield and thus ended the bitter contest between Grant and Blaine. He was always a consistent opponent of "imperialism" from the days when he aided Sumner in his opposition to the annexation of Santo Domingo; and though he supported President McKinley for reelection, he strongly opposed his policy in the Philippines, which he considered subversive of American ideals. During his service in the House Mr. Hoar was one of the managers of the Belknap impeachment trial, and after his election to the Senate he was chairman of the committees on the judiciary and on privileges and elections, and a member of the committees on engineering bills, civil service and retrenchment, library claims, Nicaragua claims, and rules, as well as chairman of the select committees on woman suffrage and relations with Canada. He served as regent of the Smithsonian Institution (1880), president of the American Antiquarian Society, president of the American Historical Association (1895), president of the board of trustees of Clark University (1900), and trustee of the Peabody Fund. He died in Worcester, Sept. 30, 1904. Consult his *Autobiography of Seventy Years* (2 vols., New York, 1903) and F. C. Lowell, "George Frisbie Hoar," in *Sons of the Puritans* (Boston, 1908).

HOAR, SAMUEL (1778-1856). An American lawyer and legislator. He was born at Lincoln, Mass., graduated at Harvard in 1802, was admitted to the bar in 1805, and soon became a prominent lawyer. He was a State Senator in 1825 and again in 1833 and was a Whig member of Congress from 1835 to 1837. In 1844 he was sent by the Massachusetts Legislature to South Carolina to test before the courts the constitutionality of certain laws of that State authorizing the imprisonment of free negroes coming into it. He was, however, not allowed to

plead, but was forcibly expelled from Charleston by the public authorities, the South Carolina Legislature by special act authorizing the expulsion.

HOARE, SIR RICHARD COLT (1758-1838). An English antiquary, born at Stourhead in Wiltshire. At 25 he married Lord Lyttelton's eldest daughter and after her death, two years later, traveled extensively over Europe. He wrote journals concerned with his tours in Ireland (1807) and in Italy (1819); a translation of Giraldus Cambrensis (1808); a topographical catalogue of the British Isles (1815); and, most important among his works, an *Ancient History of North and South Wiltshire* (1812-21), succeeded by an incomplete *History of Modern Wiltshire*, dealing with the southern section only (1822-44).

HOAR FROST. See FROST.

HOAR/HOUND. See HOREHOUND.

HOARSE/NESS. See THROAT, AFFECTIONS OF.

HOATZIN, hô-ăt'sîn (South American name), or HANNA. A bird (*Opisthocomus cristatus*) of Guiana and Brazil, possessing many conflicting characteristics of structure, so that its place in classification has been greatly in dispute. Some writers have regarded it as nearly related to the plantain eaters; others, to the curassows. Most recent writers have placed it with or very near the Gallinæ, but generally as a separate order, the Opisthocomiformes. It has the general shape of a curassow, but in size is much smaller, is olive color varied with white above and deep bay below, and has a long pendent crest of loose yellow feathers. The tail is long and

THE HOATZIN.

broadly tipped with yellow. It lives in bands in the forest, frequents the borders of streams, feeds upon leaves and fruits, rarely leaving the lower trees and bushes, flying weakly, and uttering a "sharp grating hiss" as a call note. It feeds largely on a species of arum, which at times gives its flesh and whole body a vile musky odor, so that it is known in British Guiana as "stink bird." On the Amazon it is called *cigano*, or "gypsy." Its nest is rudely built of sticks on some low bush, and the eggs, three or four in number, are whitish with reddish-brown blotches. The character and actions of the young are, however, the most remarkable thing about this extraordinary bird. They are hatched naked and possess at birth well-developed claws on both the index (forefinger) and pollex (thumb) digits of the fore limb. Soon after hatching the nestlings begin to crawl about by hooking these claws about twigs or any object accessible and

so use their wings precisely as feet, holding on also by the bill. This is an interesting reminder of the condition of the wing in the most ancient of birds (see *ARCHLEOPTERYX*), which used its anterior digits in much the same way. The young hoatzin, however, sheds its claws after a few days. Consult: Alfred Newton, *Dictionary*

of Birds (New York, 1896); C. W. Beebe, "Ecology of the Hoatzin," *Zoologica*, i (ib., 1909); M. B. and C. W. Beebe, *Our Search for a Wilderness* (ib., 1910).

HOBAN, JAMES. An American architect, born in Ireland, c.1755. After some years' residence in Charleston, S. C., he went to Washington when that city was first laid out and worked there for the government for the greater part of his life (1792-1817). He is chiefly known as the architect of the White House, which he also rebuilt after its burning by the British in 1814. He was in charge also of the building of the Capitol under Thornton.

HOBART. The capital of Tasmania, situated on the river Derwent, 12 miles from its entrance into Storm Bay, on the south coast of the island (Map: Tasmania, D 3). Besides the government official buildings, Hobart has a college, a technical school, two cathedrals, hospitals, a free library, museum, and art gallery. Its naturally excellent harbor and quay with three patent slips accommodate ships of the largest size. It has considerable manufactures, a large export and import trade, railway communication with Launceston, and steamship communication with Sydney, Melbourne, New Zealand, and London. It is the seat of a United States consul and the see of Anglican and Roman Catholic bishops. With Mount Wellington as a picturesque background and with street railroads, fine parks and drives, Hobart is a favorite summer resort for Australians. The mean temperature for the year is 52.3°, being 42.1° in winter and 63.1° in summer. Pop., 1911, 27,526; with suburbs, 39,937. Hobart was founded in 1804 and became a city in 1857. In 1881 its name was changed from Hobart Town to the present form.

HOBART. A city and the county seat of

Kiowa Co., Okla., 55 miles west of Anadarko, on the Little and Big Elk rivers, and on the Chicago, Rock Island, and Pacific and the St. Louis and San Francisco railroads (Map: Oklahoma, C 3). It is situated in an agricultural region: carries on a trade in alfalfa, hay, grain, poultry, live stock, and dairy products; and has cottonseed-oil and alfalfa mills and a cotton compress. There is a Carnegie library. The water works are owned by the municipality. Hobart was opened by the government to white settlers in 1901. Pop., 1900, 3136; 1910, 3845.

HOBART, GARRET AUGUSTUS (1844-99). An American lawyer and politician, Vice President of the United States. He was born at Long Branch, N. J., graduated at Rutgers College in 1863, was admitted to the bar six years later, and practiced his profession with success at Paterson, N. J., where he made his home until death. He was city solicitor there in 1871, was a member of the State Assembly from 1873 to 1875, and of the State Senate from 1877 to 1883, presiding over both of those bodies. He was nominated to the United States Senate in 1884, but failed of election. He was four times successively delegate at large from New Jersey to the Republican National Convention and, having been nominated at St. Louis in 1896 for Vice President on the ticket with William McKinley, was elected. To a greater extent, perhaps, than any of his predecessors in the vice presidency, he made that office one of real influence and power. He was the intimate friend and counselor of President McKinley and exercised a strong influence on the conduct of public affairs. He defeated the move to give the Filipinos independence. He was interested in many banking and other business corporations, conducted many successful receiverships, and accumulated a large fortune. He died before the expiration of his term of office, on Nov. 21, 1899.

HOBART, JOHN HENRY (1775-1830). A Protestant Episcopal bishop of New York. He was born in Philadelphia, Pa., graduated at Princeton in 1793, and was tutor from 1795 to 1798, when he took orders. His first charges were in Philadelphia, New Brunswick, N. J., and Hempstead, L. I. He was appointed curate of Trinity Church, New York (1800); was ordained priest (1801); and after serving in various capacities was appointed (1816) rector of Trinity and Bishop of the diocese. In 1821 he was appointed professor of pastoral theology and oratory in the General Theological Seminary, which he helped to found. He spent the years 1824-25 in Europe, studying social, moral, and religious conditions. He died at Auburn, N. Y. His writings, which went through many editions, include: *Festivals and Fasts* (1804); *Clergyman's Companion* (1805); *Controversial Essays* (1806); *Apology for Apostolic Order* (1807); *The Christian's Manual* (1814); *A Comparison of the United States with England* (1826). He also edited D'Oyley and Mant's *Family Bible* (2 vols., 1818-20). Consult: W. Berrian, "Memoir," attached to the *Posthumous Works of Bishop Hobart* (New York, 1833); McVickar, *The Early and Professional Years of Bishop Hobart* (Oxford, 1838); *Correspondence of John Henry Hobart*, vols. i-v (New York, 1911-12).

HOBART, JOHN HENRY (1817-89). An American Protestant Episcopal clergyman and author, the youngest son of Bishop John Henry Hobart. He was born in New York City, graduated at Columbia College, and was ordained in

1841. After having a charge at Baltimore he was assistant in Trinity Church in New York City for 15 years and afterward became rector of Trinity Church, Fishkill, N. Y. He published: *Instruction and Encouragement for Lent* (1859); *Medievalism* (1877); *Church Reform in Mexico* (1877).

HOBART COLLEGE. An institution for higher education, founded at Geneva, N. Y., under Episcopal auspices. It was projected in 1812 and named after Bishop Hobart, through whose efforts it was organized. A provisional charter was secured in 1822 and a full charter in 1825, under the title of Geneva College. In 1852 the name was changed to Hobart Free College and in 1860 to Hobart College. The college offers academic courses leading to the degrees of Bachelor of Arts and of Science. William Smith College was opened in 1908 for the separate instruction of women. The work of the two colleges is carried on independently by a common faculty, upon whose recommendation the corporation of Hobart College grants to the students of both institutions the same degrees. In 1914 it had 72 students in William Smith College and 102 in Hobart, 23 instructors, 53,000 volumes in the library, total property valued at \$1,265,955, including grounds, buildings, and other equipment worth \$507,480, and an annual income of \$82,322. The president in 1914 was Lyman P. Powell.

HOBART-HAMPDEN, AUGUSTUS CHARLES (commonly known as **HOBART PASHA**, pá-shá') (1822-86). An English admiral in the Turkish service. He entered the British navy in 1835, distinguished himself in the Crimean War, and in 1863 was promoted to the rank of captain, but shortly after this he retired. During the American Civil War he was a blockade runner and had many narrow escapes. In 1867 Hobart entered the Turkish service as naval adviser to the Sultan. His first service was in suppressing the Cretan rebellion, for which he was promoted an admiral with the title of Pasha. He reorganized the Turkish fleet, which he commanded on the Black Sea against Russia, in the War of 1877-78, and in 1881 was appointed marshal of the Empire. Although his name was twice struck from the British navy list for operating against powers friendly to Great Britain in disregard of the Foreign Enlistment Act, he was finally restored in 1885 with the rank of vice admiral. His book, *Sketches of my Life* (1887), published posthumously, is a mixture of fact and fiction.

HOBBEA, hōb'bā-mā, MEINDEBT (1638-1709). One of the greatest Dutch landscape painters. He was born at Amsterdam in 1638, the date being verified by the statement in the record of his marriage there, Oct. 2, 1668, that he was 30 years old at that time. This marriage with the cook of Lambert Reynst, burgomaster of Amsterdam, put an end to his artistic career. For, through the influence of another maidservant in the burgomaster's household, he was appointed wine gauger to the city and ceased painting. He lived at Amsterdam and was a pupil and friend of Jacob van Ruysdael. They often worked together, painting the same scene side by side. As such well-known contemporaries as Berchen, Vanderveelde, and Lingelbach are said to have painted the figures in his landscapes, it seems likely that he was appreciated by the artists of his day. Nevertheless, he died at Amsterdam in poverty, Dec. 14, 1709.

Hobbema and Ruysdael are the greatest land-

scape painters of the Dutch school; their art marks its consummation. Some of their works are difficult to distinguish; but Ruysdael is usually considered the greater because he is much more versatile. Hobbema, e.g., never painted rocky gorges, torrents, stormy autumn scenes, rough seas, coast scenes, panoramas, but preferred the gentler aspects of nature, such as quiet woodland scenes, pools of water with subtle sunlight effects, romantic water mills and streams. His pictures are rich in warm and golden tones, and his color, when it has not darkened, has a transparent quality, with brilliant effects reflected in sky and water. His technique is bold in touch, but careful in finish of detail, which occasionally becomes excessive. No one has better portrayed the magical effects of sunlight and atmosphere. It was not until the eighteenth century that his merit was appreciated. The English were the first to recognize it, and therefore far the greater number of his best works were in the private collections of England, from which they have been largely bought by American collectors. Hobbema also exercised great influence upon the English landscape painters of the latter eighteenth century, especially upon Old Crome. The rarity of his paintings has made them much sought after, and their high value has caused forgeries of signatures and dates.

Of all public collections the National Gallery, London, is richest in works of Hobbema, possessing nine, including the "Avenue, Middelharnis" and the "Ruins of Brederode Castle." Amsterdam has six, including the famous "Water Mill"; Glasgow and Brussels, each four; Paris, Dresden, and Frankfurt, each three; and Berlin two. Hobbema is especially well represented in the great American private collections. Thus, the Widener collection, Philadelphia, has four fine examples; the Frick collection, New York, three; the J. Pierpont Morgan collection three, two of which, the so-called Holford and Trevor landscapes, are on loan in the Metropolitan Museum, New York; and J. G. Johnson, Philadelphia, has four.

Bibliography. The best list of Hobbema's works is in Hofstede de Groot, *Catalogue of Dutch Painters*, vol. iv (London, 1912), with admirable brief biography. See also the scholarly treatise of Wilhelm Bode, *Great Masters of Dutch and Flemish Painting* (ib., 1909). Of a more popular character are F. E. Michel, *Hobbema et les paysagistes de son temps en Hollande* (Paris, 1890), and Frank Cundall, *The Landscape and Pastoral Painters of Holland* (London, 1891).

HOBBS, hōbz, JOHN OLIVER (PEARL RICHARDS CRAIGIE) (1867-1906). An English novelist, born in Boston, Mass. Her father removed to England while she was very young, and she was educated there by private tutors and later in Paris and at University College, London. She was married in 1887 to Reginald W. Craigie, but secured a divorce in 1895. She wrote the novels: *Some Emotions and a Moral* (1891); *A Study in Temptations* (1893); *The Gods, Some Mortals, and Lord Wickenham* (1895); *A Bundle of Life* (1894); *Robert Orange* (1900); *The Serious Wooing* (1901); *Love and the Soul Hunters* (1902); *The Vineyard* (1904); *Flute of Pan* (1905); *The Dream and the Business* (1906), posthumous; and the plays: *Journeys End in Lovers' Meeting* (1894), for Miss Ellen Terry; *The Ambassador* (1898); *A Repentance* (1899).

HOBBEWA
"THE AVENUE OF MIDDLEHARNIS," FROM THE PAINTING IN THE NATIONAL GALLERY, LONDON

A selection from her writings, *Life and Tomorrow* (New York, 1907), was made by T. Proctor. Her style is cynical, brilliant, and epigrammatic, especially in dialogue. Consult J. M. Richards, *Life of John Oliver Hobbes Told in her Correspondence with Numerous Friends* (ib., 1911).

HOBBS, THOMAS (1588-1679). An English philosopher and political theorist. He was born at Malmesbury on April 5, 1588, the son of a clergyman. At the age of 15 he went to Oxford and studied the usual course of Aristotelian logic and physics. At the age of 20, having taken his degree and quitted Oxford, he was recommended to Lord Cavendish, afterward Earl of Devonshire, as tutor to his eldest son. Thus began an intimate connection with that great family which lasted through his long life.

In 1610 he went abroad with his pupil and made the tour of France and Italy. After his return he still continued to live with the Earl of Devonshire's family, and his residence in London afforded him opportunities of becoming acquainted with Bacon, Ben Jonson, and the other distinguished men of the time. Meantime he was occupied with classical, political, and philosophical studies, and prepared for publication his first work, a translation of Thucydides, which came out in 1628. His interest in Thucydides was largely political. For many years he still derived his income from tutorial work, but gave his leisure to study. The political disturbances of the time made him desirous of political stability and order, which he believed could be obtained only by unquestioning recognition of the absolute power of the sovereign. This power, according to Hobbes, is neither original nor divine, but was delegated by the subjects in a compact which created the state and gave rise to all moral and political obligation. Primitive man did not live in any social or political organization. Every one was at first bent on securing his own selfish ends, but came to see that the warfare which inevitably resulted from the clash of unregulated interests was suicidal. A contract was made whereby this war of each against all—*bellum omnium contra omnes*—was brought to a close, a civil government established, and loyalty pledged to the sovereign power thus constituted. Whatever laws this power lays down are the measure of right and wrong. Thus, instead of recognizing "the divine right" of kings, Hobbes derived their sovereignty from the original contract; and although he vigorously maintained the supreme authority of the crown, the fact that this authority is of human origin logically involved the possibility of revoking it. So that, in spite of Hobbes's strong defense of royal sovereignty, his views were unwelcome to those in authority. These views were published in various works: *De Cive* (1642); *Humane Nature* (1650); *De Corpore Politico* (1650); *Leviathan, or the Matter, Form, and Power of a Commonwealth* (1651).

After the meeting of the Long Parliament in 1640 Hobbes had returned to Paris, from his dread of the civil troubles. In 1647 he was appointed mathematical tutor to the Prince of Wales, afterward Charles II; but the character of his writings, especially after the publication of the *Leviathan*, so offended the Royalist clergy, in common with all other sects, that Charles was induced to part with him, and he took alarm for his personal safety and abruptly fled in 1651 to Paris; but after a short stay there, knowing that

he had caused much irritation in France by his bitter attacks on the papacy, he returned to England, where he was allowed to live quietly. Very different was his position after the Restoration; for although Charles granted him a pension of £100 a year, the dislike to his views was so general that they were condemned by the House of Commons in 1666, and he was in danger of still severer measures. His connection with the Earl of Devonshire, with whom he lived in the latter part of his life, was no doubt a powerful protection to him. His old age was fruitful in additions to his writings and was marked by some sharp controversies. His last works were a translation of Homer and a history of the civil wars. He died on Dec. 4, 1679.

All his Latin works were collected and published by himself (Amsterdam, 1668) and by Molesworth (5 vols., London, 1839-45). His English works were edited by Molesworth (11 vols., including index, London, 1839-45). F. Tönnies edited and published *Behemoth, or the Long Parliament* (London, 1889). The Cambridge University Press publishes a convenient edition of the *Leviathan*. Woodbridge has edited a selection from Hobbes's writings (Minneapolis, 1903).

In philosophy and psychology Hobbes was a sensationalist and, at least at times, a materialist. All change for him is motion; hence sensuous perception is motion, and pleasure is also motion. Just why motion should appear in the form of consciousness is an inexplicable mystery. Sense impressions, in their combinations and transformations, give rise to memory and thought. This takes place according to definite laws. The order of succession of memory ideas is that of the original sense impressions, while the impressions originally in combination tend to reappear in the same combination; this fact he called the law of contiguity. Indeed, Hobbes is commonly regarded as the "father of associational psychology." Hobbes's ethics was hedonistic. It is man's desire for pleasure that made him in the first instance establish civil authority, but it is the supremacy of that authority which makes it binding now. Consult: Tönnies, "Anmerkungen über die Philosophie des Hobbes," four articles in *Vierteljahrsschrift für wissenschaftliche Philosophie* (Leipzig, 1879-81); Robertson, *Hobbes* (Edinburgh, 1886); Wille, *Der Phänomenalismus des Thomas Hobbes* (Kiel, 1888); Lewis, *Ueber den Individualismus bei Hobbes* (Halle, 1892); Lyon, *La philosophie de Hobbes* (Paris, 1893); F. J. Tönnies, *Hobbes Leben und Lehre* (Stuttgart, 1896); E. H. Sneath, *Ethics of Hobbes* (Boston, 1898); William Graham, *English Political Philosophy from Hobbes to Maine* (New York, 1900); Leslie Stephen, *Hobbes* (ib., 1904); A. E. Taylor, *Thomas Hobbes* (ib., 1909).

HOBBS, WILLIAM HERBERT (1864-). An American geologist. Born at Worcester, Mass., he graduated from Worcester Polytechnic Institute in 1883; and he studied also at Johns Hopkins University (Ph.D., 1888), and at the University of Heidelberg (1888-89). At the University of Wisconsin he was curator of the geological museum (1889-90), assistant professor of mineralogy and metallurgy (1890-99), and professor of mineralogy and petrology (1899-1906), and at the University of Michigan professor of geology and director of the geological laboratory after 1906. From 1886 to 1906 he served with the United States Geological Survey. His

publications include: *Earthquakes* (1907; Ger. trans., 1910); *Characteristics of Existing Glaciers* (1911); *Earth Features and their Meaning* (1912). In 1909 he became editor of the *Journal of Geology*.

HOB'BY (OF. *hobe*, from *hober*, to move, from Old Dutch *hobben*, to toss, *hoppen*, to hop, AS. *hoppian*, Ger. *hopfen*, to hop). A small European falcon (*Falco subbuteo*), formerly trained in falconry to fly at pigeons and partridges. The nearest North American species is the pigeon hawk.

HOB'HOUSE, ARTHUR, first BARON (1819-1904). An English judge, born at Hadspen, Somerset. He was early educated at Eton and graduated from Balliol College, Oxford, in 1840. In 1845 he was called to the bar at Lincoln's Inn, acquired a large chancery practice, became a queen's counsel in 1862, but retired from practice in 1866. In that year he accepted the post of charity commissioner. From 1872 to 1877 he was legal counsel on the staff of the Governor-General of India, and from 1881 to 1901 he served on the judicial committee of the Privy Council. Hobhouse was made a peer in 1885. Active in the work of the Municipal Reform League, he became one of the first aldermen under the newly created London County Council in 1888. He did much to promote desirable legal reforms. Some of his addresses on property were published under the title *The Dead Hand* (1880).

HOBHOUSE, JOHN CAM. See BROUGHTON, BARON.

HOBHOUSE, L(EONARD) T(RELAWNEY) (1864-). An English philosopher, son of the Archdeacon of Bodmin. Educated at Oxford, he became fellow of Merton in 1887 and assistant tutor of Corpus Christi in 1890 and fellow in 1894. He was on the editorial staff of the *Manchester Guardian* in 1897-1902, and, after being secretary of the Free Trade Union, on the staff of the *Tribune* in 1906-07. In 1907 he became professor of sociology in London University. His earlier theory of mechanical causation he gradually gave up for a theistic and teleological one. He wrote: *The Labor Movement* (1893; 3d ed., 1912); *The Theory of Knowledge* (1896); *Mind in Evolution* (1901); *Democracy and Reaction* (1904); an elaborate work on *Morals in Evolution* (1906); a sketch of *Liberalism* (1911); *Social Evolution and Political Theory* (1911), Columbia University lectures on the Julius Beer foundation; *Development and Purpose* (1913). He edited the University of London *Monographs on Sociology*.

HOB'KIRK'S HILL, BATTLE OF. A battle fought at Hobkirk's Hill, about 2 miles north of Camden, S. C., on April 25, 1781, during the American Revolution, between an American force of about 950, under General Greene, and an English and Loyalist force about equal in number, under Lord Rawdon. The latter, leaving his strong position at Camden, fell upon the Americans unprepared, and after some stubborn fighting Greene's favorite regiment, the First Maryland, was stricken with panic. The victory gave no strategic advantage to Rawdon, who on May 10 evacuated Camden and retreated towards Charleston. The loss of the Americans in killed, wounded, and missing was 271; that of the English and Tories, 258. This engagement is also known as the second battle of Camden. Consult Carrington, *Battles of the American Revolution* (6th ed., New York, 1904), and Edward Mc-

Crady, *The History of South Carolina in the Revolution* (2 vols., ib., 1901-02).

HOBOKEN. A city in Hudson Co., N. J., on the Hudson River, opposite New York, with which it is connected by ferry and tube, and adjoining Jersey City. It is the terminus of the Hamburg-America, North German Lloyd, Holland-American, and Scandinavian-American steamship lines, and of the Delaware, Lackawanna, and Western, the Lehigh Valley, and the West Shore railroads (Map: New York City, Borough of Manhattan, B 17). It lies at the base of the Palisades, the principal streets running north and south, parallel to the river. In the eastern section rises a hill. The site of Stevens Institute of Technology (q.v.) is fronted by Hudson Park. In the latter is a soldiers' monument; and in Church Square Park are situated the public library and a firemen's monument. St. Mary's Hospital is a noteworthy structure. Hoboken is a great shipping place for coal. The most important manufactures comprise foundry and machine-shop products, marine engines, technical instruments, cork products, motor fire engines, castings, elevators, inks, metal tubes, chemicals, waterproofed fabrics, lead pencils, leather goods, silk, wall paper, and caskets. The government is administered by a mayor, elected every two years, who appoints school, health, fire, and library commissioners, and, with the consent of the council, assessors and police commissioners, of which board he is the president. The council is unicameral and elects the city clerk and assistants and inspectors. The municipal income and expenditures amounted in 1912 to \$4,240,000 and \$3,930,000 respectively, the main items of expense being \$129,000 for the fire department, \$153,000 for the police department, \$225,000 for operation of the water works, and \$428,000 for schools. Pop., 1900, 59,364; 1910, 70,324; 1914 (U. S. est.), 74,994.

The land on which Hoboken stands was part of the patroonship granted to Michael Pauw in 1630 and was then called Hobocan Hacklingh (the land of the tobacco pipe), in allusion to the fact that Indians carved pipes from a kind of stone found here. A house was built about 1640 by Arendt Teunisson Van Putten, and a straggling settlement grew up; but the present city really dates from 1804, when John Stevens, "the founder of Hoboken," bought the land and laid out a town. During the first quarter of the nineteenth century the Elysian Fields in Hoboken were the favorite pleasure resort for New Yorkers and became noted as the meeting place of Federalist politicians. Hoboken was incorporated as a town in 1849, its population then being about 2000, and in 1855, with a population of about 6700, it was chartered as a city. In 1900 a fire at the wharves of the North German Lloyd Steamship Company caused the loss of about 300 lives and destroyed property, including three steamers, valued at \$5,000,000. Hoboken is associated with the early development of steam navigation and steam railroads in this country. The modern type of ferry slip, built of piling, was invented by Colonel Stevens and first used here, as was the steam-propelled ferryboat, invented by the same man in 1811. Consult Winfield, *History of the County of Hudson* (New York, 1874).

HOBRECHT. See OBRECHT.

HOB'SON, JOHN ATKINSON (1858-). An English economist, born at Derby. He was

educated at Lincoln College, Oxford, from 1880 to 1887 was classical master in schools at Faversham (Kent) and Exeter, and from 1887 to 1897 was lecturer in English literature and economics for the University Extension Delegation and the London Society for the Extension of University Teaching. From the time of the appearance of his *Problems of Poverty* (1891, No. 2 in the "Social Questions of To-Day Series") he became known as one of the more prominent British economists of the recent school and a very effective writer. His other publications include: *The Physiology of Industry: Being an Exposure of Certain Fallacies in Existing Theories of Economics* (1889), with A. F. Mummery; *The Evolution of Modern Capitalism* (1894); *Coöperative Labour upon the Land, and Other Papers* (1895); *The Problem of the Unemployed: An Enquiry and an Economic Policy* (1896); *John Ruskin, Social Reformer* (1898); *The War in South Africa: Its Causes and Effects* (1900); *The Economics of Distribution* (1900); *Capitalism and Imperialism in South Africa* (1900); *The Psychology of Jingoism* (1901); *The Social Problem; Life and Work* (1901); *Imperialism* (1902); *International Trade* (1904); *Canada To-Day* (1906); *The Industrial System* (1909); *The Science of Wealth* (1911); *The Economic Interpretation of Investment* (1911); *Gold, Prices, and Wages* (1913).

HOBSON, JOSEPH (1834-). A Canadian civil engineer. He was born in the township of Guelph, Ontario, and was educated at the local schools. He studied surveying and engineering and entered the service of the Grand Trunk Railway as an assistant engineer on construction west of Toronto. He afterward became assistant engineer on various railway lines in Nova Scotia, Ontario, and Michigan; was resident engineer of the International Bridge, Buffalo (1870-73); was appointed chief engineer of the Great Western Railway (1875); and from 1896 until 1907, when he retired, he was chief engineer of the Grand Trunk Railway system. In 1890-91 he built the St. Clair Tunnel, Ontario, and in 1897 had entire charge of the reconstruction of the Victoria Jubilee Bridge, Montreal.

HOBSON, RICHMOND PEARSON (1870-). An American naval constructor, born in Greensboro, Ala. He entered the Southern University in 1882, but three years afterward accepted an appointment to the United States Naval Academy, where he graduated in 1889, and then took a postgraduate course at the Ecole Nationale Supérieure des Mines and the Ecole d'Application du Génie Maritime in Paris. He served on various naval stations and at the New York and the Newport News navy yards, and in 1897 he was ordered to Annapolis to organize a postgraduate course for those officers who intended to enter the construction corps. During the war with Spain he was present at the bombardment of Matanzas and took part in the expedition against San Juan de Puerto Rico; but his great achievement was the sinking of the collier *Merrimac* in the entrance to Santiago harbor before daylight, on June 3, 1898, in order to "bottle up" Cervera's fleet. He did not succeed in accomplishing the desired result, as the gear of the stern anchors was shot away and the current swung the ship parallel to the channel instead of across it; but the daring of the exploit made popular heroes of all concerned

in it. After the war he raised and refitted several of the Spanish warships which had been sunk in Cuban and Philippine waters. He resigned from the navy in 1903 and entered political life. In 1906 he was elected to Congress, and until 1915 he represented a district of his native State in that body. Among his publications are *The Disappearing Gun Afloat* and *The Sinking of the Merrimac*.

HOC'CLEVE, or OCCLEVE, THOMAS (?1370-?1450). An English poet. Concerning his life very little is known. For 24 years he was clerk in the Privy Seal Office, London. His principal work, *De Regimine Principum* (Concerning the Duties of Kings), mainly a digest of a Latin treatise under the same title by Ægidius Colonna, consists of 5488 lines in Chaucer's seven-line stanza. In the prologue, which comprises about a third of the work, Hoccleve mentions some incidents of his life. He says he was poor and his pension not paid and laments the death of Chaucer, who is called the "foure of eloquence." The rest of the long poem is devoted mainly to moral reflections on the manners of the time. On the margin of one of the manuscripts Hoccleve drew in colors the well-known portrait of Chaucer, his "maister dere." Hoccleve also wrote several other poems, among which is the beautiful orison to the Virgin, beginning "Mother of God and Virgin undefouled." This last poem has been attributed to Chaucer. Consult *Works*, ed. F. J. Furnivall for the Early English Text Society (London, 1892-97).

HOC'CO (native name in Guiana). A native name applied by Buffon to curassows in general, but apparently applicable and now restricted especially to the Mexican species (*Crax alector*), also called royal pheasant by the Mexicans. Consult Sumichrast, "Native Birds . . . of Vera Cruz," in *Memoirs of the Boston Society of Natural History*, vol. i, part iv (Boston, 1869). See CURASSOW.

HOCHBERG, hōc'bērk, BOLKO, COUNT VON (1843-). A German patron of music and dramatic composer, whose earlier music appeared under the pseudonym "J. H. Franz." He was born at Castle Fürstenstein in Silesia, studied law at Bonn and Berlin, and soon gave up the diplomatic service to devote himself to music. Hochberg founded in 1870 the Silesian musical festivals, to the success of which he greatly contributed. From 1886 to 1903 he was general superintendent of the Court Theatre of Berlin. Besides symphonies, songs, and string quartets, he composed *Claudine von Villabella* (1864) and *Die Falkensteiner* (1876), entirely rewritten and produced as *Der Wärrwolf* (1881).

HOCHÉ, ôsh, LAZARÉ (1768-97). A general of the French Revolution. He was born June 25, 1768, at Montreuil, near Versailles. In 1784 he entered the National Guard, but joined the regular army at Paris in 1792 as a sergeant of grenadiers. Owing to his military experience and soldierly qualities, he rapidly obtained promotion. In 1793, after distinguishing himself under Le Veneur, he was made adjutant general of the Army of the North. Some hasty words, caused by the arrest of his chief, Le Veneur, brought about Hoche's arrest; but he was acquitted by the revolutionary tribunal at Douai and restored to his command and aided Souham in the defense of Dunkirk. Having succeeded in repulsing the Duke of York, Hoche was made a general of division and given the command of the French forces on the Moselle and in spite

of the numerical superiority of the enemy succeeded in driving the Austrians out of Alsace after defeating them at Weissenburg (Dec. 26, 1793). His important services were requited, however, by suspicion and arrest, and had it not been for the downfall of Robespierre Hoche would probably have perished on the guillotine. He was next intrusted with the task of suppressing the Royalist revolt in La Vendée and at the head of an army of 100,000 men succeeded in pacifying the country in less than a year (1794-95). His great victory in this campaign was over the *émigrés* at Quiberon. In December, 1796, he commanded the army destined for the invasion of Ireland; but adverse conditions of wind and weather scattered his ships and made the expedition a failure, though a part of the fleet succeeded in reaching the Irish coast. Hoche was then made commander of the Army of the Sambre and Meuse and in the spring of 1797 won several victories over the Austrians. The preliminaries of Leoben put an end to his activity, and on Sept. 19, 1797, he died very suddenly at his camp at Wetzlar, though not by poison, as some have supposed. There are numerous biographies of Hoche, the best being: Claude Desprez, *Lazare Hoche, d'après sa correspondance* (Paris, 1858); H. de Font-Réaulx, *Le général Hoche* (ib., 1890); A. Griffiths, *French Revolutionary Generals* (London, 1891); Albert Sorel, *Bonaparte et Hoche* (Paris, 1896).

HOCHKIRCH, hōc'kērk, or **HOCHKIRCHEN**. A village in the District of Bautzen in Saxony. It was the scene of a battle between the Austrians and Prussians (Oct. 14, 1758) during the Seven Years' War. Frederick the Great of Prussia, with an army 30,000 to 40,000 strong, having taken up an almost untenable position at Hochkirch, was surprised in the nighttime, under cover of a thick fog, by Marshal Daun, with 65,000 Austrians, and compelled to retire to the heights of Drehsa. Here he was again attacked by the Duke of Arenberg and after a conflict of five hours' duration again retired. He lost 9000 men killed and wounded and 100 guns. He himself and almost all his generals were wounded. The Austrians lost 6000 men. On May 21, 1813, a battle took place here between the French and the allies, which was won by the former. See BAUTZEN.

HÖCHST, hēkst. A town in the Prussian Province of Hesse-Nassau, at the confluence of the Nidda and the Main, 7½ miles northwest of Frankfurt. Höchst has one of the largest paint and dye factories in Germany, employing about 4300 men. There are also large porcelain works, established in 1740, and manufactures of iron and brass ware, lighting fixtures, crackers, biscuits, tobacco, gas and water mains, machinery, oilcloth, gelatin, and furniture. Höchst was made a city in 1400. Pop., 1890, 8455; 1900, 14,121; 1910, 17,240.

HÖCHSTÄDT, hēk'shtēt. See BLENHEIM.

HOCHSTETTER, hōc'shtēt-ēr, FERDINAND VON (1829-84). An Austrian geologist, born at Esslingen, Württemberg, and educated at Tübingen, where he received the traveling scholarship in geology. He was a member of the *Novara* expedition (1857-59) and made a special study of the geology of New Zealand and the gold fields of Australia, the results of which were published in the account of the expedition and in a small work on New Zealand. After his return to Europe he was appointed a

professor at the Vienna Imperial Polytechnic Institute and afterward director of the Imperial Museum of Natural History (1876). He wrote an authoritative work on the geology of Turkey and the Ural region and published, together with Hann and Pokodny, the *Allgemeine Erdkunde*.

HOCK, HOUGH, hōk (AS. *hōh*, OHG. *hahsa*, Ger. *Hechse*, hock; ultimately connected with Lat. *cowa*, thigh, Skt. *kakṣa*, armpit). The joint between the stifle and the fetlock in a horse's hind leg. *Hook joint*, the hinge formed by tibia and astragalus.

HOCK/DAY (from AS. *heah*, high + *dæg*, day). The second Tuesday after Easter; formerly a popular festival in England observed as late as the seventeenth century. Hockday and Michaelmas (q.v.) were the rent days in rural England. Hocktide or Hockdays included Hock Tuesday and the day before. The origin of the festival is uncertain.

HÖCKERT, hēk'ert, JOHAN FREDRIK (1826-66). A Swedish genre and historical painter, born at Jönköping. He studied at the Stockholm Academy under Boklund, with whom he was in Munich (1846-49); visited Lapland with the botanist Andersson (1849); went to Paris (1851) and allied himself with Max Hess; traveled through Holland, Belgium, and England (1857) and, in 1861, through Spain, Italy, and north Africa. He was a member and a professor of the Stockholm Academy. Among his works are: "Christina Ordering the Execution of Monaldeschi" (1853); "The Rescue of Gustavus Vasa" (1858); the uncompleted canvas "Burning of the Palace in Stockholm, 1697"; "Service in a Lapland Chapel," at Lille; "Interior of a Hut in Lapland" (1858), in the Stockholm Museum; and the "Rättvik Maiden," at Göteborg. He has been called the Swedish Delacroix and ranks high as a colorist.

HOCK/ET (OF. *hoquet*, *hooquet*, *houquet*, hicough; so called from the broken effect). A musical trick much used by composers during the twelfth and thirteenth centuries. In a composition for two or three voices one voice suddenly, and at irregular intervals, interrupted the other voices. The passages where such interruptions occurred were called hocket.

HOCKEY (also *hawkey*, *hookey*, apparently from *hook*, in allusion to the hooked club with which the game is played. Murray's *New English Dictionary* (1901) cites OF. *hoquet*, shepherd's staff, crook, but adds that the "connecting links are wanting"). An outdoor game played on a ground 100 yards long and not less than 55 nor more than 60 yards wide, by two teams of 11 players each, armed with sticks curved at the end, with which each team attempts to drive a ball into the goal of the other. The game is probably as old as any involving a ball. In the Copenhagen National Museum is an altar pot, made about the year 1300, on which are two figures of men with curved sticks, apparently playing some such game, and there appears in a Galway statute of 1527 a prohibition of "the horlinge of the litill balle with hockie stickes or staves," while Cowper in 1785 mentioned a game called "hockey" played by the boys at Olney. Not until 1876 was any code of rules formulated for the game. Ten years later the English Hockey Association was organized, and since then the popularity of the game in the British Isles has steadily increased, while it has also been taken up in the various British colonies and in Bel-

gium, Denmark, Holland, France, and Germany, with the result that in 1907 the International Hockey Board was formed to provide for international contests.

A hockey team usually consists of five forwards, three half backs, two backs, and a goal keeper, though this formation is not compulsory. The game is divided into two halves of 35 minutes each (unless another time is agreed upon), the teams changing sides at the end of each half. In the centre of each goal line is the goal, consisting of two posts, 4 yards apart, joined at their tops by a horizontal crossbar 7 feet from the ground. Nets are attached to the posts, crossbars, and ground beyond the goals. In front of each goal is drawn a white line 4 yards long, parallel to and 15 yards from the goal line. This line is continued each way to meet the goal line by quarter circles which have the goal posts as centres. The space within these lines is called the striking circle. The ball is either a leather cricket ball painted white or is made of white leather. The stick may have a flat surface on its left-hand side only, must not have any sharp edges, must pass through a two-inch ring, and must not weigh more than 28 ounces. The play is begun by two opposing players "bullying" the ball in the centre of the ground; i.e., each player must strike the ground on his own side of the ball and his opponent's stick over the ball three times, after which either player may strike the ball. A goal is counted when the ball has passed entirely over the goal line under the bar, the ball while within the striking circle having been hit or glanced off the stick of an attacker. While in play, the ball may be caught, but must immediately be dropped to the ground; or it may be stopped, but it may not be picked up or in any other way moved except with the stick.

Ice Hockey. The old winter game of hockey, or shinny, is the basis of the modern game of ice hockey, but the modern game is more scientific than its English and Scottish predecessors. The old game was played on more or less frozen ground, and the players cared more about action than rules, and in the beginning no restrictions existed as to the number on each side, the shape or proportion of the sticks, the size or material of the ball, the size of the playing space, or even the manner of making a goal. The organization of this crude game into the present scientific, exciting, and dangerous contest, played entirely on skates, began in 1881 with the McGill College and Victoria Hockey teams in Montreal, Canada, where the game, as a purely winter sport, has something of the popularity of baseball in the United States. The first series of challenge games between Canadian teams was played in 1884, and in 1887 the Amateur Hockey Association of Canada was formed. The game was soon taken up by players in the United States, where the American Amateur Hockey League was formed in 1896. This organization adopted a regular constitution and a set of rules which govern most amateur contests. Practically all of the larger northern universities and colleges in the United States now have hockey teams, and an intercollegiate schedule is played off each season. These American college and the athletic club teams have developed many fine players; but the most skillful teams are those of Canada, and notably the Wanderers, of Montreal, the Quebecs, and the Ottawas. Since 1895 the most im-

portant Canadian trophy for hockey has been the Stanley Cup.

The rules of the American Amateur Hockey League provide that the game shall be played on a rink at least 112 feet long by 58 feet wide,

POSITIONS OF A HOCKEY TEAM.

by teams of not more than seven players each, whose positions are shown on the accompanying diagram. The sticks must not be more than 3 inches wide at any point, nor more than 13 inches long on the blade, and must be made entirely of wood, though tape binding is permitted. Players must not wear skates that are pointed or sharpened so as to be unnecessarily dangerous. For the ball, used in English hockey, is substituted a puck, which must be made of vulcanized rubber 1 inch thick; it must be 3 inches in diameter and must weigh not less than $7\frac{1}{8}$ nor more than $7\frac{3}{4}$ ounces. The game is divided into two halves of 20 minutes each, with an intermission of 10 minutes. A goal is scored when the puck passes between the goal posts. The goals are placed midway on each goal line; each consists of a goal net supported by two upright posts, 4 feet high, placed 6 feet apart, and at least 10 and not more than 15 feet from the edge of the ice. Consult Arthur Farrel, *How to Play Hockey* (Spalding's Athletic Library, New York, issued annually).

HOCK'ING. A river in Ohio, rising near Lancaster, Fairfield Co. (Map: Ohio, F 7). It flows southeast and empties into the Ohio River below Parkersburg, W. Va., after a course of 80 miles. Boat navigation is possible for about 70

miles and can be continued through the Hocking Canal, which passes along its shore.

HOCKING, JOSEPH (1860–). An English Wesleyan clergyman and novelist, brother of Silas K. Hocking, born at St. Stephen's, Cornwall. He graduated in 1881 from Crescent Park College, Victoria Park, where he was a prize-man, and also from Owens College, Manchester, in the same year. The year 1878 he spent as a land surveyor. He entered the ministry of the Wesleyan Methodist church in 1884 and in 1887 traveled extensively in Egypt, Palestine, Syria, Greece, and Turkey. He wrote more than 20 novels, beginning with *Jabez Easterbrook* (1891), some of the later of which deal with the conflict between Protestants and Roman Catholics—*The Sword of the Lord* (1909) is a story of the time of Luther.

HOCKING, SILAS KITTO (1850–). An English novelist, brother of Joseph Hocking, born at St. Stephen's, Cornwall. He entered the Wesleyan ministry, but resigned in 1896. His novels, which have a strong flavor of Methodism, were immensely popular, and their total sales ran over 1,000,000 copies. The critics pass these stories by, but admiring readers are legion. Among Hocking's uncounted novels may be mentioned: *Alec Green* (1878); *Sea Waif* (1882); *Real Grit* (1887); *God's Outcast* (1898), which has as its appealing hero a Methodist minister who married the wrong woman; *Israel Pendray* (1899), notable for its account of Wesley's preaching in Cornwall; *Mistress Nancy Molesworth* (1899), a story of eighteenth-century Cornwall; *Who Shall Judge?* (1910); *The Third Man* (1911); *Quenchless Fire* (1912); *Woman's Love* (1913); *In Self-Defense* (1914).

HOCKTIDE. See HOCKDAY.

HODEIDA, hō-dē'ī-dā. An important fortified seaport of Yemen, Arabia, situated on the coast of the Red Sea, about 100 miles north of Mocha (Map: Turkey in Asia, E 8). Its roadstead is somewhat obstructed by coral reefs, but it is nevertheless the chief centre of the Arabian coffee trade. Hodeida is the chief landing place for Mecca pilgrims from Africa. It has steamer connection with Aden, Suez, and Nassawa. Pop. (est.), 40,000.

HODELL, hō'dēl, FRANS OSCAR LEONARD (1840–90). A Swedish dramatist and poet, born at Stockholm. He was in early life an actor, then editor (1870) and proprietor of the *Söndagsnisse*, a humorous journal. He was the author and adapter of a large number of plays, such as the popular *Andersson, Petersson, och Lundström* (1866), and wrote also some verses and ballads, under the title *Visor och kupletter* (1873).

HODGE. 1. In *Gammer Gurton's Needle*, the husband of Gammer Gurton, whose breeches she was mending when the needle was lost. 2. The conventional class name for the English farmer or countryman.

HODGE, ARCHIBALD ALEXANDER (1823–86). An American Presbyterian theologian, the son of Charles Hodge. He was born at Princeton, N. J., graduated at Princeton in 1841, and was an assistant professor there from 1844 to 1846. In 1847 he graduated at the Princeton Theological Seminary and for three years was missionary at Allahabad, India, under the auspices of the American Presbyterian Missionary Society. After 1851 he held pastorates in Maryland, Virginia, and Pennsylvania, and in 1864 was called to a church in Allegheny, Pa., where

until 1877 he was also professor of didactic theology in the Western Theological Seminary. In 1878 he succeeded to the chair of didactic, exegetical, and polemic theology at Princeton, made vacant by the death of his father, to whom he had been appointed assistant professor the year before. He was a trustee of Princeton College and edited for a period the *Presbyterian Review*. He published several theological and other works, including: *Outlines of Theology* (1860; new ed., 1879); *The Atonement* (1868; new ed., 1886); *Life of Charles Hodge, Professor in the Theological Seminary, Princeton* (1880); *Manual of Forms, Conformed to the Doctrine and Discipline of the Presbyterian Church* (1883); *Popular Lectures on Theological Themes* (1887).

HODGE, CHARLES (1797–1878). An American Presbyterian theologian and historian, of Scotch-Irish descent. He was born in Philadelphia, graduated at Princeton in 1815, and at the theological seminary there in 1819, became assistant professor in his alma mater the following year, and with the exception of an interval of two years (1826–27) in Europe, studying at the universities of Paris, Halle, and Berlin, was connected with its faculty until his death. From 1822 he was professor of Oriental and biblical literature and from 1840 professor of didactic and exegetical theology, polemic theology being added in 1852. In 1872 the semicentennial anniversary of his professional life was commemorated at Princeton by the foundation of the Charles Hodge professorship, with an endowment of \$50,000. He was also the recipient of a gift of \$15,000. In 1846 he was moderator of the Presbyterian General Assembly and in 1858 was one of the revisers of the *Book of Discipline*. He was editor of the *Biblical Repertory*, which he founded in 1825, expanding the title four years later to the *Biblical Repertory and Princeton Review*. He retired from the editorship in 1871. His chief work, *Systematic Theology* (3 vols., 1871–72), is still considered one of the best interpretations of the Calvinistic doctrine. Other important works are a *Constitutional History of the Presbyterian Church in the United States* (2 vols., 1840–41), *The Way of Life* (1842), and *What is Darwinism?* (1874). He also published several commentaries. Consult *The Semi-Centennial Commemoration of the Professorship of Charles Hodge, D.D., LL.D., September 24, 1872* (Philadelphia, 1872) and A. A. Hodge, *Life of Charles Hodge, Professor in the Theological Seminary, Princeton* (New York, 1880).

HODGE, FREDERICK WEBB (1864–). An American ethnologist, long connected with the Smithsonian Institution. He was born at Plymouth, England, but came to America in 1871 and was educated in the public schools and in Columbian (now George Washington) University. In 1886 he was made secretary of the Hemenway archaeological expedition and in this position he traveled through Arizona and New Mexico until 1889, when he joined the Bureau of Ethnology of the Smithsonian Institution. His work here was the preparation of a *Cyclopedia of Indian Tribes*. In 1895, 1897, and 1899 he explored New Mexico and Arizona again, and on the second trip he scaled the Enchanted Mesa. In 1901 he became executive officer of the Smithsonian Institution. In 1910 he became ethnologist in charge of the Bureau of Ethnology, the *Handbook* of which (2 parts, 1907–10) he prepared. His more important

works are: *List of Publications of the Bureau of Ethnology*, written while he was librarian of that department (1894); *The First Discovered City of Cibola* (1895); a pamphlet on *Coronado's Route from Culiacan to Quivira* (1899); and his contributions to the *American Anthropologist*, of which he was managing editor from 1899 to 1910 and again after 1912. He also edited Curtis's *North American Indian; Narratives of Cabeza de Vaca and Coronado* (1907); *Handbook of Indians of Canada* (1913).

HODGE, HUGH LENOX (1796-1873). An American physician, born in Philadelphia, the brother of Charles Hodge. He graduated at Princeton in 1814, studied medicine, and began to practice in 1820. During the cholera epidemic of 1838 he successfully employed a system of treatment largely based on observations made during a two years' residence in India. In 1835 he was appointed professor of obstetrics in the University of Pennsylvania and retained his connection there until 1863. He was the author of *Diseases Peculiar to Women* (1859), *Principles and Practice of Obstetrics* (1864), and *Feticide* (1869).

HODGES, HÖJ'ÉZ, GEORGE (1856-). An American Protestant Episcopal theologian, born at Rome, N. Y., and educated at Hamilton College (A.B., 1877; A.M., 1882; LL.D., 1912). He was assistant in 1881-89 and rector in 1889-94 of Calvary Church, Pittsburgh, Pa., and thereafter was dean of the Episcopal Theological School at Cambridge, Mass. He is author of *The Episcopal Church* (1889); *Christianity between Sundays* (1892; 1914); *The Heresy of Cain* (1894; 1914); *The Battles of Peace* (1897; 1914); *William Penn* (1900); *The Human Nature of the Saints* (1904); *Three Hundred Years of the Episcopal Church in America* (1906); *The Administration of an Institutional Church* (1906); *The Year of Grace* (2 vols., 1906; 2d ed., 1914); *Apprenticeship of Washington* (1909); *The Training of Children in Religion* (1910; 1912); *Everyman's Religion* (1911; 1913); *Saints and Heroes* (2 vols., 1911-12); *Glassbook of Old Testament History* (1913).

HODGES, JOHN SEBASTIAN BACH (1830-1915). An American Protestant Episcopal clergyman, born in Bristol, England (son of Dr. Edward H. Hodges, organist of Trinity Church, New York City). He came to this country in 1845 and graduated at Columbia College in 1850 and at the General Theological Seminary, New York, in 1854. After ministerial service in the West and at Newark, N. J. (1860-70), he was rector of St. Paul's Church, Baltimore, from 1870 until his retirement in 1906. His musical compositions, which include chants, anthems, and hymn tunes, are widely known. His chief work is the *Book of Common Praise* (1886), compiled as a companion to the *Book of Common Prayer*.

HODGES, NATHANIEL DANA CARLILE (1852-). An American librarian, born at Salem, Mass. He graduated from Harvard University in 1874 and studied at the University of Heidelberg (1874-75). He taught physics at Cambridge, Mass. (1876-77) and at Harvard (1877-81), was assistant editor and editor of *Science* (1883-94), and served as assistant at the Astor Library, New York (1895-97), and at the Harvard University Library (1897-1900). In 1900 he became librarian of the Public Library of Cincinnati. He was president of the American Library Association in 1909-10.

HODGINS, HÖJ'INZ, JOHN GEORGE (1821-1912). A Canadian educator and author. He was born in Dublin, Ireland, but went to Canada with his parents in 1833. He was educated at Upper Canada College, at Victoria University, Cobourg, and, in law, at Toronto University. After holding various posts, he was deputy superintendent of education (1855-76) under Egerton Ryerson (q.v.), after whose retirement in 1876 he was deputy minister of education for the province until 1890. He was then made librarian and historiographer of the Education Department, and in 1904-12 was historiographer solely. An early investigation made by him of the Irish educational system resulted in improvements to the schools of Upper Canada, and in 1871 his report upon technical schools in the United States led in part to the establishment of the School of Practical Science, now a department of Toronto University. In 1885 he was honorary secretary to the International Congress of Educators at the New Orleans Exposition. For 30 years editor of the *Upper Canada Journal of Education*, he was one of the pioneers in Canadian schoolbook literature, especially in the department of geography, and throughout his career was an important figure in the educational activities of Ontario. In 1861 he was elected a fellow of the Royal Geographical Society; in 1879 he received the French decoration of the Palm Leaf; during the governorship of the Marquis of Lansdowne he was awarded the Confederation medal for services as a public officer and man of letters; and in 1903 he was given the decoration of the Imperial Service Order. He published: *A Geography and History of British America* (1857); *History of Canada* (1860); *School Law Lectures* (1878); *Legislation and History of Separate Schools in Upper Canada* (1897); *Popular Education in England* (1899); *School Room Decoration* (1900); *The Establishment of Schools and Colleges in Ontario, 1791-1910* (1910); *Documentary History of Education in Upper Canada* (28 vols., 1910-13), a work of permanent historical value.

HODGKIN, HÖJ'KIN, THOMAS (1831-1913). An English banker and historian. He was born at Tottenham, studied at the Friends' Grove House School there, and graduated at University College, London. He studied law, but poor health forbade him to practice; so he busied himself at banking and built up a large firm, Hodgkin, Barnett, & Co. In 1874 he gave himself up to literary work. He wrote: *Italy and her Invaders* (8 vols., 1880-99); *Letters of Cassiodorus* (1886); *The Dynasty of Theodosius* (1889); *Theodoric the Goth* (1891); *George Fox* (1896); *Life of Charles the Great* (1897); *Ernst Curtius* (1905); *Political History of England from the Earliest Times to the Norman Conquest* (1906); *The Trial of our Faith* (1911).

HODGKIN'S DISEASE (LYMPHADENOMA, PSEUDOLEUCÆMIA). A form of anæmia, attended by swelling of the lymphatic glands and spleen. The cervical glands are the first to enlarge, followed by the axillary, and then the inguinal lymph nodes. The exciting cause is not known, but the disease has been attributed to decayed teeth and nasal suppuration, chronic tonsillar infection, and other inflammations; but the etiology is as obscure now as it was when Hodgkin described the affection in 1832. In the early stages there is only a slight

anæmia. Later there is a great increase in the number of white blood cells (leucocytosis), the polymorphonuclear leucocytes alone being increased. The disease is most common between the ages of 15 and 35. Recovery is rare, death taking place usually in the third year of the disease. Excision of the cervical glands is advised in the beginning, when only these are involved. Later, operation is of no benefit. Iron, arsenic, cod-liver oil, phosphorus, and bone marrow are given with great benefit in many cases. The X-ray is credited with some cures. See ANÆMIA.

HODGKINSON, hōj'kin-son, EATON (1789–1861). An English civil engineer, born at Anderton, Cheshire. After a rather desultory schooling in which he displayed an aptitude for mathematics, he undertook a course of scientific investigation that soon won him distinction. His first important work was on strains and the strength of materials, on which subject he read a paper before the Literary and Philosophical Society of Manchester in 1822. In 1828 and in 1830, respectively, he gave to the same society the results of his researches on the forms of the catenary in suspension bridges and on the strength and best forms of iron beams. In 1847 he was appointed professor of the mechanical principles of engineering at University College, London. From 1847 to 1849 he was one of the royal commissioners engaged in inquiring into the application of iron in railroad structures. From 1848 to 1850 he was president of the Manchester Literary and Philosophical Society. He was a member of the Geological Society, of the Royal Irish Academy, and an honorary member of the Institute of Civil Engineers. He made investigations as to the temperature of the earth in deep mines which were of especial interest. His experiments on the strength of materials, and especially his determination of the "neutral line" in the section of fracture, with the resultant designs for beams, mark an important step in the science of modern engineering. He published *Researches on the Strength and Other Properties of Cast Iron* (1846). Consult the "Life of Eaton Hodgkinson," in the *Memoirs of the Manchester Literary and Philosophical Society*, No. ii (3d series, Manchester, 1862).

HODGSON, BRIAN HOUGHTON (1800–94). An English Orientalist and zoologist, born at Lower Beeches and educated at Haileybury. He entered the English civil service at Calcutta in 1818 and remained in it until 1843, when he was removed, apparently without cause, by Lord Ellenborough. Hodgson then lived for a few months in Europe, but soon returned to India and lived practically alone at Darjeeling (1845–58), where he made important additions to the classified fauna of India. Besides his zoological specimens he made valuable collections of Indian manuscripts and of ethnological material. These collections he distributed generously among European museums, giving especially to the British Museum. His written studies were on the ancient texts of India, especially the literature of Buddhism, on the modern vernacular and the subject of "national education," on the ethnology of the hill tribes, on Hindu law and practice, especially in Nepal, and on zoology. Among his works, besides scores of articles in reviews and governmental bulletins, may be mentioned: *Literature and Religion of the Buddhists of the North* (1841); *Letters on Na-*

tional Education for the People of India (last ed., 1847); *Aborigines of India* (1847); *Essays on the Language, Literature, and Religion of Nepal and Tibet* (1874); *Miscellaneous Essays Relating to Indian Subjects* (1880). Consult W. W. Hunter, *Life of Brian Houghton Hodgson* (London, 1896).

HODGSON, JOHN EVAN (1831–95). An English historical and genre painter. He was born in London, spent his youth in Russia, and entered the schools of the Royal Academy in 1855. He became A.R.A. in 1873, R.A. in 1879, and in 1879 librarian and professor of painting. At first he painted domestic and historical pictures, but in 1868 a visit to Tunis and Tangiers interested him in Arab life, to which he chiefly confined himself thereafter. Among his earlier pictures are: "Arrest of a Poacher," "Canvassing for a Vote," "First Sight of the Armada," "Queen Elizabeth at Purfleet." His later works include: "An Arab Story-Teller," "A Tunisian Birdseller," "An Arab Patriarch," "Army Reorganization in Morocco." All of his pictures, Oriental as well as English, possess charm, sentiment, and often humor, but are tame in conception and sober in color. He wrote *The Royal Academy and its Members, 1768–1830* (1905), with F. A. Eaton.

HODGSON, SHADWORTH HOLLOWAY (1832–1912). An English metaphysician, born in Boston, Lincolnshire, and educated at Rugby and Oxford. In 1880 he became president of the Aristotelian Society for the systematic study of philosophy, was frequently reelected, and in his addresses to the society and its proceedings gave much of his best work. Besides these, various contributions to *Mind*, and the miscellaneous works, *The Principles of Reform in Suffrage* (1866) and *Outcast Essays and Verse Translations* (1881), mention should be made of the preliminary studies entitled *Time and Space* (1865); *The Theory of Practice* (1870); *The Philosophy of Reflection* (1878); and of the summing up of his metaphysic, *The Metaphysic of Experience* (1898), the most forcible and valuable of his works, in which he claims that "metaphysic like pure mathematic is fontal and preinductive," and as a phenomenist takes a strong stand against transcendental realities.

HÓDMEZŐ - VÁSÁRHELY, hód'mě-zě-vá'shär'hély'. A city in the County of Csongrád, Hungary, on Hód (Moon) Lake, 16 miles northeast of Szegedin (Map: Austria-Hungary, G 3). Among its principal buildings are the town hall, hospitals, and a Gymnasium. The city owns 383 square miles of the surrounding territory and so has risen into prominence as an agricultural and trading centre. In the neighborhood are raised cattle and the cultivation of the vine and tobacco is extensively engaged in. The industrial establishments include breweries and an oil factory. The town is protected from overflow of the Tisza by a large dike. Pop., 1900, 60,883; 1910, 62,394, mostly Magyars.

HODOGRAPH (from Gk. ὁδός, *hodos*, way + γράφειν, *graphein*, to write). A velocity curve, representing the acceleration of a given motion. In Fig. 1, V_1, V_2, V_3, \dots represent the velocities of a point P , which moves along the curve C , at the various positions P_1, P_2, P_3, \dots . In Fig. 2, OV_1, OV_2, OV_3, \dots are drawn parallel and equal to V_1, V_2, V_3, \dots . The curve H , formed by joining the points V_1, V_2, V_3, \dots , is called the hodograph of the motion of P . If V describes the curve H , while P describes the curve C , then the velocity

of V at any point, laid off on the tangent of the curve H at that point, represents the acceleration of the point P both in magnitude and

FIG. 1.

FIG. 2.

direction. Thus, the velocity of the hodograph is the acceleration of the original motion.

HOD'SON, WILLIAM STEPHEN RAIKES (1821-58). An English soldier, born at Maisemore Court, near Gloucester, and educated at Rugby and at Trinity College, Cambridge (B.A., 1844). In 1845 he joined the army in India and participated in the Sikh War. Two years afterward he had command of native troops and distinguished himself during the mutiny as leader of the irregular cavalry called Hodson's Horse. In 1849, when the Punjab was annexed to the British Empire, he was stationed at Umritsur as assistant commissioner; but he resigned in 1852 to reënter active duty in the army. He was killed at Lucknow. Consult: *Hodson of Hodson's Horse, or Twelve Years of a Soldier's Life in India*, being extracts from Hodson's letters, edited by his brother G. H. Hodson (London, 1889); L. J. Trotter, *Life of Hodson of Hodson's Horse* (Edinburgh, 1910).

HODY, HUMPHREY (1659-1707). A Church of England divine. He was born at Odombe, Somersetshire, Jan. 1, 1659, graduated B.A. at Oxford in 1679, became fellow of Wadham College there in 1685, and in 1697-98 regius professor of Greek. He died near Bath, Jan. 20, 1707. He participated on the government side in the controversy over the bishops and their followers who refused to accept William and Mary as their legal sovereigns—the so-called Nonjurors; and also in that about the rights and powers of convocation, contributing the valuable *History of English Councils and Convocations and of the Clergy's Sitting in Parliament* (London, 1701). But his lasting reputation rests upon his work on the Hebrew text, the Septuagint, and Vulgate version of the Bible, *De Bibliorum Textibus Originalibus* (1705). His life, written largely by himself, appears in Jebb's edition of his *De Græcis Illustribus* (London, 1742).

HOE (from OF. *houe*, hoe, from OHG. *houwa*, Ger. *Haue*, hoe, from OHG. *howan*, Ger. *hauen*, AS. *hæwan*, Eng. *hew*). An agricultural implement, used for stirring the soil, drawing up earth to plants, thinning plants in drills, clearing the ground of weeds, etc. There are two classes of hoes—*draw hoes* and *thrust hoes*. In the former the blade is almost at right angles to the handle; in the latter, almost in the same plane with it. The thrust hoe, or Dutch hoe, is chiefly used for killing weeds and for stirring ground to a very slight depth. The draw hoe is much used in gardening and is in some countries very extensively used in place of the spade in agriculture. Hoes intended for tilling the ground, instead of the plow and spade, and for

grubbing, are much larger and heavier than those ordinarily used, are raised much higher, and brought down to the ground with greater force, somewhat like the pickaxe. Hoes for stirring very stiff soils are sometimes made with prongs instead of a blade.

HOE. The name of a family prominently identified with the manufacture and improvement of the printing press in America.—**ROBERT** (1784-1833) was born in Leicestershire, England. He was indentured to a joiner, in 1802 emigrated to the United States, worked for a time as a master carpenter, and subsequently was an associate of his brothers-in-law, Peter and Matthew Smith, in the business of carpentry and in the manufacture of a hand printing press invented by the former. In 1823 he became sole proprietor of the business, retiring in 1832. A skillful mechanic, he constructed and introduced the original Hoe press and was, it is thought, the earliest American machinist to utilize steam as a motive power in his plant.—**RICHARD MARCH** (1812-86), son of the foregoing. He began the practical study of printing-press manufacture in 1827 and soon became a partner of the Hoe firm. He devised numerous ingenious improvements in the presses and also produced a fine quality of steel saw. In 1841 he, in connection with his brothers, Peter Smith Hoe and Robert Hoe, took over the entire direction of the business. The first form of rotary press, called the type revolving printing press and widely known as Hoe's lightning press, was brought out by him in 1846 and forthwith was very extensively adopted for newspaper work. (See PRINTING.) Afterward he invented the web perfecting press, which superseded his former invention and prints upon both sides of the sheet and includes complicated apparatus for cutting and folding. (See PRINTING.) Constant improvements were made by him in the output of his works.—**ROBERT** (1839-1909), a son of Robert Hoe, 2d, succeeded to the headship of the firm, which continued its preëminence among printing-press makers. He was one of the organizers and first president of the Grolier Club, the well-known New York organization for the promotion of bookmaking as an art. He was an extensive collector of rare books and manuscripts as well as of silver, miniatures, and other art objects, his collections at the time of his death being valued at several million dollars. The catalogues of his library were unique and valuable from both a typographical and a bibliographical standpoint. He edited Maberly's *Print Collector* (1880), and was the author of *A Short History of the Printing Press* (New York, 1902) and *Bookbinding as a Fine Art* (Grolier Club, ib., 1886). Consult a brief and fragmentary biographical sketch by Gilliss in the *New York Genealogical and Biographical Record*, vol. xli (ib., 1910).

HOEBER, hō'bër, ARTHUR (1854-1915). An American landscape painter, born in New York City. He studied at the Art Students' League, New York, under Beckwith, and at the Ecole des Beaux-Arts, Paris, under Gérôme. In 1882 he exhibited at the Salon his "Sur la Grande Route" and in 1885 "Le Pain Quotidien." His paintings are to be found in most American exhibitions. He was art critic of the *New York Times* for three years, associate editor of the *Illustrated American* for one year, and later became art critic of the *New York Globe and Commercial Advertiser*. He also became known

as a lecturer on art. He was elected an Associate National Academician. He published *The Treasures of the Metropolitan Museum of Art* (1892) and *Painting in the Nineteenth Century in France, Belgium, Spain, and Italy*.

HOECKE, VAN DEN, vān den hū'k'e. A family of Flemish painters.—**JAN** (1611–51), a portrait and figure painter, was a pupil of his father, Caspar, and of Rubens. After studying also in Italy and executing commissions for the Emperor of Austria, he settled in 1647 in Antwerp, as court painter to the Archduke Leopold Wilhelm. With that prince's collection a number of his best works came into the possession of the Vienna Gallery; others are at Antwerp. His portraits resemble Van Dyck's rather than those of Rubens.—His brother **ROBRECHT** (1622–48), also a pupil of his father, was an architect as well as painter. As controller of the fortifications of Flanders, he painted many views of camps, battles, and cities, very detailed in execution and pleasing in color. His work also is well represented in the Vienna Gallery.

HOEFNAGEL, hōō'f'nā'gēl, JORIS (1545–1610). A Flemish illuminator and miniature painter, born at Antwerp. He was a pupil of Jan Bol at Mechlin and for some time was at the court of Bavaria. He then went to Prague and finally to Vienna. His masterpiece is in the museum there, a Roman missal done for the Archduke Ferdinand. It is elaborately ornamented, and he worked on it for eight years (1582–90). Another fine work of Hoefnagel's is a miniature view of Seville (1573), in the Brussels Museum.—His son **JAKOB** (1575–1629), a miniature painter and engraver, was court painter to the Emperor Rudolph II.

HÖEGH-GULDBERG, hēg-guld'bērg, OVE. See **GULDBERG**, OVE **HÖEGH**.

HOENSBROECH, hōns'brōg, PAUL, COUNT (1852–). A German theologian, born at Castle Haag in the Province of Gelderland. When nine years old, he entered the Jesuit school in Feldkirch. Afterward he attended the Jesuit college at Stonyhurst, England, where he studied philosophy for a year, and then he studied law at the universities of Bonn, Würzburg, and Göttingen. In 1876 he set out on his travels through France, Portugal, Spain, northern Africa, and Italy, and in 1878 entered the Society of Jesus. In 1903 he was a candidate for the Reichstag, but was defeated by his Social-Democratic opponent. While a member of the Society, he wrote *Der Kirchenstaat in seiner dogmatischen und historischen Bedeutung* (1899) and *Christ und Widerchrist: Ein Beitrag zur Verteidigung der Gottheit Christi und zur Charakteristik des Unglaubens in der protestantischen Theologie* (1892). In 1893 he left the Jesuit Order and published a work entitled *Mein Austritt aus dem Jesuitenorden* (1893), which led to a bitter attack upon him by the Ultramontane press. Two years later he joined the Evangelical church. His later writings include: *Moderner Jesuitismus* (1893); *Der konfessionelle Friede und die deutschen Jesuiten der Gegenwart* (1896); *Das Papsttum in seiner sozialkulturellen Wirksamkeit* (vol. i, 3d ed., 1901; vol. ii, 1902).

HOERNES, hēr'nēs, MORITZ (1852–). An Austrian ethnologist, born in Vienna and educated at the universities of Vienna and Berlin. He saw military service in the occupation of Bosnia in 1878 and in 1879–80 led a scientific expedition through Bosnia and Herzegovina. He

was for several years custodian of the Vienna Natural History Museum. Hoernes edited the *Wissenschaftliche Mitteilungen aus Bosmen und der Herzegowina* (1893 et seq.) and wrote: *Altertumer der Herzegowina und Bosniens* (1881); *Dinarische Wanderungen* (1888); *Urgeschichte des Menschen* (1891); *Urgeschichte der Menschheit* (1895; 2d ed., 1897); *Natur- und Urgeschichte des Menschen* (1909); *Kultur der Urzeit* (1912).

HOERNLE, hēr'n'le, AUGUSTUS RUDOLF FREDERIC (1841–). An English Orientalist and prominent authority on Indian antiquities and languages. He was born at Agra, British India; was educated at Esslingen, Stuttgart, Basel, London, and Tübingen; became a missionary of the English church at Mirat in 1865; and taught for four years at the Jay Narain's College in Benares. He entered the governmental educational service in 1881, after several years as principal of the mission college at Calcutta, and until 1899, when he retired and returned to England, was principal of the Calcutta Madrasah. He edited: *Chanda's Grammar of the Ancient Prākṛit* (1880), *The Pruthirāj Rāsan* (1886), *The Bover Manuscript . . . with English Translation* (1893), and *The Uvāsagadaśo with Abhayadeva's Commentary* (1888–90); translated *The Sūtrutsamhitā, or the Hindu System of Medicine* (1897 et seq.); and wrote, among other linguistic works of considerable importance, *A Comparative Grammar of the Gaudian Languages* (1880) and, with Grierson, the incomplete *Comparative Dictionary of the Bihārī Language* (1885 et seq.). In 1907 he published the first part of *Studies in the Medicine of Ancient India*, dealing with osteology. With H. Stark he wrote *A History of India* (4th ed., 1909).

HOETZENDORF, hēts'en-dōrf, FRANZ, BARON CONRAD VON (1852–). An Austrian general, born at Penzing, the son of a colonel. He had a military education, became a lieutenant before he was 19, served as an officer of the general staff in Bosnia and Herzegovina in 1878–79 and against the South Dalmatian insurrection in 1882, taught tactics in the Austrian military academy at Vienna in 1888, and rose rapidly in rank. In 1906–11 and again after December, 1912, he was chief of the general staff, his resignation for the interval (when he was army inspector) being due to the opposition of the Archduke Francis Ferdinand. (See **WAR IN EUROPE** for his part in the military operations of 1914–15.) He wrote several books on tactics and infantry formations.

HOEVELL, hōō'vəl, WALTER ROBERT VAN, BARON (1812–79). A Dutch author and colonial statesman, born at Deventer. He studied theology at Groningen and in 1836 went to Bavaria, where in the following year he founded the *Tijdschrift van Nederlandsch-Indië*. For the emancipation of the slaves and for the spread of Christianity in the Dutch Indies Van Hoeffell accomplished much, especially by his writings. He also edited and translated various Malaysian poems, among which *Sjaïr Bidasari* (1843) deserves mention. But his greatest work was in colonial politics. From 1849 to 1854 he published *Reis over Java, Madura en Bali*, which joined a keen criticism of governmental methods of the time with a brilliant description of East Indian scenery and life. Returning to Holland in 1848, he was elected to the House of Deputies, where for 13 years he was leader of the

Liberal Colonial party. His parliamentary speeches delivered during this period (published 1862-66) are models. Van Hoevell was named Councilor of State in 1862. His sketches, *Uit het Indische leven* (1860; 2d ed., 1865), met with immense success and in 1868 were published in German.

HOEVEN, hoo'ven (HOOF'EN), JAN VAN DER (1801-68). A distinguished Dutch naturalist. He was born in Rotterdam, studied medicine and natural history at Leyden and Paris, became professor of zoölogy at Leyden in 1826, and held this position until his death. His most important work is his *Handboek der Dierkunde* (3 vols., 2d ed., 1846-55). An English translation, by Professor Clark of Cambridge, under the title *Handbook of Zoölogy*, was issued, with important additions by both the author and the editor, in 1856-58.—His elder brother, CORNELIS PRUYS (1792-1871), was professor of medicine in the University of Leyden and author of several important works, including: *De Historia Medicinæ* (1842); *De Historia Medicamentorum* (1847); *Etudes de la vie humaine* (1857).

HOE, hōf. A town of Bavaria, situated on the Saale, in Upper Franconia, 32 miles north-east of Bayreuth (Map: Germany, D 3). It has an attractive thirteenth-century church, recently restored, with fine glass windows, and an old Gothic Rathaus. There are a Gymnasium, opened in 1546, a city museum, and a hospital dating from 1260. The numerous textile manufacturing establishments produce chiefly cotton and woolen goods; but there are also manufactured machinery, iron and steel ware, dyes, carpets, celluloid, building stone, chemicals, vinegar, pottery, and leather. There is some trade in grain. The town has electric lights, water works, and canal communication. It was founded about the end of the eleventh century, as Regnitzhof. It was almost destroyed by fire in 1823. Pop., 1900, 32,781; 1910, 41,126, mostly Protestants.

HOEIJK, hōf'dik, WILLEM JACOBZON (1816-88). A Dutch poet and author, born at Alkmaar. His first work, a romantic poem, *Rosamunde* (1839), attracted the attention of Van Lennep, who obtained for him a clerk's position in the government offices at Alkmaar. Afterward he taught Dutch history and literature in the Gymnasium at Amsterdam. His works, which are in verse and prose, include the studies in Dutch history, *Geschiedenis der nederlandsche Letterkunde* (1853; 7th ed., 1886), *Historische Landschappen* (1856), *Geschiedenis des nederlandschen Volks* (1865-72), *Willem Frederik Hendrik, Prins der Nederlanden* (1880); and the poems, *De Bruidsdans* (1842), *De Jonker van Brederoode* (1849), and *Kennemerland, Balladen* (1850-52). He also wrote some poetical dramas, without much success. Consult Jan ten Brink for biography (Amsterdam, 1885), and C. J. B. Van der Duys, *W. J. Hofdijk in zijn leven en werken* (Edam, 1890).

HOER, hō'fēr, ANDREAS (1767-1810). A patriot leader of Tirol. He was born at Sankt Leonhard in the valley of Passeier, Nov. 22, 1767. His father was landlord of the inn Am Sand, and the son carried on the business, becoming known as the Sandwirt. In 1796 Hofer led a body of sharpshooters against the French on Lake Garda. He became a captain of the militia and in 1805 fought against Ney in the valley of Passeier, and after Tirol had been abandoned to France by the Peace of Pressburg

he was chosen as one of the secret deputation which was sent to Vienna to represent to the Archduke John the sufferings of the people and their wish to be reunited to Austria. But Austria was powerless, and in virtue of Napoleon's decree Tirol was made part of Bavaria. The patriots, however, did not lose heart, and, at the desire of the Archduke, Baron von Hormayr prepared for them a plan of insurrection. The rising took place in 1809, on the renewal of war between Napoleon and Austria. On April 11 Hofer defeated the Bavarian allies of France at Sterzing, and, after they had rallied during the early part of May, he beat them again in the neighborhood of Innsbruck, forcing them to evacuate Tirol. Napoleon, however, dispatched three armies to subdue the rebellious peasantry, who had been abandoned by the Austrians by the armistice of Znaim (July 12, 1809). At first Hofer concealed himself in the valley of Passeier, but later speedily renewed the defense of Tirol, and defeated the combined French and Bavarian forces under Lefebvre at Berg Isel (Aug. 13, 1809), driving them from the country. For two months Tirol was free, and Hofer acted as head of the government, but the Treaty of Schönbrunn (Oct. 14, 1809) resulted in a fresh invasion. The French and Bavarians poured into the country, and after an heroic struggle Hofer was obliged to take refuge in the mountains. Two months later (Jan. 28, 1810) he was betrayed into the hands of the French, conveyed to Mantua, and there shot, by order of Napoleon, after a summary trial. His family were indemnified for the loss of their property by the Emperor of Austria in 1818, and his son was ennobled. Hofer has been made the hero of tragedies by Auerbach and Immermann, and there are numerous patriotic songs about him in Tirol. Consult: J. F. Hormayr, *Das Land Tyrol und der Tyrolerkrieg von 1809* (Leipzig, 1845); K. F. Heigel, *Andreas Hofer* (Munich, 1874); Josef Egger, *Geschichte Tyrols* (Innsbruck, 1870-80); Cölest. Stampfer, *Sandwirt Andreas Hofer* (Freiburg, 1891).

HÖFER, hē'fēr, EDMUND (1819-82). A German novelist. He was born at Greifswald, was educated there, and in the universities of Heidelberg and Berlin. His first stories appeared in 1845, and from that time onward he wrote many novels marked by excellence of characterization and descriptions of north German landscapes. Later he wrote much, but not so well. Among his works may be mentioned: *Schwannwiek* (1856); *Bevoegtes Leben* (1856); *Norien: Brinnerungen einer alten Frau* (1858); *Die Honoratiorentochter* (1861); *Altermann Ryke* (1864); *Ein Findling* (1868); *Der Junker* (1878); *In der letzten Stunde* (1881). His selected works appeared in 14 volumes (1882 et seq.). Consult W. Raade's "Biographische Skizze," in *Ueber Land und Meer*, vol. xx, no. 27 (Stuttgart, 1868).

HOFF, hōf, JAKOBUS HENDRIKUS VAN 'T. See VAN 'T HOFF.

HÖFFDING, hēv'ding, HARALD (1843-). A Danish philosopher, born and educated in Copenhagen. He was a school-teacher between 1861 and 1871, in the latter year became instructor, and in 1883 professor, in the University of Copenhagen. He received honorary degrees from several European universities, among them Oxford (1904) and Cambridge (1909).

Early influenced by Kierkegaard, he held to a distinction between knowledge and belief; but later he became a positivist, though to the views of that school he applied the methods of critical philosophy and the results of psychological study. In ethics he is a utilitarian of a moderate type. His principal works are: *Den engelske Filosofi i vor Tid* (1874); *Etik* (1887; 3d ed., 1905; Ger. trans., Leipzig, 1888); *Psychologi i Omrids paa Grundlag af Erfaring* (1882; 5th ed., 1905; trans. into many languages); *Formal Logik til Brug ved Forelæsninger* (1889; 5th ed., 1907); *Psykologiske Undersøgelser* (1889); *Kontinuiteten i Kants filosofiske Udviklingsgang* (1893); *Den nyere Filosofis Historie* (2 vols., 1894-95; Ger. trans., 1907; Eng. trans., 1912); *Rousseau und seine Philosophie* (1901); *Det psykologiske Grundlag for logiske Domme* (1899); *Religionsfilosofi* (1901; 2d ed., 1906; Eng. trans., 1906); *Mindre Arbejder* (2 vols., 1899-1905); *Problems of Philosophy* (1905); *Den menneskelige Tanke dens Former og dens Opgaver* (1910); *Modern Philosophers* (Eng. trans., New York, 1914). His textbooks in philosophy are widely used. Consult: C. N. Starcke and G. Saxild in *Tilskueren* (March, 1903); G. Brandes, *Samlede Skrifter*, xv (1905); A. Ipsen, *Litterære Portrætter* (1906).

HOFFMAN, CHARLES FENNO (1806-84). An American poet and novelist, born in New York City. In early youth he had his leg crushed and amputated, but was not deterred thereby from athletics and an open-air life. He attended, but did not graduate from, Columbia College, was admitted to the bar at 21, and practiced three years, after which he devoted himself to literature. In 1833 he established the *Knickerbocker Magazine*, but soon gave it up and became editor of the *American Monthly*, which he conducted for several years. Afterward he edited for short periods the *Mirror* and the *Literary World*. His first book was *A Winter in the West*, (1835), which was followed by *Wild Scenes in Forest and Prairie* (1837)—both based upon actual experiences in search of health. He now wrote a few novels, the most important being *Greyslaer* (1840), founded upon the murder of Colonel Sharpe by Beauchamp—a theme which a little later attracted Simms (q.v.). But his fame rested chiefly upon his poems, first collected in *The Vigil of Faith* (1842), and especially his songs, which were once deservedly popular. Among them may be named "Rosalie Clare" and "Monterey." A complete edition of his poems appeared in 1874. In 1849 he became insane and for the remainder of his life was confined in an asylum.

HOFFMAN, DAVID (1784-1854). An American lawyer and author. He was professor of law in the University of Maryland from 1817 to 1836, traveled much abroad, and received honorary degrees from Oxford and Göttingen. Among his publications are: *A Course of Legal Study* (1817); *Legal Outlines* (1836); *Miscellaneous Thoughts on Men, Manners, and Things*, by "Anthony Grumbler" (1837); *Chronicles Selected from the Originals of Cartaphilus, the Wandering Jew* (1853), a work designed to present through the legend of the Wandering Jew a history of government and religion since the time of Christ.

HOFFMAN, EUGENE AUGUSTUS (1829-1902). An American Protestant Episcopal clergyman, born in New York City and educated at Rutgers

and Harvard colleges and at the General Theological Seminary. He was rector successively of Christ Church, Elizabeth, N. J.; St. Mary's Church, Burlington, N. J.; Grace Church, Brooklyn Heights; and St. Mark's Church, Philadelphia. In 1879 he was appointed dean of the General Theological Seminary, New York, and in connection with his family heavily endowed that institution. He wrote *Free Churches* (1858) and *The Eucharistic Week* (1859 and 1893). Consult T. M. Riley, *Memorial Biography of E. A. Hoffman* (New York, 1904).

HOFFMAN, FREDERICK LUDWIG (1865-). An American statistician, born at Varel, Germany. In 1894 he became statistician of the Prudential Insurance Company of America, and in 1911 he was president of the American Statistical Association. His publications include: *Sanitary Conditions of the Tenements of Trinity Church, New York* (1895); *Tornadoes and Tornado Insurance* (1896); *The Race Traits and Tendencies of the American Negro* (1896); *History of the Prudential Insurance Company of America* (1900); *Fatal Accidents in Coal Mining* (1910); *Insurance Science and Economics* (1911); *Fifty Years of Life Insurance Progress* (1911); *Statistical Experience Data of the Johns Hopkins Hospital* (1913); *Menace of Cancer* (1913).

HOFFMAN, RICHARD (1831-1909). An American pianist, composer, and teacher. He was born in Manchester, Lancashire, England, but after his sixteenth year resided in New York City. His earliest instruction was received from his father and subsequently from Meyer, Pleyel, Moscheles, Rubinstein, Thalberg, Döhler, and Liszt. Within a year of his arrival in America he made a tour of the country and later accompanied Jenny Lind on her tours. He was an exceedingly popular concert pianist and played with Gottschalk and afterward with Von Bülow (New York, 1875). He settled down to teaching and became one of the most important factors in American musical life. His compositions consist of pianoforte music, part songs, ballads, anthems, and Church music generally.

HOFFMAN, WALTER JAMES (1846-99). An American ethnologist. He was born at Weidaville, Pa., studied medicine at Jefferson College, Philadelphia, and practiced it in Reading, Pa., till 1870, when he went to the Franco-Prussian War as a surgeon with the German army. On his return he took a similar position with the United States troops and thus obtained opportunities for natural-history researches in Arizona, Nevada, and Dakota. In 1877 Hoffman was attached to the Geological Survey and two years afterward became assistant in the Bureau of Ethnology at its formation.

HOFFMAN, OR, THE REVENGE FOR A FATHER. A tragedy by Henry Chettle, performed in 1602.

HOFFMANN, hōf'mān, AUGUST HEINRICH, called **HOFFMANN VON FALLERSLEBEN**, fōn fāl'ers-lä'bēn (1798-1874). A German poet, philologist, and literary historian, born at Fallersleben. He was educated at Göttingen and Bonn and from 1823 to 1838 was librarian at the University of Breslau, where he was also professor of the German language from 1830 till his dismissal (1842) for his *Unpolitische Lieder* (1841-42). He was restored to his rights as a Prussian citizen in 1848, having passed the intervening years in wanderings till 1845, when he settled in Mecklenburg. He married in 1849 and afterward lived

at Bingerbrück, Neuwied, and Weimar, where he was an editor of the *Weimarische Jahrbuch*. From 1860 till his death he was librarian of the Duke of Ratibor at Korvei. Popular at first as a liberal political poet, he is cherished still for the ease, simplicity, and grace of songs of common life (for many of which he also composed melodies), sometimes of patriotic appeal, as the popular "Deutschland, Deutschland, über alles." Hoffmann was a diligent student and editor of early German classics (*Reineke Vos*, *Monumenta Elnonensia*, *Theophilus*), made valuable contributions to philology, now mostly of antiquarian interest, and to literary history. In 1868-70 Hoffmann published *Mein Leben*, an autobiography in six volumes. His complete works were issued by Gerstenberg in eight volumes (1890-93). His *Briefe an Ferdinand Wolf* were published in 1874. Consult: *Life* by J. M. Wagner (Vienna, 1869); Kreyenberg in *Preussische Jahrbücher* (Berlin, 1891); H. Gerstenberg, *Henriette von Schuëchenberg und H. von Fallersleben* (ib., 1903).

HOFFMANN, ERNST THEODOR AMADEUS (originally **WILHELM**) (1776-1822). An eccentric but brilliant German romantic novelist of cosmopolitan reputation and influence, born at Königsberg. His foremost characteristic is his wayward yet keen fancy, suggesting at once Hawthorne and Poe. He dealt by preference with the grotesque, startling, and marvelous, until towards the close of his life morbidity verged on madness. After a joyless childhood he prepared carefully for the law, although he wished to become a composer, lost his position in Posen because of some witty caricatures, and suffered from penury and dissipation. He eked out a living by scene and portrait painting and musical composition and criticism in Posen, Warsaw, Bamberg, Leipzig, Dresden, and Berlin, where in 1816 he became councilor of the Court of Appeals. He was a brilliant lawyer. For short intervals he was manager and musical director also. His first book was a collection of musical criticisms with illustrations, *Phantasiestücke in Callots Manier* (1814-15), in which appear the stories *Ritter Gluck*, *Don Juan*, and *Das Märchen vom Goldenen Topf*. In 1816 appeared the novel *Die Elivire des Teufels*, which, with the unfinished novel *Lebensansichten des Katers Murr* (1820-22), is the most famous of his works. Other noteworthy volumes are *Die Serapionsbrüder* (1819-21), containing many stories, and *Nachtstücke* (1817). All are alike characterized by a lyric swing and an erratic imagination that is mentally disquieting and yet blended with shrewd satire, wit, and even wisdom. He died of disease induced by dissipation, his mind at times clear, and clinging tenaciously to a life that ebbed away inch by inch. Hoffmann's *Works* are in 15 volumes (2d rev. ed., 1905). A complete edition of his musical compositions was issued by E. Istel (1906). Of the more popular, there are many editions. The *Elivire des Teufels* has been translated into English (1824), also *Der goldene Topf* (The Golden Pot), one of the *Phantasiestücke*, by Carlyle in his *German Romance* (Edinburgh, 1827), with a biographical sketch. Other translations are by Gillies (London, 1826), Bealby (New York, 1885), and Ewing (London, 1886). Consult: Z. Funck, *Erinnerungen* (Leipzig, 1836); Hitzig, *Hoffmanns Leben und Nachlass* (Stuttgart, 1839); Hans Wolzogen, *E. T. A. Hoffmann u. R. Wagner* (Berlin, 1906); Arthur Sakheim, *E. T.*

A. Hoffmann: Studien zu seiner Persönlichkeit und seinen Werken (Leipzig, 1908).

HOFFMANN, FRIEDRICH (1660-1742). A German physician, one of the most celebrated of the eighteenth century. He was born at Halle and received his medical degree in 1681 at Jena. He then studied chemistry at Erfurt under Kaspar Cramer, practiced at Minden and Halberstadt with great success, and was professor of medicine in the University of Halle from 1693 to 1742. In 1708 he became physician to the King of Prussia at Berlin and subsequently enjoyed a European reputation second only to that of Boerhaave. His name is perpetuated in the title "Hoffmann's anodyne." (See *ETHER*.) His greatest work was *Medicina Rationalis Systematica* (1718-40); *Opera Omnia Physico-Medica denuo Revisa, Correcta et Aucta* (1740) and *Medicini Consultatoria* (1721-39) were also celebrated, together with the *Opuscula*, published after his death and reprinted at Venice in 17 volumes in 1745 and subsequently at Naples.

HOFFMANN, GUSTAV (known as **GRABEN-HOFFMAN**) (1820-1900). A German composer, born at Bnin, near Posen. He was the pupil of Stümer in Berlin, and afterwards of Hauptmann at Leipzig in singing, and acquired a reputation in barytone parts in concert and oratorio. He taught vocal music and composed nearly a hundred books of songs and choral music, besides publishing several textbooks on voice training. His best-known song is "Fünfhunderttausend Teufel." In 1885 he settled at Potsdam, where he founded a singing school for women.

HOFFMANN, HANS (1848-1909). A German novelist, born in Stettin. He studied philology at the universities of Bonn, Berlin, and Halle, and made a long visit to Italy and Greece. For some time he was a Gymnasium teacher. He is one of the most gifted of the modern German novelists and unites with an uncommon talent for vivid descriptions of landscapes a poetical and delightful humor. He died while secretary of the Schiller Foundation in Weimar. Among his works are: *Der Hennenprediger* (1883), his best work; *Ivan der Schreckliche und sein Hund* (1889); *Von Frühling zu Frühling* (1889, 1898); *Tante Fritzchen* (1899); *Geschichten aus Hinterpommern* (1891); *Irrrende Mutterliebe* (1900); *Der eiserne Rittmeister* (1900); *Das Gymnasium zu Stolpenburg* (1900); *Von Haff zu Haff* (1903); and the lyrics *Vom Lebenswege* (Leipzig, 1893). Consult Otto Ladendorf, *Hans Hoffmann* (Berlin, 1908).

HOFFMANN, or HOFFMANN-DONNER, dōn'ēr, HEINRICH (1809-94). A German humorous poet, born in Frankfort-on-the-Main. At his marriage he added his wife's name (Donner) to his own. He studied medicine at the universities of Heidelberg, Halle, and Paris, then became a teacher of anatomy in the Senckenberg Institution in Frankfort-on-the-Main, and from 1851 till 1889 was directing physician of the municipal insane asylum. He wrote on medical subjects, but is far better known through his children's books, which he illustrated himself. The most famous of these, *Struwwelpeter* (1845; 250th ed., 1903), has been widely translated. A parody of this famous work by E. V. Lucas in 1914 was one of the most agreeable books produced by the war in Europe. He also published *König Nussknacker* and a volume of poems, *Auf heitern Pfaden* (1873).

HOFFMANN, JOHANN JOSEPH (1805-78). A German Oriental scholar. He was born at Würzburg, where he was educated. He became an actor in 1825, but in 1830 his attention was diverted to Oriental philology by Philipp Franz von Siebold (q.v.). He completed his studies under a Chinese instructor, became Japanese translator for the Dutch Colonial Minister, and later was made professor of Chinese and Japanese at the University of Leyden. He published a Japanese grammar in both Dutch and English in 1867 and republished it in German and English in 1876. He is author also of *Japanische Studien* (1878).

HOFFMANNITES. See FRIENDS OF THE TEMPLE.

HOFFORY, hó'fó-ré (JOHN PETER), JULIUS (1855-97). A Danish-German philologist, phonetician, and Germanic scholar, born at Aarhus, Denmark. He was educated at Copenhagen, Berlin, and Strassburg. In 1883 he was made professor of Norse philology and phonetics at the University of Berlin. In 1889 his health broke down, and in 1893 he had to enter a sanitarium near Berlin, where he died in 1897. He wrote: *Eddastudien* (1889); "Phonetische Streitfragen," in the *Zeitschrift für vergleichende Sprachforschung*, vol. xxiii, and *Professor Stevers und die Principien der Sprachphysiologie* (1884), both attacks on Sievers. He edited and translated into German some of Holberg's comedies under the title of *Dänische Schaubühne* (1885-87), and translated other Danish writings in *Nordische Bibliothek* (1889-91). He did much towards the introduction of Ibsen into Germany. Consult Henning, *Acta Germanica* (Berlin, 1898), and R. M. Meyer, *Goethe-Jahrbuch*, No. 19 (Frankfort-on-the-Main, 1898).

HOFHUF, hō'foof. See EL-HOFUF.

HÖFLER, hē'fler, KARL ADOLF KONSTANTIN VON (1811-97). A German historian. He was born at Memmingen and studied at the universities of Munich and Göttingen. For two years (1834-36) he was in Rome and Florence, making historical researches. When he returned to Munich, he directed the *Münchener Zeitung*, the official journal of Bavaria. Three years afterward he was made a professor at the university there. He became involved in the political troubles of Bavaria, and the publication of his *Konkordat und Konstitutionseid der Katholiken in Bayern* (1847), together with his active part in the agitation against Lola Montez, lost him his Munich chair; but, after being archivist at Bamberg for a time, he was made professor of history in the University of Prague (1851). In the controversy between the Czechs and the Germans Höfler sided conspicuously with the Germans, and in 1872 he was called into the Austrian House of Peers. His numerous historical publications include: *Die deutschen Papste* (1839); *Lehrbuch der allgemeinen Geschichte* (1850-56); *Papst Adrian VI.* (1880); *Monumenta Hispanica* (1881-82); *Die Ära der Bastarden am Schlusse des Mittelalters* (1891).

HOFMANN, hóf'mán, AUGUST WILHELM VON (1818-92). A distinguished German chemist, born at Giessen. After obtaining the degree of Ph.D., he became assistant to Liebig in the Giessen laboratory, and in 1845 became a docent in chemistry in the University of Bonn. In the same year the Royal College of Chemistry was established in London, and Hofmann was recommended by Liebig as highly qualified for the post of director of the new institution. This

college, which subsequently became part of the Royal School of Mines, owes much of its high reputation to Hofmann's activity. On the promotion of Thomas Graham from the post of chemist to the mint to the office of master of that institution, Hofmann was appointed his successor. In 1861 he was elected president of the London Chemical Society. In 1865 Hofmann accepted the chair of chemistry in the University of Berlin and in 1868 founded the German Chemical Society. He was ennobled in 1888. He served as judge at several industrial expositions, of which he published admirable accounts, and was a member of many scientific bodies at home and abroad.

The results of his brilliant researches have formed entire departments in organic chemistry and have had an important influence on the development of chemical theory. He investigated the organic bases obtained from coal tar and discovered a new and important class of compounds (the amines, q.v.) which are derived from ammonia by the substitution of organic radicals for hydrogen atoms. One of his best-known contributions was a method (known as *Hofmann's reaction*) for the transformation of acid amides into amines by the action of bromine and caustic potash. Among his most important discoveries are that of aniline among the products of destructive distillation of bituminous coal and the discovery of methods for the artificial preparation of beautiful coloring substances from aniline. He obtained the colorless base known as *rosaniline* and its colored salts, such as *fuchsin*, *dahlia* (*Hofmann's violet*), etc. These discoveries have contributed greatly to the development of the color industry and have practically revolutionized the art of dyeing. Among his contributions to physical chemistry may be mentioned his method of determining the vapor densities of chemical substances for the purpose of obtaining their molecular weights, and a method of demonstrating the dissociation of gases, such as carbonic-acid gas and water vapor, by the action of electric sparks. Hofmann was a brilliant teacher, and his *Introduction to Modern Chemistry* (1865, and several later editions) brought about important reforms in the methods of teaching chemistry. He also wrote: *A Handbook of Organic Analysis* (1853); *The Life Work of Liebig in Experimental and Philosophic Chemistry* (1876); *Zur Erinnerung an vorangegangene Freunde* (1889); etc. Consult Volhard and Fischer, *August Wilhelm von Hofmann: Ein Lebensbild, im Auftrage der deutschen chemischen Gesellschaft* (Berlin, 1902).

HOFMANN, FRANZ ADOLF (1843-). A German hygienist. He was born in Munich, studied medicine there, and was assistant in the physiological institute of the university until 1872, when he went to Leipzig as head of the university laboratory of pathological chemistry. Six years afterward Hofmann was appointed professor of experimental hygiene and director of the hygienic institute at Leipzig, and he continued to hold his chair after resigning from administrative work. An editor of the *Archiv für Hygiene*, he contributed to that journal, to the *Zeitschrift für Biologie*, and to the *Vierteiljahrsschrift für öffentliche Gesundheitspflege*, on pathological chemistry, on the properties of subterranean waters, and on disinfection, refrigeration, and the preservation of foods, especially meats.

HOFMANN, HEINRICH (1824–1902). A German historical painter, born in Darmstadt. He was a pupil of Theodor Hildebrandt and Schadow at Düsseldorf and of the Antwerp Academy. After visiting Italy in 1854–58, where he came under the influence of Cornelius, and practicing in different German cities, he settled in 1862 at Dresden, where he became professor at the academy. Although his subjects are drawn from the entire domain of literature and mythology, his extensively engraved scenes from the life of Christ are most widely known. Among these are: "Christ Taken Prisoner" (1858, Darmstadt); "The Adulteress before Christ" (1863, Dresden); "Christ's Sermon on Lake Gennesaret" (1875, Berlin); "Christ in the Temple" (1882, Dresden). In 1878–79 he decorated the ceiling of the vestibule in the Dresden Theatre with "Apotheosis of the Heroes of the Greek Drama." Hofmann's pictures are not distinguished by any unusual technical qualities, but owe their popularity entirely to his illustrative talent and ideal conceptions of biblical events.

HOFMANN, JOHANN CHRISTIAN KONRAD VON (1810–77). A German Lutheran theologian and historian, born in Nuremberg. He studied history and theology at the universities of Erlangen and Berlin and in 1833 was appointed a teacher in the Gymnasium at Erlangen. Two years later he became a privatdocent in the theological faculty of the university and in 1841 professor extraordinarius. The next year he accepted a call as full professor to Rostock, but in 1845 returned to Erlangen. In 1857 he was ennobled. He was the head of the so-called Erlangen school, which developed the theological ideas of Bengel, and in the end conformed in all essential respects with the doctrines of the Lutheran church. As a member of the Second Chamber of the Bavarian Legislature, he labored for the union of Germany and was, despite his clerical conservatism, a member of the Liberal party. His writings include: *Lehrbuch der Weltgeschichte* (2d ed., 1843); *Weissagung und Erfüllung im alten und neuen Testament* (2d ed., 3 vols., 1857–60); *Die heilige Schrift neuen Testaments, zusammenhängend untersucht* (1862–86, the latter part edited by Vlock); *Der Schriftbeweis* (2d ed., 1857–60). Consult Grau, *Johann Christian Konrad von Hofmann: Erinnerungen* (Gütersloh, 1879).

HOFMANN, JOSEF (1877–). A celebrated Polish concert pianist, born in Cracow, Galicia. His father was a leading musician of Warsaw, in which city he held the position of professor of harmony and composition at the conservatory and also the directorship of the opera. Josef studied with his father until he was 15 years of age, after which he spent two years with Rubinstein. As a child, he was one of the most remarkable musical prodigies ever known; at the age of six years he had made his public début, and by the time he was nine had toured continental Europe and Great Britain, and in 1887–88 he visited America. On the conclusion of the last-named tour he went into retirement for further study and preparation and in 1894 made his reappearance at Dresden and subsequently toured every civilized country. On his reappearance in New York in 1901 he showed a vastly improved technique and great interpretative ability. Among his contemporaries no pianist was his superior. He is equally at home in the interpretation of all

schools of music—classic, romantic, or modern. Although he never taught music, he published two little books, *Piano Playing* and *Piano Questions Answered*, the principal merit of which is their eminent practicability. He composed several attractive numbers for the piano and also five concertos.

HOFMANN, KONRAD (1819–90). A German philologist, born near Bemberg. He studied medicine at Munich and Erlangen and philology at Munich, Leipzig, Berlin, and Paris. In 1852 he was put in charge of the materials gathered by Schmeller among the manuscripts in the library of Munich. In the following year he succeeded Schmeller as professor of Germanic philology, assuming in 1860 also the chair of Romance philology. Most of his writings were for journals, especially the publications of the Munich Academy, *Romanische Forschungen*, and Pfeiffer's *Germania*. His other works are editions of the *Hildebrandlied* (1850), with Vollmar; *Amis et Amiles, Jourdain de Blairies* (last ed., 1882); *Primavera y Flor de Romances* (1856), with Wolf; *Karls des grossen Pilgerfahrt* (1866); *Joufrois* (1880); Lutwin's *Adam und Eva* (1881), with Meyer; *Chanson de Roland* (not published); and the critical works *Ueber die Gründung der Wissenschaft altdeutscher Sprache und Litteratur* (1857) and *Zur Textkritik der Nibelungen* (1872).

HOFMANN, MELCHIOR (c.1498–c.1544). A German Anabaptist, born at Hall in Swabia. He was a furrier at Livland, but under the influence of Luther became a lay preacher and in 1524 visited Sweden. From this country, however, he was expelled, and he was also driven from Dorpat in the same year. But Frederick I of Denmark appointed him to preach at Kiel. For a short period he enjoyed the favor of Luther, whom he visited at Wittenberg; but in 1529, because of his view of the Eucharist, he was attacked by Luther and his adherents. He preached at Strassburg and afterward in East Friesland. Upon his return to Strassburg in 1533 his Anabaptist doctrines had become so pronounced that he was placed in prison, and there he died.

HOFMANNSTHAL, höf'mäns-täl, Hugo von (1874–). An Austrian poet. He was born of wealthy parents in Vienna and studied law, then literature and the languages, at the university of that city; but he early turned his attention entirely to literary work. His first venture, written under the pseudonym of Theophil Morren, when he was 18, a short lyric-dramatic study called *Gestern* (1892; 2d ed., 1904), he has hardly surpassed. His brief drama *Der Tod des Tizian* (1901; 4th ed., 1908) was successful and remains one of his best works. After the appearance of the plays *Theater in Versen* (containing *Die Frau im Fenster*, *Die Hochzeit der Sobeide*, *Der Abenteuerer und die Sängerin*, 1899), *Der Tor und der Tod* (1900), *Der Kaiser und die Here* (1900), *Das Bergwerk zu Falun* (1900), and *Das kleine Welttheater, oder die Glücklichen, ein Puppenspiel* (1903), Hofmannsthal tried something more serious in his imitations of Greek tragedy, *Elektra* (1903), *Ödipus und die Sphinx* (1906), *Alkestis* (1911), and in his *Das gerettete Venedig, nach Thomas Otway* (1904), with promising but not permanent success. He has a flowing, graceful style, which, however, soon palls with its sweetness, and his characters almost never approach real life. In this he is true to his stated principle,

that art and life lie far apart. His gift is lyric rather than dramatic. Among his other works may be mentioned: *Ausgewählte Gedichte* (1903; 2d ed., 1904); *Das Märchen der 267. Nacht, und andere Erzählungen* (1904); *Viktor Hugo* (1904); *Vorspiele* (1908); *Prosaische Schriften* (1907); *Der Rosenkavalier* (1911), the libretto of a popular opera, which, with music by R. Strauss, had its first New York performance in 1913; *Jedermann, ein altes Spiel erneuert* (1912); *Ariadne auf Naxos* (1912). Consult: Sulger-Gebing, *H. von Hofmannsthal* (Leipzig, 1905); Borchhardt, *Rilke und Hofmannsthal* (ib., 1905); Köllmann, *H. von H.* (ib., 1907); Hladny, *Hofmannsthals Griechenstücke* (Vienna, 1910).

HOFMANNSWALDAU, hōf'māns-vāl'dou, CHRISTIAN HOFMANN VON (1617-79). A German poet, born in Breslau; the chief representative of the so-called second Silesian school. He studied law at Leyden and then traveled through the Netherlands, England, France, and Italy. On his return, and before he had reached the required age, he was made a member of the Breslau city council. His poetry was greatly influenced by the Italians Guarini and Marino and departed more and more from the somewhat insipid and tasteless style of the previously authoritative Martin Opitz (q.v.). Witty and endowed with considerable literary skill, he was much admired; his love lyrics were often imitated, and many editions of them were published. His style is pompous, bombastic, and highly artificial. Although of clean reputation himself, his poems cannot boast of that virtue. Selections from his poems are given in vol. xxxvi of Kürschner's *Deutsche Nationalliteratur*. Consult: Josef Ettlinger, *Christian Hofmann von Hofmannswaldau* (Halle, 1891); Brossmann, *Hofmann von Hofmannswaldau* (Leipzig, 1900); P. Hintringer, *Sprach- und textgeschichtliche Studien zu H. von H.* (Breslau, 1908).

HOFMEISTER, hōf'mī-stēr, FRANZ (1850-). A German chemist, born at Prague, Bohemia, and educated at the universities of Prague, Leipzig, and Strassburg. At Prague he became an assistant in medical chemistry in 1872, lecturer in 1879, and professor of pharmacology in 1883. In 1896 he became director of the physiological-chemistry department at Strassburg. His investigations deal with action of salt in the body, assimilation of nourishment, metabolic assimilation of tissues, supply and use of albumen in organisms, and other problems in physiological chemistry. He published *Leitfaden für den praktisch-chemischen Unterricht der Mediziner* (3d ed., 1908).

HOFMEISTER, WILHELM (1824-77). A German botanist, born at Leipzig. He has the reputation of being the father of modern morphology, i.e., the morphology of life histories and phylogeny. He was by profession a druggist and entirely self-trained in botany, having no university connection until long after his most famous contributions had appeared. His work was done during a period of revolution and foundation laying in every department of botany, and as a consequence he lived in the midst of violent opposition on the part of the established order. When 25 years old (1849), he published one of his two greatest works, *Die Entstehung des Embryo der Phanerogamen*, which corrected a remarkable misapprehension concerning the embryo of seed plants. In 1851

appeared his most famous work, under the title *Vergleichende Untersuchungen höherer Kryptogamen und der Koniferen*, an English translation of which, by Frederick Curry, was published in 1862 by the Royal Society. This, his epoch-making contribution, bridged the great gulf which was thought to separate cryptogams and phanerogams. The methods he had used in studying embryo formation in seed plants were applied to the embryology of Bryophytes and Pteridophytes, and in the course of this investigation he brought out with remarkable clearness, and for the first time, what is now called alternation of generations (q.v.). The estimate of this work given by Sachs is as follows: "These results were magnificent beyond all that has been achieved before or since in the domain of descriptive botany. The many valuable details are lost in the splendor of the total result." The idea of what is meant by the development of a plant was suddenly and completely changed. The intimate connection of all groups, from liverworts to angiosperms, was seen in all of its relations with a distinctness never before attained. When Darwin's theory of natural selection was given to the world, eight years after Hofmeister's investigations, the relations of affinity between the great divisions of plants were so well established and so evident that the theory of descent had only to accept what Hofmeister's morphology had actually brought to view. All of these results were obtained before he achieved his first university position, which was the professorship of botany at Heidelberg (1863-72). Later (1872-77) he was professor of botany at Tübingen. After he entered upon his career as a teacher, his work seems to have deteriorated; at least his investigations dealt with subjects of minor importance.

HOFMEYER, hōf'mī'ēr, JAN HENDRIK (1845-1909). A South African politician, born at Cape Town, South Africa, and educated at the South African College. He edited the journals *Volksvriend*, *Zuid Afrikaan*, and *Zuid Afrikaansche Tijdschrift*; organized the Boeren Vereeniging (Farmers' Association) in 1878; and when the Afrikaner Bond was formed in 1882 he gained control of it and amalgamated the two societies, thereby becoming the leader of the Dutch residents of Cape Colony. From 1879 to 1895 he was a member of the Cape Parliament, and in 1882 he served in Scanlon's ministry. At the first colonial conference in London, in 1887, he proposed an Imperial customs federation. Two years later he was a member of the South African customs conference, and in 1890 he negotiated the Swaziland Convention. He brought about the conference between Lord Milner and President Kruger at Bloemfontein, and later he personally visited that city and Pretoria in his efforts to prevent war between England and the Transvaal. After the war he favored conciliation and was one of the delegates sent to London in 1909 to make final arrangements for the South African union. Consult the *Life* by J. H. Hofmeyr (London, 1914).

HOFSTEDE DE GROOT, hōf'stā-de de grōt, PETRUS (1802-86). A Dutch theologian and reformer, born at Leer in East Friesland, Prussia. In 1826 he became pastor at Ulrum and in 1829 professor of theology in Groningen. He was the head of the so-called Groningen school, the members of which style themselves the Evan-

gelicals and form a middle Church party between the moderns and the orthodox, although they lean more towards the latter. The party organ was the *Waarheid en Liefde*, of which Hofstede was an editor. His writings include: *Opvoeding der Menschheid* (2d ed., 1855); *Institutio Theologiæ Naturalis* (4th ed., 1861); *Die Groninger Theologen* (1854); *Over de evangelisch-catholieke godgeleerdheid als de godgeleerdheid der toekomst* (1856); *Die moderne Theologie in den Nederlanden* (1870). Consult Heerspink, *Dr. Petrus Hofstedes leven en werken* (Groningen, 1897).

HOFUF. See EL-HOFUF.

HOG, THE DOMESTIC (probably from *hog*, *hag*, to cut, Icel. *hoggrva*, Swed. *hugga*, AS. *hæawan*, OHG. *houwan*, Ger. *hauen*, to hew; connected with OChurch Slav. *kovati*, Lith. *kauti*, to strike, to forge; referring ordinarily to a castrated boar). All the known breeds of domestic swine (see SWINE, for the general natural history of the race) may be divided into two groups—the European hog (*Sus scrofa*), which is sprung from and resembles the wild boar; and the Asiatic pigs, regarded as descended

DENTITION OF THE WILD BOAR.

Right upper and lower jaws, with their teeth and their nerves, exposed from the inside: *t*, *i*, incisors; *c*, *c*, canines (tusks); *pm*, premolars; *m*, molars.

from the Indian wild boar (*Sus cristatus*). The common hog (*Sus scrofa*) appears to be a native of most parts of Europe and Asia, and domesticated swine were found by the first navigators in many islands of the southern seas. Although the use of its flesh was prohibited to the Jews, and the prohibition has been adopted in the Mohammedan law, it constitutes a large part of the food of many nations. The fecundity of the hog is great; with proper treatment it will produce two litters annually, generally of four to eight pigs each, although sometimes there are as many as 14 in a litter. The period of gestation is usually 16 weeks. Great quantities of the flesh and fat are consumed in various forms as pork, fresh or salted, bacon, ham, and lard. Hog skin is made into leather, which is highly esteemed. The bristles are much used for brush making.

Breeds. Numerous breeds of the domestic hog have resulted from selection and crossing and from conditions of environment favorable to improvement. Apparently there were two original or native breeds in Great Britain—the old English hog and a breed found in the Highlands of Scotland. From these our modern improved breeds have been developed by crossing the native breeds with foreign hogs, principally the Chinese and Neapolitans. The modern white breeds, with fine bone, thin skin, short legs, and tendency to fatten at an early age, take these qualities from the Chinese hog; while the black breeds, of which the Essex is a type, get their qualities from the Neapolitan stock.

The *Yorkshire* is the principal of the English

white breeds and is divided into three subvarieties—the Large Whites, or Large Yorkshires, the Middle Whites, and the Small Whites, or Small Yorkshires, which are considered the smallest and finest of the white breeds. They mature early and fatten quickly. The Large Whites are characterized by immense size, although the best are rather fine-boned and not coarse. The Yorkshires are very popular in England, and white swine generally are preferred in that country. It is said that from this source came the American breed of Chester Whites, which was originated in Chester Co., Pa. Pigs of this breed are among the largest, and individuals have attained a weight of 1300 pounds.

The *Berkshires* are popular and widely disseminated. This breed is of English origin and takes its name from the county whence it came. It is of large size, black in color with white on the face and occasional splashes elsewhere, and fattens readily at any age. Great improvement has been made in its size and symmetry in recent years. The quality of the pork is unexcelled.

The *Poland-Chinas* divide honors with the *Berkshires* in the great pork-producing sections of the United States. This is also a black breed and is a purely American one, originating in Ohio. It is not generally believed that any Polish cross was ever introduced in its development, in spite of its name. As now bred, the *Poland-Chinas* are similar to the *Berkshires*, but show rather more white in their markings. They are among the largest of hogs, but have been much improved in fineness of bone, early maturity, and tendency to fatten at an early age.

The *Duroc-Jerseys* are the result of uniting several families of red pigs which were bred in New York and New Jersey. Though the color is red, the shades vary considerably. The body, as a whole, resembles the *Poland-China*. The breed has become very popular in recent years. The *Cheshires* are a medium-sized white breed which originated in New York. Though possessed of many good qualities, it has not been popular in the West. The *Thin Rind*, or *Hampshire*, is a good bacon pig of American origin. The color is black with a white band about the body. The *Tamworth* is a large, coarse, "leggy" hog, of a dark chestnut color, more or less spotted with black. This animal has been widely exploited as a bacon hog. It originated in England, but is popular in America. The *Victorias* are a white breed of medium size, not widely raised in the United States; and the *Essex* is a black English breed, classed among the smaller breeds. It has not become popular in the United States. The *Small Black*, or *Suffolk*, originated in England from a cross between the *Essex* and the *Neapolitan*. The *Large Black* is a new English breed. The *Lincolnshire Curly Coated* is a native of eastern England. A few have been brought to the United States.

Care and Treatment. Although hogs are raised to some extent in all parts of the United States, the great pork-producing section is in the Mississippi valley, where corn is abundant and cheap. The northern part of this valley is said to be the greatest hog-raising section in the world. The hogs are commonly pastured during the earlier stages of growth. Frequently a herd of swine are put with steers which are being fed whole corn, and the hogs feed upon the corn voided in the manure. Alfalfa pasturage is used for hogs in some sections. In the

South cowpeas, peanuts, chufas, and a variety of other crops are grown for hog pasture. Corn is the great hog feed of the Middle West; sometimes it is ground, but it is largely fed on the ear. As corn contains only a small percentage of ash, the hogs fed upon it exclusively become weak-boned and can hardly walk about. This is corrected by giving wood ashes, which they eat greedily. Skim milk and buttermilk from creameries constitute excellent food for pigs of all ages; and if corn meal is added, a pork of the finest quality is obtained. The large, over-fattened hog, weighing 400 or 500 pounds, has given way to a quickly maturing hog of from 200 to 300 pounds. This animal is produced more economically and is preferred by the packing houses. The gains in proportion to the food eaten diminish as the animal grows, and experiments have shown that it is most profitable to market the hogs when they have reached 200 or 250 pounds. Packers prefer a hog weighing about 250 pounds. See **PORK**; **SWINE**.

The number of hogs on farms in the United States increased from 1890 to 1911, when the total was 65,620,000, valued at \$615,170,000; but decreased in subsequent years, being in 1914 58,933,000 valued at \$612,950,000.

HOG (so called as resembling in outline the back of a hog). This nautical term implies the opposite of *sag*. A ship is *hogged* when through weakness her ends droop in such a manner as to cause her keel to curve upward amidships. In lightly built or shallow vessels a tendency to hog is prevented by a truss frame arranged to support the ends and called the hog-frame. Most wood-built and many iron paddle-wheel river steamers have such frames rising well above the hull and sometimes above the deck houses. Instead of a framework extending from end to end, it may be located only amidships, and the strain transmitted to it by *hogchairs* extending to the ends. In deep-draft vessels, the side plating and fore-and-aft bulkheads act as girders to prevent hogging or sagging; the plating of the decks (especially of the upper deck) and bottom serves as ties to hold the framing in shape.

HOGAN, hō'gan. A cone-shaped earth-covered house used by the Navaho (q.v.).

HOGARTH, hō'garth, JOHN SHERIDAN (c.1815-c.61). A Canadian journalist and legislator. Born near Dublin, Ireland, in early youth he came to Toronto, Upper Canada. For a few years he practiced law in Hamilton. In 1841 he came into wide notoriety on account of his arrest at Rochester, N. Y., on a charge of having been concerned in the destruction of the *Caroline*, an American steamer that was set on fire and sent over Niagara Falls during the rebellion of 1837-38. He was set at liberty and returned to Hamilton. Later he established at Toronto the *United Empire*, a weekly news-

paper, and also became the parliamentary correspondent for several journals. About 1850 he contributed a number of vigorous articles on Canadian politics to *Blackwood's Magazine*. In 1855 his essay on *Canada and her Resources* was awarded the first prize of the Paris Exhibition Committee, and in 1857 he was elected a Liberal member of the Canada Legislative Assembly, and gave promise of a distinguished parliamentary career. While in Toronto in 1859, he suddenly disappeared, and it was not known until two years later, when his body was found, that he had been murdered.

HOG APE. The mandrill. See **BABOON**.

HOG APPLE. See **PODOPHYLLUM**.

HOGARTH, hō'garth, DAVID GEORGE (1682-). An English archæologist, born at Barton-on-Humber. He was educated at Winchester and at Magdalen College, Oxford, and was tutor of Magdalen in 1886-93 and afterward fellow. He traveled in Asia Minor in 1887, 1890, 1891, and 1894, and carried on excavations at Paphos (1888), Dér-el-Bahari (1894), Alexandria (1895), Fayûm (1896), Naukratis (1899, 1903), Cnosus and the Dictæan Cave (1900), Zakro (1901), the Artemisium in Ephesus (1904-05), Assiut (1906-07), and Jerablus (1911)—largely for the British Museum. In 1897-1900 he was director of the British School at Athens, and in 1909 he became keeper of the Ashmolean Museum, Oxford. He wrote: *Devia Cypria* (1890); *A Wandering Scholar in the Levant* (1896); *Philip and Alexander of Macedon* (1897); *The Nearer East* (1902); *The Penetration of Arabia* (1904); *Excavations at Ephesus: The Archaic Artemisia* (1908), with others; *Ionian and the East* (1909); *Accidents of an Antiquary's Life* (1910).

HOGARTH, WILLIAM (1697-1764). An English painter and engraver. He was born in London, Nov. 10, 1697. His father was an unsuccessful schoolmaster, who was also a hack writer and corrector for the press. At the age of 17 Hogarth was apprenticed to a silversmith, for whom he made designs for plate which are now much prized by collectors. In 1718 he entered business on his own account, and, besides engraving arms and shop bills, he began to design copper plates for the booksellers. During the years 1721-26 he designed a number of engravings, the most important of which were "Masquerades and Operas" (1724), which struck the keynote of his future satire, and his illustrations to Butler's *Hudibras*, which brought him into public notice. At first Hogarth's ambition was to be a line engraver; but about 1724 he began to attend the private art school of Sir James Thornhill, in St. Martin's Lane, with a view to painting. In 1728-29 he painted a series of small conversation pieces, groups of family portraits connected by some common interest or occupation, besides others of a political and social character. Between 1727 and 1732 he engraved a large number of frontispieces for well-known books. In 1729 he ran away with his former master's daughter, Jane Thornhill, who made him an excellent wife.

Soon after his marriage he began the first of the series of paintings, "The Harlot's Progress," reproduced also as engravings, which made him famous. It represented in six plates the story of a country girl who came innocent to town to seek a situation. The original paintings, except one, are lost, but the plates are well known. The shameless piracy of these plates resulted in

WILLIAM HOGARTH
"AFTER THE MARRIAGE" (FROM "MARRIAGE À LA MODE")
FROM THE ORIGINAL IN THE NATIONAL GALLERY, LONDON

the Parliamentary Act of 1735 vesting in artists the exclusive rights to their designs. In the same year appeared "A Rake's Progress," eight plates, representing the career of a profligate young man of means, who ends in the madhouse, the original paintings for which are in the Soane Museum, London. The third and most famous series, the "Marriage à la Mode," was not completed till 1745. It represents in six plates the story of a fashionable marriage between the son of an impoverished lord and the daughter of a wealthy city alderman. The original paintings are in the National Gallery and are Hogarth's greatest work. Another prominent series was "Industry and Idleness" (12 sheets, 1747), executed as engravings only. They represent the respective careers of an idle and an industrious apprentice and were intended for the working class. Besides these he executed briefer series and many single plates.

Hogarth's art was essentially of a literary character, and he has well been called the Molière of painting. His constant endeavor was to point out the vices and follies of society with the strict moral purpose of reforming. His great importance in the development of art lies in the fact that he was the first to turn his back on traditional practices and to go directly to nature for the figures he painted. He is free from all foreign and ancient influence. In his portraits he is a technician of high order. His pictures are strongly and broadly painted and excel equally in drawing and in color. His paintings are better than his engravings, which are hastily executed and lack finish, although they are always spirited and intelligible.

He succeeded especially well in his portraits, one of the best of which is of himself with his dog Trump (1745), in the National Gallery. This collection contains also portraits of his sister, Mary Hogarth (1746), Lavinia Fenton as Polly Peachum, David Garrick as Richard III, the Earl of Feversham, and the inimitable "Shrimp Girl." The Metropolitan Museum, New York, possesses the portrait of Peg Woffington. Among his other paintings of a didactic character, painted for engraving, were "Southwark Fair" (1733), "Midnight Modern Conversation" (1734), the "Distressed Poet" (1735), the "Enraged Musician" (1741), "March to Finchley," and the "Election"—the two latter in the Soane Museum. He also attempted a few historical pictures on a large scale, but not with equal success.

Hogarth took a prominent part in the art controversies of his day, being the uncompromising foe of the imitation of the old masters—the "black masters" as he called them because of their darkened colors. In 1753 he published his *Analysis of Beauty* (reprinted at Pittsfield, Mass., 1909), setting forth his views on art; it was not a success and brought ridicule upon him. After the death of his father-in-law, in 1734, Hogarth converted his art school into a sort of life class, in which 30 or 40 artists drew after the nude. In 1757 he was appointed sergeant painter of all his Majesty's works, succeeding his brother-in-law, John Thornhill. His last days were marred by the ill success of his "Sigismunda Weeping over the Heart of her Husband," the harsh criticism of which was especially painful to Hogarth, as Sigismunda bore the features of his wife. An ill-advised effort in behalf of Lord Bute's ministry in 1762

brought down upon him the terrible satire of Wilkes and Churchill, until then his intimate friends. Though much grieved, Hogarth retaliated by two prints—a hideous portrait of Wilkes with a satyr's leer and squint, and "The Bruiser, C. Churchill." He died at London, Oct. 25, 1764.

Bibliography. Among the commentaries to Hogarth's engravings are: Trusler, *Hogarth Moralized* (London, 1768); Horace Walpole, *Anecdotes of Painting*, vol. iv (ib., 1771); Samuel Ireland, *Hogarth Illustrated* (ib., 1791-98) and *Graphic Illustrations of Hogarth* (ib., 1794-99); G. C. Lichtenberg, *Ausführliche Erklärung der Hogarth'schen Kupferstiche* (Göttingen, 1794); Nichols and Stevens, *Genuine Works of Hogarth* (London, 1808-17); Clerk, *Works of Hogarth* (ib., 1806). Hogarth's engravings are easily accessible in Hind's *Great Engravers Series* (ib., 1913). Among the numerous editions of his *Works* are those of Nichols (ib., 1820-22), of Monkhouse and Dobson (ib., 1872), and of Ireland and Nichols (ib., 1883). By far the best monograph on Hogarth is the folio by Austin Dobson (ib., 1902), with introduction by Sir Walter Armstrong, and admirable half-tone illustrations. Others are by Nichols (ib., 1785), G. A. H. Sala (ib., 1866), and Austin Dobson (New York, 1908); Benoit, in *Les grands artistes* (Paris, n.d.); Meier-Gräfe (Munich, 1910); Edward Garnett (New York, 1910); C. L. Hind (ib., 1910); and the excellent brief folios by Hutton in *Kunst der Gegenwart* (Berlin, 1908).

HOG CHOLERA, SWINE FEVER, or SCHWEI-NEPEST. An acute, subacute, or chronic contagious disease of hogs, caused primarily by a filterable virus and accompanied by a very high death rate. In the course of the disease inflammatory and necrotic processes develop, produced either by *Bacillus suispestifer* when the lesions occur in the intestinal canal and in the abdominal lymph glands, or by the *Bacillus suissepticus* when the lesions are manifested in the lungs. The term has been used to cover at least two diseases—true hog cholera and swine plague (q.v.).

The chief symptoms of hog cholera are a rise in body temperature, loss of appetite, a discharge from the eyes, watery at first but later yellowish and viscid, a purplish coloration of the skin, giving rise to a common name, blue sickness, occurring especially on the ears, chest, and abdomen, the underside of the neck, and on the inside of the thighs. Constipation is an early symptom, but diarrhoea soon sets in and persists until the death of the animal. The excrement is dark-colored and possesses a fetid odor. The body temperature may rise from one to three degrees above the normal, but the elevation of temperature is frequently absent. The animals are dull and indifferent to surroundings, lie down a great part of the time, and hide their heads under straw or litter, often have a dry cough, and sometimes squeal from intestinal pain. As the disease progresses, they become gaunt with arching backs. Acute cases may last from two to five days; chronic ones, a month. The characteristic pathological changes are enlargement of the spleen and a hemorrhagic condition of the large intestines and lymphatic glands. In chronic cases ulcers are formed in the large intestines, or the whole wall may become effused with blood.

Hog cholera and swine plague (*Schweine-seuche*) have been frequently confounded, but

in typical cases they may be distinguished by clinical symptoms and post-mortem lesions. In most outbreaks of contagious hog diseases, hog cholera and swine plague occur in combination in the same animal. In general, however, the seat of infection in hog cholera is in the intestines; that of swine plague is in the lungs and secondarily in the intestines. A reddening of the skin is an indication of hog cholera, while coughing is more pronounced in cases of swine plague. For a reliable differential diagnosis of the two diseases it is necessary to make pure cultures of the microorganisms that are concerned.

No satisfactory medicinal treatment has been devised for hog cholera. Recognized tonics which assist in keeping hogs in good physical condition may render them less susceptible to disease. A mixture containing sodium salts, sulphur, sulphide of antimony, and wood charcoal has proved as effective as any remedy.

The investigations carried on by agents of the United States Department of Agriculture which led to the discovery that this disease is caused primarily by a filterable virus were followed by experiments which have resulted in the production of an immune serum that is being successfully used in immunizing hogs against the disease. This immune serum is produced by the repeated injection of blood from a hog sick of hog cholera into vigorous immune hogs. Two methods of immunizing hogs against the disease are now practiced. The first, which confers a passive immunity, consists in the injection of the immune serum into the hog. While protecting against the disease for but a few weeks, it gives the grower sufficient time to fatten and market his drove after the disease appears. The second, known as the serum simultaneous method, which confers an active immunity, consists in the injection of the immune serum on one side of the body and a small amount of blood taken from a hog sick of hog cholera on the other side. This simultaneous method confers upon the injected pig a permanent and lasting immunity.

It has been found practically impossible to disinfect hog pens and yards after an outbreak of hog cholera. Infected pens should be burned, and the surrounding ground should be cultivated to some crop for at least a year before again using as a hog yard. Pens should be kept as clean as possible and treated from time to time with lime and whitewash. By observing these precautions, preventing infection of the water supply, and quarantining imported hogs before allowing them to run with the herd, the liability to infection from hog cholera will be much reduced. Consult Hutyra and Marek, *Special Pathology and Therapeutics of the Diseases of Domestic Animals*, vol. i (Chicago, 1912), and publications of the United States Bureau of Animal Industry and of the Department of Agriculture.

HOG DEER. The "para," or smallest of the East Indian rusine deer (*Cervus porcinus*), which takes its name from its habit of darting through the tall grass like a startled boar. It stands only 2 feet high at the withers. Its legs are comparatively short, and its antlers, having given off a brow tine, are nearly straight to the small terminal fork and are mounted upon remarkably high pedicels. The general color is rufous brown, paler in summer and somewhat spotted. This deer ranges through northern

India and down the coasts of Assam and Burma. It is very numerous, not gregarious, and forms a favorite object of jungle sport, sometimes by spearing.

HOGGE, hōg, MOSES DRURY (1819-99). An American Presbyterian minister. He was born in Hampden-Sidney, Va., was educated there, and was made assistant in a Richmond church in 1844. When a second Presbyterian church grew out of the first, Dr. Hoge became its pastor (1845-85), and during the Civil War he succeeded in securing from the British and Foreign Bible Society a very large number of volumes for the use of Confederate soldiers. He was joint editor of the *Central Presbyterian* (1862-67). A volume entitled *Perfection of Beauty and Other Sermons* was published in 1904.

HOG'FISH', or Hog'MOL'LY. A local name for the log perch (q.v.).

HOGG, hōg, JAMES (1770-1835). A Scottish poet, known as the Ettrick Shepherd, born in the parish of Ettrick, Selkirkshire, in 1770. His father was a poor farmer. The boy's education was slight, for he was taken from school to herd ewes. But from his mother he learned many folk tales of giants, fairies, and brownies. Beginning to make songs for lasses to sing in chorus, he next wrote them out with great labor. His first poem was published anonymously in 1800. Going to Edinburgh, in 1801, to sell his employer's sheep, he wrote out from memory a collection of his songs and published them roughly as *Scottish Pastorals, Poems, Songs, etc.* The next year he made the acquaintance of Scott, who was visiting the Ettrick Forest in search of material for the *Minstrelsy of the Scottish Border*. Several ballads which Hogg and his mother furnished Scott appeared in the third volume of the *Minstrelsy* (1803). In 1807 Hogg published *The Mountain Bard*, original ballads suggested by Scott. With the proceeds of this volume and a treatise on sheep, amounting to £300, Hogg took a farm, which proved a disastrous venture. In 1810 he went to Edinburgh and began as professional author with the *Forest Minstrel*, published in the last-named year. Three years later appeared his most imaginative poem, *The Queen's Wake*. By this time he was becoming acquainted, directly or through correspondence, with some of the most eminent men of letters, who admired him greatly. He married in 1820 and retired to the farm of Eltrive Lake in the valley of the Yarrow. In 1834 appeared his *Domestic Manners and Private Life of Sir Walter Scott*. He died Nov. 21, 1835, and was buried in the Ettrick churchyard. In 1860 a monument was erected to his memory, overlooking St. Mary's Lake. Hogg was immortalized as the Ettrick Shepherd by Wilson in the *Noctes Ambrosianæ*. Among his poems not cited above are *The Pilgrims of the Sun* (1815), *The Poetic Mirror* (1816), and *Songs* (1829). These and other poems place Hogg among the greatest of the peasant poets of Scotland. Well known are such songs as "When the Kye Comes Hame" and "Flora Macdonald's Farewell." Hogg also wrote many tales of uneven quality. The most remarkable is entitled *Confessions of a Fanatic* (1824). Interesting, too, is the volume called *Winter Evening Tales* (1820), depicting the manners of the border. Consult: *Works*, edited with memoirs by T. Thomson (London, 1865); "Poems," selected, in *Canterbury Poets* (ib., 1886); *Me-*

morials of J. Hogg, by his daughter, Mrs. Garden (ib., 1887).

HOGG, THOMAS JEFFERSON (1792-1862). An English biographer. He was born at Norton, Durham. In 1811 he was expelled from University College, Oxford, with Shelley for suspected complicity in bringing out *The Necessity for Atheism*. He became a conveyancer at York, studied law, was admitted to the bar in 1817, and became a revising barrister in 1833. He resumed his intimate relations with Shelley in 1814, published his reminiscences of the poet in 1832 in the *New Monthly Magazine*, and in 1844 received a £2000 bequest under Shelley's will. Supplied with the documents, he began in 1855 to write Shelley's biography, of which he produced the first two volumes in 1858 (re-published in 1906). The work was so unsatisfactory that members of Shelley's family obliged Hogg to discontinue the task he had started. Consult Richard Garnett, in *Dictionary of National Biography*, vol. xxvii (London, 1891).

HOG-NOSE. A harmless American serpent, remarkable for its blunt snout and curious manners. Three species form the colubrine genus *Heterodon*, all confined to North America, exclusive of the Pacific coast and Mexico. The best-known species (*Heterodon platyrhinus*) is one of our most common and widespread snakes. It is usually about 2, but may be 3, feet long and is normally reddish brown above, heavily blotched or obscurely barred with a darker tint, and underneath is greenish white. Great variety in color and markings exists, however, and many seem sooty black or dark slate all over. It is

HEADS OF HOG-NOSE SNAKES.

1, *Heterodon platyrhinus*. 2, face of same. 3, *Heterodon nasicus*. 4, *Heterodon simus*.

always to be recognized by its piglike snout and its extraordinary behavior when disturbed. It is timid, and will hide or escape when possible; but if surprised or cornered it will throw itself into vigorous contortions and perhaps soon tumble over on its back as if dead, or, more probably, it will inflate its long lung until its body swells up like a sausage, and at the same time extend its anterior ribs until its neck is surprisingly broad and flat, and then, opening wide its great mouth, will blow and hiss loudly. This alarming menace is meant to terrify its foes and has led to the popular names of "blowing viper," "spreading adder," etc., and to the general belief that it must be very poisonous. Its blotched back, easily mistaken by the unobserving for that of a copperhead, adds to its evil reputation. Nevertheless, this snake is entirely harmless, and when handled is found to be so gentle that it can hardly be forced to bite.

It feeds on mice, frogs, insects, birds' eggs, and so on, all obtained on the ground, for it is

unable to climb trees. It lays a number of eggs, about an inch in length, in loose soil, into which it burrows for this purpose. The eggs are covered with a tough parchment-like coat and probably hatch in a few days. There seems to be no precise time of laying; young have been reported from May until September. The young just issued from the egg will go through their contortions and hissing when molested, as do the adults. Much interesting information as to their breeding and other habits, collected by Abbott, Hay, and others, will be found summarized in Cope, *Crocodilians, Lizards, and Snakes*, published by the Smithsonian Institution (Washington, 1900).

The Southern States have a second species (*Heterodon simus*), and Texas and the Mexican border a third (*Heterodon nasicus*), in which the point of the snout is longer and more up-turned than in the Northern forms. See Plate of SNAKES, AMERICAN HARMLESS.

HOG PLUM, SPANISH PLUM, and BRAZILIAN PLUM. Names given in the West Indies and other tropical countries to the fruit of certain species of *Spondias*, a genus which belongs to the family Anacardiaceae. The species are trees and shrubs, with pinnate leaves, with terminal leaflets, and flowers in racemes or panicles. Some of them produce very pleasant fruits, among which may be mentioned *Spondias purpurea* and *Spondias lutea*, which are generally called hog plum in the West Indies, because the fruits are a common food of hogs. *Spondias purpurea* has fruit about an inch in length, ovate or oblong, purple or variegated with yellow; yellow pulp with a peculiar but agreeable acid and aromatic taste. The fruit of *Spondias tuberosa*, called imbuzeiro in the north of Brazil, is about twice the size of a large gooseberry, oblong, yellowish, with a leathery skin and sweetish-acid pulp. The tree is remarkable for the numerous round black swellings, about 18 inches in diameter, which it produces on its widely spreading roots, and which are very cellular and full of water. They are evidently intended for the wants of the tree in the dry season and are often dug out by travelers for the sake of the water, of which each full-grown knot yields about a pint. An important species is the ti or Tahiti apple (*Spondias dulcis*), a very fine fruit of the South Sea Islands. This tree often attains a height of 50 to 60 feet and, according to Seeman, is laden with fruits averaging a pound each.

HOG RAT. See HUTIA.

HOGS-HEAD. An old English measure of capacity. For wine, it was equivalent to 63 gallons or 52½ imperial gallons; for ale, 48 gallons; and for beer, 54 gallons. In the United States it is still used as a measure for liquids, equivalent to two barrels, or 63 gallons, each of 231 cubic inches. Section 3339 Revised Statutes, in referring to standard barrels of fermented liquids, says, "more than one barrel, and not more than sixty-three gallons, shall be accounted two barrels, or a hogshead." When used for tobacco, the hogshead varies by custom rather than by statute, in different States ranging from about 750 to 1200 pounds; it is usual, however, to mark the actual net weight of the contents on the hogshead.

HOGUE, ♂g, or **HOUGUE**, ♂og, LA. A roadstead near the northeast extremity of the peninsula of Cotentin, Normandy, a few miles south of Barfleur. It gives its name to the naval

battle of May 29 (old style May 19), 1692, when the combined English and Dutch fleets, under Admiral Russell, defeated the French fleet commanded by Tourville. The name of La Hogue is often confounded with La Hague, the name of the cape at the northwest extremity of Cotentin.

HOH. See QUILLAYUTE.

HOHENBERG, hō'en-bĕrk, SOPHIE, DUCHESS OF (1868-1914). The morganatic wife of Francis Ferdinand, Archduke of Austria (q.v.), with whom she was assassinated at Serajevo, Bosnia, in June, 1914. She was born at Stuttgart, Württemberg, and before her marriage to the Archduke in 1900 was known as the Countess Chotek. She was the mother of Princess Sophie (born 1901), and of Princes Maximilien Charles (born 1902) and Ernest (born 1904); but her children were excluded from succession to the Austro-Hungarian throne by the laws of the Empire.

HOHENHEIM, hō'en-hīm, PHILIPPUS, A. P. VON. See PARACELSUS.

HOHENLINDEN, hō'en-lin'den (Ger. tall lindens). A village in Upper Bavaria, 19 miles east of Munich, celebrated for the victory gained there by the French, under Moreau, over the Austrians under Archduke John, Dec. 3, 1800. Moreau's army was posted on the plateau between the Isar and the Inn and barred the way to Munich, which was the Archduke's objective point. In three columns the Austrians advanced to the attack through forest and ravines in a blinding snowstorm. Moreau contented himself with holding them in check until Richepanse, whom he had sent around the enemy's flank, reached the Austrian rear. Then he hurled Ney against their front. Richepanse delivered his attack from the rear, and the Austrian army was destroyed between the two French forces. The Austrians lost 20,000 men (including 10,000 prisoners) and 100 guns, while Moreau's loss amounted to only 5000. The battle hastened the conclusion of peace at Lunéville, Feb. 9, 1801.

HOHENLOHE, hō'en-lō'e. Formerly an earldom, later a principality, in Franconia, Germany. It lost its sovereignty and was divided in 1806, the main portion being assigned to Württemberg and a part to Bavaria.

HOHENLOHE. A princely family of Germany, claiming descent from Eberhard, one of the early dukes of Franconia. The family first appears in history in the early part of the twelfth century in possession of the castle of Holloch, near Uffenheim. The first Count we hear of is Heinrich, who lived in the twelfth century. He left two sons, Konrad and Gottfried, who followed the fortunes of the Hohenstaufen and founded respectively the lines of Hohenlohe-Brauneck and Hohenlohe-Holloch. The former became subdivided into the Haltenbergstetten and Brauneck branches, both of which were extinct in 1390; the latter into the Weikersheim and Uffenheim, or Speckfeld, branches, of which the latter became extinct in 1412. In 1551 a new division in the Weikersheim line gave rise to the branches of Hohenlohe-Neuenstein and Hohenlohe-Waldenburg, which still continue. In the Reformation the Neuenstein branch became Protestant, while the Waldenburg counts remained Catholic. Princely rank was conferred upon the latter branch in 1744 and on the former in 1764. Of the Neuenstein branch, there were two lines—

Oehringen, extinct in 1805 (see *MEDIATE*), and Langenburg, the latter being further subdivided into the Hohenlohe-Ingelfingen (Oehringen after 1805) and Hohenlohe-Kirchberg (extinct in 1861). The Waldenburg branch formed two lines—Bartenstein, with the cadet branch of Jagstberg, and Schillingsfürst, to which was added the Duchy of Ratibor. Among the prominent members of the Hohenlohe family are:

FRIEDRICH LUDWIG, PRINCE OF HOHENLOHE-INGELFINGEN (1746-1818). A Prussian general. He distinguished himself at the storming of Weissenburg (1793) and won the battle of Kaiserslautern (Sept. 20, 1794). After the defeat of Jena, in which he shared, he succeeded the Duke of Brunswick in command and capitulated at Prenzlau with 17,000 men (Oct. 28, 1806). For this he was severely censured and forced to retire from further participation in the campaign.—**KRAFT KARL AUGUST EDUARD FRIEDRICH, PRINCE OF HOHENLOHE-INGELFINGEN** (1827-92). A Prussian general of artillery. He received a thorough training for the artillery service and was placed in several positions of responsibility. He served with distinction through the Crimean War. In 1866 he held an important command at Sadowa, and in 1870 he commanded the artillery of the Guards in all its engagements, including Saint-Privat and Sedan. He was chief of artillery at the siege of Paris. He was made a lieutenant general in 1873, adjutant general in 1875, general of infantry in 1883, and general of artillery in 1889. He died in Dresden, Jan. 16, 1892. He was the author of several works on military science: *Militärische Briefe* (1887-90); *Strategische Briefe* (1887); *Die Feldartillerie in ihrer Unterstellung unter die Generalkommandos* (1889); *Ideen über Befestigungen* (1888); also, *Gespräche über Reiterei* (1887).—**CHLODWIG KARL VICTOR, PRINCE OF HOHENLOHE-SCHILLINGSFÜRST, DUKE OF RATIBOR AND KORVEI** (1819-1901). Chancellor of the German Empire from 1894 to 1900. He was born March 31, 1819, at Rotenburg-an-der-Fulda. His mother was a princess of Hohenlohe-Langenburg. He studied political science and jurisprudence at Heidelberg, Göttingen, and Bonn. Before he came to his title of Duke of Ratibor and of Korvei, in 1845, he held offices in connection with the law courts at Ehrenbreitstein and Potsdam. In the Bavarian Diet he opposed the Ultramontane policy, and in 1866 he strove to bring over Bavaria to the side of Prussia. At the close of the year he became Bavarian Minister of Foreign Affairs and President of the Ministerial Council, holding office till March, 1870. It is now that his importance in history begins. His efforts in behalf of a united Germany long met with fierce opposition, but he saw clearly the triumph of the cause for which he had worked, and entered the First German Reichstag as a member of the *Reichspartei*. In 1874 he was appointed German Ambassador to Paris, and in 1878 he was the third German Plenipotentiary at the Congress of Berlin. In 1885 he became Governor of Alsace-Lorraine, in which position he displayed conspicuous tact. On the resignation of Count Caprivi, in 1894, Prince Hohenlohe was created Imperial Chancellor. This office he resigned in 1900, being succeeded by Count von Bülow. During his long career in German politics Prince Hohenlohe did much to promote German unity. He had to face the hostility of the anti-Unionists in Bavaria and was one of Bismarck's chief

supporters in that statesman's Imperial policy. As Chancellor, he promoted the colonial policy and favored the creation of a powerful navy. He was a favorite with William II up to the time of his resignation, in October, 1900. It was said that the cause of his resigning the chancellorship was dissatisfaction with the Emperor's aggressive policy, especially in so far as it related to China. He died at Ragatz, Switzerland, July 6, 1901. Consult his *Denkwürdigkeiten* (Stuttgart, 1906; Eng. trans., New York, 1906), which caused an international sensation on their appearance. They supersede all his biographies.—GUSTAV ADOLF (1823-96), PRINCE OF HOHENLOHE-SCHILLINGSFÜRST. A brother of the Chancellor. He took holy orders in 1849 and became in 1857 Bishop of Edessa in partibus and almoner to Pius IX. He was made Cardinal in 1866, and endeavored to prevent the Kulturkampf (q.v.). He was sent to Rome in 1872 as Ambassador to the Holy See, but his appointment was rejected by Pius IX. He returned to Rome in 1876 and subsequently gained the favor of Leo XIII. From 1879 to 1884 he was Bishop of Albano and became subsequently archpriest of Santa Maria Maggiore in Rome. He died in Rome, Oct. 30, 1896.—HERMANN, PRINCE OF HOHENLOHE-LANGENBURG (1832-1913). He entered the Württemberg army, was in the Austrian service from 1854 to 1860, and was a general in the army of Baden from 1862 to 1871. After 1860 he was a member of the Upper Chamber of Württemberg, but was represented by his son after 1895; Vice President in 1893. He was a member of the Imperial Reichstag from 1871 to 1880 and acted with the *Reichspartei*. (See POLITICAL PARTIES, Germany.) From 1894 to 1907 he was Governor of Alsace-Lorraine. He was the founder and president (1887-94) of the Deutsche Kolonialgesellschaft. He held the military rank of general of cavalry in the Prussian army.—ERNST, PRINCE OF HOHENLOHE-LANGENBURG (1863-), son of the preceding, was born at Langenburg and studied at the universities of Bonn, Tübingen, and Leipzig. In 1889 he entered the army as a lieutenant colonel. From 1900 to 1905 he was Regent of Saxe-Coburg-Gotha. He was a member of the Upper Chamber of Württemberg after 1895 and of the German Reichstag (1907-11; second Vice President, 1909-10).

HOHENSTAUFEN, hō'en-stou'fen. A princely house of Swabia in Germany, which held possession of the German Imperial throne from 1138 to 1254, except for a few years in the early thirteenth century. The family traced its descent from Frederick of Biren, who lived in the second half of the eleventh century, and whose son, Frederick of Staufeu, built the castle from which the family derived its name, some vestiges of which are still to be seen on the summit of the Hohenstaufen, close to the town of Göppingen, Württemberg. The son, Frederick of Staufeu, was a faithful partisan of the Emperor Henry IV and in return received Henry's daughter and the Duchy of Swabia in 1079. Duke Frederick, at his death in 1105, left two sons—Frederick II the One-Eyed and Conrad; the former was immediately confirmed in the possession of Swabia by Henry V, and in 1112 the latter received the Duchy of Franconia. Upon the death of Henry V in 1125 his family estates fell to the house of Hohenstaufen. It seemed, too, as if the Imperial dignity would be conferred upon Frederick on account of his

talents and popularity; but Lothair of Saxony, his rival and enemy, was elected as Henry V's successor. On Lothair's accession he demanded the Imperial possessions held by the house of Hohenstaufen, and a war ensued between him and the Hohenstaufen princes, in which Lothair was supported by the house of Welf (Guelph). In the course of this struggle Conrad was crowned King of Italy in 1128; but the two brothers were forced to make peace with Lothair in 1135 and afterward lent him their support. After Lothair's death Conrad was elected King of Germany, in 1138, as Conrad III (q.v.). Under Conrad III the house of Hohenstaufen waged war against the house of Guelph, which for a brief time was weakened by the loss of Bavaria.

On Conrad's death, in 1152, his nephew, Frederick I Barbarossa, became Emperor. As he was the offspring of a Hohenstaufen father and a Guelph mother, it was hoped that the struggle between the two houses might be ended by his accession. But the defiant attitude of Henry the Lion, Duke of Saxony and Bavaria, the powerful representative of the Guelph family, caused the conflict to break out afresh in 1180. Henry the Lion was conquered and deprived of most of his possessions. Frederick went on the Third Crusade, but died in 1190, before reaching Jerusalem. His son, Henry VI, succeeded to the throne without opposition. By a marriage with the heiress of Sicily and by conquest he added southern Italy and Sicily to the Empire. He exercised the most far-reaching power of all the Hohenstaufens and dreamed of a world-wide empire. Richard the Lion-Hearted of England was obliged to become his vassal in order to be freed from captivity. Some of the Christian rulers in the East had sought protection from Henry, and he sent an army to the Holy Land, "the German Crusade" (see CRUSADE) to establish his own supremacy. His plans were frustrated by his early death, in 1197. His son, Frederick II, had already been crowned King of Germany, but as he was only a child of three his rights were passed over. The Guelphs chose Otho of Brunswick, son of Henry the Lion, and the choice of the partisans of the Hohenstaufen fell upon Philip of Swabia, uncle of Frederick II. Civil war followed, the contest terminating with the assassination of Philip in 1208 by Otho of Wittelsbach. For a time Otho of Brunswick (Otho IV) was recognized as ruler; then his opponents rallied about Frederick II, who in the meantime had been ruling his Kingdom of Sicily, which he had inherited from his mother. Frederick was crowned and by 1215 was recognized by all except a few obstinate partisans of Otho IV. He ruled over Germany, Italy, and Sicily, and also became King of Jerusalem. His reign was spent to a great extent in a struggle with the papacy. The partisans of the Hohenstaufen in Italy and the opponents of the Imperial power, in general the supporters of the papacy, were known respectively as Ghibellines and Guelphs. (See GUELPHS AND GHIPELLINES.) After Frederick's death, in 1250, the inveterate animosity of the Guelphs followed his son, Conrad IV, who abandoned Germany for his hereditary Italian possessions and died in 1254. After Conrad's death his half brother, Manfred, fought for the Hohenstaufen interests until he was defeated and killed at the battle of Benevento, in 1266, against Charles of Anjou, who at the invitation of the Pope had undertaken

the conquest of the Two Sicilies. Manfred's sons were kept in prison until his death. His daughter married Peter III of Aragon, who later avenged the destruction of the Hohenstaufen by expelling their foes from the Kingdom of Sicily. Conrad's young son, Conradin, in an attempt to reconquer the Two Sicilies, was taken captive by Charles of Anjou at the battle of Tagliacozzo and executed at Naples on Oct. 29, 1268. Enzo, an illegitimate son of Frederick II, who had been made King of Sardinia, died in prison four years later. Thus all of the male descendants of Frederick II perished. The emperors of this family rank among the ablest rulers of Germany and hold the first place in popular German tradition to-day, just as they held the first place in the affections of the people during their lifetime. They appear in general as men possessed of great virtues and of great faults and impressive by reason of both. Frederick Barbarossa, according to the legend, which was originally told of Frederick II, is not dead, but asleep, and will wake to help his people in time of need. Frederick II is one of the most remarkable figures of the Middle Ages in his character as ruler, knight, scholar, and freethinker. Consult Friedrich von Raumer, *Geschichte der Hohenstaufen* (5th ed., 6 vols., Leipzig, 1878), and Jastrow and Winter, *Deutsche Geschichte im Zeitalter der Hohenstaufen* (2 vols., Berlin, 1893-1901). See also articles on the individual emperors.

HOHENSTEIN, hō'en-shtin, COUNT. See THUN UND HOHENSTEIN.

HOHENSTEIN-ERNSTTHAL, ernst'täl. A manufacturing town in the Kingdom of Saxony, 12 miles northeast of Zwickau. It produces chiefly textiles and knit goods, gloves, machinery; in the neighborhood are mines of sulphur, copper, arsenic, and gold. Hohenstein and Ernstthal, formerly two cities, were incorporated together in 1898. Pop., 1900, 13,397; 1910, 15,776.

HOHENWART, hō'en-värt, KARL, COUNT (1824-99). An Austrian statesman, leader of the Federalist party. In 1868 he became Governor of Upper Austria and three years afterward succeeded Potocki as President of the Ministry. In his cabinet he held the portfolio of the Interior. His Federalist policy met with such opposition on the part of the Hungarian Ministry and the German Liberals that he was forced to resign after holding office for less than a month. He was elected to the Lower House in 1873 and became a leader of the Right Centre, which had a coalition majority under Taaffe's ministry (1879-91). In 1885 Hohenwart was appointed president of the Supreme Court of Accounts, and in 1891 he formed the Hohenwart Club, a strongly conservative body consisting of German Conservatives, Slovenes, Croats, and Rumanians, as well as the great landed proprietors of Bohemia. But this party broke in 1896, through the defection of the German members, and in 1897, on the appointment of its leader to the Upper House, it disintegrated entirely.

HOHENZOLLERN, hō'en-tsōl'ern. A province of Prussia, consisting of a narrow strip of land entirely surrounded by Württemberg and Baden, and covering, together with its nine exclaves, an area of about 440 square miles (Map: Germany, C 4). Previous to 1850 it was divided into two parts, Hohenzollern-Sigmaringen and Hohenzollern-Hechingen, but they were united to form the Government of Sigmaringen. It

extends from the Neckar in the northwest to the vicinity of Lake Constance and is divided by the Rauhe Alb, which rises in places to 3000 feet. The Danube crosses the province in the south, the Neckar in the north. The mountain valleys are productive and yield grain, fruit, hops, etc. The Alb chain yields some iron, gypsum, coal, and peat, and in other mountains some deposits of rock salt are found. Mineral springs abound. Some manufacturing is done in the way of cotton spinning and the production of iron; but the chief industries are agriculture and cattle raising. Since 1873 it has had a Landtag sitting at Sigmaringen. It sends one deputy to the Reichstag. Pop., 1900, 66,783; 1910, 71,011. The inhabitants are nearly all Roman Catholics, and the province forms a dependency of the Archbishop of Freiburg. On a steep eminence near Hechingen stands the magnificent castle of Hohenzollern, erected in the second half of the nineteenth century, in the style of the fourteenth century, on the ruins of the mediæval stronghold, the cradle of the reigning Hohenzollern dynasty of Prussia.

HOHENZOLLERN. The family name of the royal house of Prussia, in which has been vested also, since Jan. 18, 1871, the dignity of German Emperor. The name is derived from the ancestral Castle Zollern, or Hohenzollern, in Swabia. The origin of the house is involved in obscurity, and the story of its descent from Count Thasilo, a Swabian noble of the time of Charles the Great, is a fiction of the sixteenth century. The family name occurs as early as the eleventh century in the persons of Burchard and Wezel of Zolorin, who were killed in 1061; but whether there is any relationship between these and the succeeding Hohenzollern family is a matter of doubt. The house of Hohenzollern occupied a prominent position among the petty princely families of Swabia as early as the first half of the twelfth century, and at the close of that century (1192) we find Count Frederick of Zolorin invested with the Burgraviate of Nuremberg, an Imperial office, which descended to his posterity. His sons, Frederick and Conrad, divided the possessions of the house in 1227, founding the Swabian and Franconian lines respectively. From the close of the sixteenth century the elder, or Swabian, branch of the house of Hohenzollern existed in the two lines of Hohenzollern-Hechingen and Hohenzollern-Sigmaringen. In 1695 a pact of inheritance was made between these branches and that of Brandenburg (see below). In 1821 a new covenant was drawn up and confirmed by the King of Prussia, as head of the Hohenzollern family, by which it was provided that in case of failure of male issue in either line possession should pass to the other and on the extinction of both lines should vest in the royal family of Prussia. But before the prospect of extinction presented itself the princes of Hohenzollern-Hechingen and Hohenzollern-Sigmaringen, after the commotions of the revolutionary year 1848, decided to abdicate in favor of the King of Prussia. The act of renunciation took place at the close of 1849, and Frederick William IV took possession of the two principalities in the following year, the two princes being given annual pensions. Leopold of Hohenzollern, the prince who was offered the crown of Spain in 1870, an offer which was the immediate cause of the Franco-Prussian War, was the eldest son of the last ruler of Hohenzollern-Sigmaringen. The second son, Charles,

became Prince and King of Rumania, and died in 1914.

The great destiny of the family was reserved for the cadet branch, the Franconian line. They attached themselves to the Hohenstaufen until that great house became extinct, when they gave their support to Rudolph of Hapsburg. During the civil war which followed the double election of 1314 they sided with Louis of Bavaria against the house of Austria, but subsequently they became once more faithful supporters of the Hapsburgs. Acquisitiveness and a capacity to hold what was once obtained and to administer it with thrift seem to have characterized to a greater or less degree all the Franconian Hohenzollern princes. From the founder of the line, Conrad III (died 1261), there was a steady gain in territory and influence under Frederick III (1261-97), Frederick IV (1297-1332), John II (1332-57), and Frederick V (1357-98). The possessions of the house, in which was vested the Burgaviate of Nuremberg, were constituted into the two margraviates of Bayreuth (originally Culmbach) and Anspach. The sons of Frederick V, John III and Frederick VI, possessed respectively Bayreuth and Anspach, the latter inheriting his brother's possessions in 1420. Frederick VI in 1411 received the Margraviate of Brandenburg as a pledge for a loan to the Emperor Sigismund, and in 1415 it was granted to him as an hereditary possession, together with the dignity of Elector. This was the foundation of the real greatness of the house of Hohenzollern.

The Elector Albert Achilles of Brandenburg by the so-called *Dispositio Achillea* of 1473 decreed that the Franconian margraviates (Anspach and Bayreuth) should be separated from Brandenburg and ruled as secundogenitures. The last Margrave of Bayreuth died in 1769, when the state was united with Anspach. In 1791 the Margrave of Anspach and Bayreuth sold his principalities to Prussia, which, however, retained them only a few years.

The electors of Brandenburg were as follows:

Frederick I (the Frederick VI mentioned above)	(1415-1440)
Frederick II.....	(1440-1470)
Albert Achilles.....	(1470-1486)
John Cicero.....	(1486-1499)
Joachim I Nestor.....	(1499-1535)
Joachim II Hector.....	(1535-1571)
John George.....	(1571-1598)
Joachim Frederick.....	(1598-1608)
John Sigismund.....	(1608-1619)
George William.....	(1619-1640)
Frederick William, the Great Elector.....	(1640-1688)
Frederick III.....	(1688-1713), after 1701, King Frederick I of Prussia

The Hohenzollern kings of Prussia since Frederick I have been as follows:

Frederick William I.....	(1713-1740)
Frederick II the Great.....	(1740-1786)
Frederick William II.....	(1786-1797)
Frederick William III.....	(1797-1840)
Frederick William IV.....	(1840-1881)
William I.....	(1861-1888), after 1871, German Emperor
Frederick III.....	(1888)
William II.....	(1888-)

The history of the Hohenzollern family from the fifteenth century is that of BRANDENBURG, PRUSSIA, and GERMANY. Consult: Stillfried-Alcantara and Kugler, *Die Hohenzollern und das deutsche Vaterland* (Munich, 1881), a well-ordered account, dedicated to Emperor William I and presumably having a semiofficial standing; Albert Waddington, *L'Acquisition de la couronne royale de Prusse par les Hohenzollern*

(Paris, 1888), a valuable study of Hohenzollern history in the seventeenth and eighteenth centuries, with many documents; Paul Seidel, *Hohenzollern-Jahrbuch, Forschungen zur Geschichte der Hohenzollern in Brandenburg-Preussen* (Leipzig, 1897-1914); Linau, *Hohenzollern* (Berlin, 1905); Herbert Tuttle, *History of Prussia* (4 vols., Boston, 1884-96), one of the best products of American historical scholarship, cut short at 1757 by the death of the author.

HOHLFELD, hōl'fēld, ALEXANDER RUDOLF (1865-). An American Germanic scholar, born at Dresden, Germany. He received his Ph.D. from the University of Leipzig in 1888 and studied at Paris in 1889. At Vanderbilt University he was instructor in French (1889-90), adjunct professor of Romance languages (1890-92), professor of Germanic languages (1892-1901), and dean of the academic department (1900-01). In 1901 he became professor of German at the University of Wisconsin, and in 1913 he was president of the Modern Language Association of America. He is author of *Die altenglischen Mysterienspiele* (1888) and *The Teaching of the History of a Foreign Literature* (1905), was editor in chief of a *Deutsches Liederbuch für amerikanische Studenten* (1906), and contributed to American and German periodicals.

HÖHNEL, hē'nel, LUDWIG VON (1857-). An Austrian explorer, born at Pressburg and educated at the Naval Academy of Fiume. In 1886 he accompanied Count Teleki in the journey from Zanzibar, on which Lakes Rudolph and Stephanie were discovered, and a large area, before unknown, carefully plotted on Höhnel's maps. The expeditions proved the connection between the Abyssinian plateau and the Rand. Lieutenant Höhnel described the results of his journey in his book *Zum Rudolfsee und Stefanieesee* (1892). In 1892-93 he explored with an American traveler, William Astor Chanler (q.v.), the country between the rivers Tana and Juba in Central Africa. Consult W. A. Chanler, *Through Jungle and Desert* (New York, 1896).

HÖHSCHIED, hē'shit. A town of the Prussian Rhine Province, situated on the Wupper, 17 miles east-southeast of Düsseldorf. It has extensive manufactures of steel products, machinery, pocketbooks, and corsets. Pop., 1900, 14,172; 1910, 16,088.

HOIHOW, hoi'hou'. The seaport of Kiungchow (q.v.).

HOININGEN, hoi'ning-en, BARON VON. See HUENE, KARL.

HOJÉDA, ô-hā'dā, ALONSO DE. See OJÉDA.

HŌJŌ, hō'jō. The name of five towns in Japan, from one of which, in Idzu (q.v.), arose the celebrated family of regents known as the Hōjō, which during the era of the puppet Shoguns at Kamakura (1219-1333 A.D.) ruled the Empire. During their régime Buddhism developed rapidly, and the Mongol invaders under Kublai Khan were driven off and their armada destroyed. The Hōjō were overthrown by one Nitta Yoshisada in 1333. Consult: Adams, *History of Japan*, vol. i (London, 1884); Frank Brinkley, *Japan: Its History, Arts, and Literature* (Boston, 1901-02); W. E. Griffis, *The Mikado's Empire* (11th ed., New York, 1906).

HOKIONG. See FUKIEN.

HOKITIKA, hō'kē-tē'kā. The capital of

Westland County, on the northwest coast of South Island, New Zealand (Map: New Zealand, S. I., C 3), 24 miles southwest of Greymouth. It has rail connections and thriving agricultural industries, while gold mining, formerly of great importance, is carried on. Pop., 1901, 1951; 1911, 2291.

HOKKAIDO, hōk'kī'dō. See YEZO.

HOKOW, hō'kou'. The name of a number of towns in China, the most important of which are the following: 1. A town in the Province of Kiangsi, on the right bank of the Poyang-hu Lake, opposite Kiukiang (Map: China, L 6). It has an extensive trade in black tea. Pop. (est.), 300,000. 2. A treaty port in the northern part of the Province of Yunnan, on the left bank of the Red River, nearly opposite Laokai in Tongking, with which it is connected by a suspension bridge, completed in 1900. It has about 4000 inhabitants and was opened for foreign trade, as the first subport of entry for the Mengtze District, in accordance with the supplementary convention between China and France of June 20, 1895. The trade is not large. 3. A small town in the northern part of the Province of Shansi, at the confluence of the Hei-shui and the Hoang-ho. It lies near the beginning of the highway to Peking and has important soda works.

HOKUSAI, hōk'ō-sī (1760-1849). A noted Japanese artist. He was born at Honjō in Yeddo (now Tokyo), son of an artisan named Nakashima Ise, a maker of metal mirrors in the employ of the Shogun of the time. Little is known of his life beyond what he himself tells in the prefaces to his numerous works. At 13 he left home and apprenticed himself to an engraver. Five years afterward he gave up engraving to study with Shunsho, the most noted designer of the time, but was expelled in 1786 for persistently indulging in a style that was displeasing to his master. He tried to make a living by illustrating comic books, but, not meeting with success, he became a peddler, continuing to draw and paint as he had opportunity. In order to attract attention and raise money he in 1804 exhibited his dexterity by painting in public a colored figure of a Buddhist saint on a sheet of paper 18 yards long and 11 yards wide, using brooms for brushes and buckets to hold his liquid India ink. Three years later he became associated with Bakin, the novelist, and collaborated with him in illustrating a work translated from the Chinese by Bakin and containing 108 portraits of Chinese heroes. This appeared in 1828. His connection with Bakin lasted only four years, and he was again adrift. His public career really did not begin until 1810, when he became an industrial artist and a teacher of drawing. Pupils flocked to him in numbers so great that he could not supply them with original drawings of his own as models, so he began wood engraving in order to furnish the needed number. In this way his *Mangwa*, or album of 'Ten Thousand Sketches,' took form, and his fame spread as volume after volume and edition after edition appeared. The later volumes of this series appeared in 1836, a year after his *Fugakū Hyakūkei*, or *Huji Hyakke* (A Hundred Views of Fujisan). His industry was great, and his works numerous. Thirty thousand drawings of his have been counted up, yet he was always in poverty. He died April 13 (some say May 10), 1849, at Asakusa, a district of Yeddo.

Money for his funeral was provided by his pupils and admirers.

Hokusai was a man of the people to the end. He never rose above his class and never made any attempt to do so. His talent lay in producing *Ukiyo-ye* (pictures of this passing world), free from the conventionalities of his predecessors and his contemporaries. His influence on modern art has been very great. His whole life was spent in perfecting himself; yet when he came to die his last words were "If Heaven would only grant me ten more years!" and a moment later, "If Heaven had only granted me five years more, I could have been a thorough artist." His signatures were numerous. In 1798 he appears under the name of Sori, and in 1800 he called himself simply Hokusai (North Studio). A favorite signature was Hokusai Gwa-kyo Rōjin (Hokusai, the old man crazy about drawing). His latest name was Manji (the Swastika), and the inscription over his grave is the one he preferred—Manji Gwa-kyo Rōjin. A full list of his works (with a bibliography) is in Anderson's *Descriptive and Historical Catalogue of Chinese and Japanese Art* (London, 1886).

HOL, RICHARD (1825-1904). A widely known Dutch pianist, organist, and composer, born at Amsterdam. A brilliant exponent of the modern Romantic German school, he received many decorations and foreign orders for his services to the cause of music. He was director of the Amstels Männerchor (1856), director of the Society for the Promotion of Music (1857), city musical director of Utrecht (1862), cathedral organist (1869), director of the School of Music (1875). Hol was perhaps better known in America as a composer of part songs for male or female voices. His compositions include an oratorio, two operas, four symphonies, masses, songs, chamber music, orchestral music, etc. His male choral works are standard with the leading men's choruses.

HOLABIRD, SAMUEL BECKLEY (1826-1907). An American soldier, born in Canaan, Conn. He graduated at West Point in 1849, served with the Army of the Potomac (1861-62), and became brigadier and quartermaster-general (1883), as well as translator for the army. His chief translation was General Jomini's *Treatise on the Grand Military Operations of Frederick the Great* (1865).

HOLADIN. An extract of the pancreas, the entire gland being used. Holadin possesses the property of digesting starch and proteids and splitting up fats in the same way as the pancreatic juice. It is given in capsule form and is useful in some cases of indigestion.

HOLARCTIC REGION (from Gk. ὅλος, *holos*, entire + ἀρκτικός, *arktikos*, northern, from ἀρκτος, *arktos*, bear). A division in zoogeography, defined in two senses: 1. *Arctogæa*.—In the larger sense the term is used unhappily as a synonym for "Arctogæa." (See DISTRIBUTION OF ANIMALS; NOTOGÆA.) This "region" em-

braces all of the Northern Hemisphere except the hot coast regions of Central America, all of Africa and Madagascar, and an indefinite extent of the Malayan and Polynesian islands, where its boundaries vary in different classes of animals; in other words, it is a combination of the Nearctic, Palearctic, Paleotropical, and Oriental regions of Scater and Wallace, as opposed to the combined Neotropical and Australasian regions (Notogæa). The fundamental difference between Arctogæa and Notogæa reaches back to an early geological period, while many of the present distinctions between their subdivisions disappear when traced back to the Tertiary, when the distribution of animal life was very different from now. It is this broad historical view, rather than the modern aspect, which has led naturalists to the generalizations of Arctogæa and Notogæa. Limiting the comparison to vertebrate animals, the characteristics of Arctogæa are in outline as follows: Among fishes, the perches, carps, salmons, and sturgeons are present as whole tribes, together with many lesser groups, especially of freshwater or coast fishes, while the lungfishes are conspicuous absentees. In the class Amphibia the line is drawn at the frog family, Cystignathidæ, which is entirely Arctogæan. Gadow also points out the predominance of Arcifera, which constitute nine-tenths of the anurous population and are hardly represented in Notogæa. Of turtles, the presence of Trionchoidea and the absence of Chelydida are distinctive. Of lizards, exclusively Arctogæal groups are the Lacertidæ, Zomoridæ, Gerrhosauridæ, and Aneliidæ. Among the snakes, the viper family is entirely Arctogæal, and the crotaline tribe mainly so. Lesser exclusive groups are the Uropeltidæ, Xenopeltidæ, and many genera. Ornithological distinctions may be most easily sketched by saying that Arctogæa possesses no emus or cassowaries, no mound birds, birds of paradise, lyre birds, cockatoos, tinamous, curassows, hoatzins, toucans, cotingas, or many others, although it is rich in game birds, finches, woodpeckers, wood warblers, and the like. But perhaps the most striking difference is the presence of the large Arctic tribe of auks and the like and the absence of penguins. Among mammals, also, the most notable feature is the entire absence of edentates, of monotremes, of marsupials (except one opossum), of cebine monkeys, and of marmosets. The northern region, however, has the lemurs, the insectivores except the West Indian Solenodon, the elephants, rhinoceroses, hyraces, horses, deer, giraffes, bovines, hyenas, hares, and a variety of other important families; it is, in fact, as Beddard points out, the headquarters of all the Eutheria except edentates and marsupials.

2. *Holarctic, or Periarctic, Province.*—In a more restricted and perhaps more usual sense the term "holarctic" in zoogeography denotes a circumpolar district formed by the union of the Palearctic and Nearctic provinces of Scater and Wallace, elsewhere described. It was long ago felt that the faunal characteristics of North America and the northern part of the Old World were not sufficiently distinct to justify their separation into two provinces. Their union under one name was first made by A. Heilprin, who proposed "Triarctic" as the new designation. For this A. Newton suggested the substitution of "Holarctic," which Heilprin at once adopted. More recently Gadow has used "Peri-

arctic" as a synonym, on the ground that it is more precise. Its faunal characteristics are those sketched in the first paragraph, with the omission of such forms as are exclusively Ethiopian (Africa, south of the Sahara) or Oriental (the Asiatic coast and islands south of the Himalayan watershed). The faunal agreement between North America and the northern part of the Old World is greater than any differences. There are few families not represented in both, and the distinctive animals are mainly local genera or species, while a great many apparently identical forms occur on both continents, having a circumpolar distribution due either to their powers of travel or to ancient land connections. Consult: Angelo Heilprin, *Geographical and Geological Distribution of Animals* (New York, 1887); Alfred Newton, *Dictionary of Birds* (ib., 1896); J. G. Bartholomew, *Atlas of Zoogeography* (London, 1911), and the authorities referred to under DISTRIBUTION OF ANIMALS. See also NEARCTIC REGION; PALEARCTIC REGION.

HOLBACH, ôl'bäg, PAUL HENRI THYRY D'BARON (1723-89). A French philosopher of the eighteenth century and one of the Encyclopædists. (See ENCYCLOPÉDIE.) He was born of wealthy parents at Heildelsheim in the Palatinate in 1723. At an early age he went to Paris, where he continued to reside during the remainder of his life. His personal popularity and his generous hospitality drew to his house the most eminent thinkers and writers of the day, such as Condorcet, Diderot, Duclos, Helvétius, Raynal, Rousseau, Buffon. The witty Abbé Galiani called Holbach the *maître d'hôtel* of philosophy. Here speculation, it is said, was carried to such daring lengths that Buffon, D'Alembert, and Rousseau were compelled to withdraw from the circle. Holbach was the zealous champion of naturalism and contended not only against Christianity but against all positive religion. His principal work, the *Système de la nature* (published anonymously in 1770), has been called the "Bible of Naturalism." In this work the author endeavors to expound the principles of morality upon a sensualistic, materialistic, deterministic, egoistic, and atheistic basis. For him God is only an ideal being, created by kings and priests. The work is in no sense original, but gives voice to the materialism of the French *philosophes* of the eighteenth century, which is nowhere more openly advocated than in the writings of Holbach. In 1774 he published *Système Social* (London) and in 1776 *Ethocratic; ou le gouvernement fondé sur la morale* (Amsterdam). He was a man of good heart and of most unselfish benevolence. When the Jesuits fell into disgrace during the reign of Louis XV, Holbach, though he hated their system and had written against them in the days of their prosperity, made his house an asylum for his old foes when the clouds gathered around them. Many anonymous works besides the *Système* have been attributed to Holbach.

HOLBEIN, hól'bín, HANS, THE ELDER (c.1460-1524). A noted German painter of the Swabian school. The little known of his life is derived from the tax and court records of Augsburg, where he was born, the son of the tanner Michael Holbein, and where he resided at intervals for many years, alternately prosperous and in want. He is mentioned as a citizen of Ulm in 1499 and two years later was active in Frankfurt. In 1502 he was again in Augsburg, where in 1506-08 he executed commissions for the cathedral, the records of which show him in dire financial straits. In 1517 he was sued for debt by his brother, and the same year he visited Frankfurt. After 1516 he lived at a short distance from Augsburg and in 1517 wandered off to paint an altarpiece for the priory of St. Antony at Issenheim. Here he probably died c.1524, when he is mentioned as deceased in the records of the Augsburg guild.

With whom the elder Holbein studied is not known. That he worked in the studio of Martin Schongauer at Colmar is a surmise suggested by a certain resemblance of style, especially in the types of his heads. Undoubtedly Holbein formed his style on the models of the early Flemish school and subsequently modified it by yielding to local tradition and Italian influences. In his early pictures slender figures, mild and regular features, staidness of attitude, and a clear transparency of tone unrelieved by depth of shadow are the prevailing characteristics. To this class belong the Weingartner altar (1493), treating the "Life of the Virgin" in four separate panels, now in the cathedral of Augsburg; the altar of St. Afra, representing the death of that saint; and "Death" and "Coronation of the Virgin"—the first and last in the archiepiscopal palace at Eichstätt, the other in the Museum of Basel; and a large "Death of the Virgin," in private possession, Paris. Of a similar stamp are four altar panels (1493), representing "Jacob's Sacrifice," "Birth and Presentation of Mary," and "Presentation of Christ," in the cathedral of Augsburg. Somewhat less marked is the Flemish origin of the master's manner in the large altarpiece (1499) with the "Basilica of Santa Maria Maggiore" in the centre, "Coronation of the Virgin" above it, the "Nativity" and "Martyrdom of St. Dorothea" in the wings, complete in the Gallery at Augsburg. From the same period date the small Madonna in the Germanic Museum, Nuremberg, the 12 passion scenes in the Gallery at Donaueschingen, and the "Ecce Homo" in the Gallery of Strassburg. In Frankfurt he painted for the Dominicans a composite altarpiece (1501), comprising the "Last Supper," "Entry of Christ into Jerusalem," "Expulsion of the Jews from the Temple," etc., and "Seven Scenes from the Passion"—all now in the Städel Institute. In 1502 he painted the large altarpiece for the monastery of Ratisheim near Donaueschingen, of which 16 are in the Old Pinakothek, Munich, and three at Augsburg. The outer, painted by his assistants, represented scenes from the "Passion of Christ"; the far better inner panels, by the painter himself, scenes from the "Life of Mary." To this period belong other works in the Augsburg Museum, at Nuremberg, Basel, Schleissheim, and elsewhere. Of the same period are the "Crucifixion," "Descent from the Cross," "Entombment," and "Transfiguration," also "Sixteen Scenes from the

Life of Mary"—all parts of a large altarpiece in the Old Pinakothek at Munich. A marked progress in the master's manner is to be noticed in the "Basilica of St. Paul" (1504), with scenes from the life of that saint, in its more ideal conception, correct drawing, and delicate execution, and of traditional interest as containing the portraits of the artist and his two sons, Ambrosius and Hans. The influence of the Italian Renaissance is still more apparent in the greater expressiveness and beauty of color displayed in the four panels of the "St. Catharine Altar" (1512)—this and the preceding also in the Augsburg Gallery; but his maturest work is the "Altar of St. Sebastian" (1515-16), in the Pinakothek at Munich. The central panel, representing the martyrdom of the Saint, is a composition full of dramatic power, far transcending his previous efforts; the wings, two delightful female saints. His last important work was probably the "Fountain of Life" (1519), in the National Museum at Lisbon. Holbein the Elder also excelled as a portrait painter, and his rare gift for characterization is apparent especially in the numerous head studies, mostly in silver point, distributed in various collections, among which those in Berlin, Copenhagen, and Basel are the richest. Very interesting examples are those of the painter himself (Chantilly), of his brother Sigismund Holbein (Berlin), and his sons Ambrosius and Hans (ib.). The museum at Basel also possesses a number of sketches for his religious paintings. Mention should be made also of his designs for stained glasses, after which two fine windows survive in the cathedral of Eichstätt, and of his designs for copper engravings, carried out by Israhel Meckenen.

His brother SIGISMUND (?-1540) first appears on the rate books of Augsburg in 1504 and in 1519 removed to Bern, where he died, making his nephew, Hans the Younger, his heir. There is very little doubt that he assisted the elder master in several of his most important works, although no single picture can be traced to him directly.—AMBROSIUS (c.1494-c.1519), son and pupil of Hans the Elder, was born in Augsburg and with his brother, Hans the Younger, was sent to Basel about 1515, when both were engaged chiefly in designing title-pages, initials, and other illustrations for books. The art of Ambrosius shows the influence of his father's teaching and his younger brother's example, without attaining the latter's excellence. In 1517 he was admitted into the guild Zum Himmel and acquired the freedom of the city in the year following, but all trace of him is lost after 1519. The museum at Basel preserves, besides many drawings, three authenticated paintings by him, "Christ Crowned with Thorns" and two "Bust Portraits of Boys," besides which the portrait of the goldsmith Georg Schweiger, of Augsburg, may also be attributed to him with tolerable certainty. Other portraits are in the museums of Darmstadt and St. Petersburg and in the Ambras collection, Vienna. A portrait of a young man (1518) is in the Hermitage at St. Petersburg.

HOLBEIN

"THE MADONNA OF THE BURGOMASTER MEYER," FROM THE PAINTING
IN THE DARMSTADT GALLERY

principal works cited on Hans Holbein the Younger. For Ambrosius Holbein, see the monograph by Hess (Strassburg, 1911).

HOLBEIN, HANS, THE YOUNGER (1497-1543). A German painter and designer, one of the chief masters of the German Renaissance. He was a son of Hans Holbein the Elder and was born at Augsburg, where he studied with his father and with Hans Burgkmair. Two of the works which may have been painted in his father's workshop survive: a "Madonna" (1514), in the Museum of Basel, and "Christ Bearing the Cross," in the Gallery at Karlsruhe. Both resemble the work of his father, to whom the latter picture has also been ascribed. In 1514 the family left Augsburg, and early in 1515 we find Holbein at Basel, where he and his elder brother Ambrosius had probably come to make illustrations for books; Basel was then an important centre of the book trade. Here Hans was introduced into the classic world, especially through his association with Beatus Rhenanus, corrector for the printer Froben. This influence is revealed in the table plate in the Museum of Zurich, which he painted for the family Baer, with scenes of hunting, fishing, and knightly tourneys, and in his 83 pen drawings for Erasmus's *Praise of Folly*, which are in the Museum of Basel. These drawings are a curious mixture of the coarse style of the fifteenth century and the more refined manner of the sixteenth. They show a great master at the beginning of his powers. The Museum of Basel contains two characteristic works of 1516: a sign for a schoolmaster, on which are painted two school scenes, and the double portrait of Burgomaster Jakob Meyer and his second wife; "Adam and Eve" of 1517, besides undated heads of the Virgin and St. John, and five Passion scenes of the same period.

In 1517 he went to Lucerne to decorate the façade and interior of the house of Jakob Hertenstein. Excepting a fragment in the Museum of Lucerne, these paintings have perished; but the original pen design in the Museum of Basel shows that the façade was decorated with classical subjects, completely in the style of the sixteenth century, and that he was influenced by the study of Mantegna's prints. At this time (1517) he painted the remarkable portrait of Benedikt von Hertenstein, now in the Metropolitan Museum, New York, and probably other members of that family. In 1518 he probably traveled in Lombardy, visiting Milan. The influence of the Lombard school may be seen in Holbein's modeling and chiaroscuro after 1518, in such works as his "Last Supper" (Basel Museum), which closely resembles Leonardo's masterpiece at Milan.

In 1519 Holbein entered the painters' guild of Basel, and in the following year he became a citizen. During the next few years he decorated the façades of a number of houses at Basel, chief among which was the Haus zum Tanz, of which the original pen design is in the museum, with architectural decorations and a representation of peasants dancing. He also began his extensive decorations of the council chamber, with antique historical subjects representing civic virtue and justice and with allegorical figures. On the organ doors of the minster of Basel he painted, in brown monochrome, grandiose figures of saints and angels singing. Among his panel pictures is an altarpiece of "Passion Scenes," of great dramatic power and fine effects of light and shade, and the "Dead Body of Christ" (1521), of strik-

ing, almost repulsive realism—all in the Museum of Basel. Among other works of this period is the "Madonna with Saints Ursus and Martin" (1522), in the Museum of Solothurn.

Holbein's best-known altarpiece is the "Madonna of Burgomaster Meyer," painted in 1525 or 1526, which holds the same rank in German painting as the "Sistine Madonna" in Italian. The original is in the Gallery of Darmstadt, the Dresden example having been proved to be an excellent copy by a Netherlander of the seventeenth century. Especially fine, in this picture, are the portraits of the kneeling burgomaster and his family, and the nude figure of his youngest son—a cherub worthy of Correggio.

His portraits of this period include the refined face of Bonifazius Amerbach (1519), the first great German art collector; three likenesses of Erasmus, who was then a resident of Basel—two in profile, at Basel and in the Louvre, and a larger three-quarter view in Longford Castle; the portrait of an unknown young woman, probably Holbein's wife, in the Museum of The Hague; his own portrait in colored chalk at Basel; and two allegorical representations of the courtesan Dorothea Offenburg in the Basel Museum (1526), as "Lais of Corinth" and as "Venus" with Cupid.

At the same time Holbein was occupied with other forms of design. Among his drawings of the period are two admirable youths—one a pencil, supposed to represent Holbein himself, the other a chalk drawing in the Museum of Basel. One of his favorite subjects was the contemporary German "Lanzknechte" (soldiers), in various actions and attitudes. To the same period belong his drawings of female costumes, then current in Basel, which may have been designs for actual use. His designs for glass painting in the Basel Museum include 10 wash drawings of "Passion Scenes," the equals of the painted series mentioned above, Madonnas and other biblical subjects, and coats of arms—all in beautiful Renaissance framing. As a designer for woodcuts, Holbein is second only to Dürer. He left over 300 blocks, the best of which were cut by Hans Lützelburger. His illustrated Luther's Bible, and his "Historiarum Veteris Instrumenti Icones" (Pictures from the Old Testament), 91 plates, were first published together at Lyons in 1538. Best known of all is his "Dance of Death," 58 plates in all, replete with humor and satire upon the ecclesiastical and social conditions of the day. It was published in book form at Lyons in 1538 and has been often republished; a good modern edition is that of Lippmann (Berlin, 1878).

The advent of the Reformation and the consequent disturbances in Basel were the chief cause of Holbein's journey to England in 1526. Equipped with recommendations from his friend Erasmus, he found a ready welcome in the house of Sir Thomas More at Southwark. His activity during his stay there, which lasted two years, may best be studied in the fine series of chalk drawings at Windsor Castle (published in London, 1884). In 1527 he painted Sir Thomas More, now in possession of Henry Huth, London; Sir Henry Guildford, in Windsor Castle; and Archbishop Warham, of Canterbury, in Lambeth Palace (replica in the Louvre), the best of all—a wonderful piece of realism and strength. Among his portraits of 1528 are those of Nicholas Kratzer, the King's astrologer, in the Louvre, and of Thomas Godsalve and his son John, at

Dresden. His famous picture of More and his family is lost, but the studies for the heads are at Windsor, and the pen sketch which he brought back for Erasmus is still at Basel. Among undated portraits of his first English period are those of Sir Henry Wyatt (Louvre), and several of Sir Bryan Tuke, of which the best-known version is at Munich.

On his return to Basel in 1529 he purchased a house. But during his stay the storm of iconoclasm broke over the city, and the demand for religious pictures ceased. Holbein, indeed, finished his frescoes in the council chamber, adding two large subjects from the Old Testament, "Samuel Reproving Saul" and "Rehoboam's Pride." Both paintings are lost, but the sketches in the Museum of Basel, masterly in composition and dramatic action, show Holbein as a great historical painter. In 1529 he painted one of the finest and certainly the most pathetic of all of his portraits, that of his wife with her two children (Basel Museum); two portraits of Erasmus (Parma and Basel); and one of Melanchthon (Hanover). Notwithstanding the efforts of the burgomaster and council of Basel to retain him, he returned in 1532 to England.

On his arrival at London he resided with the German merchants of the Steelyard, with whom he found occupation. In 1532 and in the following years he painted a number of portraits of these merchants, of which examples survive at Vienna, Windsor, Munich, Brunswick, and Petworth. The most remarkable of these fine portraits is perhaps that of George Gysse (1532), in the Museum of Berlin, noted for its easy pose, wonderful treatment of light and shade, and exquisite balance of detail and general effect. On the occasion of Anne Boleyn's coronation he designed for the German merchants an allegorical pageant of Parnassus; he decorated their guildhall with two large paintings, of which there are sketches in the Louvre, "Triumph of Riches" and "Triumph of Poverty." It is not known when he first entered Henry VIII's service, but in 1536 we find him mentioned as the King's painter. In that year he painted the portrait of the Queen, Jane Seymour (Hofmuseum, Vienna), in the following year the King (Earl Spencer, Althorp), and afterward (1538-39) their son Edward, Prince of Wales (Hanover). In 1537 he was sent to Brussels to paint the portrait (now in the National Gallery, London) of Christina of Denmark, Duchess of Milan, whom the King thought of marrying, and in 1539 to portray Anne of Cleves, whose portrait (now in the Louvre) had much to do with the King's marrying her. The same year he again portrayed the King (National Gallery, Rome) and in 1540-41 the Queen, Catharine Howard. His chief work for Henry VIII was a group painted on the wall of the Privy Chamber at Whitehall, in 1537, representing the King with his father and mother and Jane Seymour. This painting was destroyed in the fire of 1698, but the cartoon of the King is at Hardwick Hall, and there are several copies of the portrait, the best known of which is at Windsor Castle. The King also commissioned him to design various decorations, especially in the goldsmith's art, in which he acquitted himself with great taste and ability, as is evident from the original designs in the British Museum and elsewhere. In 1538 he visited Basel, where he was banqueted by the council, and he promised to return after two years, which promise, however, he did not keep.

His principal portraits, executed during his last stay in England, besides those mentioned above, are: "The Ambassadors" (1533), in the National Gallery; Robert Cheeseman (1533), the King's falconer, at The Hague; Thomas Cromwell, at Tittenhanger; John Reskitamer, at Hampton Court; Hans of Antwerp, in the Windsor and Salting collection, London; the French Ambassador, Sieur de Morette, at Dresden, a magnificent achievement; Thomas Howard, Duke of Norfolk, at Windsor; Lady Rich (c.1536) and Margaret Wyatt, Lady Lee (c.1539), in the Altman collection, Metropolitan Museum, New York; two unknown men (1541), at Berlin and Vienna, and an unknown woman, at Vienna; Dr. John Chambers, the King's physician, at Vienna; Sir William Butts and Lady Butts, in the Gardner collection, Boston; the Artist (1543), Uffizi; and Simon George, at Frankfurt.

Another important part of his activity at the English court was the painting of miniatures, in which art he achieved an unsurpassed mastery. Within the narrow bounds of the miniature he achieved unusual largeness of expression; and his light, delicate touch, thinness of color, and subtle modeling are particularly adapted to this technique. Authentic miniatures by him are very rare. The J. P. Morgan collection (Metropolitan Museum, New York) is richest with eight authentic examples, including two of Henry VIII, Sir Thomas More, and Mrs. Pemberton; five are in the royal collection at Windsor Castle; and others are in the Royal collection of The Hague, in Florence, in Munich, in the Wallace collection and the South Kensington Museum, London. He also designed a number of important wood engravings, including the title-page of Coverdale's Bible, illustrations of Cranmer's catechism, and "King Henry in Council," the title-page of Hall's *Chronicle*.

Holbein died of the pestilence in London in the autumn of 1543. He is chiefly known as a portrait painter; but his religious pictures, and especially his mural decorations, show that, had the opportunity presented itself, he might have been one of the greatest historical painters of all times. In England he was compelled by the taste of his noble patrons to adopt an archaic style, with emphasis on detail and neglect of light and shadow, his predilection; but these restrictions did not prevent his development into one of the world's greatest portraitists. The most striking quality of his portraits is their absolute truthfulness. "He is the one painter whom one can never suspect of flattery . . . whose entire veracity is unquestionable." They are rendered with an objectivity and absence of sentiment attained among the old masters only by Velazquez. They charm also by an impeccable draftsmanship, "with an accuracy unknown before or since." This phase of his activity may best be studied in his inimitable drawings, preserved more especially at Windsor and Basel. Designed as rapid preliminary sketches for his portraits, they cause even greater pleasure by reason of their greater freedom and directness. The composition of both his drawings and portraits is of the very first rank. In color his handling is "tight," and he prefers smooth enamel-like surfaces, but with complete mastery of values, consummate treatment of light and shadow, great purity of individual color, in bright as well as grave harmonies. Dürer was a greater genius, a greater thinker, a

greater engraver; but Holbein was the greatest painter Germany has ever produced.

Bibliography. A complete bibliography of Holbein up to 1900 was published in *Schweizerisches Künstlerlexikon*, vol. i (Frauelfeld, 1900). The most important monographs are the folios of Mantz (Paris, 1879), Davies (London, 1903), and A. B. Chamberlain (2 vols., New York, 1913). Of very great value are the researches of Paul Ganz, published in various German and Swiss periodicals and in works cited below. Of earlier monographs, those of Wornum (London, 1867) and Woltmann (Leipzig, 1874-76; Eng. trans., London, 1872) are best; popular biographies are those of Knackfuss (Bielefeld, 1897) and Gauthiez (Paris, 1908). The most complete edition of his drawings is in course of publication by Ganz (Berlin, 1911 et seq.); those at Windsor were published by Holmes with Hanfstängel's reproductions (n. d.). A convenient selection is that of Baldry (London and New York, 1904). For other designs, consult Hiis-Hausler, *Dessins d'ornements de Hans Holbein*, fol. (Paris, 1886); Goethe, *Holbeins Totentanz* (Strassburg, 1897). For his engravings, see Hind, in the *Great Engravers Series* (London, 1912); for miniatures, Williamson, *History of Portrait Miniatures*, vol. i (ib., 1904). A delightful appreciation of Holbein is by the painter Kenyon Cox in his *Painters and Sculptors* (2d series, New York, 1907).

HOLBERG, hól'bérǵ, LUDVIG, BARON (1684-1754). A Norwegian-Danish poet, novelist, dramatist, and historian, born at Bergen, Norway. He is called the "father of Danish comedy." Left an orphan in childhood, he proved an eager student in spite of poverty and discouragements and supported himself precariously as tutor for some years, in the course of which he visited Holland, Germany, and England, and studied for two years at Oxford. He lectured in the University at Copenhagen, where his scholarship was recognized, though not remunerated. Some historical studies in manuscript attracted the attention of King Frederick IV, and Holberg received a traveling scholarship that took him through a great part of Europe, largely on foot. He returned to Denmark in 1716 and in 1718 published *An Introduction to Natural and Popular Law*, which brought him a professorship in the University of Copenhagen and a modest competence. Thus eased, his genius welled up in the seriocomic epic *Peder Paars* (1719), a brilliant satire on contemporary manners, followed by five others, hardly less successful. In 1721 he was made director of the first Danish theatre in Copenhagen, for which he wrote during 1722 five classic comedies and in 1723 10 others. His best comedy, *Henrik and Pernille*, belongs to 1724. The theatre failed, and Holberg closed his dramatic career by publishing his collected comedies in 1731. Adapting himself to a change in the national spirit, he turned to history, philosophy, and satire, writing much that is now forgotten, and also the famous satire, *Subterranean Journey of Niels Klim* (*Nicolai Klimii Iter Subterraneum*, 1741), which was thrice translated from Latin into Danish, 10 times into German, three times into Swedish, English, and Dutch, twice into French and Russian, and once into Hungarian. He published also five volumes of *Letters* (1748-54). He shares with Voltaire the preëminence in European literature in his generation. He made Danish a literary language and won for it aristocratic recognition.

His influence has endured for two centuries. Editions of his works are countless; the best edition of the *Comedies* is by Lichtenberg (Copenhagen, 4th ed., 1893; illustrated jubilee ed., 1883-88). The Holberg Society, founded at Copenhagen in 1842, oversaw (1848-54) a critical edition of Holberg's comedies in eight volumes. There are biographies by Prutz (Stuttgart, 1857), Smith (Copenhagen, 1858), and Horn (ib., 1884). Consult also: Legrelle, *Holberg considéré comme imitateur de Molière* (Paris, 1864); O. Skavlan, *Holberg som Komædieforfatter* (Christiania, 1872); Georg Brandes, *Holberg und seine Zeitgenossen* (Berlin, 1884); *Holbergliteratur i det Deichmanske Bibliothek* (Christiania, 1906).

HOLBORN, hō'bŭrn. A district and street in London. The name is derived from Old or Hole Bourne, the former name for a part of the Fleet, which ran through a valley. The depression is now crossed by the famous Holborn Viaduct, an iron structure 27 yards wide and 657 long, built in 1869 to facilitate communication by avoiding the ascent of Holborn Hill. Criminals formerly passed through Holborn on their way to execution and according to an old custom received a nosegay at St. Sepulchre's Church, near Newgate Prison, from which the thoroughfare leads west to New Oxford Street. On Holborn are Barnard's, Furnivall's, and Staple Inn, and near it are Ely Chapel, Gray's Inn, and Lincoln's Inn. Milton at one time lived on the western portion of the street, called High Holborn. A number of picturesque old houses stand on this street, which survived the Great Fire.

HOLBROOK. A town in Norfolk Co., Mass., 14 miles south of Boston, on the New York, New Haven, and Hartford Railroad (Map: Massachusetts, E 4). It contains a public library, and has extensive manufactures of boots and shoes. Holbrook has become a popular residential suburb of Brockton and Boston. It was first incorporated on Feb. 29, 1872. Pop., 1900, 2229; 1910, 2816.

HOLBROOK, JOHN EDWARDS (1794-1871). An American physician and naturalist, born in Beaufort, S. C. He graduated at Brown in 1815 and in medicine at the Pennsylvania University three years later, studied afterward in Europe, and began practice in Charleston in 1822. In 1824 he was made professor of anatomy in the South Carolina College. This position he retained for more than 30 years. While there, he began work on *The Ichthyology of the South*, which was not finished. Part of it, however, was published in 1854 as *The Ichthyology of South Carolina*. His previous work upon *American Herpetology* (5 vols., 1842) was highly commended by Agassiz and others.

HOLBROOKE, JOSEF (1878-). An English composer, born at Croydon. He studied at the Royal Academy of Music in London under Westlake (piano) and F. Corder (composition), graduating in 1898. Thereafter he devoted his entire time to composition. His music is extremely modern, finding its inspiration chiefly in tragic, frequently in fantastic subjects. The chamber-music works, of which he wrote a considerable number, are the least satisfactory, because the themes generally are of a character that calls for orchestral treatment. His talent shows itself most advantageously when employing the orchestra for its expression. But here also one encounters many strange and even bizarre effects in harmonization and instrumentation.

His compositions for orchestra are an overture, *The New Renaissance*; the symphonic poems: *The Raven*, *Ode to Victory*, *The Skeleton in Armor*, *Ululume*, *Queen Mab*, *The Mask of the Red Death*, *Apollo and the Seaman*. A choral work with orchestra, *The Bells*, gave rise to much discussion after its first performance at the Leeds Festival of 1907; while his opera *The Children of Don*, produced by Hammerstein at the London Opera House in 1912, proved a puzzle to many serious musicians. A sequel to this opera, *Dylan*, was produced at Drury Lane in 1914. An earlier opera, *Pierrot and Pierrette*, was given in 1909.

HOL'BROOK'IA (named in honor of the American naturalist J. E. Holbrook). A genus of iguanid lizards of the southwestern United States and northern Mexico, especially characteristic of the Rio Grande valley. The half-dozen species are of moderate size, with short legs,

HOLBROOKIA MACULATA.
a, underside of head; b, profile.

squat depressed bodies, covered with minute scales, and long tails. The general color is gray, and all are blotched, spotted, and barred (on the tail) with darker tints, but the colors are highly variable; hence they are popularly known as spotted lizards. They prefer rocky ground and run swiftly with their tails curved over their backs. They subsist mainly on insects, worms, and the like, but also take vegetable food. They make interesting pets. When placed in a fly trap, they pick out the very large, black, and bright-colored flies before eating the house flies. See **IGUANA**.

HOLCOMBE, hōl'kūm, CHESTER (1844-1912). An American author and diplomat, born at Winfield, N. Y. After graduating from Union College in 1861, he went to China, where he was interpreter and Secretary to the United States Legation at Peking in 1871-85 and acting Minister in 1875-76, 1878-79, and 1881-82. He assisted the United States government in making treaties with China in 1880 and with Korea in 1882. In 1896 he prepared the Chinese and English documents for the government loan of \$100,000,000, and later he drew up in both languages plans for the construction of 3000 miles of Chinese railroads. He was a lecturer of the Lowell Institute, Boston, in 1902. His writings in Chinese include *Mental Arithmetic* (1873), *Life of Christ* (1875), and a translation of the American Declaration of Independence; in English, *Travels in Western China* (1875), *The Practical Effect of Confucianism upon the Chinese Nation* (1882), *Catalogue and Handbook of Antique Chinese Porcelains* (1890), *The Real Chinaman* (1895), *The Real Chinese Question* (1900), *China's Past and Future* (1904).

HOLCROFT, hōl'krōft, THOMAS (1745-1809). An English dramatist and novelist, born in London. The son of a shoemaker, he learned his father's trade; later he was a stable boy, a tutor,

an actor, journalist, printer, and lastly a playwright. In 1783 he was correspondent in Paris for the *Morning Herald*. In 1784 he translated the *Mariage de Figaro* from memory and produced it at Covent Garden, himself playing the leading rôle. He wrote 30 plays, the best and most successful of which is *The Road to Ruin* (1792), still occasionally acted. During the French Revolution he became a member of the Society for Constitutional Information, and was indicted (1794) for high treason, imprisoned, and finally discharged without trial. He was a man of great industry. He learned French, German, and Italian, and translated many works, including Goethe's *Hermann und Dorothea* (1801), Lavater's *Physiognomische Fragmente* (1793), and some of the works of Frederick the Great. He was also the author of four novels and numerous poems—*Alwyn* (1780); notable among the former, and *Human Happiness* (1783) among the latter. His *Memoirs*, written by himself or compiled from his diary and other papers, by William Hazlitt, were published after his death (3 vols., 1816).

HOL'CUS. See **SOFT GRASS**.

HOLD (older form *hole*, from Dutch *hol*, hole, hold; connected with AS., OHG. *helan*, Ger. *hehlen*, Lat. *celare*, Gk. *καλύπτειν*, *kalyptein*, to hide, OIr. *celim*, I hide; confused in popular etymology with *hold*, to contain). That portion of the interior of the ship which is below the upper deck. This part of a ship may be divided into several parts, as the *forepeak*, the *forehold*, the *main hold*, the *after hold*, the *engine and boiler rooms*, *coal bunkers*, *storerooms*, etc. To *stow* a hold is to put things in it and arrange them properly; to *break out* a hold is to remove the contents of it.

HOLD. In music, a sign placed above (∩) or below (∪) a note or rest to indicate that its time value is increased. The length of a hold is governed by the rhythm of the music and is left to the performer's discretion. See **GENERAL PAUSE**.

HOLDEFLEISS, hōl'de-flis, FRIEDRICH WILHELM (1846-). A German agricultural chemist. He was born at Bennstedt and studied at Halle, where for several years he acted as assistant in the Agricultural Experiment Station and in the Agricultural Institute of the university. In 1878 he was appointed director of the agricultural station of the Central Silesian Agricultural Society at Breslau. In 1881 he became professor extraordinary and in 1882 ordinary professor of agricultural chemistry in the Agricultural Institute of the University of Breslau. After filling this position with distinction for 10 years, he was appointed director of the Institute. During his incumbency he was actively engaged in the preparation of numerous works dealing with his specialty. Among these may be mentioned: *Untersuchungen über den Stallmist* (Breslau, 1889); *Das Knochenmehl* (Berlin, 1890); *Die Rinderzucht Schlesiens* (Breslau, 1896); *Schatzkästlein des praktischen Landwirts* (Berlin, 1896).

HOLDEN, hōl'den, EDWARD SINGLETON (1846-1914). An American educator and astronomer. He was born in St. Louis, Mo., and was educated at Washington University and at West Point, where he graduated in 1870. He occupied successively the positions of professor of mathematics, United States navy (1873-81), director of the Washburn Observatory, Madison, Wis. (1881-85), president of the University of California (1885-

88), and (1888-98) director of the Lick Observatory, Cal., where his most important work was done. Most of the buildings and instruments of this institution were designed and built under his direction. In 1901 he was appointed librarian of the United States Military Academy. He was a member of the National Academy of Sciences and of various foreign learned bodies, including the Royal Astronomical Society, London. Besides editing various publications, he wrote: *Bastion System of Fortification* (1872); *Life of Sir William Herschel* (1881); *Mountain Observatories* (1896); *Elementary Astronomy* (1899); *Essays in Astronomy* (1900); *The Sciences* (1903); *Galileo* (1905).

HOLDEN, HUBERT ASHTON (1822-96). An English classical scholar. He studied at King Edward's College, Birmingham, and graduated from Trinity College, Cambridge, in 1845, was tutor and lecturer at Trinity in 1848-53, vice principal of Cheltenham College in 1853-58, and head master of Queen Elizabeth's School, Ipswich, in 1858-83, and in 1890 became a fellow at the University of London. His best-known texts are *Foliorum Silvula* (4 parts, 1852; part i, 18th ed., 1910); *Foliorum Centuriæ* (1852; 12th ed., 1901); *Folia Silvulæ* (2 vols., 1865-70). He also edited Cicero's *De Officiis* (1869; 6th ed., 1886) and *Pro Publio Sestio* (1883; 3d ed., 1889); Xenophon's *Hieron* (1883; 3d ed., 1888) and *Economicus* (1884; 4th ed., 1889); and various other texts.

HOLDEN, SIR ISAAC (1807-97). A British inventor, who produced lucifer matches and improved wool-carding machinery. He was born in Hurlet, Renfrewshire, of English parents, and from being a drawboy to hand weavers, he went into a Paisley cotton mill, educating himself meanwhile till he was able to teach school. In the course of experimenting for a chemistry class he discovered the efficiency of sulphur as a medium between the explosive matter and the wood for matches (1829); but, as he took out no patent, others reaped the benefit of his invention. He was next bookkeeper, then manager, then owner of a wool-combing mill, and made such important improvements in its machinery that he became a wealthy manufacturer. He was elected to Parliament in 1865 and was knighted in 1893.

HOLDER, hōl'dēr, ALFRED (THEOPHIL) (1840-). A German philologist. He was born in Vienna, the son of a portrait painter, was educated at Heidelberg and Bonn, taught in the Rastatt Lyceum and in a private secondary school at Ryswick, and in 1867 entered the Karlsruhe Hofbibliothek, of which he became librarian in 1870 and the manuscripts of which he described in volumes published from 1895 to 1914. His other publications are in widely different fields, including *Altoeltischer Sprachschatz* (1896-1914, particularly important for Gaulish), and editions of Horace (1864-70), with Keller—still the best critical text; of Waltharius (1874), with Scheffel; of Tacitus' *Germania* (1878); of the *Lex Salica* (1879-80); of Cæsar's *Bellum Gallicum* (1882); of Saxo Grammaticus (1886), the only recent complete edition; of Herodotus (1886-88); of Avienus (1887); of Porphyrio's scholia on Horace (1894); of Cæsar's *Civil War* (1898); etc.

HOLDER, CHARLES FREDERICK (1851-1915). An American naturalist. Born in Lynn, Mass., of Quaker parents, he was sent to the Friends' School in Providence, R. I., afterward to a

seminary near Boston, thence to the United States Naval Academy at Annapolis, but followed his natural bent towards science and became assistant curator of zoology in the American Museum of Natural History, New York City (1871-75). He spent some time collecting specimens for the Aquarium at New York City and was lecturer in the city schools as well as a writer upon scientific subjects for young people. He removed to California and was made trustee and professor of zoology in Throop University. His publications include: *Marvels of Animal Life* (1880); *Elements of Zoology* (1885); *Living Lights* (1887); *The Ivory King* (1886); *A Frozen Dragon* (1888); *A Strange Company* (1889); *Around Pasadena* (1889); *The Pasadena Highlands* (1889); *Santa Catalina Island: Its Sports* (1889); *Louis Agassiz: His Life* (1892); *Charles Darwin's Life and Work* (1893); *The Treasure Divers* (1898); *Stories of Animal Life* (1900); *Half Hours with Nature* (5 vols., 1901); *The Boy Anglers* (1904); *Half Hours with the Lower Animals* (1905); *Life in the Open* (1906); *Log of a Sea Angler* (1906); *Big Game at Sea* (1908); *The Marooners* (1909); *The Channel Islands* (1910); *Distinguished American Scientists* (1911); *Game Fishes of the World* (1913); *The Ocean* (1914); *Angling Adventures around the World* (1914).

HÖLDER, hēl'dēr, EDUARD OTTO (1847-1911). A German jurist, especially versed in Roman law. Born at Stuttgart, he studied at Tübingen and became professor at Zurich (1872), Greifswald (1874), Erlangen (1880), and professor of Roman law at Leipzig (1893). His works include: *Institutionen des römischen Rechtes* (3d ed., 1893); *Zum allgemeinen Teil des Entwurfs eines deutschen bürgerlichen Gesetzbuchs* (1888); *Pandekten* (1886-91); *Ueber objektives und subjektives Recht* (1893); *Die Stellung des römischen Erben* (1895); *Naturliche und juristische Personen* (1905). With Schollmeyer and others, he undertook the preparation of the *Kommentar zum deutschen bürgerlichen Gesetzbuch* (1900).

HÖLDERLIN, hēl'dēr-lēn, JOHANN CHRISTIAN FRIEDRICH (1770-1843). A German poet, born at Lauffen and educated at Tübingen, where he knew Hegel and Schelling. He was an ardent admirer of Schiller, who secured him a tutorship in the house of his friend, Charlotte von Kalb (1793-94). Then he became tutor in a banker's family at Frankfurt, where the mother of his young charges, Frau Gontard, inspired him with a Platonic passion, which led him to celebrate her under the name of Diotima in his *Hyperion*. But from this time on his mind began to fail, and, save for intervals of sanity, he never recovered. His style was classic; his thought, in his best work, deep and full. He wrote: *Hyperion, oder der Eremit in Griechenland*, a novel in epistolary form, but really a prose poem (1797-99); an incomplete drama, *Empedokles*; translations from Sophocles' *Œdipus* and *Antigone* (1804); and the *Lyrische Gedichte*, his best work, mostly elegiac in tone, edited by Uhland and Schwab (4th ed., 1878; in 1899, by Linke). A complete edition of his works, with his letters and biography by Schwab, appeared at Stuttgart (1846). Consult Scherer, *F. Hölderlin Vorträge* (Leipzig, 1874); Müller-Rastatt, *Hölderlin, sein Leben und sein Dichten* (Bremen, 1894); Milbrandt, *Friedrich Hölderlin* (Berlin,

1896); Klein-Hattingen, *Das Liebesleben Hölderlins, Lenaus, Heines* (ib., 1900); Lange, *Holderlin, eine Pathographie* (Stuttgart, 1909).

HOLDERNESS, hōl'dēr-nēs, SIR THOMAS WILLIAM (1849-). An English administrator in India. He was educated at Cheltenham and at University College, Oxford, entered the Indian Civil Service in 1872, was member of the Famine Commission of 1897, acted as Secretary in the Revenue and Agricultural Department in 1898-1901, was Secretary of the Revenue Statistics and Commerce Department of the India Office from 1901 to 1912, and in 1912 became permanent Undersecretary of State in the India Office. In 1907 he was made Knight Commander of the Star of India. He revised Strachey's *India* (1911) and wrote *Narrative of the Indian Famine* (1896-97) and a brief *Peoples and Problems of India* (1912).

HÖLDICH, hōl'dich, SIR THOMAS HUNGERFORD (1843-). An English explorer, born in Dingley, Northampton. He was educated at Woolwich, entered the Royal Engineers, served in the Afghan War in 1878-80 and on frontier expeditions, and in 1884-86 made important additions to our knowledge of Afghan Turkestan when he was on the Afghan Boundary Commission. From 1892 to 1898 he was superintendent of the Indian frontiers survey. In 1899 he was appointed one of three British commissioners on the disputed Patagonian boundary of Chile and Argentina and in 1902 personally surveyed the country, furnishing the data on which the "King's award" was made, and published *The Countries of the King's Award* (1904). He was knighted in 1897. He wrote: *The Indian Borderland* (1901); *India* (1904); *Tibet the Mysterious* (1906); *The Gates of India* (1910).

HOLD'ING (Lat. *tenementum*, a tenement, something held, from *tenere*, to hold). In the feudal law of land tenure, an estate in land held of a superior lord in fee. The term is seldom found in English law except in its Latin form, *tenementum*, which has in English taken on the form of *tenement*. It appears, however, in abbreviated form in the familiar expression "freehold" (*liberum tenementum*). The word has survived in Scots law in its original sense. See also ESTATE; FEE; FREEHOLD; TENEMENT; TENURE.

HOLDREGE, hōl'drēj. A city and the county seat of Phelps Co., Neb., 151 miles west of Lincoln, on the Chicago, Burlington, and Quincy Railroad (Map: Nebraska, E 4). It has a Carnegie library and a fine courthouse. It is a grain centre and distributing point for an agricultural and cattle-raising region. Settled in 1883, it is governed by a mayor, elected annually, and a city council. The water works are owned by the city. Pop., 1900, 3007; 1910, 3030.

HOLE, WILLIAM (1846-). A British painter and etcher, born at Salisbury, England. After serving an apprenticeship as civil engineer, he studied in the school of the Royal Scottish Academy, of which he was elected associate in 1878. He stands highest as etcher, his plates after Millet, Constable, and Velazquez possessing remarkable interpretative merit. His principal paintings are: "End of the '45" (1879); "Prince Charlie's Parliament" (1882); "The Night's Catch" (1883); "The Fill of the Boats" (1885); "The Canterbury Pilgrims" (1889); "The Ascension" (1906). There are mural paintings by him in Edinburgh—in St. James's Church (1896), the National Portrait Gallery

of Scotland (1900), the Municipal Buildings (1903).

HOLGUIN, ol-gēn'. A city of Cuba, in the Province of Santiago de Cuba, and capital of the department of the same name, about 25 miles by rail from Gibara, its port (Map: Cuba, J 6). It has a number of fine buildings. It exports tobacco, timber, corn, and cattle. It was founded in 1720 and received the title of city in 1751. Pop., 1907, 7592.

HOLIBUT. See HALIBUT.

HOLIDAY (AS. *hālg dæg*, holy day). A day set apart as a religious anniversary, or for the purpose of commemorating some extraordinary event, or of honoring the memory of a distinguished person, or for some reason of public policy. As a rule, holidays are occasions for rejoicing. People are expected to observe them "with the voice of joy and praise." (Ps. xlii. 4.) At times, however, they are accompanied by fasts rather than feasts. Of this character are days of humiliation and prayer, such as Fast Day, formerly observed in Massachusetts and other New England States, and days appointed from time to time by proclamation of governmental or ecclesiastical authorities.

During the Middle Ages holidays became so numerous, in many parts of Europe, as to interfere seriously with industrial pursuits. One of the most important results of the religious reformation of the sixteenth century was the abolition of excessive holidays with its consequent increase in the volume of secular labor. A legal holiday is one set apart, either by common or by statute law, as a day of rest, or of cessation in whole or in part from ordinary business activities. Sunday is the only common-law holiday in the United States, although in England Good Friday has been recognized as such for centuries. Legal holidays are of two kinds—general or public, and special or limited. On a public holiday, such as Sunday or the Fourth of July, public offices are closed, and persons under contract to render services cannot lawfully be required to work. In England, and in many of the United States, persons are prohibited from carrying on business or making contracts on Sunday, though there is no general rule prohibiting voluntary labor on other public holidays. (See SUNDAY.) On special or limited holidays, such as some of the bank holidays (q.v.), exemption from labor and from the performance of contracts generally is confined to a particular class of employees or to a designated section of the community, as public officials and employees, bank clerks, etc. As a general rule, negotiable paper falling due on a public or general holiday is not payable until the following day.

There are no national holidays in the United States, although Congress has at various times designated special holidays. Sundays, certain fast days, as Mardi-Gras (Shrove Tuesday) in Alabama, Florida, and Louisiana, and Saturdays after twelve o'clock noon are now legal holidays in all States and Territories where they are so designated by act of legislature. When holidays occur on Sunday, the following day is usually observed. The principal legal holidays in all of the States are as follows: January 1, New Year's Day (except in Arkansas, Massachusetts, and Mississippi); February 22, Washington's Birthday (except in Mississippi); May 30, Decoration, or Memorial,

Day (except in Arkansas, Florida, Georgia, Louisiana, Mississippi, North Carolina, South Carolina, and Texas); July 4, Independence Day; September, first Monday, Labor Day; November, Election Day, first Tuesday (or Tuesday after the first Monday) in all States holding election, also other days on which elections are held in various States; November, Thanksgiving Day, usually the last Thursday; and December 25, Christmas Day.

In addition to the foregoing the following holidays are commonly observed: January 19, Robert E. Lee's Birthday, in Alabama, Arkansas, Florida, Georgia, Mississippi, North Carolina, South Carolina, and Virginia; February 12, Lincoln's Birthday, in California, Colorado, Connecticut, Delaware, Illinois, Iowa, Indiana, Kansas, Michigan, Minnesota, Montana, Nevada, New Jersey, New York, North Dakota, Oregon, Pennsylvania, South Dakota, Utah, Washington, West Virginia, and Wyoming; variable in date, Good Friday, in Alabama, Connecticut, Delaware, Florida, Louisiana, Maryland, Minnesota, New Jersey, Pennsylvania, Porto Rico, and Tennessee; April 19, Patriots' Day (anniversary of the battle of Lexington), in Maine and Massachusetts; Confederate Memorial Day, April 26, in Alabama, Florida, Georgia, and Mississippi; May 10, in North Carolina and South Carolina; second Friday in May, in Tennessee; June 3, Jefferson Davis's Birthday, in Alabama, Arkansas, Florida, Georgia, Louisiana, Mississippi, South Carolina, Texas, and Virginia; October 12, Columbus Day, in Alabama, Arkansas, California, Colorado, Connecticut, Delaware, Idaho, Illinois, Indiana, Kansas, Kentucky, Maine, Maryland, Massachusetts, Michigan, Missouri, Montana, Nebraska, Nevada, New Hampshire, New Jersey, New Mexico, New York, Ohio, Oklahoma, Pennsylvania, Rhode Island, Vermont, and Washington.

Also the following special holidays are observed only in the State or Territory mentioned: January 8, anniversary of the battle of New Orleans, in Louisiana; February 12, Georgia Day; March 2, anniversary of Texan Independence, in Texas; March 22, Emancipation Day, in Porto Rico; April 12, Halifax Independence Resolutions, in North Carolina; April 13, Thomas Jefferson's Birthday, in Alabama; April 21, anniversary of the battle of San Jacinto, in Texas; May 20, anniversary of the signing of the Mecklenburg Declaration of Independence, in North Carolina; June 11, Kamehameha Day, in Hawaii; June 15, Pioneer Day, in Idaho; July 10, Admission Day, in Wyoming; July 24, Pioneers' Day, in Utah; July 25, landing of United States troops, in Porto Rico; August 1, Colorado Day; August 16, Bennington Battle Day, in Vermont; September, third Saturday, Regatta Day, in Hawaii; September 9, Admission Day, in California; October 18, Alaska Day; October 31, Admission Day, in Nevada; November 1, All Saints' Day, in Louisiana; November, first Friday, Pioneer Day, in Montana.

Arbor Day and Flag Day (June 14) are frequently celebrated, and in certain cities special days are more or less observed; as, March 4, Inauguration Day, in Washington, D. C.; September 12, Defenders' Day, anniversary of the battle of North Point, in Baltimore, Md.; November 25, Evacuation Day, in New York. Thanksgiving Day, although designated as a holiday by a proclamation by the President of

the United States, is a legal holiday only in the District of Columbia and the Territories. The governors of the States usually designate the same day as the President for Thanksgiving Day, but not always.

In England certain Church festivals, known as "red letter" days (so called because they are printed in red letters in the calendar), are still observed as holidays. They include January 6, Twelfth Day (the evening preceding is Twelfth Night); February 2, Candlemas; February 14, Old Candlemas (St. Valentine's Day); March 25 (formerly April 6), Lady Day; June 24 (formerly July 7), Midsummer Day, or St. John's Day; July 15, St. Swithun's Day; August 1, Lammas Day; September 29, Michaelmas; November 1, Allhallowmas, or All Saints' Day (the evening preceding is Allhalloween); November 2, All Souls' Day; November 11, Martinmas (formerly November 23); and December 28, Childermas. Bank holidays (q.v.) in Great Britain are days designated by act of Parliament on which banks may suspend business.

HOLINESS, ENTIRE. See **HIGHER LIFE.**

HOLINSHED, or HOLLINGSHEAD, hól'-inz-héd, RAPHAEL (?-1580). An English chronicler. Little is known of his life save that he was of a Cheshire family, probably the son of Ralph Holinshed, of Cophurst, in the township of Sutton Downes. He is celebrated as the author of a history of England, Scotland, and Ireland, which the Elizabethan dramatists drew upon for material in the construction of their historical plays. The work had been started originally by Wolfe, who, however, died in 1573 before its completion. Thereupon Holinshed undertook the work, and in 1577 appeared *Raphael Hollingshed's Cronycle*, in two folio volumes. Holinshed had been assisted by William Harrison, who wrote the historical descriptions of England and Scotland, and by Richard Stanhurst, who contributed a part of the history of Ireland. All copies of the work were printed by Henry Bynnenman. The publishers were George Bishop, John Harrison, and Luke Harrison. A second edition appeared in 1587, after Holinshed's death. This edition was chiefly revised by John Hooker, Abraham Fleming, and Francis Thynne, and contained some passages disagreeable to Elizabeth, who immediately ordered them cut out. A modern edition in six volumes was published in London (1807-08), with the "disagreeable passages" restored. But, after all, Holinshed's *Chronicle*, though popular in its day, would be seldom recalled to-day were it not for Shakespeare's indebtedness to it. From it the data for most of the great historical plays were probably derived; and in *Macbeth*, *Lear*, and *Cymbeline* most of the borrowed action and dialogue can be illustrated by excerpts from Holinshed. Consult: Cooper, *Athenæ Cantabrigienses* (Cam-

bridge, England, 1858); W. G. Boswell-Stone, *Shakespeare's Holinshed* (New York, 1907); C. F. Fiske, *A Study of a Feature of Sixteenth Century Conventionalism as it Reveals itself in Holinshed's Chronicle* (Bloomington, Ill., 1910).

HOLKAR, hōl'kār. The name of a powerful Mahratta family, later adopted as a title by the rulers of Indore, one of the native states of Central India. The founder of the family was Malhār Rao Holkar, who was born in the Deccan in 1694 and, having gained by his valor the favor of the Peshwa (q.v.), obtained from him the western half of Malwa, with Indore for his capital. In 1761 he joined the great league of the princes of Hindustan, formed to bar the progress of Ahmed Shah Durrani, and was present at the battle of Panipat, Jan. 6, 1761; but as he fled shortly after the battle began, he was suspected of treason. Holkar was the only Mahratta chief of note who escaped the slaughter. He died in 1766 and was succeeded by his grandson, Māle Rao, who died the following year. The government then passed to Ahalyā Bai, the mother of Māle Rao, who resigned the military power to Tukoji Rao Holkar. On his death, in 1797, his natural son, Jaswant Rao Holkar, a man able, brave, and unscrupulous, seized Indore, but was driven out by Sindia (q.v.). Such, however, was Holkar's reputation for energy and ability that part of the victorious army deserted to him, with whose aid he obtained a signal victory over Sindia and the Peshwa (October, 1802). After fighting a long time against the British with varying success, he was compelled to conclude peace. He died insane Oct. 20, 1811. His son, Malhar Rao Holkar II, a minor, succeeded, and in 1817 declared war against the British, but his army was totally routed at Mahedpore, December 21; whereupon he sent offers of peace, which were accepted, and an English residency was established at Indore in January, 1818. He died in 1833. Mārtand Rao Holkar, Hari Rao Holkar, and Khande Rao Holkar successively ruled after him. The last of these died without heirs in 1843, and the East India Company assumed the right of nominating Tukoji Rao Holkar, who did not belong to the Holkar family. He was educated under the auspices of the British government and displayed great ability and always remained on the most friendly terms with the British. In 1886 he was succeeded by his oldest son, Sivaji Rao Holkar (died 1908), who ruled until 1903, when he abdicated in favor of his 12-year-old son, Tukoji Rao Holkar, who succeeded with full ruling powers in November, 1911. Consult: J. G. Duff, *A History of the Mahrattas* (3 vols., London, 1826); M. G. Ranade, *Rise of the Maratha Power* (Bombay, 1900); *The Imperial Gazetteer of India* (Oxford, 1907-09).

HOLKAR'S DOMINIONS. See **INDORE**.

HOLL, hōl, FRANK (1845-88). An English portrait and genre painter. He was born in London, the son and grandson of engravers whose profession he at first intended to follow. He entered the Royal Academy schools in 1860, won numerous medals, and was made A.R.A. in 1878 and R.A. in 1883. In 1868 he won the traveling scholarship with "The Lord Gave, and the Lord Hath Taken Away," which, because of its grim pathos and high technical qualities, made his reputation. The blackness of its coloration is perhaps due to his training as an en-

graver. Among other works exhibited at the Royal Academy were: "No Tidings from the Sea" (1871), painted for Queen Victoria; "I Am the Resurrection and the Life" (1872); "Deserted" (1874); "Her First-Born" (1876); "Committed for Trial" (1878); "The Gifts of the Fairies" (1879); "Ordered to the Front" (1880). His portrait of Samuel Cousins, the mezzotint engraver (1878), was hailed as a masterpiece, and immediately Holl was overwhelmed with commissions, the execution of which broke down a constitution never strong. Among the 200 portraits he painted are those of Lord Roberts (1882), for Queen Victoria; the Prince of Wales, Lord Dufferin, the Duke of Cleveland (1885); Lord Overstone, Mr. Bright, Mr. Gladstone, Mr. Chamberlain, and Earl Spencer. Holl's earlier pictures owed part of their striking success to the sombre and melodramatic sentimentality of the stories they told; but his methods as a portrait painter are less open to criticism. Though he sometimes failed to catch a likeness, his work is at best full of strength and decision and ranks him among the foremost men of the English school.

HOLL, KARL (1866-). A German Protestant theologian and Church historian, born and educated in Tübingen. He was licensed in theology in 1890, became an assistant in the Berlin Academy of Sciences in 1894, and lecturer in the University of Berlin in 1896. In 1900 he was made professor at Tübingen and in 1906 professor at Berlin. Among his publications are: *Sacra Parallela des Johannes Damaszenus* (1896); *Enthusiasmus und Bussgehalt beim griechischen Monchthum* (1898); *Amphilochius von Ikonium* (1904); *Die geistliche Uebungen des Ignatius von Loyola* (1905); *Die Rechtfertigungslehre im Lichte der Geschichte des Protestantismus* (1907); *Der Modernismus* (1908); *Calvin* (1909); *Thomas Chalmers und der Anfang der kirchlichsozialen Bewegung* (1913).

HOLLAND, hōl'and. A mediæval county, whose territories now form the provinces of North and South Holland (qq.v.), in the Kingdom of the Netherlands (Map: Netherlands, C 2). The hereditary counts of Holland, whose dominions were included within the limits of the Holy Roman Empire, appear in history as early as the tenth century, but the title Count of Holland was not used until the following century, and the counts owed their importance to the victory won from the Duke of Lorraine in 1018. During the eleventh and twelfth centuries the Dirks and Florises, as all the counts were named, gradually increased their lands and powers. Count William II was elected Roman Emperor in 1247 in opposition to Frederick II. He contested the Imperial crown with Conrad IV, Frederick's successor, and on the death of Conrad in 1254 was recognized by many German princes. He was drowned by breaking through ice while on an expedition against the Frisians in 1256. In 1299 the last lineal descendant of Dirk I died, and Holland passed to the counts of Hainault. Soon after, Zeeland was permanently united with Holland. In 1417 the Countess Jacqueline succeeded to the rule at the age of 17; her husband, the heir to the Kingdom of France, had died only a few months before. From that time she was in constant trouble and was betrayed by husbands and relatives until finally her fourth husband, to whom she seems to have been

strongly attached, was taken prisoner, and in 1433 she made over Hainault, Holland, and Zeeland to Philip the Good of Burgundy, who succeeded in 1436, after her death. Holland shared the fortunes of the united Netherlands and was one of the provinces which achieved their liberation from Spain and constituted themselves into the Dutch Republic. Consult P. J. Blök, *History of the People of the Netherlands* (5 vols., New York, 1898, 1912), and Pouillet, *Histoire politique nationale; origines, développements, et transformations des institutions, etc.* (2d ed., 2 vols., Louvain, 1882-92). See BURGUNDY; NETHERLANDS.

HOLLAND. A city in Ottawa Co., Mich., at the head of Black Lake, which affords a good harbor, having regular steamboat lines to Chicago, and 26 miles southwest of Grand Rapids, on the Pere Marquette Railroad (Map: Michigan, C 6). It is the seat of Hope College, opened in 1865, and of the Western Theological Seminary, both under the control of the Reformed church in America, and has a public library, fine school buildings and city hall, and Jenison and Centennial parks. There are several summer resorts on the shore of Black Lake that enjoy considerable popularity. Holland carries on an extensive grain trade and is a manufacturing centre of importance, its industrial establishments including flour and planing mills, machine shop, tanneries, furniture factories, a beet-sugar factory, a large pickling plant, and manufactories of wood-working machinery, pianos, rucks, and electric and steam launches. The water works and electric-light plant are owned by the municipality. Founded in 1847 by Dutch settlers, Holland was chartered as a city in 1867. Its inhabitants are still largely of Dutch descent. On Oct. 9, 1871, almost the entire city was destroyed by fire, more than 300 buildings being burned down. Pop., 1900, 7790; 1910, 10,490; 1914 (U. S. est.), 11,639.

HOLLAND. A variety of unbleached linen cloth used largely for window shades, being either dyed or coated with a colored dressing. The name is derived from the fact that it was first manufactured in Holland. See LINEN.

HOLLAND, CHARLES (1733-69). An English actor. He was born at Chiswick and in 1755 made his début in *Oroonoko* at Drury Lane, where he played until his death. He was the first to play Florizel in Garrick's alteration of Shakespeare's *The Winter's Tale*. He also appeared in Mrs. Sheridan's *Discovery* (1763), in Garrick and Coleman's *Clandestine Marriage* (1766), in Kendrick's *Widowed Wife* (1767), in Murphy's *Zenobia* (1769), and in Mrs. Griffith's *School for Rakes* (1769). In his final season he played the rôle of Richard III in Garrick's *Jubilee* pageant (1769) and that of Timur in Dow's *Zingis* (1769).

HOLLAND, EDMUND MILTON (1848-1913). An American comedian, born in New York City, the son of George Holland, who was also a well-known actor. He appeared upon the stage in childhood, but his regular professional career began in 1866 at Barnum's Museum. The next year, under the name of Mr. E. Milton, he became a member of Wallack's company, with which he played successfully in *The Road to Ruin*, *Caste*, and other pieces till 1880. After an interval, during which he made a tour in England, he was engaged in 1882 at the Madison Square Theatre. Among his characters in

the years that followed were Pittacus Green in *Hazel Kurke*, Old Rogers in *Esmeralda*, Captain Redwood in *Jim the Penman*, Lot Burden in *Saints and Sinners*, and Colonel Carter in *Colonel Carter of Cartersville*, the last named at Palmer's Theatre. Beginning in 1895, he and his brother Joseph starred for about two years in *A Social Highwayman* and other plays. In 1901-02 he played the title rôle in *Eben Holden*, and from 1903 to 1906 he played Captain Bedford in *Raffles*. In 1909 he joined the New Theatre Company, of which he remained a member till 1911, playing, among other parts, Sir Oliver Surface in *The School for Scandal*, Canon Bonington in *Don*, Mr. Elkin in *The Thunderbolt*, Gaffer Tyl in *The Blue Bird*, and Baron Von Haugh in *Old Heidelberg*. He appeared as Metz in *Years of Discretion* at the Belasco Theatre in 1912. Consult McKay and Wingate, *Famous American Actors of To-Day* (New York, 1896), and L. C. Strang, *Famous Actors of the Day in America* (Boston, 1900).

HOLLAND, SIR HENRY (1788-1873). An English physician, natural philosopher, and author, born at Knutsford, England. He was educated at London and Edinburgh, receiving his medical degree at the University of Edinburgh in 1811. He traveled extensively, practiced medicine from 1815 till his death, was elected fellow of the Royal College of Physicians in 1828, physician in ordinary to the Prince Consort in 1840 and in 1852 to Queen Victoria, was made Baronet in 1853, and was very prominent medically, socially, and in literary circles. He was the author of *Medical Notes and Reflections* (1840); *Chapters on Mental Physiology* (1852); *Essays on Scientific Subjects* (1862); *Recollections of a Past Life* (1871).

HOLLAND, HENRY FOX, first BARON (1705-74). An English politician, the younger son of Sir Stephen Fox, born in Chiswick. He was educated at Eton and at Christ Church, Oxford, and, after a reckless early life, during which time he spent the greater part of his fortune, he entered politics. He was returned to Parliament as a Whig for the borough of Hindon in Wiltshire in 1735, and from 1741 to 1761 he sat for Windsor. In 1737 he was appointed surveyor-general of works by Walpole. After his chief's fall he was Lord of the Treasury (1743) and Secretary of State for War and member of the Privy Council (1746). In 1755 he was bribed by a seat in the cabinet to back George II's measures and quickly became leader of the House. But in 1756 he resigned, and a year later he entered upon the lucrative office of Paymaster-General. Grenville's resignation in 1762 made him again leader of the House of Commons. The task of getting the Peace of Paris approved he accomplished by corruption and browbeating (1763), and for his reward was made Baron Holland, a title which carried with it a seat in the House of Lords. By 1765 he had become so unpopular that he was forced to resign the paymaster-generalship. The Court of Exchequer brought proceedings against him, and the Mayor of London (1769) spoke of him in a petition to George III as "the public defaulter of millions," but he had served the King so well that all attacks were unsuccessful even when he was out of favor at court. Consult T. W. Riker, *Henry Fox, First Lord Holland* (Oxford, 1911).

HOLLAND, HENRY RICH, first EARL OF (1590-1649). An English nobleman, educated

at Emmanuel College, Cambridge, and created Earl in 1610. For Charles, Prince of Wales, he conducted the marriage negotiations with Henrietta Maria in 1624. He became constable of Windsor and high steward to the Queen in 1629, groom of the stole in 1636, and general of the horse in 1639. During Charles's troubles with Parliament Holland three times supported the Parliamentarians, only to desert their cause each time for that of the King. In 1647 he led a force of 800 men in behalf of the royal cause, but was defeated, was captured at St. Neots, and imprisoned at Warwick Castle. He was tried and sentenced to death by the courts and was executed together with Capel and Hamilton, March 9, 1649.

HOLLAND, HENRY RICHARD VASSALL FOX, third BARON (1773-1840). An English politician, only son of Stephen, second Lord Holland, and nephew of Charles James Fox. He was born at Winterslow House, Wiltshire, and was educated at Eton, at Christ Church, Oxford (M.A., 1792), and by extensive travels on the Continent. He entered the House of Lords in 1796 and won especial fame by his protests, later collected by Moylan, *The Opinions of Lord Holland, 1797-1840* (1841). He was soon recognized as a power in the Whig party and fought against suspension of the Habeas Corpus Act, against the union with Ireland, and for the repeal of the Test and Corporation Acts. He was a commissioner (1806) to negotiate a treaty with America. When his uncle died, he was a member of the Privy Council and was a member of the cabinet of 1806 as Lord Privy Seal. When his party was restored to power in 1830, he became Chancellor of the Duchy of Lancaster, and except for two short intervals he held this post until his death. He is perhaps most widely known as the host of Holland House and the centre with Lady Holland of the brilliant company that gathered there. Besides his *History of the Whig Party during my Time*, edited by his son (1852), he wrote *Some Account of the Life and Writings of Lope Felix de Vega Carpio* (1806) and *Inquiry into the State of the Nation, at the Commencement of the Present Administration* (3d ed., 1806). His *Foreign Reminiscences* (1850) gives vivid pictures of his times. His *Further Memoirs of the Whig Party* (1807-21) was published in 1905.

HOLLAND, HENRY SCOTT (1847-). An English preacher and theologian, born at Ledbury in Herefordshire. He was educated at Eton and at Balliol College, Oxford, was made canon (1884) and precentor (1886) of St. Paul's Cathedral, London; and in 1910 he became regius professor of divinity at Oxford and canon of Christ Church. His publications include several volumes of sermons, such as *Logic and Life* (1882); also *Personal Studies* (1905); *Vital Values* (1906); *Fibres of Faith* (1910); *Unity in Diversity* (1914).

HOLLAND, JOHN PHILIP (1844-1914). An American inventor. He was born at Liscannor, County Clare, Ireland, and was educated at the Christian Brothers' school, Limerick. For 15 years he was a school teacher, including, after removal to America, five years at Paterson, N. J. His interest in Irish independence led him to investigate means of breaking up England's sea power, and for this purpose he directed his attention to the construction of submarine torpedo boats. He laid his first plans

for a submarine before the United States Navy Department in 1875, and two years later constructed his first vessel of the sort, a clumsy wooden affair. In 1893 he received his first contract from the United States government, but because of others' interference the boat when constructed was practically a failure. Joining the Crescent Shipyards at Elizabeth, N. J., he built, according to his own plans, the submarine *Holland*, which was successfully tried in 1898 and then purchased by the United States. See **TORPEDO BOAT, SUBMARINE**. Holland died in poverty.

HOLLAND, JOSIAH GILBERT (1819-81). An American journalist and author, born at Belchertown, Mass., July 24, 1819. He graduated at Berkshire Medical College, Pittsfield, Mass., in 1844, practiced medicine three years, was made school superintendent at Vicksburg, Miss., became assistant editor of the *Springfield Republican* (1849-66), and made that journal attain great influence in New England. Here he published his *History of Western Massachusetts* (1855) and during these years gained distinction as a popular lecturer. On his return from two years in Europe (1868-70) he founded *Scribner's Monthly*, which absorbed successively *Hours at Home*, *Putnam's Magazine*, and *Old and New*, and, under changed ownership, is the present *Century Magazine*. Of this he remained editor till his death in New York, Oct. 12, 1881. Of his many volumes of fiction and verse, the earlier were published under the assumed name of Timothy Titcomb. The more noteworthy of the novels are: *The Bay Path* (1857); *Miss Gilbert's Career* (1860); *Arthur Bonnicastle* (1873); *The Story of Seven Oaks* (1875); *Nicholas Minturn* (1877). Of the poems the most popular are: *Bittersweet* (1858); *Katharina* (1867); *Garnered Sheaves* (1873). Noteworthy also are: *Letters to Young People* (1858); *Letters to the Joneses* (1863); *Plain Talk on Familiar Subjects* (1865); *Life of Lincoln* (1865); *The Mistress of the Manse* (1874). A collected edition of his works (16 vols., New York) appeared in 1897-1911. His prose and verse are alike clean in diction and thought, pure and sweet in feeling, earnest in moral tone, and appeal to a wide circle of readers. For his life, consult H. M. Plunkett, *J. G. Holland* (New York, 1894).

HOLLAND, NORTH. See **NORTH HOLLAND**.

HOLLAND, PHILEMON (1552-1637). A native of Chelmsford, England, called by his contemporaries "the translator general of his age." He was educated at Trinity College, of which he became a fellow. On being appointed to the rectorship of the free grammar school of Coventry he began a long series of translations from the classics. He also found time to carry on practice as a physician. By distribution of his time he reconciled his three professions of schoolmaster, doctor, and translator, fulfilling the functions of all three till his eightieth year. His chief translations are those of Livy (entire), Pliny's *Natural History*, Plutarch's *Morals*, Suetonius, Ammianus Marcellinus, and the *Cyropædia* of Xenophon. He also did good service to literature by his edition and translation of Camden's *Britannica*, to which he made some valuable additions.

HOLLAND, THOMAS ERSKINE (1835-). An English authority on international law. He was born at Brighton, studied there and at Balliol and Magdalen colleges, Oxford, where he won

high honors, and entered law practice in 1863. In 1874 Holland became Vinerian reader in English law at Oxford and immediately afterward was appointed Chichele professor of international law and diplomacy, which post he held until 1910. Holland was given the degree of D.C.L. by Oxford and that of LL.D. by Bologna, Glasgow, Brussels, and Dublin, and received numerous other honors. In 1913 he was president of the Institute of International Law. His best-known work, *Elements of Jurisprudence* (1880; 11th ed., 1910), is a standard in England and America. He also wrote: *The Institutes of Justinian* (1873-81); *The European Concert in the Eastern Question* (1885); *Studies in International Law* (1898); *Neutral Duties in a Maritime War as Illustrated by Recent Events* (1905); *The Law of War on Land* (1908); *Proposed Changes in the Law of Prize* (1911).

HOLLAND, WILLIAM J. (ACOB) (1848-). An American zoölogist and paleontologist, born at Bethany, Jamaica, West Indies. He graduated from the Moravian College and Theological Seminary at Bethlehem, Pa., in 1867, from Amherst College in 1869, and from Princeton Theological Seminary in 1874. He was principal of high schools in Massachusetts (1869-71), was ordained to the Moravian ministry in 1872, held pastorates at Philadelphia (1872-74) and at Pittsburgh, Pa. (1874-91), and was chancellor of the Western University of Pennsylvania (now the University of Pittsburgh) from 1891 to 1901. In 1898 he became director of the Carnegie Institute at Pittsburgh, where he had been professor and lecturer since 1892. In 1907-09 he served as president of the American Association of Museums. His publications include *The Butterfly Book* (1898), *The Moth Book* (1903), *To the River Platte and Back* (1913), and papers on the Tertiary fauna and Jurassic dinosaurs.

HOLLAND, WILLIAM OF. See **WILLIAM OF HOLLAND**.

HOLLÄNDER, BERNARD (1864-). An English physician. He was born in Vienna, went to London in 1883, became a British subject, studied medicine at King's College Hospital and on the Continent, and practiced in London. His particular interest in abnormal psychology led him to study cerebral localization and to attempt a modern scientific phrenology. He wrote: *The Mental Functions of the Brain* (1901); *Scientific Phrenology* (1902); *Crime and Responsibility* (1907); *Psycho-Therapeutics of Insanity* (1908); *The Unknown Life and Works of Dr. Francis Joseph Gall* (1909); *Eugenics and Marriage* (1912); *The Insanity of Genius* (1913).

HOLLÄNDER, GUSTAV (1855-1915). A German violinist and teacher, born at Leobschütz (Upper Silesia). He received his first instruction from his father, a physician and most enthusiastic music lover, and even as a child played in public. In 1867-69 he studied under David at the Leipzig Conservatory, from 1869 to 1874 under Joachim at the Hochschule in Berlin and at the same time composition under Kiel. Immediately upon the completion of his studies he joined the orchestra of the Royal Opera in Berlin and was appointed teacher of violin in Kullak's academy. In 1881 he was called to Cologne as concert master of the Gürzenich Orchestra and professor at the

conservatory. A few years later he also succeeded Japha as first violin of the famous Professoren Streichquartett. In 1895 he went again to Berlin to assume the directorship of the Stern Conservatory. He made many successful concert tours of Germany, Austria, Holland, and Belgium. In the field of composition he confined himself to works for his own instrument.

HOLLANDER, JACOB HARRY (1871-). An American economist, born in Baltimore. He graduated from Johns Hopkins University in 1891. He was appointed secretary to the Bi-metallic Commission of 1897; in 1900 the Secretary of War made him special commissioner on the revision of law in Porto Rico, and a few months afterward he was named Treasurer of the island by President McKinley. At Johns Hopkins he served as associate professor of finance until 1900, and as associate professor of political economy from 1901 to 1904, when he was appointed professor. In 1908 he was special commissioner to Santo Domingo to investigate the public debt, and after 1908 he was financial adviser of that Republic. His publications include: *The Cincinnati Southern Railway: A Study in Municipal Activity* (1894); *The Financial History of Baltimore* (1899); *Studies in State Taxation* (1900); *Report on the Debt of Santo Domingo* (1906); *David Ricardo: A Centenary Estimate* (1910). He edited the *Letters of David Ricardo to J. R. McCulloch* (1895) and to *Hutches Trower* (1899).

HOLLAND (höl'and) HOUSE. A London mansion of Tudor architecture, on a hill near Kensington Gardens, built in 1607 for Sir Walter Cope. Its name is derived from an early owner, Henry Rich, Earl of Holland. The house is famous for its associations with the names of those who have occupied it. After Lord Holland's execution it passed into the hands of the Parliamentary generals Fairfax and Lambert, but was later restored to Lady Holland. Addison lived in it from 1716 to his death in 1719. Henry Fox, father of Charles James Fox, purchased it in 1762, and it is still in the possession of his line. Among its other inmates have been Cromwell, Ireton, William Penn, William III and Mary, Moore, and Macaulay.

HOLLAND PURCHASE. See **NEW YORK**.

HOLLAND SOCIETY. A genealogical society, founded in New York City on April 6, 1885. Its objects are to collect information respecting the early history and settlement of New Amsterdam by the Dutch and to discover and preserve all existing documents, mementos, etc., relating to their genealogy and history, as well as to publish material for a memorial history of the Dutch in America, in which shall be particularly set forth the part belonging to that element in the growth and development of American character, institutions, and progress. The society admits to membership descendants, in the male line only, of Dutchmen, or of persons entitled to the privileges of Dutch citizenship in Dutch settlements in America, prior to the year 1675. The badge is a facsimile of the famous Beggars medal of 1566. The society has marked various historical localities in New York City by inscribed plates and publishes a yearbook containing historical and genealogical information. Its membership in 1914 was 1000, with a waiting list, being limited to that number.

HOLLAR, höll'är, WENCESLAUS (in Bohe-

mian, VACLAV HOLLAR) (1607-77). A celebrated Bohemian etcher. He was born at Prague, June 13, 1607, the son of a lawyer, and received a good education. When quite young, he took up the study of drawing, modeling his work especially on that of Dürer. He was only 18 when he published his first works, consisting of the "Virgin" (after Dürer), the "Ecce Homo," and some other subjects. Leaving Prague, he began a wandering life through Germany, taking views of the chief towns and of the most striking scenery of the Danube, Rhine, and other streams. He lived two years at Frankfort, where he worked under Matthew Marian, a pupil of Rubens and Van Dyck, and afterward in Strassburg and Cologne. At Cologne in 1635 he fell in with the Earl of Arundel, the English Ambassador to the German Emperor, who attached him to his service. Soon after reaching England with his patron he was appointed to instruct the Prince of Wales in drawing and in 1640 published his *Ornatus Muliebris Anglicanus*, a description of the customs of the contemporary Englishwomen, followed in 1643 by *Theatrum Mulierum*, a similar production for the women of the remaining parts of Europe. During the Civil War he enlisted as a Royalist and took part, with other artists, in the defense of Basing House. In 1645 he joined Lord Arundel at Antwerp. He was simple and honest in money matters, and nearly always the victim of unscrupulous dealers. After Arundel's death he became very poor. He worked by time, fixing his tariff at fourpence an hour, which he marked by a sandglass. During this period, however, he produced his best work. He returned to England in 1652 and worked with the same unflagging industry and with no more profitable result. His plates in Dugdale's *Monasticon* and *History of St. Paul's* and in other works attest his diligence. After the Restoration he was made designer to the King, and in 1669 he was commissioned by Charles II to take plans and perspective drawings of Tangier and its fortifications, in payment for which work he received a very paltry sum. In 1673 he traveled through northern England, etching the principal cities there. He died in great poverty in London, Jan. 19, 1677.

He left some 2750 plates on a great variety of subjects. They include views of cities, such as Strassburg, Frankfort, Cologne, Greenwich, Oxford, Lincoln, York, Albury, Windsor, Tangier, etc.; architectural drawings, for example of Antwerp Cathedral, St. George's Chapel (Windsor), tomb of Edward IV (Windsor); and other subjects: "Trial of Archbishop Laud," "Coronation of Charles II," "Engagement with the Algerian Pirates," the "Four Seasons." His portraits were especially after Holbein and Van Dyck. Among the best known are those of Charles I and his Queen after the latter, and his original engravings of the Duke of York (afterward James II), Oliver Cromwell, Hobbes, and Lady Venetia Digby. While most of his work was original, he executed with equal facility engravings after the old masters. Some of the best known are an "Ecce Homo," after Titian; "Esther before Ahasuerus," after Veronese; "Cupid Riding a Lion," after Giulio Romano; and especially a beautiful goblet after Mantegna's pen drawing. There are almost complete collections of his works in the British Museum and in the library of Windsor Castle.

Hollar's work unites, in a remarkable fashion,

accuracy and the pictorial quality. He is known chiefly as a topographical and architectural engraver, and even into such subjects he knows how to introduce poetry and romance. His portraits are admirable, his landscapes dainty and free. Catalogues of Hollar's plates were edited by Vertue (London, 1759) and by Parthey (Berlin, 1853; supplement, 1858; additions by Borowsky, Prague, 1898). The former contains valuable biographical notices; the latter is an excellent and exhaustive treatise.

HOLLAZ, hól'läts, DAVID (1648-1713). A German dogmatic theologian, born at Wulkow in Pomerania. He studied at Erfurt and Wittenberg, became preacher at Pützerlin in 1670, assistant rector at Stargard in 1681, and afterward was situated at Kolberg and at Jakobs-hagen. His great work, *Examen Theologicum Acroamaticum Universam Theologiam Thetico-polemicam Complectens* (1707), passed through many editions and surpassed preceding works in clearness and simplicity rather than scientific knowledge. It may be considered the best expression of Lutheran orthodoxy of the period. He is not to be confused with David Hollaz, his grandson, who preached at Günthersberg and was the author of *Beschreibung der Wiedergeburt* (1737), *Anweisung zum Gebet* (1747), *Evangelische Gnadenordnung* (1751), and *Pilgerstrasse nach Zion* (1771).

HOLLEBEN, hól'la'b'en, THEODOR VON (1838-1913). A German diplomat. He was born in Stettin and was educated at Berlin, Heidelberg, and Göttingen. After serving in the Franco-Prussian War he left the Hussars for the diplomatic service in 1872. He was Minister to Argentina (1875-85); Envoy to Japan (1885-91), to Washington (1892-93), to Stuttgart (1893-97), and then again to Washington, where he received the rank of Ambassador (1897). After the failure of the German effort to induce President Roosevelt to act as arbitrator in the Venezuelan dispute, Von Holleben resigned (1903), his health having failed.

HOLLES, hól'iz, or hólz, DENZIL, LORD (1599-1680). An English statesman, born at Haughton, Nottinghamshire, Oct. 31, 1599. He was a member of Parliament for St. Michael, Cornwall, in 1624, for Dorchester in 1628, and in 1629 was one of two members who forced the Speaker to keep his seat when he strove to obey Charles I by adjourning the House before it could pass certain acts upon taxation and religion obnoxious to the King. Holles was fined and imprisoned in the Tower for nearly a year. He again represented Dorchester in Parliament in 1640. Two years afterward he was one of the famous five members whom King Charles tried unsuccessfully to arrest, and while the civil war was in progress held Bristol for the Parliament and raised a regiment of foot that made its mark at Edgehill and Brentford. But, his war spirit having abated, he was one of the commissioners appointed to treat with the King both at Oxford and at Newport. When he proposed the disbandment of the army in 1647, its leaders accused him of high treason, and he was once again obliged to seek an asylum on the Continent and remained in France until the close of the Protectorate. He was one of those who conferred with Monk regarding the proposed Restoration and again took his seat in Parliament in February, 1660. He was ever watchful that Charles II did not encroach upon the public liberties, dearer to him than the

King who had made him a peer (1661) and in whose Privy Council he sat (1679), and he exercised his great influence towards the disbanding of the army, lest the restored monarch should attempt to use it for his own purposes. Lord Holles was one of the commissioners of the Treaty of Breda (1667). He wrote: *The Grand Question Concerning the Judicature of the House of Peers* (1669); *The Case Stated Concerning the Judicature of the House of Peers in the Point of Appeals* (1675); *The Case Stated of the Jurisdiction of the House of Lords in the Point of Impositions* (1676); *Considerations Touching that Question whether the Prelates have the Right to Sit among the Lords and Vote with them in Parliament in Capital Cases* (1682).

HOLLEY, ALEXANDER LYMAN (1832-82). An American metallurgist and mechanical engineer, born at Lakeville, Conn., where his father, Alexander H. Holley, later Governor of the State, had a cutlery factory, in which the boy became an adept as a machinist. He took a scientific course at Brown University (1850-53). In 1854 he became editor and partner with Zerah Colburn of the *Railroad Advocate*. Four years later he and Colburn wrote *The Permanent Way and Coal-Burning Locomotive Boilers of European Railways*, which did much to reform American railroad management. He was an editor of the *New York Times* and of Webster's *Dictionary*, traveled in Europe in 1862, and wrote a *Treatise on Ordnance and Armor* (1864). In 1863 he went to England, purchased the Bessemer patents, and in 1865 started the Bessemer plant at Troy, which, later, he greatly improved. (See **IRON AND STEEL**, *Bessemer Process*.) He was closely connected with the building of many large steel works. He was trustee of the Rensselaer Polytechnic Institute (1865-82) and in 1875 became president of the Institute of Mining Engineers and a member of the government board for testing structural materials.

HOLLEY, MARIETTA (1850-). An American author, born near Adams, Jefferson Co., N. Y. She began by writing poetry for the country press at the age of 16. Her prose contributions to periodicals giving the amusing adventures of "Samantha," and the sayings and doings of "Josiah Allen's Wife," proved very popular. Her books include: *Samantha at the Centennial* (1877); *My Wayward Partner* (1880); *Miss Richard's Boy* (1883); *Samantha at Saratoga* (1887); *Samantha amongst the Colored Folks* (1892); *Samantha in Europe* (1895); *Around the World with Josiah Allen's Wife* (1899); *Samantha at the St. Louis Exposition* (1904); *Samantha on the Woman Question* (1913); *Josiah Allen on the Woman Question* (1914).

HOLLEY, MYRON (1779-1841). An American reformer and editor, born in Salisbury, Conn. A graduate of Williams College, he began the practice of law in 1802, but left it for a bookselling business in Canandaigua, N. Y., and was a leading promoter of the Erie Canal. Afterward he was prominent in the Antimasonic and the antislavery movements. He was editor first of the *Countryman* (1831-34), then of the *Hartford Free Elector* and of the *Rochester Freeman*.

HOLLICK, CHARLES ARTHUR (1857-). An American geologist, born on Staten Island, N. Y. He graduated from the Columbia School

of Mines in 1879 and as Ph.D. from Columbian (now George Washington) University in 1897. He served as president of the Port Richmond (N. Y.) boulevard commission (1896), and of the Richmond County (N. Y.) park commission (1897-1904), and as member of the New York City Board of Education (1907-10), from 1891 to 1900 taught geology at Columbia University, and thereafter was curator of the department of fossil botany of the New York Botanical Garden. In 1881 he joined the United States Geological Survey, of which he became geologist. His writings deal with the fossil botany and geology of the eastern United States. He became a contributor to the *NEW INTERNATIONAL ENCYCLOPEDIA*.

HOLLIDAYSBURG. A borough and the county seat of Blair Co., Pa., on the Juniata River, 7 miles south of Altoona, on branches of the Pennsylvania Railroad (Map: Pennsylvania, E 6). Coal, iron ore, ganister, and limestone are found in the vicinity; and the borough has foundries and machine shops, a silk mill, car works and classification yards. The borough owns its water works. On the outskirts of Hollidaysburg are the Ant Hill Woods, famous for their colony of ants. Pop., 1900, 2998; 1910, 3734.

HOLLINS, ALFRED (1865-). An English musician, born at Hull. He was blind from his birth and at nine years of age entered the Wilberforce Institution for the Blind at York, where he remained three years, studying music under William Barnby. In 1878 he entered the Royal Normal College for the Blind at Upper Norwood, making the piano his chief study, his teacher being Fritz Hartvigson. Through the kindness of the principal of the institution he secured organ lessons from E. J. Hopkins, who took a special interest in him, and who helped him considerably in the mastery of orchestration, which was later a conspicuous feature of his compositions. At the age of 16 he had given recitals before the courts of England and Germany and was a special favorite with Queen Victoria and the Empress Frederick of Germany. In furtherance of his equipment as a pianist he studied piano with Von Bülow in Berlin and in 1887 became a pupil at the Raff Conservatory, studying in addition under Max Schwartz. He visited America twice—in 1886 as a member of Dr. Campbell's party and in 1888 as a concert organist. His most important engagement was as organist of United Free St. George's Church, Edinburgh. His organ compositions are universally known and are very popular in the United States. The following are among his better-known works: two concert overtures (in C major and C minor); andante in D; grand *chœur* in G minor; two preludes; intermezzo in D flat; and a nocturne in B flat.

HOLLINS, GEORGE NICHOLS (1799-1878). An American naval officer. A native of Baltimore, Md., he was midshipman at the age of 15, and, being aboard a frigate taken by the English, he was held a prisoner by them till the end of the War of 1812. Ten years later he had exchanged the naval for the merchant service, and by 1844 was captain of an armed vessel which he subsequently employed to enforce the rights of Americans living in Nicaragua, thereby causing international complications with Great Britain. This was in 1855. At the outbreak of the Civil War he sided with the Confederates

and as a commodore in their navy rendered important service.

HOLLIS, HENRY FRENCH (1869-). An American legislator. He was born in Concord, N. H., and graduated from Harvard University in 1892. In the following year he took up the practice of law at Concord. He became a member of the Democratic State Central Committee in 1900 and was Democratic candidate for Congress in 1900 and for Governor in 1902 and 1904. He was elected United States Senator from New Hampshire for the term 1913-19.

HOLLIS, IRA NELSON (1856-). An American marine engineer and educator, born at Mooresville, Ind. He graduated from the United States Naval Academy in 1878, rose to the rank of assistant engineer in the United States navy in 1888, but resigned in 1893. Thereafter until 1913 he was professor of engineering at Harvard University, and in the latter year he became president of Worcester Polytechnic Institute. He received the honorary degrees of A.M. from Harvard in 1899, L.H.D. from Union College in 1899, and Sc.D from the University of Pittsburgh in 1912. Besides contributions to engineering magazines, he is author of *War College Lectures on Naval Ships* (1892) and a history of *The Frigate Constitution* (1900).

HOLLISTER. A town and the county seat of San Benito Co., Cal., 94 miles southeast of San Francisco, on the Southern Pacific Railroad (Map: California, D 6). It is the centre of farming, fruit-growing, dairying, and stock-raising interests. The town has a hospital and a Carnegie library. Quicksilver is found in the vicinity. Pop., 1900, 1315; 1910, 2308.

HOLLISTER, GIDEON HIRAM (1817-81). An American author, born in Washington, Conn. After graduating at Yale (1840), he studied and practiced law in Litchfield, with digressions to other towns in Connecticut and with a year in Haiti as United States Minister (1868-69). In 1880 he was sent to Congress. His literary work consists of an historical novel, *Mount Hope* (1851), *History of Connecticut* (2 vols., 1854), *Thomas à Becket: A Tragedy, and Other Poems* (1866), and *Kinley Hollow* (1882), published posthumously.

HOLLMANN, hól'mán, FRIEDRICH (1842-1913). A German admiral, born in Berlin. He entered the Prussian navy in 1857, served in the Asiatic expedition of 1859-62, commanded a gunboat in 1864, and, after service on schoolship and at the Kiel Naval Academy, fought at the battle of Grille in the Franco-Prussian War. His advance was rapid; in 1889 he arranged the trip of the German Emperor and Empress to Greece and Turkey; and in the following year he was made Secretary of State for the Navy—a post which he held until June, 1897, when he resigned because of his inability to pass the naval budget. He had been promoted to admiral in 1896. Since 1904 he had been a member of the Prussian House of Lords.

HOLLMANN, JOSEF (1852-). A Dutch violoncellist, born at Maestricht. After having been prepared in his native town by Keller, he entered the Brussels Conservatory, where he studied the cello with Servais and composition with Fétis. Although he left the institution as winner of the first prize, he went to Paris for further study under Jaquard and Savart. His first tour of Scandinavia established his reputation, which grew steadily on his subsequent tours

of Germany, the Netherlands, France, and England. Twice he visited the United States, in 1892 and 1906, both times with most gratifying results. His playing is characterized by a fiery energy artistically restrained, and an extremely beautiful tone of great power and mellowness. He published a number of compositions for his instrument.

HOLLOWAY, JOSEPHUS FLAVIUS (1825-96). An American mechanical engineer, born at Uniontown, Ohio. From 1865 to 1872 he was superintendent and engineer and thereafter, until 1886, president of the Cuyahoga (Ohio) Steam Furnace Company, manufacturers of locomotive and marine engines. He then became consulting engineer of the H. R. Worthington firm of New York City, and in 1895 took up the same duties with the Snow Steam Pump Works of Buffalo. He patented several improvements in marine engines and in pumping machinery. In 1885 he served as president of the American Society of Mechanical Engineers.

HOLLOWAY, LAURA CARTER (afterward MRS. LANGFORD) (1848-). An American author, twice married, whose maiden name was Carter. She was born in Nashville, Tenn., and was educated at the Female Academy there. For 12 years she was associate editor of the Brooklyn *Daily Eagle*. She was president of the Seidl Musical Society in Brooklyn and a collaborator with Anton Seidl himself in the musical work for the *Standard Dictionary*. She published: *Ladies of the White House* (1870); *An Hour with Charlotte Brontë* (1883); *The Mothers of Great Men and Women* (1884); *Chinese Gordon* (1885); *Adelaide Neilson: A Biography* (1885); *The Buddhist Diet Book* (1887); *Atma Fairy Stories* (1903).

HOLLOWAY COLLEGE, THE ROYAL. An institution founded in 1883 at Mount Lee, Egham, Surrey, England, by Thomas Holloway, for the purpose of supplying higher education to women, particularly of the middle class. The building is very handsome, in the French Renaissance style, and was opened by Queen Victoria in 1886. Seventeen governors look after the management. Accommodation is provided for some 200 students, who are prepared for the examinations of the University of London in the faculties of arts and science.

HOLLOW WARE. There are two classes of iron goods so called, viz., cast-iron hollow ware and wrought-iron hollow ware. Both kinds include cooking and other vessels for domestic use, which have in large part displaced earthenware, and comprise also some other articles, such as coffee mills, which are molded and finished in a similar way. Wrought-iron hollow ware is largely made by the process of stamping (see DIES AND DIE SINKING), though it may be forged, drawn, or planed. Hollow ware is finished in three ways; some of it is enameled, some tinned, and some of it is left black, or untinned. See ENAMEL.

HOLLS, hólz, GEORGE FREDERICK WILLIAM (1857-1903). An American lawyer. He was born at Zelenople, Pa., graduated at Columbia (1878) and at Columbia Law School (1880), and gained a large German-American practice in New York City. He was a Republican delegate at large to the State Constitutional Convention in 1894 and was commissioner on government of cities of the third class (1895). During the Spanish-American War he did much in Germany to better feeling towards the United States and

in the following year was appointed secretary and counsel of the American delegation to the Peace Conference at The Hague. In the treaty there concluded Holls wrote the article "Special Mediation." He wrote: *Franz Lieber* (1884, in German); *Sancta Sophia and Troitza* (1888), a sketch of travel in Russia and the East; *Compulsory Voting* (1891); *The Peace Conference at The Hague and its Bearings on International Law and Polity* (1900).

HOLLY (older *hollen*, from AS. *holen*; connected with Ir. *cuilenn*, Gael. *cuiloun*, Welsh, *celyn*, holly, and also with OHG. *hulis*, huls, Ger. *Hülse*, holly, Skt. *śala*, staff). *Ilex*. A genus of trees and shrubs of the family Aquifoliaceæ, chiefly natives of temperate climates, with evergreen, leathery, shining, and generally spinous leaves. The common holly (*Ilex aquifolium*), the only European species, and a native also of some parts of Asia, is a well-known ornament of parks and shrubberies in Great Britain, where it sometimes attains a height of 50 feet upon suitably light soils. Numerous varieties of holly are in cultivation, which exhibit great diversity in the leaves. The flowers of the holly are whitish, axillary, nearly umbellate; the fruit small, scarlet, rarely yellow or white. Medicinal properties are attributed to the leaves, berries, and roots. Birdlime is made from the inner bark. The wood is almost as white as ivory, very hard and fine-grained, and is used by cabinetmakers, turners, musical-instrument makers, etc., and sometimes for wood engraving. The holly is often planted for hedges, since it bears clipping well. The name "holly" is said to be derived from the use of the branches and berries to decorate churches at Christmas, from which the tree was called holy tree. Numerous species of holly are found in North America, most of them in swampy situations; in South America, Nepal, Japan, and other parts of the world. Some of these have been introduced as ornamental trees and shrubs. Maté (q.v.), or Paraguay tea, is the leaf of a South American

furnished the "black drink" of the North Carolina Indians.

HOLLYHOCK (ME. *holihoc*, holy hock, from *holi*, AS. *hālig*, holy + *hoc*, AS. *hoc*, leaf), *Althæa rosea*. A plant of the family Malvaceæ, native of India and south of Europe, etc., and common in gardens throughout the world. It

HOLLYHOCK (*Althæa rosea*).

has a tall, straight, hairy, unbranched stem, 4 to 15 feet tall; heart-shaped, crenate, wrinkled, five to seven angled leaves, which diminish upward into bracts; and large axillary flowers, almost without stalks, which on the upper part of the stem form a spike; the petals are hairy at their bases. Its flowers vary much in color, and double and semidouble varieties are common. It is an ornamental autumnal flower, which continues till frost. It is propagated either by seed or cuttings.

The plant is frequently attacked by a fungus, a rust, *Puccinia malvacearum*, which has greatly reduced its culture in many parts of the United States and Europe. Its presence may be first noticed in May or June by small yellow spots on the leaves and stems. Soon the leaves become dry and dead, as though scorched by fire. Any standard fungicide applied frequently from early spring until flowering time will keep the disease in check. Washing the leaves with a solution of two tablespoonfuls of potassium permanganate in a quart of water is a common remedy employed in Europe. The hollyhock is sometimes attacked by blight (*Colletotrichum malvarum*), and a leaf-spot disease (*Cercospora althæina*), both of which may be prevented by the use of some good fungicide (q.v.).

HOLLY SPRINGS. A city and the county seat of Marshall Co., Miss., 45 miles southeast of Memphis, Tenn., on the Kansas City, Memphis, and Birmingham, and the Illinois Central railroads (Map: Mississippi, F 1). It has a public library, Rust University for negroes (Methodist Episcopal), opened in 1868, the Mississippi Synodical College for young ladies, the Holly Springs Normal Institute, and the experiment station of the Mississippi Agricultural and Mechanical College. The city is situated in a fertile stock-raising and dairying region and is principally engaged in the cotton trade and has a cotton compress and gin, a cottonseed-oil mill, bottling works, an ice factory, stone-jug fac-

HOLLY (*Ilex aquifolium*).

species of holly (*Ilex paraguensis*). In the United States there are a dozen species of *Ilex*, the finest of which, American holly (*Ilex opaca*), is a small tree, 20 to 40 feet tall, extensively used as a Christmas decoration, though the leaves are less glossy and the berries not so bright a red as the European species. *Ilex vomitoria* is a shrub which occurs from Virginia southward. Its leaves are used for tea, and it

tories, etc. Holly Springs is governed under a charter of 1896, which provides for a mayor, elected biennially, and a city council. The water works and electric-light plant are owned and operated by the municipality. In December, 1862, during the Civil War, General Grant established here a depot of supplies, protected by a small garrison under Col. R. C. Murphy, preparatory to moving forward against Vicksburg. On December 20 the Confederate General Van Dorn by a rapid movement captured the post, taking about 1500 prisoners, and destroyed supplies valued by Grant at \$400,000. This, together with a raid by Forrest into Tennessee, forced Grant to abandon for a time his forward movement. Pop., 1890, 2246; 1900, 2815; 1910, 2192.

HOLM, hölm, GUSTAV FREDERIK (1849-). A Danish naval officer and Arctic explorer, born at Copenhagen. He was made commander in the navy in 1899, was chief of the hydrographic bureau from 1899 to 1909, and became director of pilots in 1912. A member of the Royal Greenland Commission after 1896, he became distinguished for his explorations, which greatly enlarged our knowledge, especially of the east coast of Greenland and of its natives. Among many explorations he investigated archaeologically the Norse ruins of the Julianehaab district. From 1883 to 1885 he explored, with Garde (q.v.), the east coast of Christian IX Land, as far as 86° 8' N. Holm discovered 11 hitherto unknown Eskimo communities, numbering 431 inhabitants, and five great ice floids. As a result, Denmark established a missionary station and commercial post at Angmagsalik, 65° 37' N., thus saving from annihilation the slowly vanishing natives of that coast. For his explorations he received gold medals from the Société de Géographie, Paris (1891), and the Danish Geographical Society (1895), and the Danish Order of Merit (1909). He wrote, with Garde, *Den danske Konebaade-Expedition til Grønlands Østkyst 1883-85* (1887) and *Om de geografiske Forhold i dansk Østgrønland* (1889). Consult *Meddelelser om Grønland*, ii, vi, ix, x, xvi (Copenhagen, 1879).

HOLM, hölm, PETER EDWARD (1833-). A Danish historian, born at Copenhagen. He studied philology at the University of Copenhagen and, after receiving his doctor's degree there, became lecturer in 1865 and from 1868 to 1899 was professor of history. In 1875 he published *Danmark-Norges udenrigske Historie 1791-1807* in two volumes. He planned to write the history of Denmark and Norway from 1720 to 1814 and published as introduction *Danmark-Norges indre Historie, 1660-1720* (2 vols., 1885-86), and up to 1914 seven volumes had appeared of his *Danmark-Norges Historie fra den store nordiske Krigs Afslutning til Rigerens Adskillelse*. This work is monumental in Danish historical writing. Holm's great historical learning and broad culture, his practical administrative knowledge, his good sense and calm estimation of persons and actions, and his strict impartiality to both kingdoms fitted him eminently to be the historian of the period he treats. His *Danmarks Riges Historie* (1903) is an abbreviation of his history of the period 1699-1814. Holm was elected an officer or member of many scientific societies.

HOLM, hōm, SAXE. The nom de plume signed to a series of short stories, first published in *Scribner's Monthly Magazine* and then in a vol-

ume (New York, 1873; 2d series, 1878). They have been attributed to Mrs. H. M. F. Jackson (at the time of publication, Mrs. Helen Hunt).

HOLM, hölm (HERMAN) THEODOR (1854-). An American botanist. He was born at Copenhagen, Denmark, and graduated from the University of Copenhagen in 1880. He was botanist and zoologist of the Danish North Pole Expedition in 1882-83 and made explorations in west Greenland for his government in 1884-86. In 1893, after five years of residence in the United States, he became an American citizen. He served as assistant botanist of the United States National Museum in 1888-93 and of the United States Department of Agriculture in 1893-96, and in 1896-99 he made investigations of the high Alpine flora of Colorado. He is author of several papers on Arctic plants and on the anatomy and morphology of phanerogams. In 1902 he received an honorary Ph.D. from the Catholic University of America.

HOLMAN, höl'man, JOSEPH GEORGE (1764-1817). An English actor and dramatist. Educated in London and at Oxford, he made his début, when 20 years of age, as Romeo at Covent Garden, and continued to present Shakespearian and other rôles there till the end of the eighteenth century. In 1806 he played in Dublin and then at the Haymarket, London. He went in 1812 to America, where he had the support of his daughter in performances at New York City and Philadelphia. He was successful as a writer of comedies and comic operas, such as *Abroad and at Home* (1796), *Red Cross Knights* (1799), *Voluntary of Wealth* (1799), and *What a Blunder* (1800).

HOLMAN, SILAS WHITCOMB (1856-1900). An American physicist, born at Harvard, Mass. He graduated at Massachusetts Institute of Technology in 1876, was appointed an instructor in that institution in 1881, assistant professor in 1882, associate professor in 1885, and professor in 1893. In 1897 ill health and failing eyesight compelled him to retire with the title of professor emeritus. He was particularly interested in the methods of laboratory instruction and published investigations on *The Effect of Temperature on the Viscosity of Air* (1876) and on *The Viscosity of Gases*; and other works, including *Physical Laboratory Notes* (1885-95), *Computation Rules and Logarithms* (1896), and *Matter, Energy, Force, and Work* (1898).

HOLMAN, WILLIAM STEELE (1822-97). An American jurist and politician. He was born in Dearborn Co., Ind., and was educated at Franklin College, became a judge of probate at the age of 21, was elected district attorney of his county in 1846, and in 1851 was sent to the Legislature. With the exception of eight years he was a Democratic Representative in Congress from 1859 till his death, in 1897, and from his opposition to extravagant appropriations was known as "the great objector" and "the watchdog of the Treasury."

HOLMBOE, hölm'bō, CHRISTOPHER ANDREAS (1796-1882). A Norwegian philologist and numismatist, brother of Bernt Michael Holmboe (1795-1850), the mathematician. He was born at Vang, studied at Christiania, and made a specialty of Oriental languages, especially Persian, under De Sacy in Paris (1821-22). In 1822 he became lecturer in Oriental languages at Christiania, and in 1825 professor. Besides being a pioneer in philology, he took an active interest in education. He founded the *Norske Universitets og Skole-Annaler* (1834-40). His more im-

portant works are: *De Re Prisca Monetaria Norvegica* (1841); *Sanskrit og Oldnorsk* (1846); *Det Oldnorske Verbum* (1848); *Det Norske Sprogs væsentligste Ordforraad, sammenlignet med Sanskrit* (1852); *Norsk og Keltisk* (1854); *Bibelsk Real-Ordbok* (1868).

HOLMBY (hōm'bi) **HOUSE**. A mansion near Northampton, England, erected by Sir Christopher Hatton during the reign of Elizabeth and later purchased by James I. It was here that Charles I was imprisoned by the Parliamentary commissioners from the time he was surrendered by the Scots until removed to Newmarket by Cornet Joyce (February–June, 1647). Five years thereafter the house was dismantled. See Gardiner, *History of the Great Civil War*, vol. iii (new ed., London, 1893).

HOLMES, hōmz, ABIEL (1763–1837). An American Congregational clergyman and historian, born at Woodstock, Conn. He graduated at Yale in 1783 and for a time was a tutor and a student of theology there. His first pastorate was at Midway, Ga., in a district settled largely by New Englanders. There he remained from 1785 till 1791. In 1792 he accepted a call to the First Congregational Church of Cambridge, Mass., where he continued during the next 40 years. His first wife was a daughter of President Stiles, of Yale College; his second was the daughter of Oliver Wendell and became the mother of Oliver Wendell Holmes (q.v.). His publications include: *A Life of President Stiles* (1798); *Annals of America* (1805; new ed., 1829, bringing the narrative down to 1826)—his best-known work, characterized by the minutest accuracy and still standard for the period covered; *Historical Sketch of the English Translation of the Bible* (1815); and a number of sermons, addresses, and memoirs.

HOLMÈS, ô'mès', **AUGUSTA MARY ANNE** (1847–1903). A French composer, born in Paris of English-Irish parents. Her father was Capt. Dalkeith Holmes, of the British army, and her mother was a member of an old Hampshire (England) family. She studied under Lambert, Klose, and César Franck, and, although a brilliant pianist (in her childhood regarded as a prodigy), she attained distinction entirely through her compositions. In 1879 she won the third prize with her *Lutèce*, in an open competition instituted by the city of Paris. Her other important compositions are a psalm, *In exitu* (1873); the operas *Héro et Léandre* (1874) and *La montagne noire* (1895); an *Andante pastoral* (1877); the symphonies *Les Argonautes* (1880), *Irlande* (1882), and *Pologne* (1883); and over 100 songs, besides other orchestral works. Two more operas, *Astarte* and *Lancelot du Lac*, she left in manuscript. Consult P. Barillon-Bauché, *Augusta Holmès et la femme compositeur* (Paris, 1913).

HOLMES, hōmz, E(LIAS) **BURTON** (1870–). An American traveler and lecturer. He was born in Chicago, where he was educated at the Allen Academy and at the Harvard School, and where he began his lecture work in 1890. With the exception of Australia, New Zealand, and South Africa, he traveled in nearly every country in the world in gathering material for his lectures; these he delivered in all the leading American cities and in several foreign countries. He is author of *The Burton Holmes Travelogues* (12 vols., 1908).

HOLMES, GEORGE FREDERICK (1820–97). An American educator. He was born in British

Guiana, was educated at Durham University, England, came to America in 1838, and taught in Virginia, South Carolina, and Georgia. He was for a time one of the editors of the *Southern Quarterly Review* and in 1846 became first president of the University of Mississippi. From 1847 to 1857 he was professor of history, political economy, and international law in William and Mary College. From that time until his death he was professor of history and literature in the University of Virginia. He prepared a series of textbooks for the use of schools in the Southern States, in which the sentiments and selections were made with reference to the justification of slavery.

HOLMES, JOHN HAYNES (1879–). An American Unitarian clergyman, born in Philadelphia. He graduated from Harvard University in 1902 and from Harvard Divinity School in 1904. He then became minister of the Third Religious Society (Unitarian) of Dorchester, Mass., and in 1907 he succeeded Minot J. Savage as pastor of the church of the Messiah, New York City. From 1908 to 1911, as president of the Unitarian Fellowship for Social Justice, he was especially active in urging reforms. He became associate editor of *Unity*, Chicago, and of the *Unitarian Advance*, New York; and is author of *The Revolutionary Function of the Modern Church* (1912) and *Marriage and Divorce* (1913).

HOLMES, JOSEPH AUSTIN (1859–1915). An American geologist, born at Laurens, S. C. In 1881 he graduated from Cornell University. From 1881 to 1891 he was professor of geology and natural history at the University of North Carolina, where he afterward served as lecturer. He was State geologist of North Carolina from 1891 to 1904; had charge of the United States Geological Survey laboratories for testing fuels and structural materials at St. Louis, Mo., in 1904–07 and at Pittsburgh, Pa., after 1908; investigated mine accidents in 1907–10 for the government; and when the Bureau of Mines was organized under the Department of the Interior (1910), he became its director. In 1904 he was chief of the department of mines and metallurgy at the St. Louis Exposition, and he wrote on mining technology, on mine explosions, and on more efficient and safe methods of mining.

HOLMES, MARY JANE (c.1839–1907). An American novelist. Her maiden name was Hawes, and she was born in Brookfield, Mass., but moved at her marriage to Versailles, Ky., and afterward to Brockport, N. Y. She was at first a district school-teacher, and the didactic tendency is perceptible throughout her works, which were favorites of the young person of a past generation and, indeed, are still current. Her first novel, *Tempest and Sunshine* (1854), a picture of Southern society, was followed by a book almost every year, and the total circulation of her many volumes has exceeded two millions. Mrs. Holmes was a novelist of domestic life, free from sensationalism, and, in the moral tone of her stories, quite unobjectionable.

HOLMES, NATHANIEL (1815–1901). An American jurist and author, born in Peterboro, N. H. He graduated at Harvard, began legal practice in 1839 at St. Louis, and was judge of the Missouri Supreme Court from 1865 to 1868. From that time until 1872 he was Royall professor of law at Harvard. In *The Authorship of Shakespeare* (1866; enlarged ed., 1886) he credits Francis Bacon with the dramas, and

he published also *Realistic Idealism in Philosophy Itself* (2 vols., 1888) and an *Historical Address* (1890).

HOLMES, OLIVER WENDELL (1809-94). An American man of letters, born at Cambridge, Mass., Aug. 29, 1809, son of the Rev. Abiel Holmes (q.v.), a minister of Calvinistic orthodoxy, who withstood the Unitarianism which was then gaining ground, and to which his son was later to give his adherence. Holmes was sent to Phillips Academy, Andover, Mass., for his preliminary education, and graduated from Harvard College in 1829. He at once entered the Law School of that institution, but, finding the law uncongenial, he gave it up for medicine. While a law student, he wrote and published in the *Boston Advertiser*, in 1830, his well-known and stirring verses, "Old Ironsides," which were an effective and popular protest against the proposed breaking up of the famous frigate *Constitution*. After three years in Harvard Medical School, Holmes in 1833 sailed for Europe, where he studied two years, chiefly in Paris, and on his return began the practice of medicine in Boston in 1836. The same year witnessed the publication of his first volume of poems. In 1838 he was appointed to the professorship of anatomy at Dartmouth College, a post which he held for two years. Thenceforth he passed his life almost wholly in Boston, with which city his name became very intimately associated. On June 15, 1840, he married Miss Amelia Lee Jackson, of Boston. His only important contribution to medical science was made in 1843, when he published his essay on the *Contagiousness of Puerperal Fever*, though he wrote numerous other scientific papers. From 1847 to 1882 he was Parkman professor of anatomy and physiology in Harvard Medical School. He was, however, not really eminent in his profession. His literary gift was marked, and he was less renowned in Boston as a practitioner than as a writer of very facile, witty verse, collections of which appeared from time to time until *Before the Curfew*, the last of them, was published in 1888.

Until 1857, however, his reputation was almost wholly local. The establishment in that year of the *Atlantic Monthly*, under the editorship of Lowell, brought him a national and almost world-wide vogue through the serial publication in that magazine of *The Autocrat of the Breakfast Table*, which appeared in book form in 1858. These delightfully egotistical talks, full of brilliant wit and buoyant seriousness, essentially of New England and Boston, had had their origin in two forgotten essays by Holmes in the *New England Magazine* in 1833. The success of *The Autocrat* was remarkable, and Holmes has been likened to almost every famous essayist from Montaigne to Lamb. Among orthodox Calvinists of the day the sketches met with disfavor, since the ideas and the manner were those of an essential rationalist. They were followed in the next year by a series scarcely less delightful, *The Professor at the Breakfast Table* (pub. 1860 in book form), and after a lapse of more than a decade, in 1871-72, by the third and last volume of the series, *The Poet at the Breakfast Table*. *The Autocrat*, however, is the best, most original, and most popular of the works of Holmes, who is often called the "Autocrat."

In 1861 Holmes published his first novel, *Elsie Venner*. Though rather formless and un-

even in quality and inartistic in method, it is interesting and full of power. More commonplace in idea than *Elsie Venner*, but equally interesting in its delineation, often rather contemptuous, of New England character, was *The Guardian Angel* (1867). In the interval between these two novels appeared *Songs in Many Keys* (1861) and *Humorous Poems* (1865) and a volume of prose, *Soundings from the Atlantic* (1863). His remaining literary work contained nothing very new or striking. The chief titles are: *Mechanism in Thought and Morals* (1871); *Songs of Many Seasons* (1874); *John Lothrop Motley* (1878), a memoir; *The School-Boy* (1878); *The Iron Gate, and Other Poems* (1880); *Pages from an Old Volume of Life* (1883); *Medical Essays* (1883); *Ralph Waldo Emerson* (1884), a life; *A Mortal Antipathy* (1885), his last novel, inferior to the two former; *The New Portfolio* (1885-86), in the *Atlantic*; *Our Hundred Days in Europe* (1887), an account of a voyage taken with his wife and daughter; *Before the Curfew, and Other Poems* (1888); and *Over the Tea-Cups* (1890), in the vein of *The Autocrat*. His death occurred in his eighty-sixth year, in Boston, Oct. 7, 1894.

Dr. Holmes was slight in stature and fastidious as to his personal appearance. In temper he was humane and kindly, particularly gracious to his numerous correspondents when confident of their sincerity, and genial in all his writing. His social accomplishments were unusual; he is said to have been the best talker in Boston. His style, at its best, is the style of spoken discourse—light, intimate, and winning, but not flippant. His verse, which is mainly of an occasional character, such as poems read at reunions of his college class or scattered throughout the pages of *The Autocrat*, is, like that prose work, sparkling with wit, or a graceful compound of gravity and humor. He is a prince among writers of *vers de société*. Among the best known of his poems are "Old Ironsides," "The Chambered Nautilus," "The Last Leaf," "Dorothy Q.," "The Voiceless," "The Deacon's Masterpiece; or, the Wonderful One-Hoss Shay."

Bibliography. Consult J. T. Morse, *Life and Letters of Holmes*, vols. xiv and xv of the *Collected Works*; T. W. Higginson, *Old Cambridge* (1899); Howells, *My Literary Friends and Acquaintance* (1899); S. M. Crothers, *O. W. Holmes* (1909). The standard edition of his works is the Riverside, in 15 volumes (Boston, 1892). A complete edition of his works in 14 volumes was published in New York (1913).

HOLMES, OLIVER WENDELL, JR. (1841-). An American jurist, son of Dr. O. W. Holmes. He was born in Boston, was educated at Harvard, served in the Civil War and was three times wounded—at Ball's Bluff, at Antietam, and at Fredericksburg. He practiced law in Boston, edited the *American Law Review* (1870-73), became professor of law at Harvard in 1882, and in the same year was appointed a member of the Massachusetts Supreme Court, of which he became Chief Justice in 1899. In 1902 he was named to succeed Justice Gray in the United States Supreme Court, where his profound legal learning, his sound judgment and humor, and his gifts of literary expression have given him a position of great influence. Holmes edited the twelfth edition of Kent's *Commentaries* and published his own Lowell Institute lectures, *The Common Law* (Boston,

1881), a notable contribution to our legal history. He has also published a volume of *Speeches* (Boston, 1913).

HOLMES, SHERLOCK. See DOYLE, SIR ARTHUR CONAN.

HOLMES, THEOPHILUS HUNTER (1804-80). An American soldier, prominent on the Confederate side in the Civil War. He was born in Sampson Co., N. C., graduated at West Point in 1829, served in the Florida War and the War with Mexico, and at the outbreak of the Civil War was acting as superintendent of the general recruiting service, with the rank of major. In April, 1861, he resigned his commission in the United States army and for a time was engaged in organizing the State troops of North Carolina. He became a brigadier general in the Confederate service soon after the secession of his State, commanded the Confederates in the engagement at Aquia Creek, was promoted to be major general, and from September, 1862, to March, 1863, was in command of the Trans-Mississippi Department, attaining the rank of lieutenant general. On July 3, 1863, he made an unsuccessful attack on Helena, Ark. In 1864 his health failed, and he was assigned to command the reserve forces in North Carolina. After the war he retired to his farm near Fayetteville, N. C.

HOLMES, T(HOMAS) RICE (EDWARD) (1855-). A British historian, born in County Westmeath, Ireland. He was educated at Christ Church, Oxford, and became a schoolmaster, teaching in St. Paul's School from 1886 to 1909 and then receiving a civil-list pension. He wrote an excellent *History of the Indian Mutiny* (1883; 5th ed., 1898) and *Four Famous Soldiers* (1889), but is even better known for his studies of Julius Caesar's campaigns in Gaul and Britain—*Cæsar's Conquest of Gaul* (1899; 2d ed., 1911), *Ancient Britain and the Invasions of Julius Cæsar* (1907), and an English version of Cæsar's *Commentaries on the Gallic War* (1908). Parts of the works on Cæsar's campaigns in Gaul and Britain were translated into German as *Cæsars Feldzüge in Gallien und Britannien*, by W. Schott and Felix Rosenberg (Leipzig, 1913). Holmes also edited, with Introduction and Notes, Cæsar's *Commentarii de Bello Gallico* (Oxford, 1914).

HOLMES, WILLIAM HENRY (1846-). An American anthropologist and archaeologist. He was born near Cadiz, Ohio, and after graduating at the McNeely Normal College (1870) was assistant on the United States Geological Survey (1872-80). During that period he accompanied Dr. F. V. Hayden's explorations in the Rocky Mountain region and superintended the survey of the San Juan territory until the reorganization of the survey (1880), when he was appointed geologist in charge of the department of illustrations. He had charge of the archaeological explorations of the Bureau of Ethnology in 1889-93, in 1894-98 was professor of archaeologic geology at the University of Chicago, from 1898 to 1902 and again after 1910 was curator of the United States National Museum, and was chief of the Bureau of American Ethnology from 1902 to 1909. He was president of the American Anthropological Association, and of the National Society of Fine Arts in 1909. In 1905 he became a member of the National Academy of Sciences. He edited geological publications, including Hayden's *Atlas of Colorado* and the eleventh and twelfth re-

ports of the Geological Survey, and published: *Archæological Studies among the Ancient Cities of Mexico* (1895); *Stone Implements of the Potomac-Chesapeake Tidewater Province* (1897); and papers on aboriginal American art.

HOLMGREN, hölm'grän, ALARIK FRITHIOF (1831-97). A Swedish physiologist, born in Vestra Ny Socken, Östergötland, and educated at the University of Upsala, at the University of Berlin under Du Bois-Reymond and Helmholtz, and under Brücke and Ludwig in Vienna. In 1864 he became professor of physiology at Upsala, the first chair in that subject in Sweden, and soon afterward founded a physiological laboratory. His medical studies were mostly in the field of ophthalmology, and he was an authority on color blindness; his works on this subject, "Om den medfödda färgblindhetens diagnostik och teori," in *Nordisk medicinsk Arkiv* (1874), and *Om färgblindheten i dess förhållande till järnvägstrafiken och sjöväsenet* (1877), have been translated into many languages. Holmgren was a firm believer in the hygienic value of Swedish gymnastics. He edited the *Skandinavisches Archiv für Physiologie* (1889 to his death, 7 vols.).—His wife, ANN MARGRETA TERSMEDEN (1850-), a strong advocate of education, wrote, under the pseudonym Märta Bolle, the novels *Fru Stråhle* (1894) and *När Riddar Alf suckar* (2 vols., 1896).—His brother, AUGUST EMIL ALGOT HOLMGREN (1829-88), was a naturalist of much ability. He wrote: *Ichneumonologia Suecica* (1864); *Handbok i Zoologi* (1865-71); *Om Småfåglarne* (1869); *Om skadeinsekter inomhus* (1879), besides other works on entomology and ornithology.

HOLMIA, höl'mi-ä. A characteristic genus of trilobites found in the Lower Cambrian rocks. It possesses a cephalon very much like *Olenellus*, but 16 free thoracic segments and a telson that is composed of a small plate without apparent segmental divisions, while the pleura of the thorax end in rounded spines. It occurs in Scandinavia and America.

HOLOCAINE, höl'o-kä'in. A drug used as a local anæsthetic, especially in operations upon the eye. It is slightly more irritating than cocaine, but has germicidal properties. It has a greater effect on inflamed tissues than cocaine and does not produce dilatation of the pupil. The drug has been employed successfully in suppurative conditions of the cornea.

HOL/OCEPH'ALI (Neo-Lat. nom. pl., from Gk. ὅλος, *holos*, entire + κεφαλή, *kephalē*, head). A subclass of cartilaginous fishes, including the single living family Chimaeridae. The number of living genera is small, but in the remote past they were a dominant group, numerous in species. See CHIMÆRA.

HOL/OGRAPH (Lat. *holographus*, from Gk. ὁλόγραφος, written entirely by the author's hand, from ὅλος, *holos*, entire + γράφειν, *graphein*, to write). A deed or writing wholly in the handwriting of the maker or author. In those countries which derive their legal systems mainly from the civil, or Roman, law, a holographic writing is deemed to prove itself; i.e., proof of the handwriting of the person whose instrument it purports to be is in itself sufficient to authenticate the document, without formal attestation by subscribing witnesses, notarial seals, and the like. This is true of Scotland, Quebec, and Louisiana, as well as of most continental states. In the common-law system, however, of England

and America no superior validity attaches to zoographic writings, and they require the same formal attestation and the same proof of validity as other writings. See EVIDENCE; HAND-WRITING, and the authorities there cited.

HOLOPTYCHIUS, hōl'ōp-tik'ī-ūs (Neo-Lat., from Gk. ὅλος, *holos*, entire + πτυχή, *ptychē*, πτύξ, *ptyx*, fold). A genus of fossil ganoid fish of the order Crossopterygii, remains of which are found commonly in the Catskill sandstones of North America and in the Old Red Sandstone of the British Devonian system. Some of the species were 30 inches long, with rounded tapering bodies and heterocercal tails. There are two dorsal fins, a pair of long, stout, pointed pectoral fins, and short pelvic and anal fins. The body was covered with large, rounded (cycloid) scales, the surfaces of which are marked by prominent ridges of ganoin, a structureless enamel. These scales, of gray or bluish-white color and 1 to 3 inches in diameter, are very abundant in some parts of the Catskill formation in New York and Pennsylvania. See CATSKILL FORMATION; DEVONIAN SYSTEM; GANOIDEI; FOSSIL.

HOLOSTEI, hōl-ōs'tē-i (Neo-Lat. nom. pl., from Gk. ὅλος, *holos*, entire + ὀστέον, *osteon*, bone). A group of bony ganoids, embracing the garpikes and bowfins. See GAR; BOWFIN.

HOLOTHURIAN (from Lat. *holothurium*, Gk. ὁλοθούριον, water polyp; probably from ὅλος, *holos*, entire + θούριος, *thourios*, θύπος, *thouros*, impetuous). An echinoderm of the class Holothuroidea, easily recognized by the soft body,

generally wormlike form, and circle of tentacles about the mouth. The madreporic plate is internal. Sea cucumber, sea squirt, and sea slug are some of the popular names of these animals, whose dried bodies form the Oriental trepang (q.v.). The class have not the covering of calcareous plates characteristic of the more typical Echinodermata, but a tough, leathery, muscular integument, in some genera strengthened by minute or rather large calcareous plates or hooks, very irritable and capable of great distention and contraction. Some of them are almost globose, some truly wormlike; but the same individual is often capable of extending itself to

urchins, are the ambulacral feet, of which there are sometimes five double rows, while sometimes they are distributed over the whole surface of the body; but some of the species have the feet developed only on the ventral side, and the body then presents an upper and an under surface. When the feet are furnished with suckers and are very extensible, they are called pedicels; but when they end in a blunt point and their function seems to be chiefly respiratory, or to serve as organs of touch, they are called papillae. Sometimes all the feet are pedicels; sometimes there are pedicels on the ventral side and papillae on the dorsal; rarely all the feet are papillae. In two families the feet are completely wanting.

The radiate structure is apparent at the mouth, which is surrounded with tentacles, in number frequently a multiple of five, exhibiting considerable variety of form and capable of being more or less retracted. These tentacles vary in number from 8 to 30, but 10, 12, 15, and 20 are the usual numbers. They are very rarely short, simple, and unbranched; generally they are provided with branches, which may be arranged along the sides, clustered at the top, or irregularly scattered. The tentacles are very sensitive and are the most important sense organs of the animal; upon them are occasionally found special sense cups, supposed to be olfactory, or there may be at the base pigment eyes or positional organs. The nervous system is perfectly radiate in structure and very simple in organization. The mouth opens into an alimentary canal, usually much longer than the body and therefore more or less looped or coiled. An œsophagus, stomach, intestine, and cloaca can usually be distinguished. Arising from the cloaca, there are often two irregularly branched organs, known as the respiratory trees. These are hollow, very thin-walled, and capable of containing a great deal of water, which they receive through the anus. They are excretory and perhaps respiratory in function. In many species there arise from the wall of the cloaca, and extend into the body cavity of the animal, numerous glandular tubules, known as Cuvier's organs. These can be ejected from the anus as long, sticky threads, and thus seem to be protective. The blood system is well developed in most holothurians, especially along the intestine. In those forms which have a respiratory tree one branch of it is often closely bound up with a network of blood vessels, arising from the principal vessel on the intestine. The sexes are generally separate, hermaphrodite forms being quite unusual; but there is no external difference between male and female, save in a very few forms. The eggs are generally thrown out into the water, where they are fertilized; but several viviparous forms are known, in which the eggs fall into the body cavity of the mother, and the young develop there. In such cases the development is direct, but in species whose eggs develop in the water the young assume a peculiar larval form, known as the *auricularia*, from which the adults develop by a more or less complicated metamorphosis. Several cases are known of female holothurians which brood their eggs and care for the young.

The holothurians are capable of the most extraordinary regeneration of parts, even of the most important organs. In direct relation with this is their curious and noteworthy habit of evisceration. Many species when alarmed or irritated expel from the anal opening (or less

THE COMMON NORTH ATLANTIC HOLOTHURIAN.

(*Pentacta frondosa*.)

everal times the length which it has in a state of repose. In locomotion the body is extended and contracted as in the annelids, and in the pedous forms this is the only means of locomotion, except such aid as is given by the tentacles. In the pedate forms the principal organs of locomotion, as in starfishes and sea

commonly the mouth) the viscera, either wholly or in part. They thus lose their entire digestive, reproductive, respiratory, and excretory systems and a large part of the blood system; but if not disturbed further, they will in the course of a few weeks replace all they lost with an entirely new set.

Holothurians are found in all seas, but particularly abundant in the West Indies and between Asia and Australia. The largest American species is *Holothuria floridana*, which abounds just below low-water mark on the Florida reefs. Another large one, *Cucumaria frondosa*, inhabiting the North Atlantic and probably circumpolar, is about a foot in length and is yellowish brown. Many of the tropical species exhibit attractive colors and are among the creatures which make the bottom of the sea, particularly among coral reefs and islands, extraordinarily interesting.

The holothurians (Holothurioidea) are classified in two orders according to the point of origin of the tentacles. In the Actinopoda they arise from the radial vessels of the water-vascular system, while in the Paractinopoda they arise from the circum-oval ring. The Actinopoda include more than five-sixths of the species and are grouped in five very distinct families. Of these, the Elaspoda are the most remarkable. They are all deep-sea forms

SYNAPTA.

a, free-swimming young; b, adult synapta.

and occur in all parts of the world. Many of them assume the most grotesque shapes, and some reach a large size. The Paractinopoda are all footless forms, of a single family. The best-known genus is *Synapta* containing more than 50 species, found in all parts of the world. Over 600 species of holothurians are known, varying in size from those $\frac{1}{2}$ inch long up to certain tropical species 2 or even 3 feet in length. The colors vary from white, or almost transparent, to jet black; but as a rule the colors are more or less in correspondence with the bottom on which the animal lives. They chiefly feed on Foraminifera. Their movements are generally very sluggish, and they seem to have few enemies. All are harmless; but the only ones of any use to man are the larger forms, from which bêche de mer, or trepang, a great delicacy with the Chinese, is prepared.

Consult: Lampert, *Die Seewalzen* (Wiesbaden, 1885); Ludwig, "Die Seewalzen," in Bronn, *Klassen und Ordnungen des Tierreichs: Echinodermen*, vol. i (Berlin, 1889-92), a standard work on holothurians; one of the best works in English is Théel, "Report on the Holothurioidea," in *Challenger Reports: Zoölogy*, vol. iv, part xiii, and vol. xiv, part xxxix (London, 1882 and 1886); Bather and others, "Echinodermata," in Lankester's *Treatise on Zoölogy* (ib., 1900).

HOLOTHUROIDEA. A class of echinoderms. See ECHINODERMATA; HOLOTHURIAN.

HOLROYD, hōl'roid, SIR CHARLES (1861-). An English painter and etcher, born at Leeds. He studied under Legros (q.v.) at the

Slade School, University College, London, and for two years in Italy. On his return he was Legros's assistant for four years. He was the first keeper of the National Gallery of British Art (Tate Gallery) and in 1906 became director of the National Gallery. He was knighted in 1903. His best-known etchings are the "Monte Olivetto" series, the "Icarus" series, and the "Eve" series. He frequently exhibited at the Royal Academy, the Royal Institute of Painters in Water Colors, and the Royal Society of Painter Etchers. His book on *Michel Angelo* (London, 1903) is a scholarly production.

HOLST, hōlst, HANS PETER (1811-93). A Danish poet and novelist, born of humble parents at Copenhagen. From 1875 until his death he was dramaturgist for the Royal Theatre, Copenhagen. His first work to attract attention was a memorial poem on the death of Frederick VI (1839). This was followed by *Ude og Hjemme*, prose and verse (1843), and *Den lille Hornblaser* (1849; 9th ed., 1902), a collection of patriotic poems. He also wrote a number of plays, vaudevilles, and novels, and translated *Much ado about Nothing* (1880). His *Udvalgte Skrifter*, in 6 vols., appeared in 1887-88. Consult T. Arentzen, *Danske Digtere i det 19 Aarhundrede* (Copenhagen, 1864).

HOLST, hōlst, HERMANN EDUARD VON (1841-1904). A German American historian and educator, born at Fellin in Livonia, of German parentage. He studied at Dorpat from 1860 to 1863 and at Heidelberg from 1863 to 1865 and became a tutor at St. Petersburg in 1866, but was excluded from the Russian dominions in the following year for publishing a pamphlet of which the Russian government disapproved, and emigrated to America. Settling in New York, he was an assistant editor of Schem's *Deutsch-amerikanisches Konversations-Lexikon*. He returned to Germany, was professor of history in the University of Strassburg from 1872 to 1874 and in the University of Freiburg from 1874 to 1892, visited America in 1878-79 and in 1884 served for a number of years in the Baden Diet, for the last two sessions as vice president, and in 1892 became head of the department of history in the newly founded University of Chicago. In 1900 ill health compelled his retirement, and he returned to his home in Freiburg. Von Holst's works are almost altogether on American topics. The chief defect in Von Holst's studies in American history is found in the fact that he regards the slavery question as dominant to the exclusion of all others. His *Verfassung und Demokratie der Vereinigten Staaten von Amerika* (5 vols., 1873-91; Eng. trans. by Lalor and Mason, *The Constitutional and Political History of the United States*, 8 vols., 1877-92) is his best-known work and contains a remarkably able presentation of the Federalist and antislavery view of American political history. More than half of it is devoted to the decade 1850-60. Among his other publications are: *Das Staatsrecht der Vereinigten Staaten von Amerika* (1885; Eng. trans., *The Constitutional Law of the United States of America*, 1887); *John C. Calhoun*, in the "American Statesmen Series" (1882); *John*

Brown (1888), *The French Revolution Tested by Mirabeau's Career* (1894). Consult *Hart*, "Hermann von Holst," in the *Political Science Quarterly*, vol v (New York, 1890), and the *Nation*, vol lxxviii (ib., 1904).

HOLSTEIN, hōl'stīn. Formerly a duchy belonging to Denmark, and at the same time a member of the Holy Roman Empire and of the Germanic Confederation (Map Germany, C 1). In 1864, after Schleswig and Holstein had been wrested from Denmark, Holstein was placed in the care of Austria (Germany taking Schleswig). It was ceded in 1866 to Prussia at the end of the Austrian War and now forms the southern part of the Province of Schleswig-Holstein (q v).

HOLSTEIN, or **HOLSTEIN-FRIESIAN**. A breed of dairy cattle. See **CATTLE**.

HOLSTEIN, FRIEDRICH VON (1837-1909). A German diplomat and statesman, born in Schwedt. Entering the diplomatic service, he held minor appointments at St Petersburg, Rio de Janeiro, London, Washington, Florence, and Paris until 1876, when he was recalled to Germany to take charge of the political department of the Foreign Office. When Bismarck was dismissed in 1890, Holstein was retained by Count Caprivi in the Foreign Office, where his influence practically shaped the German foreign policy. He was largely responsible for the German seizure of Kiaochau (q v), China. The Emperor William II's visit to Tangier was the result of his advice, but the later proceedings in the Morocco crisis did not meet with his approval, and the disregard of his protests led to his retirement in 1906. Von Holstein was little heard of by the general public, but his influence in international affairs was very great.

HOLSTEIN-GOTTORP, güt'tōrp. See **OLDENBURG**, HOUSE OF.

HOLSTON (hōl'stūn) **RIVER**. One of the two rivers, the French Broad (q v) being the other, which unite 4½ miles east of Knoxville, Tenn., to form the Tennessee River. It is formed by the junction of its North and South forks, about 1 mile below Kingsport, Sullivan Co., Tenn. From this point it flows in a generally southwesterly direction, its course to its confluence with the French Broad measuring 141½ miles. During rain tides it is navigable for about 50 miles for light-draft vessels. The fall of the river from its forks to its mouth is about 361 feet.

HOLT, HAMILTON (1872-). An American editor. He was born in Brooklyn, N Y, graduated from Yale University in 1894, and studied at Columbia University in 1894-97. He was managing editor of the *Independent* from 1897 to 1913, for some months was editor and owner, and in 1914 became editor alone. In 1912 he lectured at the School of Journalism, Columbia University. Widely known as a lecturer on international peace, as an advocate of simplified spelling, as a reformer of municipal government, and as a worker for improved social and labor conditions, he was chosen a trustee of the American College for Girls at Constantinople, and a member of the executive committee of the International Conciliation Society. While visiting Japan in 1912, he was decorated by the Mikado with the order (third class) of the Sacred Treasure. He is author of *Undistinguished Americans* (1906) and *Commercialism and Journalism* (1909).

HOLT, HENRY (1840-). An American author and publisher, born in Baltimore, Md.

He graduated from Yale University in 1862 and from Columbia Law School in 1864 and received the honorary degree of LL D from the University of Vermont in 1901. Associated with G P Putnam in the publishing business beginning in 1863, in 1873 he became president of Henry Holt and Company, publishers in New York City. At various times he lectured at Yale, Columbia, and the University of Vermont. He served as a member of the first executive committee of the Simplified Spelling Board, and as first chairman of the New York University Settlement Society. In 1913 he founded and undertook the editorship of the *Unpopular Review*, a quarterly magazine of high literary quality, containing contributions of a serious nature and in lighter vein by temporarily anonymous writers. He is author of *Calmie—Man and Nature* (1892, 6th ed, 1906), *Talks on Civics* (1901), *Sturmsee—Man and Man* (1905, 3d ed, 1906), *On the Civic Relations* (1907), *On the Cosmic Relations* (1914).

HOLT, SIR JOHN (1642-1710). An English jurist, born at Thame, Oxfordshire, Dec 30, 1642. After receiving his education at Oriel College, Oxford, he was called to the bar (1663) from Gray's Inn. He soon displayed a decided talent for law and became an able advocate, well versed in the constitutional law of England. In 1685-86 he was Recorder of London and about this time was appointed sergeant at law and king's sergeant. He fell into disfavor with King James II because of a decision favoring liberal government, but the ability which he displayed in the Convention Parliament raised him so high in the estimation of the Prince of Orange that, upon the accession of the latter to the English throne, Holt was made Lord Chief Justice of the King's Bench. As a judge, he was noted for the fairness and even kindness with which he treated accused persons and for his opposition to prosecutions for witchcraft. He was also opposed to standing armies and to the use of military power for the preservation of domestic peace. In 1694 he stoutly maintained his prerogative when assailed by the House of Lords, and seven years later he was equally firm in a clash with the House of Commons. He died in London, March 5, 1710. Consult *Report of all the Cases Determined by Sir John Holt, Kt., from 1688 to 1710, etc* (in the Savoy, 1738), *Report of Cases Argued, etc, in B[anc]o R[eg]næ in the Time of Queen Anne* (1b, 1737), Foss, *Judges of England with Sketches of their Lives, etc* (London, 1848-64), Burnet, *History of my own Time* (6 vols, London, 1838).

HOLT, JOSEPH (1807-94). An American jurist, born in Breckinridge Co, Ky, and educated at St Joseph's College and Centre College in the same State. He studied law, practiced in Elizabethtown, then in Louisville, lived for a time after 1835 in Mississippi, where he contested several suits with Sergeant S Prentiss, among them the case as to the ownership of some public land, claimed by the heirs of Newit Vick, for whom Prentiss was counsel. He attracted attention as politician and orator by his defense of R M Johnson in the Democratic National Convention in this same year (1835). He was a strong supporter of Buchanan in 1856 and was appointed by him Commissioner of Patents in the following year. In 1859 he became Postmaster-General and in 1860 succeeded

Floyd as Secretary of War. A Douglas Democrat before the war, he heartily supported the Union and in 1862 became Judge Advocate and two years later Judge-Advocate-General. As head of the department of military justice, he conducted the trial of Fitz John Porter and that of Lincoln's assassins. He was brevetted major general in 1865 and retired 10 years later.

HOLT, L(UTHER) EMMETT (1855–) An American physician. He was born at Webster, N. Y., and graduated from the University of Rochester in 1875 and from the College of Physicians and Surgeons (Columbia) in 1880. He was professor of the diseases of children at the New York Polyclinic from 1890 to 1901 and thereafter at the College of Physicians and Surgeons. He became also attending physician to the Babies Hospital and the New York Foundling Hospital, and a member of the board of directors, and secretary, of the Rockefeller Institute for Medical Research. Besides special articles on the diseases of children, he is author of *The Care and Feeding of Children* (1894, 7th ed., rev., 1914) and *Diseases of Infancy and Childhood* (1896; 6th ed., rev., 1911).

HOLTEI, hōl'ti, KARL VON (1798–1880). A German poet, dramatist, and novelist, born in Breslau. He took part in the campaign of 1815, studied law, and then, at the age of 21, went on the stage. In 1821 he married an actress, Luise Rogee, and after acting as secretary and dramaturgist to the Breslau Theatre for two years went to Berlin with his wife (engaged at the Court Theatre there) and wrote the very successful plays, *Die Wiener in Berlin* and *Die Berliner in Wien*. Soon after his first wife died (1825), he married Julie Holzbecher (1809–39), a clever comedienne. In 1833 he returned to the stage and toured with his wife, writing for this purpose *Loi-bee-baum und Bettelstab* and *Shakespeare in der Heimat* (1840). He died at Breslau in the cloister of the Brothers of Charity. The best of his productions is his *Schlesische Gedichte* (22d ed., 1905), lyrics in the Silesian dialect. Holtei's collected plays are contained in the *Theater* (1867). Besides his plays, operettas, and lyrics, Holtei wrote many novels, among which mention should be made of *Die Vagabunden* (4 vols., 8th ed., 1894), *Christian Lammfell* (5 vols., 4th ed., 1878), *Noblesse oblige* (2d ed., 1862), and others collected in *Erzählende Schriften* (1861–66), and sketches and criticisms. Consult the excellent autobiographical work *Vierzig Jahre* (8 vols., Berlin, 1843–50), Kurnik, *Karl von Holtei, ein Lebensbild* (Breslau, 1880), Otto Storch, *Karl von Holtei* (Waldenburg, 1898), P. Lindau, *Holteis Romane* (Berlin, 1904).

HOLTHAUSEN, hōl'thou'zen, FERDINAND (KARL WENNEMAR) (1860–) A German philologist, born in Soest, Westphalia. He was educated at Leipzig, Heidelberg, Jena, and Berlin, became lecturer at Heidelberg in 1885 and at Göttingen in 1887, was made professor at Gießen in 1892, taught Germanics in Gothenburg, Sweden, in 1893–1900, and then became professor of English philology at Kiel, where he edited the *Kieler Studien zur englischen Philologie*. He edited many Old English and Middle English texts, *Havelok* (1901, 2d ed., 1910), *Beowulf* (1905, 3d ed., 1912), *Cynewulf's Elene* (1905, 2d ed., 1910), etc., and published *Studien zur Thidrekssaga* (1884), *Soester Mundart* (1886), *Altislandisches Elementarbuch* (1895),

Altislandisches Lesebuch (1896), *Altislandisches Elementarbuch* (1899), and a revised edition of Grein's *Sprachschatz* (1912 et seq.).

HOLTÓN, hōl'tūn. A city and the county seat of Jackson Co., Kans., 30 miles north of Topeka, on the Union Pacific, the Chicago, Rock Island, and Pacific, and the Missouri Pacific railroads (Map Kansas G 4). It is the commercial centre for a stock-raising and farming region and has a rat-trap factory, bottling works, quilting factory, and fruit nursery. Campbell College was established here in 1882. Settled in 1859, Holton was incorporated in 1870 and adopted the commission form of government in 1912. The city owns its water works and electric-light plant. Pop., 1900, 3082, 1910, 2842.

HOLTON, LUTHER HAMILTON (1817–80). A Canadian statesman. He was born in South Leeds, Ontario, and when nine years old was taken by his parents to Montreal. There he became a clerk (1830), and later a partner, in the city's leading forwarding house. After 1846, when the repeal of the Corn Laws (qv) deprived the British American colonies of preferential treatment, Holton was one of the prominent signers of the manifesto of 1849, which favored annexation to the United States. He was an advanced free trader and one of the founders of *Le Parti Rouge* (see *POLITICAL PARTIES, Canada*). In 1854–57 he represented the city of Montreal in the Canada Legislative Assembly, and in 1862–63 he was a member of the Canada Legislative Council (at that time elective) for the Victoria Division. For part of 1863 he was Commissioner of Public Works in the short-lived Brown-Dorion administration and in 1863–64 Minister of Finance in the Macdonald-Dorion cabinet. He opposed Canadian confederation and the coalition cabinet organized to facilitate it (see *BROWN, GEORGE*). Elected in 1867 to the first Dominion Parliament, he remained a member of that body until his death.

HOLTY, hōl'tē, LUDWIG HEINRICH CHRISTOPH (1748–76). A popular German poet, born at Mariensee, the son of a country parson. He studied theology at Göttingen (1769), fell in there with Burger, Voss, and the Stolbergs, and assisted in founding the patriotic poetic league of the *Hainbund*. He was naturally sentimental and dwelt, though not morbidly, on death, nature, and solitude, showing the influence of Rousseau and especially of the *Night Thoughts* of Young. Occasionally there is also a joyous or even a playful strain, but it is with harmonious melancholy that he is associated in the popular mind. In some of his odes he surpassed his teacher, Klopstock (qv). A few of his poems are known wherever German is sung. Holty's *Works* were collected in 1789, his complete works appeared in 1882. There is a life by Ruete (Guben, 1883), and biographies in the critical editions by Voss (Hamburg, 1835), Voigt (Hanover, 1858), and Halm (Leipzig, 1870).

HOLTZ, hōlts, WILHELM (1836–) A German physicist. He was born at Saatel, near Barth, in Pomerania, and studied physics and other sciences at Berlin, Dijon, and Edinburgh. He invented the electrical machine which bears his name (see *ELECTRICAL MACHINE*) in 1865 and engaged in many researches, particularly in electricity, but his health forced him to give up scientific investigations for a number of years. In 1877 he became assistant in the

physical laboratory of Greifswald, where in 1881 he was made privatdocent and three years later professor. He is the author of many papers on electricity published in the scientific journals and of two volumes on lightning protection, *Ueber Theorie, Anlage und Prüfung der Blitzableiter* (1878) and *Ueber die Zunahme der Blitzgefahr und ihre vermuthlichen Ursachen* (1880).

HOLTZENDORFF, hólts'en-dóif, FRANZ VON (1829-89). A German jurist. He was born in Vietmannsdorf, Prussia, studied law at Berlin, Heidelberg, and Bonn, became professor of jurisprudence at Berlin in 1860 and held the same professorship at Munich from 1873 until his death. He strove especially to correct the criminal law, to abolish the death penalty, and to improve the condition of penal institutions. He was interested and active in the Protestant Union, in the Berlin People's Kitchen, and in the reform of female labor, and he was considered an authority on international law. Among his works are *Französische Rechtszustände* (1859), *Die Reform der Staatsanwaltschaft in Deutschland* (1864), *Die Prinzipien der Politik* (2d ed, 1879), *Wesen und Wert der öffentlichen Meinung* (2d ed, 1880), *Das Verbrechen des Mordes und die Todesstrafe* (1874). He edited *Allgemeine deutsche Strafrechtszeitung* (1861-74), the *Encyclopädie der Rechtswissenschaft* (1880-90), a series of manuals on German law (1871-89), and, with Virchow, the *Sammlung gemeinverständlicher wissenschaftlicher Vorträge* (1866 et seq.). Consult Stoerk, *Franz von Holtzendorff* (Hamburg, 1889).

HOLTZENDORFF, HENNING VON (1853-) A German naval officer, born in Berlin. He entered the marine in 1869 and served through the different grades. In 1895-96 he commanded the cruiser *Prinzess Wilhelm* in the Far East, where he was again stationed in 1899-1901 in command of the *Kurfürst Friedrich Wilhelm*. Returning to Germany, he became chief inspector of docks at Danzig in 1901, was promoted second admiral in 1902, rear admiral in 1904, vice admiral in 1907, and admiral in 1910, and was chief of the first squadron of the sea fleet in 1906 and of the entire fleet in 1910. He retired from active service early in 1913 and in June of that year became a member of the House of Lords.

HOLTZ MACHINE. See ELECTRICAL MACHINE.

HOLTZMANN, hólts'mán, ADOLF (1810-70). A German philologist, born at Karlsruhe. He studied theology at Berlin and Halle and was for a short time vicar at Kandern. In 1832 he renewed his studies at Munich under Franck and later at Paris under Burnouf and made a specialty of old Germanic dialects and Sanskrit. His works are of unequal value. In 1852 he was made professor of German and Sanskrit at Heidelberg, where he died. His works are in Indian philology, *Ueber den griechischen Ursprung des indischen Tierkreises* (1841) and the translations *Ramayana* (last ed, 1843), *Indische Sagen* (1845-47), in Germanics, *Kelten und Germanen* (1855), an attempt to identify the two peoples, *Untersuchungen über das Nibelungenlied* (1854) and *Das Nibelungenlied* (1857), both attacking Lachmann's theory of the composite authorship of the poem and renewing the question, Holtzmann's view being that such epics as the *Nibelungenlied* and the *Thas* were not synthetic products but remnants

of greater and more complete works, the much more important grammatical works, the edition of Isidorus (1836), *Ueber den Umlaut* (1843), *Ueber den Ablaut* (1844), *Altdeutsche Grammatik* (uncompleted, 1870-75), and the posthumous works, *Germanische Altertümer mit Text, Uebersetzung und Erklärung von Tacitus Germania* (1873) and *Deutsche Mythologie* (1874). Consult necrologies in *Germania*, vol. xvi (Vienna, 1871), and *Zeitschrift für deutsche Philologie*, vol. iii (Halle, 1871).

HOLTZMANN, HEINRICH JULIUS (1832-1910). A German Protestant theologian, born at Karlsruhe. Educated at Berlin, he was appointed professor of theology at Heidelberg in 1865 and at Strassburg in 1874. He became especially known for his exegetical and critical works on the New Testament. These include *Die synoptischen Evangelien, ihr Ursprung und geschichtlicher Charakter* (1863), *Kritik der Epheser- und Kolosserbriefe* (1872), *Die Pastoralbriefe* (1880), *Lexikon für Theologie und Kirchenwesen* (1882, 3d ed, 1895), with Zopf, *Lehrbuch der historisch-kritischen Einleitung in das neue Testament* (1885, 3d ed, 1892), *Handkommentar zum neuen Testament* (1889-90, later editions), with Lipsius, Schmiedel, and Von Soden, *Lehrbuch der neutestamentlichen Theologie* (2 vols, 1897), *Die Entstehung des neuen Testaments* (1904), *Das messianische Bewusstsein Jesu* (1907).

HOLTZMANN, OSKAR (1850-) A German New Testament critic, born in Stuttgart, where his father was director of the Royal Polytechnic. He was educated at the universities of Strassburg, Göttingen, and Giessen and in the theological seminary at Friedberg, preached for a year and taught in secondary schools and in 1890 became professor of New Testament exegesis at the University of Giessen. He taught in the Giessen Gymnasium also. Probably his most important work is the valuable *Neutestamentliche Zeitgeschichte* (2d ed, 1906). He published, besides, *Das Johannes-evangelium untersucht und erklärt* (1887), *Das Ende des jüdischen Staatslebens und die Entstehung des Christentums* (1888), *Christbild der Geschichte und Christbild der Dogmatik* (1890), *Jesus Christus und das Gemeinschaftsleben des Menschen* (1893), *Leben Jesu* (1901, English trans, 1904), *Jüdische Schriftgelehrsamkeit zur Zeit Jesu* (1901), *Das Messiasbewusstsein Jesu* (1902), *War Jesus Blutsatzer?* (1903), *Das christliche Gottesglaube* (1905), *Christus* (1907), and, with Beer, the text, with translation and commentary, of the Mishna (1912 et seq.).

HOLUB, hó'ľup, EMIL (1847-1902). An African explorer, born at Holitz in Bohemia. He studied medicine and natural science at the University of Prague and then, in 1872, went to South Africa. He lived for a time in the diamond fields as a surgeon, but early in 1873 made a journey through the southern Bantu countries and in the fall a second to the Transvaal and the lands to the north. In 1875 he succeeded in reaching the Zambezi and the Victoria Falls and brought back with him a rich natural science and ethnological collection, which he divided among various European institutions. In 1883, accompanied by his wife, he started from Cape Town with the intention of traversing the entire length of the African continent to Egypt. He had accomplished scarcely one-third of the journey, however, when

he was attacked by hostile tribesmen on the Kafue, a northern tributary of the Zambezi, and only after a desperate struggle was he able to win his way back to civilization. Fortunately he was able to save the large collection which he had gathered, and this, after it had been exhibited in Vienna and Prague, he divided among a number of museums. He died from the effects of malaria acquired during his explorations. His publications include *The Victoria Falls* (1879), *Sieben Jahre in Sudafrika* (1880-81, trans by Ellen E. Frewer as *Seven Years in South Africa*, 2d ed., 1881), *Von der Kapstadt ins Land der Maschukulumbé* (2 vols., 1888-90).

HOLY ALLIANCE A league formed after the fall of Napoleon, at the instance of Alexander I of Russia, by the sovereigns of Russia, Austria, and Prussia, nominally to regulate the relations of the states of Christendom by the principles of Christian charity. As it formed itself in the mind of Alexander it was the scheme of a pietistic idealist, but it was utilized by Metternich as an instrument of his reactionary policy. The document was drawn up by Alexander and was signed by the three rulers at Paris in September, 1815. In addition to the original signatories, Naples, Sardinia, France, and Spain acceded to the treaty, and it received the commendation, though not the signature, of the Prince Regent of Great Britain. It was formally made public in the *Frankfort Journal*, Feb. 2, 1816. Metternich, who privately sneered at the treaty, used it as the basis for the conferences of Troppau and Laybach and the congresses of Karlsbad and Verona, which were intended to unite the Powers in support of absolutism everywhere. It was in the name of the Holy Alliance that Austria, in 1821, crushed the revolutions in Naples and Piedmont and that France, in 1823, restored absolutism in Spain. Apart from this use of it, as one writer has said, "no one of the princes who adhered to the Holy Alliance, with the single exception of Alexander himself, ever took it seriously." Meaningless in itself, it soon ceased to have any importance, especially when both France and England refused to give it any support.

The text of the covenant is as follows:

"In the name of the Most Holy and Indivisible Trinity. Holy Alliance of Sovereigns of Austria, Prussia, and Russia. Their Majesties the Emperor of Austria, the King of Prussia, and the Emperor of Russia, having . . . acquired the intimate conviction of the necessity of settling the steps to be observed by the Powers, in their reciprocal relations, upon the sublime truths which the Holy Religion of Our Saviour teaches. They solemnly declare that the present Act has no other object than to publish, in the face of the whole world, their fixed resolution, both in the administration of their respective States, and in their political relations with every other government, to take for their sole guide the precepts of that Holy Religion, namely, the precepts of Justice, Christian Charity, and Peace. *Art. I.* The three contracting Monarchs will remain united by the bonds of a true and indissoluble fraternity, and, considering each other as fellow countrymen, they will, on all occasions and in all places, lend each other aid and assistance, and, regarding themselves toward their subjects and armies as fathers of families, they will lead them, in the

same spirit of fraternity with which they are animated, to protect Religion, Peace, and Justice. *Art. II.* In consequence, the sole principle of action, whether between the said Governments or between their Subjects, shall be that of doing each other reciprocal service, and . . . to consider themselves all as members of one and the same Christian nation, the three allied Princes looking on themselves as merely delegated by Providence to govern three branches of the One family, namely, Austria, Prussia, and Russia, thus confessing that the Christian world, of which they and their people form a part, has in reality no other Sovereign than Him to whom alone power really belongs. *Art. III.* All the Powers who shall choose solemnly to avow the sacred principles which have dictated the present Act . . . will be received with equal aid and affection into this Holy Alliance. Done in triplicate and signed at Paris, the year of grace 1815, 14/26th September."

Perhaps the most noteworthy development from the Holy Alliance came from the attempt to extend its operation to the New World by the coercion of Spain's revolted colonies. George Canning (qv), on behalf of England, opposed this at the Congress of Verona, and the threatened invasion of American autonomy, together with the proposed colonization of the Pacific coast of North America by Russia, the leader in the Alliance, brought from the government of the United States the famous declaration of American policy known as the Monroe Doctrine (qv). For accounts of the Holy Alliance and its bearing upon contemporaneous history, consult the histories of the time and the biographies of leading persons connected with it. For its bearing on American history, the John Quincy Adams *Memoirs* are a veritable storehouse of material.

HOLY BROTHERHOOD See HERMANDAD

HOLY CITY The common designation among different peoples and religious sects for the city regarded as the chief place of their religion. The term is most often understood as applying to Rome, but has been used also of Jerusalem, Allahabad, Benares, Mecca, Medina, Moscow, Kiev, and Cuzco.

HOLY COAT. A relic preserved with the greatest reverence in the cathedral of Treves (qv). It is alleged to be the seamless robe, or upper garment, of Jesus Christ (John xix 23) and to have been discovered in the fourth century by the Empress Helena, in her memorable visit to Palestine (see HELENA, SAINT) and by her deposited at Treves. The earliest definite documentary evidence, supported, however, by still earlier incidental testimony, dates from the eleventh century. The holy coat of Treves was solemnly exhibited to the public gaze in 1196 and again in 1512, when Luther wrote against it and Leo X appointed it to be exhibited every seven years. The Reformation and wars prevented the regular observance of this religious festival, but it was celebrated in 1810 and was attended by a concourse of no fewer than 227,000 persons and in 1844 and 1891 by still greater crowds, while miraculous cures were confidently asserted to be performed by the precious relic. The exhibition of the holy coat in 1844 led to the secession of the "German Catholics" from the Catholic church. The seamless coat of Jesus is also said to be preserved in the church at Argenteuil, near Versailles, but this claim is not considered well founded. The legend here is that

it was given by Charlemagne to the monastery located there, his daughter Theodrada being abbess. Consult Joseph Hommer, *Geschichte des heiligen Rockes unseres Heilandes* (Bonn, 1844), Gildemeister and Sybel, *Der heilige Rock zu Trier und die zuanzig andern heiligen ungenaheten Rocke* (3d ed., Dusseldorf, 1845), Beissel, *Geschichte des heiligen Rockes* (Trier, 1889), R. F. Clarke, *Pilgrimage to the Holy Coat of Treves* (London, 1892), E. A. Plater, *The Holy Coat of Treves* (ib., 1891).

HOLY COMMUNION. See LORD'S SUPPER.

HOLY CROSS, COLLEGE OF THE A Roman Catholic institution of higher education, founded at Worcester, Mass., in 1843, by Rt. Rev. Benedict Joseph Fenwick, second Bishop of Boston. Holy Cross is the oldest Catholic college in New England. In its establishment Bishop Fenwick was aided by Rev. James Fitton, who had as early as 1838 established the Seminary of Mount St. James. This institution, with its 60 acres of land, Father Fitton presented to the Bishop in 1842, upon which site the college was built. The first college building was completed in 1844. On July 14, 1852, a fire destroyed the whole of the central building of the college, but in the following year the college, enlarged and remodeled, was again ready to receive students. Although, as noted above, instruction was carried on in the college beginning in 1843, it was not incorporated until 1865. A petition for a charter was presented to the Legislature of the State in 1849, but this was refused. From 1849 to 1852 and from 1858 to 1865 Georgetown College conferred the degrees on all the students who graduated from Holy Cross. The college buildings are situated on one of the highest of the eminences surrounding the city of Worcester. The old buildings have been enlarged and improved in many ways, and extensive new constructions and improvements have been made in recent years. Among the newer and larger buildings are the O'Kane Building, an extension of the first main building, which contains the gymnasium, reception halls, laboratories, and classrooms, Alumni Hall, opened in 1905, and Beaven Hall, opened in 1913. The system of education at the university is the one in use in all colleges of the Society of Jesus. The natural sciences and modern languages are by no means excluded, but the ancient languages and their literature are still retained as prescribed courses and, with mathematics and philosophy, form the chief studies. The college provides a number of scholarships for deserving students. The total enrollment in 1913-14 was 551, of whom 532 were in the college proper and 19 in the preparatory department. The degrees conferred are M. A., B. A., and Ph. B. The faculty numbered, in 1914, 46. The library contains about 40,000 volumes. The productive funds amount to about \$60,000, and the total annual income to about \$240,000. The president in 1914 was Rev. Joseph N. Dinand, S. J.

HOLY CROSS, CONGREGATION OF THE An institute formed in France in 1836 by uniting the Brothers of St. Joseph, founded at Ruillé in 1820, and the Auxiliary Priests of Le Mans, founded in 1835. The members teach and do missionary work. It had much success in France, where its schools and houses were suppressed by the Law of Associations (1901) and the members left for India, Canada, and the United States. It was introduced into the United States in September, 1841, by Father

Edward Sorin, who located in the wilderness near South Bend, Ind. This foundation has since developed into the important University of Notre Dame. There are colleges also in Washington, D. C., Oregon, Wisconsin, Ohio, Louisiana, and Texas, and many parish foundations and secondary schools. At Notre Dame the *Ave Maria*, a well-known Catholic weekly, is published. The university also awards every year on Mid Lent Sunday the Letare medal, an adoption of the old papal idea of the Golden Rose, to some distinguished American lay Catholic. It is, since the exile of the Congregation from France, the residence of the Father General. The congregation has 3 provinces, 60 houses, and 650 members. Four Sisters followed Father Sorin to South Bend in 1843. There St. Mary's College for Women at Notre Dame is now one of the most flourishing institutions in the West. There are more than 1000 Sisters working in the archdioceses of Baltimore, Chicago, New York, and San Francisco, where they conduct 1 college, 2 normal schools, 16 boarding schools, 40 academies and parish schools, 6 hospitals, and 4 asylums. Their greatest development was under Mother Angela (Eliza Gillespie, James G. Blaine's aunt), 1853-57. During the Civil War Mother Gillespie and 70 sisters took charge of six military hospitals in the Southwest. Consult F. J. Poirier, *Le Père Lefebvre et l'Académie* (Montreal, 1898), and Moreau, *Basile Antoine Moreau et ses œuvres* (Paris, 1900).

HOLY CROSS, ORDER OF THE The name of several monastic or semimonastic orders. The origin of the first community bearing this name is lost in obscurity, but leaving aside legendary accounts, we find the order definitely established in Italy as early as the accession of Pope Alexander III (1150). The mother house was at Bologna, and the work of the members was largely the care of the sick. They were confirmed by Urban III in 1187 and spread until they had 200 convents in all parts of Italy, the order declined later, so that Pius V was obliged to reform it in 1568, and Alexander VII to suppress it in 1656.

More important is the congregation of canons regular who were known in England as Crutched, or Crossed, Friars. This order was founded by Theodore de Celles at Huy, near Liège, Sept. 14, 1211, and confirmed by Innocent III five years later; it followed the rule of St. Augustine, assimilated in many particulars to that of the Dominicans. It spread rapidly throughout the Netherlands, France, Germany, having 90 convents, and several in England—in London (1298), Oxford (1349), Colchester, Hoxton, and other places. The order was reformed from within in 1410. At the present day, while still faithful to its original spirit, it has very few houses, the principal ones being two in Holland (St. Agatha, the mother house, and Uden in North Brabant) and three in Belgium. In 1857 an attempt was made to start a branch at Bay Settlement, Wisconsin, but it failed because of local obstacles not surmountable. Consult Hermans, *Annales Canoniarum Regularium Sancti Augustini, Ordinis Sanctæ Crucis* (3 vols., Bois-le-Duc, 1858).

The knightly order bearing this name is of some importance in the history of Bohemia. It is distinguished by a red six-pointed star in addition to the cross worn on the habit and was originally an outgrowth of the Hospitaller

MOUNTAIN OF THE HOLY CROSS

brotherhood attached, in the first half of the twelfth century, to the hospital of the Poor Clares in Prague. In 1238 Gregory IX constituted it a definite order, under the rule of St Augustine. It spread throughout Bohemia and other lands now included in Austria-Hungary and was one of the strongest bulwarks of the Church against the sectarian movements of the fifteenth and sixteenth centuries. At the siege of Eger in the Thirty Years' War it verified its knightly title by fighting at the head of the people. Its hospital at Prague was always open to new allies, and sheltered the first Jesuits in Bohemia in 1555, the Capuchins in 1599, and the Tinitarians in 1704. From 1561 to 1694 the order practically supported the archbishops of Prague, who had been deprived of their possessions in the wars of religion, making them grand masters during their incumbency of the see. The order now has less than 100 members, its library consists of 50,000 volumes, including many incunabula, and manuscripts of great value for Bohemian history. Consult Jacksche, *Der ritterliche Orden der Kreuzherren mit dem rothem Stern* (Vienna, 1882).

A Protestant Episcopal order of the same name was founded in 1881. Both priests and laymen are eligible, and its chief work is the carrying on of missions, conferences, and retreats. It conducts St Andrews School for mountain boys at Sewanee, Tenn., and the Kent School for boys at Kent, Conn.

HOLY CROSS MISSION. A Catholic mission on the north bank of the Yukon River, Alaska, opposite the native village of Koserefsky. The centre of industrial and religious instruction for 400 natives, the mission has greatly benefited the community, especially as to agriculture and stock raising. The adjacent village of Koserefsky, with a population of 287 in 1910, has a government school, with an average attendance of 100, the largest native school in Alaska.

HOLY CROSS MOUNTAIN. A celebrated peak of the Rocky Mountains in Colorado, situated in Eagle County, in the central part of the State, 15 miles northwest of Leadville (Map. Colorado, C 2). Its height is 14,170 feet. It derives its name from two snow-filled ravines, which cross each other at right angles and present from a distance the appearance of a white cross.

HOLY DYING, RULE AND EXERCISES OF. A devotional manual, by Jeremy Taylor, published in 1651. It was soon extensively used, reached a twenty-first edition in 1710, has been frequently republished, and may be said, with its equally popular companion tractate, *Rule and Exercises of Holy Living* (1650), to offer a summary of the duties and devotions necessary to a Christian life.

HOLY FAMILY. The name given in art to representations of the Virgin and the Infant Saviour and their relatives, St Joseph or St Elizabeth and the infant John. The earliest such composition is that in the Catacomb of St Calixtus in Rome, with the prophet Isaiah. The Virgin is represented sitting on a seat, which soon became a throne, the traditional attitude up to the Renaissance. The Byzantine school, as early as the sixth century, invented the type in which the Child is seated directly in the centre of the Virgin's lap and is blessing, both figures gazing straight forward. Some of these early pictures were regarded as painted by St. Luke

and endowed with miraculous powers. Such are a number in the churches of Rome (e.g., at San Sisto, Santa Maria Maggiore, etc.) and Venice (e.g., that of St Mark, brought from St Sophia in 1204). Later, this school added attendant angels, who sometimes, as in the school of Crete, bore the emblems of the Passion, the sight of which affrights the Child. The arrangement in which the angels are throne-bearing and adoring figures, in rhythmic arrangement on either side of an immense throne, was developed very beautifully by Cimabue and Duccio in their famous pictures at Florence and Siena. It was quite late in the Middle Ages when other figures were brought into the composition. These were, especially, St Anna, the mother of the Virgin (sometimes holding the Virgin in her lap), St Joseph, and, as playmates to the Infant Christ, the infant John the Baptist (usually in goatskin and bearing a cross), or St Catharine (with whom Christ is being sometimes mystically married). Even the early legendary history of the infancy of Christ has been drawn upon for such scenes as the Twelve Apostles playing with the Infant Christ as boys—a scene peculiar to German art. Of all subjects of Christian art that of the Madonna and Child, comparatively unknown before the thirteenth century, came into overwhelming prominence, becoming the favorite theme of the Italian painters of the Renaissance. One of its variants at that time was the adoring Virgin on her knees before the Infant, a favorite subject with Filippo Lippi. The Holy Family represents a more intimate aspect of the subject, some phase of family life, it must include St Joseph, St Elizabeth, and the infant John—to be distinguished from the Madonna (q.v.) proper, as well as from the more elaborate scenes in which the Virgin and Child, similarly portrayed, are accompanied by several large figures, saints and fathers of the Church, which are not mere accessories of the sacred group, this is usually termed a *Sacra* (or *Santa*) *Conversazione*, and was a popular scene, especially with the Umbrian, Venetian, and northern schools of the fifteenth and sixteenth centuries. Among the distinguished painters who have treated the Holy Family, which was especially popular in the sixteenth century, the first place belongs to Raphael, who often repeated it, and in the example formerly in the Cambrani collection, now at Munich, created the most typical example. Others among the Italians were Bartolommeo, Correggio, Giulio Romano, Leonardo, Michelangelo. It was a favorite subject with Durer especially in his "Life of the Virgin"; with Gerard David and Rubens among the Flemings, Murillo among Spaniards, and Knaus (Metropolitan Museum) among modern Germans. Consult the bibliography of MADONNA, and, for the location of the paintings cited, the articles on the painters mentioned. See PLATES of CORREGGIO, ENGRAVING, GHIRLANDAIO, HOLBEIN, RAPHAEL, ROBBIA, SARTO.

HOLY GHOST, or HOLY SPIRIT. In orthodox theology, the third person of the Trinity (q.v.), "proceeding from the Father and the Son," yet of one substance, majesty, and glory with the Father and the Son, very and eternal God. In early Hebrew thought the Spirit of God was God working in man on special occasions with particular results. It might bring evil as well as good. Both Saul's insanity (1 Sam. xvi. 19) and the work of a prophet (Ezek. ii. 2) might be ascribed to God's Spirit. Later, when noth-

ing evil was ascribed to God, His Spirit of course did only good. In the writings after the exile the term was also used for God working in nature (Job xxxi 13), but this usage did not pass into the New Testament period. By that time the term Holy Spirit was limited to the working of God upon the lives of men. There had long been the conception that when the Messiah came the Spirit would be given more freely (Joel ii 28, 29), and the early Christians, who believed that Jesus was the Messiah, were ready to ascribe the divine guidance of their lives to the Spirit, as the abundant use of the term in the Acts and Paul's letters shows. Paul enlarged the term to mean, not merely the guidance of God in particular events, but the divine basis of the entire Christian life. The term, in its stage of biblical development, expresses the belief that the whole religious life originates from and is guided by God's Spirit acting directly on man's spirit. The proof of this action of God's Spirit lay (1) in the feeling of the man subject to it, (2) in its result, as furthering the recognized plan of God in human life and society.

The history of this term in theology is closely linked with that of Christology. In the Apostolic fathers, God, Christ, and the Spirit are sometimes distinguished, and sometimes the Spirit is made identical with the preexistent Christ. As Greek thought came in, the Spirit and the Logos are often identified (Justin Martyr). The doctrine of the personality of the Spirit followed that of the personality of Christ. Arius held that the Holy Spirit was the first created nature produced by the Son. The clause in the Apostle's Creed, "I believe in the Holy Ghost," probably meant not the personality, but the work of the Spirit—that God's Spirit is active in man. The Constantinople Creed (381), called the Nicene Creed in the Western churches, first expresses the claim of the Spirit to worship. The "procession" (qv) of the Spirit became later one of the chief differences between the Eastern and the Western churches. The "filioque" (qv) clause was inserted in the creed by the third Council of Toledo (589). The orthodox belief regarding the Spirit has been that He is God, but distinct from Father and Son, in the same way as the Son is from the Father, that His function is to carry on the work of God in the hearts of men, by regeneration and sanctification. The doctrine of the Spirit has never been so actively discussed as that of Christ, but it is sometimes held that the Holy Spirit is, in the Bible, merely a name for God acting in the hearts of men, and that the idea of a separate personality is an inference from the person of Christ.

1908), J. Ainal, *La notion de l'Esprit*, parts 1 and 11 (Paris, 1908-11), H. B. Swete, *The Holy Spirit in the New Testament* (New York, 1909).

HOLY GHOST, ORDER OF THE (Fr. *L'Ordre du Saint-Esprit*). The name of an order of knighthood founded in 1578 by Henry III, King of France, because on Pentecost, 1573, he had been elected King of Poland and on Pentecost, 1574, had succeeded to the French throne. Its purpose was to relieve the poor and infirm and to take care of foundlings. The grand master of the order was always to be the King of France. The insignia were a green cross with eight points, on the obverse of which was a dove turned downward, on the reverse the representation of the archangel Michael, the chain, after Henry IV, bore the lilies of France and the monogram "H". There were 100 knights, without counting foreigners. The order was definitely dissolved on Feb. 10, 1831, by Louis Philippe.

HOLY GHOST, PROCESSION OF THE See PROCESSION OF THE HOLY GHOST.

HOLY GHOST FLOWER, or DOVE FLOWER See HOLY SPIRIT PLANT.

HOLY GRAIL See GRAIL, HOLY.

HOLY GRASS (*Hierochloa odorata*). A grass about a foot high, with a brownish glossy lax panicle. It is found in the north of Europe and throughout North America. It has a sweet smell, like that of sweet vernal grass, and in Iceland, where it is plentiful, it is used for scenting apartments and clothes. In some countries it is strewn on the floors of the places of worship on festival days, whence its name. Its stems are used by North American Indians to weave into their baskets, mats, etc. It is of little value for forage, as stock seem to dislike it. This grass is known by many other names, as vanilla grass, Seneca grass, sweet-scented grass, etc.

HOLY GROTTO. The traditional scene of the Annunciation at Nazareth. Over the grotto stands a monastery, occupying the site of the Santa Casa, the house in which Mary was born, and which was carried by a miracle to Loreto. The grotto is marble-lined and is lighted by nine silver lamps. It is 20 feet square and 10 feet deep.

HOLYHEAD, hōl'i-hēd A seaport of Anglesey, North Wales, situated on Holy Island, 24½ miles west-northwest of Bangor (Map. England, B 3). It is the terminus of the London and Northwestern Railway, and a port for the mail steamers to Dublin, 60 miles distant. It has a celebrated breakwater, 7860 feet long, which forms a government harbor of refuge of 400 acres. It has three lighthouses. Coasting trade, shipbuilding, and rope making are carried on, and there is also some fishing. The town possesses assembly rooms and baths and a picturesque old embattled church. Interesting Roman and early English remains exist in the neighborhood. The United States is represented by a consular agent. Pop., 1901, 10,039, 1911, 10,636.

HOLYHEAD ISLAND A small island of North Wales, west of the island of Anglesey, forming part of the county of that name (Map. Wales, B 3). Its area is about 6000 acres. Pop., 1901, 11,414, 1911, 11,131.

HOLY INNOCENTS' DAY See CHILDRENS' DAY.

HOLY ISLAND, or LINDISFARNE, līn'dis-farn A small island belonging to Northumberland, England, in lat 55° 40' N., long 1° 47' W., 10 miles southeast of Berwick-on-Tweed and 2

miles east of the mainland (Map England, E 1). Area, 1051 acres. It is about 4 miles long and 2 miles broad and is connected with the mainland at low water. The north part is barren and uninhabited, but the south is very fertile. Rabbits, fish, and oysters are exported. On the south coast is the village of Holy Island, much resorted to by summer visitors. On the island are several ruins, the chief of which are the extensive and sombre-looking remains of the famous Abbey of Lindisfarne, originally a Saxon edifice, founded in 635 by St Aidan, the disciple of St Columba. There is also an ancient castle, now fortified. Holy Island flourished under St Cuthbert, who died here in 687. In 793 the abbey was destroyed by the Danes. Consult R Hegge (ed.), *Legend of St Cuthbert with the Antiquities of the Church of Durham* (London, 1663), and Wilson, *Lindisfarne Churches* (1870). Pop., 1901, 405, 1911, 359.

HOLY LANCE See LANCE, THE HOLY

HOLY LAND See PALESTINE

HOLY LEAGUE The name given to a number of political alliances in Europe. Of these the principal were the leagues formed (1) in 1511, by the Pope, Spain, and Venice against France, (2) in 1527, by the Pope, Francis I, and Henry VIII against the Emperor Charles V, (3) in 1538, by Charles V and the Catholic princes of Germany against the Schmalkaldic League, (4) in 1571, by the Pope, Spain, and Venice against the Turks, (5) most important of all, the one formed in 1576 by the Guisces, the Pope, Spain, and the Parlement of Paris against the Huguenots, (6) in 1609 a Holy League (known as the Catholic League) organized by the Catholic states of Germany, with Bavaria at its head, in opposition to the Protestant Union.

HOLY MAID OF KENT See BARTON, ELIZABETH

HOLY MOTHER OF THE RUSSIANS.

An epithet originally given to Moscow, the former capital of Russia, by the masses of that nation and still preserved among the peasantry.

HOLYOAKE, hōl'yōk, GEORGE JACOB (1817-1906). An English writer, lecturer, and reformer, particularly identified with the "cooperative movement." He was born in Birmingham, England, was educated at the Mechanics' Institute there, taught mathematics for a time, and while still young became widely known as a radical in politics and religion, attracting attention in particular by his advocacy of the theories of Robert Owen (qv). He early became especially interested in the theory and practice of cooperation, was active in the movement for the organization of the so-called Rochdale Pioneers in 1843, and subsequently was largely engaged as a lecturer and writer in the interests of cooperation. In 1842 he was imprisoned for six months for blasphemy, his being the last conviction on that charge in England. Soon afterward he devised a moral system, known as secularism (qv), which he advocated in public speeches and in the press. For a time he was president of the London Secular Society, the central organization of secularism. He was instrumental in securing the repeal of the so-called "tax upon knowledge" in 1854. He edited at various times the *New Moral World*, the *Reasoner* (from 1846 to 1866), and the *Cause of the People*, in which he contended vigorously for his views, and published numerous books, including *History of the Rochdale Pioneers* (1857; 10th ed, enlarged, 1893), *The*

History of Cooperation in England (rev ed, 2 vols, 1906), *Life of Joseph Rayner Stephens, Preacher and Political Orator* (1881), *Self Help One Hundred Years Ago* (1890), *The Cooperative Movement To-Day* (1891), *Sixty Years of an Agitator's Life* (1892), an interesting though somewhat rambling autobiography, *Nature and Origin of Secularism, Showing that where Free Thought Commonly Ends Secularism Begins* (1896), *Jubilee History of the Leeds Cooperative Society* (1897), *Bygones Worth Remembering* (1906).

HOLYOKE, hōl'yōk. A city in Hampden Co, Mass., on the Connecticut River, 8 miles north of Springfield, on the Boston and Maine and the New York, New Haven, and Hartford railroads (Map Massachusetts, B 4). It was originally a part of West Springfield and was incorporated as the Third Parish in 1786, though it was commonly called Ireland Parish, from the fact that several Irish families were the first settlers. In 1850 Holyoke was set off from West Springfield and incorporated as a separate town, and in 1873 it was chartered as a city. Its importance as a manufacturing centre dates from 1847, when the Hadley Falls Company began to develop the great natural water power. The river here falls 60 feet and is crossed by a granite dam 1000 feet long and 32 feet high, affording a maximum capacity of 40,000 horse power, the most valuable power in New England. For many years it has been noted for its paper mills. It now has also extensive manufactures of cottons, woolens, thread, silk, alpaca, belting, bricks, screws, wires, machinery, envelopes, and school supplies. It is an important centre for hydraulic engineering, for testing water wheels, etc. It has a public library, a tuberculosis hospital, a city hospital, and the House of Providence Hospital. The Holyoke Scientific Society has done valuable work in American archaeology and has fine collections of Indian antiquities. In the vicinity are many places of scenic interest, notably Mount Tom (1215 feet), ascended by an electric railway from Holyoke, and Mount Holyoke (955 feet). Holyoke is governed under a revised charter of 1896, by a mayor, elected annually, and a city council, two-thirds of whose members are elected at large for two years, the remainder by wards for one year. The subordinate offices are filled as follows: appointed by the mayor—board of public works, fire commissioners, board of health, city marshal and assistants, city solicitor, and inspector of milk, appointed by the mayor with the consent of the council—sealer of weights and measures and inspectors of animals and provisions, elected by the council—water commissioners, city physician, poor overseers, city auditor, and city messengers. The annual income and expenditures of the city in 1912 amounted to \$3,095,000 and \$3,106,000 respectively, the main items of expense being \$79,000 for the police department, including amounts for police courts, jails, etc., \$126,000 for the fire department, and \$290,000 for schools. The city owns and operates its water works and its gas and electric-light plants. Pop., 1870, 10,773, 1880, 21,915, 1890, 35,637, 1900, 45,712, 1910, 57,730, 1914 (U S est.), 62,852. See MOUNT HOLYOKE COLLEGE.

HOLYOKE, MOUNT. A steep ridge of greenstone in Massachusetts, near the east bank of the Connecticut River and about 6 miles due north of Holyoke. It rises 955 feet above sea level (Map Massachusetts, B 3). A carriage

road winds upward to the point where a mountain railway carries passengers for 600 feet up a precipitous incline to a hotel built on the summit in 1821. The view here obtained of the Connecticut River and valley has long been famous as one of the finest in New England.

HOLY ORTHODOX CATHOLIC AND APOSTOLIC CHURCH. The official name of the Eastern church. See GREEK CHURCH.

HOLY PHIAL, BARONS OF THE (Fr *Sainte Ampoule*). Sometimes described as an order of knighthood which formerly existed in France. They were four persons, prominent for rank, family, and fortune in the Province of Champagne. At the coronation of the French kings they were delivered to the dean, priors, and chapter of Rheims, as hostages for the return of the holy phial in which the coronation oil was kept. The phial, according to legend, was brought from heaven by the Holy Ghost in the form of a dove and put into the hands of St. Remigius at the coronation of Clovis (q.v.). The holy phial preserved at Rheims was broken by Ruhl, a member of the Convention, in 1793. The badge of the barons was a cross of gold enameled white, cantoned with four fleurs-de-lis, and on the cross a dove descending with a phial in its beak and a right hand receiving it. An interesting account of the coronation of Louis XIII and of these barons is given in Favine's *Theater of Honour* (London, 1623).

HOLY ROMAN EMPIRE. The name now given to the Empire erected by Charles the Great (q.v.), King of the Franks in western Europe, usually dated from his coronation, at Rome, by Pope Leo III in 800, or, more technically, to this Empire as revived in 962 by Otto the Great (q.v.). In theory the Holy Roman Empire was a continuation of the Western Empire, which was overrun by the barbarians in 476. When Charles the Great was crowned Emperor by Leo III, he thought of himself as the successor of Augustus, Trajan, and Marcus Aurelius, and styled himself Augustus. This theory prevailed throughout the Middle Ages. Louis the Pious, Lothaire I, Louis II, Charles the Bald, and Charles the Fat were crowned as Roman emperors. After the deposition of the latter (887), which was followed by the disruption of the great Frankish Empire, the Imperial title was still held by a few princes, as Arnulf, King of Germany, and Berenger I, King of Italy. In 962 Otto the Great, after wresting the royal crown of Italy from a descendant of Charles the Great, had himself crowned Emperor of the Romans by Pope John XII and inaugurated the Roman Empire of the German nation. From that time the King of Germany was usually Emperor. The Empire consisted of Italy and the lands whose rulers recognized the overlordship of the German monarch, but theoretically the Emperor was the ruler of all Christians in western Europe, and some emperors, as, e.g., Henry VI, dreamed even of a world-wide empire. At different periods the rulers of Hungary, Poland, Denmark, Jerusalem, and Cyprus were to a greater or less extent vassals of the Roman Emperor. Until the reign of Frederick Barbarossa the name had been merely Roman Empire, Frederick added the designation Holy, either to vindicate its sacred character against the exclusive pretensions of the Church or else to describe its chief function as the protection of that Church. By the close of the thirteenth century the authority of the German emperors in Italy was reduced to a mere shadow. At the

close of the fifteenth century the Swiss cut loose completely from the Empire. In the Netherlands the Imperial authority had come to an end long before their connection with the Empire was declared to be severed in an article of the Peace of Westphalia (1648).

The early German kings were elected by the chief men of the nation with the assent of the other freemen. Gradually the chief nobles secured almost entire control of the elections, but there was no fixed mode of procedure. At the election of Lothair in 1125, e.g., a committee consisting of 10 from each duchy was chosen to select an emperor. In the thirteenth century—by a process of evolution, which it is not possible to trace here—the number of electors had been fixed at seven, but there was a dispute as to who were included in the seven. This was settled in 1356 by the Golden Bull of Charles IV, which determined that the electoral college should be composed of the archbishops of Mainz, Treves, and Cologne, the King of Bohemia, the Count Palatine of the Rhine, the Duke of Saxony, and the Margrave of Brandenburg. The Golden Bull also declared that the electoral votes were attached to the office, not to the persons, and descended in the case of the lay principalities by right of primogeniture. This continued to be the constitution of the electoral college until 1623, when Ferdinand II arbitrarily transferred the vote belonging to the Count Palatine to Maximilian of Bavaria. At the Peace of Westphalia (1648) an eighth electorate was created for the Palatinate. In 1692 the ninth electorate, that of Hanover, was instituted. The Imperial elections were held at Frankfort-on-the-Main and the coronation city was Aix-la-Chapelle. The Emperor at some time during his reign went to Rome to receive the Imperial crown at the hands of the Pope. The last ceremony of this kind took place in 1530, when Charles V was crowned at Bologna by Pope Clement VII. The successor elect to the Emperor of the Romans was styled King of the Romans.

During the so-called Interregnum following on the death of the last Hohenstaufen Emperor there was a double election (1257), both Richard of Cornwall and Alfonso X of Castile being made Emperor, one receiving four votes and the other three. Their election may be taken to illustrate the theory held by some at the time, that a man of any nationality might be chosen to the Empire, but their total failure to obtain anything but the mere Imperial title proved that, as a matter of fact, the sovereignty of the Holy Roman Empire could be held only by a Germanic prince. After 1438 all the emperors but two belonged to the house of Hapsburg.

Charles the Great and his immediate successors followed the old German custom of calling together at frequent intervals the nobles and freemen for consultation about the public welfare. As feudalism developed, these assemblies ceased, and the Emperor called together only such of his vassals as he chose. Their meetings were called Imperial diets (*Reichstage*). In the thirteenth century the cities became very influential, and consequently their representatives were summoned to the diets. As the power of the emperors declined, the diets took a more prominent part in the administration of the Empire. Their functions were judicial as well as administrative. In the fourteenth century it came to be fixed that the Diet consisted of the three classes—electors, princes, and representa-

tives of the cities. The lesser nobility had no voice in the Diet. But the power of the Diet was slight, because it was concerned only with Imperial matters, and the Empire had ceased to be of real importance as a factor in European politics. This was clearly shown in 1495, when Maximilian I attempted to unite the Imperial estates against the French invasion of Italy. The Diet which he summoned did nothing to check the French, but with the Emperor's consent created the Imperial Chamber (qv), a supreme tribunal for the preservation of peace within the Empire. It consisted of a president and 16 members, who could not be removed from office. It held its sessions at Frankfort, Speyer, and other cities until 1689, in 1693 it was established permanently at Wetzlar. Gradually the Imperial Chamber became an important factor in the maintenance of peace within the Empire. The Emperor was jealous of it, as he had no control over it. Consequently he attempted to transfer some of its authority to the Aulic Council (qv)—a somewhat similar body for Austria, which was under his control. During the first half of the sixteenth century the Aulic Council interfered in the affairs of Italy, the Netherlands, and other portions of the Empire. After that time, however, it was again restricted to Austrian interests alone.

The Empire came to an end in 1806, when Francis II resigned the Imperial crown after having assumed (1804) the title of Emperor of Austria. After the time of the Hohenstaufen, whose dynasty came to an end in 1254, the Empire rapidly sank in importance and owed any real authority which it possessed to the strength of the ruler who was Emperor. Still the possession of the title gave some additional prestige. By the Peace of Westphalia (1648) the bonds which held the Empire together were greatly loosened, the right being accorded to the individual states to enter into foreign alliances. In the eighteenth century Voltaire said of the Holy Roman Empire that it was neither holy, nor Roman, nor an empire. During its earliest existence, however, it was a very important factor in the history of Europe. Consult Karl Biedermann, *Deutschland in achtzehnten Jahrhundert* (3 vols, Leipzig, 1867-80), Shailer Mathews, *Select Medieval Documents and Other Material Illustrating the History of the Church and Empire, 754-1254 A.D.* (2d ed., New York, 1900), W. F. Butler, *Lombard Communes* (ib, 1906), William Stubbs, *Germany in the Middle Ages* (ib, 1908), James Bryce, *The Holy Roman Empire* (ib, 1909), Herbert Fisher, *The Medieval Empire* (2 vols, ib, 1909), Karl Hampe, *Deutsche Kaiser Geschichte in der Zeit Salier und Staufer* (2d ed., Leipzig, 1912). See GERMANY, ITALY, and the articles on the individual emperors, with the books cited.

HOLYROOD (hól'í-rood) **PALACE.** The former residence of the Scottish kings in Edinburgh. It was rebuilt between 1671 and 1679 by King Charles II of England from the designs of Sir William Bruce of Kinross, after the destruction by fire in 1650 of the prior palace built by James IV. It occupies the site of the famous Augustinian Abbey of the Holy Rood erected by King David I in 1128, at the place where, according to a fabulous story, he was miraculously saved from the attack of a hunted stag by the interposition of the lost holy cross or rood which fell from the stag's antlers into the King's hands, and at the sight of which the animal

turned and fled. The black rood of Scotland, as it was called, was brought to Scotland by St. Margaret about the year 1070 and became one of the kingdom's heirlooms. It is known to have fallen into the hands of the English at the battle of Neville's Cross in 1346, but its disappearance in course of time gave currency to the above fable. The sole remains of the abbey are the ruins of the church, which anciently was a safe refuge for criminals and remained so for debtors until the abolition of imprisonment for debt in 1880. Holyrood is interesting as the scene of many historical events, including the term of Queen Mary's residence and of Rizzio's murder in 1566. It is the occasional residence of the British sovereigns and since the death of Queen Victoria has undergone thorough renovation. Consult Charles Mackie, *Original Historical Description of the Monastery, Chapel Royal, and Palace of Holyrood House* (9th ed., Edinburgh, 1832); Daniel Wilson, *Memoirs of Edinburgh* (ib, 1848), J. H. Burton, *The History of Scotland* (ib, 1870), F. W. Watkeys, *Old Edinburgh* (New York, 1913).

HOLY SEPULCHRE. The place where Jesus was entombed. According to the New Testament data the sites of the crucifixion and burial of Jesus were not far apart (John xix 41), outside Jerusalem (Heb. xiii 12), and near a road (Mark xv 29, Matt. xxvii 39). The tomb itself was in a garden (John xix 41) and apparently on a slope. The place of crucifixion was called Golgotha (Mark xv 22, Matt. xxvii 33, John xix 17), an Aramaic word meaning 'skull'. Calvary is but the anglicized form of the Latin *calvaria*, skull. There is no evidence for supposing that the locality was sufficiently elevated to be called a hill or mount. The Gospels imply that the site was well known when they were written, but the references are not full enough to make a modern identification easy or certain.

The traditional site of both Golgotha and the tomb of Jesus is that now covered by the church of the Holy Sepulchre, 400 to 500 yards west of the northern part of the Haram esh-Sherif, or temple area, and well within the modern city of Jerusalem. Here Constantine the Great built a beautiful church on the spot then supposed to be the place of the Resurrection. This identification was not seriously disputed until Jonas Korte, in 1741, claimed that, being within the city walls, it could not be correct. Korte supposed that the modern north wall was in existence at the time of the crucifixion, but in fact it was built later. In 1841 Edward Robinson, in his *Biblical Researches*, disputed the correctness of the traditional site, on the supposition that the second wall of Josephus—which was the outer wall in Christ's day—passed to the north of it, and in that case the traditional site must have been within the city. Since Robinson, this has been considered by many to be the chief and fatal obstacle to the view that the modern church actually covers the spot where Jesus was buried. But the excavations and measurements of Conrad Schick (1888 and later) strongly support the view that the wall in Christ's day lay south and east of the disputed site, which therefore was outside the city and may well have been the scene of the crucifixion and burial. Of other proposed sites, two—both outside the modern city, near the Damascus Gate—have received strong support. The question is still unsettled, but the drift of competent opinion is towards

provisional acceptance of the traditional view until more decisive evidence compels its rejection.

A few years after the crucifixion the northern area of Jerusalem was inclosed by a third wall, as it was becoming thickly settled. There is no reason to suppose that the early Christians forgot where the crucifixion and burial had occurred, though there is no probability that they venerated the place as holy. In the Jewish war with Rome (66-70) this part of the city was occupied by the Roman army preparatory to the assault on the second wall. From its capture by Titus (70) to the rebellion of Bar-Cochba (132-135), the city was practically in ruins, though not entirely desolate. After suppressing this rebellion Hadrian rebuilt Jerusalem as a heathen city, calling it *Ælia Capitolina* and absolutely forbidding Jews to enter it. On the site of the temple a shrine to Jupiter was built, and on that of the supposed tomb of Jesus a temple to Venus was erected (by Hadrian or one of the later emperors). Incidentally this may be evidence that even then Christian tradition pointed out that spot as worthy of veneration. In the third century the holy places of the city and vicinity began to attract pilgrims from various parts of the Empire, though there is no evidence that any visited this particular spot. In the fourth century the pilgrimages became more popular, and when through Constantine I the Empire became nominally Christian, it was but natural that the Emperor, urged on, doubtless, by his mother, determined to rescue the holy sepulchre from oblivion and disgrace. What guided Constantine in selecting this spot was, without doubt, the tradition already current. On removing the accumulated rubbish the workmen came upon a rock tomb. So astonishing was this coincidence that it was counted as simply miraculous that the precious grave, so long hidden away, should at last have come to light. Legends soon began to multiply—e.g., that Helena, Constantine's mother, miraculously discovered the true cross near by, of which Eusebius, the contemporary and well-informed witness, says nothing (See CROSS, INVENTION OF THE). Constantine now built here a magnificent church. Over the grave was erected a beautiful gilded dome open to the sky, supported by columns and surrounded by a wall, the inside diameter being about 65 feet. From the rotunda eastward extended the basilica, 250 feet in length, with its nave and two aisles, the nave ending in a semicircular choir. Still farther to the east, connected with the basilica by three gateways, was the atrium, surrounded with colonnades and containing basins for the customary ablutions. From the atrium three gates led out into the propylæum, which connected the whole edifice with the market street to the east. The entire length of the church or cathedral so constructed was about 475 feet. It was due, doubtless, to the necessities of the situation that the propylæum and atrium were to the east rather than, as usual, west of the basilica. In the south aisle a knob of the native rock, with a cleft in it (the grave of Adam, according to legend), rose a few feet above the level of the floor, inclosed within a silver fence. This was supposed to be the rock in which the cross was set,—i.e., Golgotha proper. In 336 A.D., 10 years after its foundation, Constantine's church was dedicated by the Synod of Tyre. For nearly 300 years the edifice remained intact, famed for its beauty, one of the chief attractions for the numerous pilgrims constantly

visiting Jerusalem. During this period legends grew apace, and numerous miraculous events were associated with the locality. In 614 the church was destroyed, at least partially, by the Persians under Chosroes II. Steps were taken at once by Modestus, acting Bishop of Jerusalem, to rebuild the edifice, and after 10 years' labor (616-26) the work was completed. The new buildings were not of the same plan or dimensions or beauty as their predecessor. The rotunda was rebuilt as a separate church—of the Resurrection—and on the site of the large basilica of Constantine a smaller one, the *Martyrium*, over the place where the cross was said to have been found, was erected. Southeast of the rotunda a new church in honor of the Virgin was built, while over Golgotha, now outside of the basilica, a chapel was placed. These edifices remained, with occasional damage and consequent repairs, until their destruction by Hakim, Caliph of Egypt, in 1010. With the assistance of the Byzantine Emperor they were restored in 1048, with some changes of plan. In 1140 the Crusaders began a general rebuilding of all the edifices on a larger scale. The new church was dedicated July 15, 1149, but not completed until 1168. The church of the Crusaders was destroyed in 1244, but again rebuilt (c 1300). Extensive alterations and improvements took place in 1555 and 1719. In 1808 the rotunda was burned and much other damage done to the western buildings. The restoration, the work of the Greeks and Armenians, was completed in 1810. Since that time, with the exception of the renewal of the dome in 1865 by Napoleon III and Alexander II of Russia, the buildings have undergone no serious alteration.

For plan of the present buildings, with extended descriptions, consult Baedeker's *Palestine and Syria* (New York, 1912), for the plan and extent of the buildings of Constantine, consult Carl Mommert, *Die heilige Grabeskirche zu Jerusalem in ihrem ursprünglichen Zustande* (Leipzig, 1898), or the *Survey of Jerusalem*, published by the Ordnance Survey, for the best bibliography, Hermann Guthe's article in the *Hauck-Herzog Realencyklopädie* (Leipzig, 1899). Consult also C. W. Wilson, *Golgotha and the Holy Sepulchre* (London, 1906), and G. A. Smith, *Jerusalem*, vol. 1, pp. 247 ff. (New York, 1908).

HOLY SEPULCHRE, KNIGHTS OF THE An order of knighthood instituted (1496), probably by Pope Alexander VI, for the guardianship of the Holy Sepulchre and the relief and protection of pilgrims. The Pope was originally the grand master, but he subsequently ceded his rights to the Guardian Father of the Holy Sepulchre at Jerusalem. The knights were held to strict rules of honor, faith, and purity, but in return they had the most unusual and extraordinary privileges conferred on them. They were exempt from taxation, could marry, as an organization could possess property, could legitimize bastards, and could cut down and bury the bodies of criminals who had been hanged. After a temporary union with the Hospitalers, the order was reconstructed in 1814, both in France and in Poland, and is still in existence, its members being chosen by the Guardian of the Holy Sepulchre out of noble and devout pilgrims. The badge of the order consists of a Jerusalem cross of red enamel, with four smaller Latin crosses between its arms, surmounted by a crown and held by a black ribbon. The collar is made up of small crosses like the badge.

HOLY SPIRIT. See HOLY GHOST.

HOLY SPIRIT PLANT, or DOVE PLANT A name given to a species of orchid, *Peisteria elata*, found in Central America, especially in the vicinity of Panama. It is an epiphytic orchid, with large striated green pseudobulbs, which bear three to five lanceolate leaves, often a yard long and 6 inches across. The flower stem springs from the base of the pseudobulbs and is 4 to 6 feet high, a third of its height bearing creamy-white, fragrant flowers, an inch or more in diameter, the inner part of which is often tinged with crimson or other shades of red. The name is derived from the shape of the united column of style and stamens. This column resembles a conventional dove hovering with expanded wings in the vase formed by the petals. It is used in religious festivals in Central America as symbolical of the Holy Spirit, hence its name "el espíritu santo." See GROUND.

HOLY STONE A miraculous rock at Ardmore, Ireland, which is said to have floated from Rome with robes, a bell, and a lighted taper for St. Patrick.

HOLYSTONE A piece of soft stone, usually sandstone, used in scrubbing decks. To holystone a deck is to scrub it, using holystones. Holystones are smooth on one side at least and have a small depression on the other to receive the end of a handle or stick by which they are pushed back and forth. To increase the scrubbing power of the stones, the decks are wetted and sand is sprinkled over them prior to holystoning. The derivation of the term is supposed to be from the fact that holystoning used chiefly to be done on Saturday as a preparation for Sunday inspection, church, etc.

HOLY THURSDAY See ASCENSION DAY, HOLY WEEK, MAUNDY THURSDAY.

HOLY WAR See AMPHICTYONIC COUNCIL, SACRED WARS.

HOLY WAR, THE 1 The first of Thomas Fuller's historical writings (1639). It is a history of the Crusades and was very popular up to the time of the Restoration. 2 A religious allegory, explained on the title-pages as "made by Shaddai upon Diabolus," by John Bunyan (1682).

HOLY WATER (Lat. *aqua benedicta*) Water blessed by a priest for religious uses and employed in the Roman Catholic and Oriental churches. In most ancient religions the use of lustral or purifying water not only formed part of the public worship, but also entered largely into the personal acts of sanctification prescribed to individuals. The Jewish law contained many provisions to the same effect, and Christ, by establishing baptism with water as the necessary form of initiation into the religion instituted by Him, gave His sanction to the use. The usage of sprinkling the hands and face with water before entering the sanctuary, which was prescribed in the Jewish law, was retained, or at least very early adopted, in the Christian Church. It is expressly mentioned by Tertullian in the end of the second century. Water was used for the exorcism of evil spirits. St. Jerome mentions the blessing of water, and the Apostolic Constitutions contain a formula for the purpose. That now given in the Roman missal and ritual has been preserved unaltered from the sacramentary of St. Gregory. It includes an exorcism (qv.) and the admixture of salt which has been blessed. The water so prepared is sprinkled by the priest on the congregation before high mass (this rite being called the *asperges*, from the first word of

the anthem which is sung during its progress), and is publicly employed as part of the rites for funerals and for the blessing of various objects and persons, that used in the consecration (qv.) is prepared in a special manner. The ordinary holy water is also used privately by devout Roman Catholics on entering and leaving the church and at other times. It is considered by them as included among sacramentals (qv.). The original idea of purification became early in the history of religion, symbolic of spiritual cleansing, but Christian devotion assigned another potency to blessed water accompanied by special invocation, that of casting out evil spirits. Although it is difficult to fix the precise time, it cannot be doubted that the practice of mingling salt with the water is of very ancient origin, perhaps with the idea of adding to the magical power of the water.

HOLY WATER VASE, or STOUT A receptacle, known in France as *brûtière*, for holy water, placed at the entrance of Roman Catholic churches, so that those who come in or go out may dip their fingers in it and cross themselves. It is frequently in the form of a shell and usually attached to the wall. The kind of vessel known as *pila* in Italy stands on a base of its own. The artists of the Italian Renaissance produced exquisite examples of both types, especially of the *pila*, as in Siena Cathedral. The two holy water stoups in St. Peter's at Rome are huge marble shells, held each by a colossal infant figure.

HOLY WEEK. The week immediately preceding Easter and especially consecrated to the commemoration of the passion of Christ. The observance of the week can be traced back at least to the fourth century. In the Roman Catholic church the special characteristics of the celebration of the Holy Week are increased solemnity and gloom, penitential rigor, and mourning. If any of the ordinary Church festivals fall therein, it is transferred till after Easter. All instrumental music is suspended in the churches, the altars are stripped of their ornaments, the pictures and statues are veiled from public sight, manual labor, although it is no longer entirely prohibited, is by many persons voluntarily suspended, the rigor of fasting is redoubled, and almsdeeds and other works of mercy sedulously enjoined and practiced. All Church services of the week, moreover, breathe the spirit of mourning, some of them being specially devoted to the commemoration of particular scenes in the passion.

Palm Sunday (qv.) commemorates the triumphal entry of Christ into Jerusalem and is observed by the blessing of palm branches, which are carried in the procession as they were by the people of Jerusalem on that day. Spy Wednesday is the old English name for the day which commemorates the betrayal of Christ by Judas. Holy Thursday (also called Maundy Thursday, qv.) is the commemoration of the Last Supper and the institution of the Eucharist. With this in mind, white vestments are worn at the mass (only one mass is celebrated on this day), after which the altars are solemnly stripped and washed by the clergy. (See also FOOT WASHING.) The matins of the last three days, generally sung on the preceding evening (see LENEAGE), constitute an impressive service. On Good Friday the mass is not celebrated, the day being the commemoration of the one sacrifice of the great High Priest, but a special service is held,

called the "mass of the presanctified," including the communion of the priest from the host reserved from the previous day on the 'altar of repose," but without the prayer of consecration or the words of institution (For the ceremony of the "adoration of the cross," see CROSS.) Holy Saturday was in the earliest times set aside for the solemn administration of baptism and orders, the present services of the day begin to partake of the gladness of Easter (q v). In the Anglican communion the observance of the week in a similar spirit is prescribed, and the Scripture selections all have a bearing upon the events commemorated. Good Friday is a legal holiday in England and Ireland. The observance of Holy Week is largely increasing, even among the nonliturgical denominations throughout the English-speaking world. For old English customs, consult Chambers, *The Book of Days*, March 20-28 (London, n d). For the Catholic ritual, consult Thurston, *Lent and Holy Week* (ib, 1904), Duchesne, *Christian Worship* (ib, 1906), Hellner, *Heortology* (ib, 1908).

HOLYWELL, hól'wél. A market town and parliamentary borough in Flintshire, North Wales, 4½ miles northwest of Flint (Map England, C 3). It has limestone quarries, coal, lead, copper, and zinc mines, and numerous establishments for smelting, manufacturing shot, zinc, brass, leather, flannel, cement, cottons, galloons, paper, and beer. Holywell owes its origin to the renowned well of St Winifred, which is said to be the most copious spring in Britain, giving forth at the rate of 21 gallons a minute. Its waters were believed to be efficacious in curing diseases and are still resorted to by Roman Catholic pilgrims. The well is covered by a fine Perpendicular chapel attributed to Margaret, mother of Henry VII. In the vicinity are remains of the old Saxon abbey of Basingwerk, and in the town is St. Bueno's College for Roman Catholic priests. Pop., 1901, 2652; 1911, 2549.

HOLYWOOD, JOHN OF. See SACROBOSCO.

HOLZ, hólts, ARNO (1863-) A German poet and critic, born at Rastenburg. In 1882 he published a volume of poems, *Klingensherz*, which won the Augsburg Schiller prize. In *Deutsche Weisen* (1884), written with Jerschke, and in the *Buch der Zeit* (1885 and 1892), his extremely modern tendency appears, and the attention to details and the attempt at photographic realism (under the influence of Zola) are carried even further in *Neue Gleise* (1892), in which he collaborated with Johannes Schlaf. His realistic theory is further illustrated in the plays *Socialaristokraten* (1896) and *Die Blechschmiede* (1902) and is defended in *Die Kunst, ihr Wesen und ihre Gesetze* (1891 et seq.) and *Revolution der Lyrik* (1899). His latest work comprises *Lieder auf einer alten Laute* (1903) and *Dafnis* (1904) and, with Jerschke, the drama *Traumulus* (1904, 10th ed., 1905), *Frei!* (1905), comedy, *Sonnenfinsternis* (1908), tragedy, *Buul* (1911), comedy, in collaboration with Jerschke, *Ignorabimus* (1913), tragedy. Consult F. Servaes, *Preludien* (Berlin, 1899), Karl Strobel, *A Holz und die jungstdeutsche Bewegung* (ib, 1902), R. Röss, *A Holz* (ib, 1913).

HOLZSCHUH, hólts'shōō, DIETRICH. A German pretender, also called **TILE KOLUP**. He laid claim to the throne as Frederick II, who died in 1250. In Cologne (1284) his claim was ridiculed; he was ducked in a sewer and driven from the city. At Neuss he fared better, because he was looked upon as a powerful magician. In

1285 he went to Wetzlar and there held court, but on the approach of Rudolf he was turned over to the King and was hanged as a heretic (1285). Consult Meyer, *Tile Kolup* (Wetzlar, 1868), and Petri, "Der falsche Friedrich," in vol. II of *Zeitschrift des bergischen Geschichtsvereins* (Bonn, 1864).

HOMAGE, hóm'aj (from OF *homage*, *homage*, Fr *hommage*, Prov *homenatge*, *homenage*, from ML *hominaticum*, homage, from Lat *homo*, man). In the feudal system, the ceremony whereby a tenant in chivalry or by knight's service completed his investiture and thus became entitled to the lands of which he was enfeoffed by his lord, or which fell to him by inheritance. The form was ordinary as follows. The vassal knelt before his lord, placed his hands between his lord's hands, and declared himself the lord's vassal for his fief. The lord then gave him a kiss and raised him from his knees. Homage and fealty (q v) were usually parts of the same ceremony, but were not synonymous. Homage was always due to the immediate lord of whom the land was held. It consisted in an oath of allegiance wherein the vassal declared himself the lord's man (*homo*) and devoted himself to the lord's service "of life and limb and earthly obedience." It differed from fealty in that it was exacted only of military tenants, while fealty was due from socage tenants as well, and in the further fact that fealty was accounted a service, or obligation, by which the tenant held his land (a tenant was sometimes said to hold by fealty in lieu of all other services), whereas homage was not a specified service to be rendered by the tenant for his land, but an incident of the more honorable tenure of knight's service. However, there was probably little difference in the form of oath required in the two cases. With the other incidents peculiar to military tenure, homage was abolished by statute in 1660 (12 Car II, c. 24), but fealty survived as a feature of socage tenure, though it has fallen into disuse.

In modern English law the term "homage" is still employed to denote the oath of allegiance taken by the nobility on the coronation of a new sovereign as well as the oath taken by a newly appointed bishop or archbishop. Consult Luchaire, *Manuel des institutions françaises* (Paris, 1892). See **FEDERALISM**.

HOMAGE ANCESTRAL. An ancient form of English land tenure of a privileged character. It was a form of the tenure of free and common socage (q v) and existed "where time out of mind a man and his ancestors had held by homage" only, in lieu of all other services. The alienation of an estate held by homage ancestral converted it into an ordinary socage tenure by homage and freed it from the peculiar privileges which attached to it by virtue of its ancestral character.

HOMALONOTUS (Neo-Lat, from Gk *ὁμαλός*, *homalos*, level + *νότος*, *nōton*, back). A genus of fossil trilobites of large size, found in the Silurian and Devonian rocks and characterized by the absence of trilobation of the thoracic segments. See **TRILOBITE**.

HOMALOP/SIDÆ. See **HERPETON**.

HOMATROPINE (from Gk *ὁμός*, *homos*, same + Eng *atropine*, from Neo-Lat *atropina*, from *Atropa*, deadly nightshade, from Gk *Ἀτρώπος*, *Atropos*, name of one of the Fates, the inflexible, from *α*, *a*, not + *τρεπός*, *tropos*, a turning, from *τρέπειν*, *trepein*, to turn). A by-product in the manufacture of atropine, used

chiefly for paralyzing the accommodation and dilating the pupil for purposes of examination. For this purpose the hydropiometate, which is freely soluble in water, is employed. Its action is similar to that of atropine, but less powerful and of shorter duration. The dilatation of the pupil passes off in from 24 to 36 hours, while that resulting from atropine lasts several days. Homatropine is often combined with cocaine when used for dilating the pupils. For internal use it is inferior to atropine.

HOMBERG, hōm'bĕrk, WILHELM (1652-1715). A Dutch naturalist and chemist, born at Batavia, Java. He studied law at Jena and Leipzig, and, having graduated in medicine at Wittenberg, practiced at Paris in 1682-85 and after 1691 and at Rome in 1685-90. He is remembered chiefly for his discovery of boric acid in 1702, but he made several other important contributions to chemistry and physics.

HOMBURG. See HESSE-HOMBURG.

HOMBURG, PRINCE OF. See FREDERICK II.

HOMBURG VOR DER HOHE, hōm'būrk fōr dēr hē'e. A fashionable watering place, largely frequented by English, in the Prussian Province of Hesse-Nassau, situated at the foot of the Taunus Mountains, 11 miles northwest of Frankfurt (Map Germany, C 3). Towering above the older section of the town is an old castle which formerly belonged to the landgraves of Hesse-Homburg and is now used by the Prussian royal family. The new town was founded by the Landgrave Frederick II. The landgraves resided here from 1680 to 1866. The old Kurhaus contains a museum of antiquities. The splendid gambling resort here was closed in 1872. The chief of the eight mineral springs is the Elisabeth-Brunnen, the water of which is very rich in salts and is extensively exported. Other springs are rich in iron, and the waters of several are used only for bathing. The annual number of guests exceeds 14,000. Homburg has manufactures of machinery, soap, leather, hats, noodles, iron, castings, paper boxes, vinegar, mustard, and white lead. Pop., 1900, 9635, 1910, 14,344. The environs are delightful. The remains of extensive Roman intrincements are to be seen in the vicinity.

HOME, DANIEL DUNGLAS (1833-86). A Scottish spiritualist medium, born near Edinburgh. He was descended on his mother's side from a Highland family noted for its gift of "second sight." When a child, he was brought to the United States, and before he was 20 he was widely known as a medium. On the testimony of William Cullen Bryant, Professor Wells of Harvard, and other well-known men, it is recorded that knocking on the walls, the sliding about of the furniture, and the "levitation" of the medium himself in the air occurred without the slightest recourse to trickery so far as they could observe. When he returned to England in 1856, his sittings were attended by many prominent people, including Robert Browning and his wife. Mrs. Browning is said to have believed in spiritualism, but her husband disbelieved, and was inspired to write *Mr Sludge, the Medium*. In 1856 Home became a Catholic while at Rome, but in 1864 was expelled from the city as a sorcerer. Dr. Robert Chambers and Dr. Lockhart Robertson were among his converts, and a number of scientists were convinced of the genuineness of his powers, including Sir William Crookes, who published an account of the experiments made with him, entitled *Re-*

searches in the Phenomena of Spiritualism (1874). In 1866 Home became secretary of the Spiritual Athenæum for the propagation of spiritualism. He instituted a vigorous campaign against professional mediums and scrupulously abstained from taking money at his seances. He published *Incidents in my Life* (2 vols., 1863-72) and *Lights and Shadows of Spiritualism* (1877). Consult Madame Home, D. D. Home *His Life and Mission* (London, 1888) and *The Gift of D. D. Home* (ib., 1890).

HOME, SIR EVERARD (1756-1832). An English surgeon, born at Hull, the son of an army surgeon. He studied at Westminster School and in 1773 resigned a scholarship in Trinity College, Cambridge, to study under John Hunter (qv), who married Home's sister. Home was long connected with the College of Surgeons, was chosen its professor of anatomy and surgery in 1804, member of its court of examiners in 1809, master in 1813, and its first president in 1821. He was censured bitterly for burning Hunter's valuable manuscripts, of which he was custodian, and for using them in his work on *Comparative Anatomy* (1814-23), which gains what value it has from the source employed. Among Home's other writings are *The Properties of Pus*, which won a gold medal from the Lyceum Medicum Londinense (1788), a biographical notice of Hunter, prefixed to Hunter, *On Blood, Inflammation, and Gunshot Wounds* (1794), *Practical Observations on the Treatment of Strictures in the Urethra and Esophagus* (1795), *Observations on the Treatment of Ulcers on the Legs* (2d ed., 1801), *Practical Observations on the Diseases of the Prostate Gland* (1811-18), *On the Formation of Tumors* (1830).

HOME, HENRY, LORD KAMES (1696-1782). A Scottish judge and author, born at Kames. He entered the bar in 1724, was raised to the bench in 1752, with the title of Lord Kames, and was made one of the lords of judiciary in 1763. As a coarse but able judge, he is mentioned by Scott in *Redgauntlet* (chap. 1). In 1728 he published *Remarkable Decisions of the Court of Session from 1716 to 1728*. The materials for this work were in 1741 embodied in his *Dictionary of the Decisions of the Court of Session* during its whole history. He is best known, however, by *Essays on the Principles of Morality and Natural Religion* (1751), containing a solution of the question of human freedom, which brought on him the suspicion of infidelity, *Introduction to the Art of Thinking* (1761) and, above all, the celebrated *Elements of Criticism* (1762), the work on which his fame now chiefly rests. In 1774 appeared his *Sketches of the History of Man*. While thus occupied with judicial and literary labors, he took a very active interest in agriculture, writing a useful tract entitled *The Gentleman Farmer Being an Attempt to Improve Agriculture by Subjecting it to the Test of Rational Principles* (1776). His last work, *Loose Thoughts on Education* (1781), was written in his eighty-fifth year. Consult Lord Woodhouselee (A. F. Tytler), *Memoirs of the Life and Writings of Home* (Edinburgh, 1807).

HOME, JOHN (1722-1808). A Scottish dramatist, born at Leith. He was educated at the University of Edinburgh and prepared for the Church. During the uprising of 1745 he fought as volunteer on the Hanoverian side. In 1747 he became minister of Athelstaneford in East

Lothian, where he wrote his famous tragedy of *Douglas*. Performed at Edinburgh in 1756 and at London in 1757, it was received with enthusiasm. For his plot Home used the popular Scottish ballad of *Childe Maurice* and in a less degree Shakespeare's *Othello*. The play, though turgid in diction, has great merits. It was the best English tragedy since Otway. The clergy of the Scottish Kirk, opposed to the theatre on principle, were scandalized by the production. After a bitter controversy Home resigned his charge (1757). He became secretary to Lord Bute, tutor to the Prince of Wales (afterward George III), and received liberal pensions. In 1770 he married and returned to East Lothian and after a time settled in Edinburgh. Besides *Douglas*, Home wrote other plays, which either failed or met with moderate success. Among them are *Agis* (produced 1758 at Drury Lane), *Aquilon* (1760), *Fatal Discovery* (1769), *Alonzo* (1773), *Alfred* (1778). He also wrote a *History of the Rebellion of 1745* (1802). Consult *Works*, with memoir by Henry Mackenzie (Edinburgh, 1822), Wilson, *Poets and Poetry of Scotland* (London, 1875), Francis Espinasse, in *Dictionary of National Biography*, vol. xxvii (ib., 1891).

HOME, SIR PATRICK See **HUME, SIR PATRICK**

HOME AS FOUND. A novel by J. Fenimore Cooper (1838). It is a sequel to *Homeward Bound*.

HOME ECONOMICS treats of the materials used in the home and of its economic and social interests and activities, all considered in their practical and also in their scientific aspects. Its content has been drawn from many sources, including experience and the results of research in various fields of knowledge. As a subject of study, it has only recently been systematically formulated, and its terminology is therefore not entirely uniform. It has been called home science, domestic science, household economics, household science, household arts, and domestic economy. There is a tendency at present, however, to use these various terms to designate special branches of the subject and to use "home economics" to cover the whole field. In support of this usage it is said that the word "home" has immaterial as well as material implications, while the kindred words have not, and that it may stand not only for the household and the roof which shelters it, but also for the centring points of the affections, and, further, that economics (*oikos*, the house or household, *nomos*, law) of the old Greek writers carries not only its modern meaning, but also its original significance, viz., the art of wise and systematic household management.

Home economics, like agriculture and engineering, is a complex. Grouped about it and only imperfectly marked off from it are history, economics, sociology, aesthetics, mathematics, physics, hygiene, chemistry, physiology, biology, and other subjects. From all of these it draws information for the solutions of its own problems, which in general concern four main topics—food, clothing, shelter, and home management. In one form or another its problems have engaged thought and labor since home life first developed from the barbarism which preceded it. Even their formulation dates far back, for Xenophon's *Oeconomicus* deals didactically with the management of a farm and household. As a subject for formal instruction, however, home

economics is of much more recent origin. Records, though imperfect, show that it had its beginning in the Western Hemisphere in the middle of the seventeenth century, when the nuns in Quebec gave instruction in needlework, knitting, and household tasks to groups of girls. Regular class instruction in cooking seems to have been given in Edinburgh as early as 1835. For a long time formal instruction was confined to cooking, sewing, and housekeeping. These became a part of public-school instruction in the United States as early as 1876, being introduced first in the Eastern States. The work in colleges, on the other hand had its origin in western United States, where the influence of State universities and agricultural colleges was pronounced.

State institutions in Iowa, Kansas, and Illinois were the pioneers in college work in home economics. Some confusion exists as to dates, but Iowa seems to have been (in 1869) first in the field with domestic-science instruction, which was, however, not permanent. The early seventies witnessed a new beginning there, destined to lead to uninterrupted development, and also the beginnings of work in Kansas and Illinois. In these and other Western institutions home economics proved itself to be mentally nutritive and not simply a form of vocational training as some of its opponents had maintained. With the realization of its educational possibilities when rightly combined and correlated with other work, came the recognition in other localities of its great educational importance, and many women's colleges and coeducational institutions throughout the United States have opened their doors to it. Many other colleges which do not offer instruction specifically designated as home economics offer courses in hygiene, sanitation, food chemistry, and other subjects which are foundational to a well-rounded course in home economics, but which were not formerly a part of higher education of women.

Interest in the teaching of home economics has grown very rapidly during the last 25 years. It is now taught in 140 or more colleges and universities, in many normal and high schools in the United States, as well as in technical, vocational, and trade schools. A similar development may be noted in Canada. In Great Britain and on the Continent it forms a part of the general plan of education. Up to the present the work has been confined chiefly to secondary and technical schools and extension education. However, interest in the subject in its relation to higher education is increasing.

Courses of instruction in home economics may be cultural, technical, or vocational, elementary, secondary, or advanced. Advanced cultural courses deal chiefly with historical, economical, and sociological data, and with the sciences that are applied in household processes and problems. Technical courses lay special stress upon the problems of household management in order to develop special proficiency in the profession of teaching home economics or in managing homes or institutions. Vocational or trade courses deal chiefly with the manufacturing processes carried on in the home. Elementary courses usually take the form of manual training and are designed to have general educational value and also to be useful in a practical way to pupils who must leave school early.

Original investigation in connection with the

teaching of home economics has so far been concerned chiefly with the functions and uses of food, with hygiene, and with economics. The hygienic and economic problems which clothing and shelter present have been little investigated, but even in these matters the value of careful laboratory research is coming to be recognized.

Though late in its development in pedagogical form, home economics, like other branches of education, has its general and specific literature, its textbook and periodical literature, in addition to its empirical knowledge gained in the past and handed on from generation to generation. It has also its associations and gatherings for counsel and progress. An International Bureau has been established in Fribourg, Switzerland, to collect the literature of the subject and to serve as a clearing house for information. See ADULTERATION, COOKERY, FOOD, FOOD PRESERVATION, FISH AS FOOD, FIRELESS COOKER, FRUIT, MEAT, MILK, PORK, VEGETABLES, and similar topics. See also MANAGEMENT, HOME AND INSTITUTION, TEXTILES AND CLOTHING, COSTUME, DRESS EMBROIDERY, FASHION, GLOVE, JEWELRY, LACE, SHOES, ETC. See SHELTER AND HOUSING, ARCHITECTURE, BUILDING, FURNITURE, HEATING AND VENTILATION, PLUMBING.

Richards, *Euthenics: The Science of Controllable Environment* (Boston, 1910), Columbia University, Teachers College, *Annotated List of Books Relating to Household Arts* (New York, 1910); American Home Economics Association, *Syllabus of Home Economics* (Baltimore, 1913).

HOMEL, hómél. A town of Russia. See GOMEL.

HOMER. A city and the parish seat of Claiborne Parish, La., 45 miles (direct) east by north of Shreveport, on the Louisiana and Northwest Railroad (Map Louisiana, C 1). It is the commercial centre for a productive cotton-growing district. The water works and electric-light plant are owned by the city. Pop., 1890, 1132, 1900, 1157, 1910, 1855.

HOMER. A village in Cortland Co., N. Y., 34 miles south of Syracuse, on the Delaware, Lackawanna, and Western Railroad (Map New York, D 5). It is in a fertile farming and dairying region, has a canning factory, and manufactures shirts, carriages, fishing lines, and sleighs. The village contains Homer Academy, the county home for aged women, and a public library. The water works are municipally owned. Pop., 1900, 2381, 1910, 2695.

HOMER (Lat. *Homerus*, from Gk. *Ὅμηρος*). The less critical of the ancients attributed to Homer, who was to them a real person, many minor poems, as the *Hymns*, the *Margites* (qv), the late *Batrachomyomachia* (qv), and many of the lost so-called Cyclic Epics, dealing with

the early legends. (See CYCLIC POETS.) To the more thoughtful, however, he was the author of the *Iliad* and the *Odyssey* only. The skeptical "separatists" (chorizontes) denied him the *Odyssey*. To us he is the unknown poet who chiefly shaped the *Iliad* and possibly also the *Odyssey*. His date is placed by Herodotus about 850 B.C., by the moderns, anywhere from 900 to 1100 B.C. At any rate, his is the first name in European literature. The *Iliad*, in 24 books, deals with an episode in the legendary siege of Troy (qv), or Ilion, a real town of which Schliemann (qv) excavated the remains at Hisarlik, a hillock in northwestern Asia Minor. This siege, in one view, is an idealization of the prolonged struggles of Achæan and Æolian invaders from Greece with the old (Phrygian?) possessors of the soil, in another view it represents the struggle between the Greeks and the inhabitants of the Troad for mastery of the Hellespont, and consequent control of trade with the Black Sea. (For this view, consult Leaf, *Troy: A Study in Homeric Geography*, London, 1912.) In the legend the war is undertaken to recover the beautiful Helen (qv), wife of King Menelaus of Sparta, who had eloped with Paris (qv), son of King Priam of Troy. In the tenth year of the war Achilles (qv), the Achæan (Thessalian) hero, quarrels with the Greek commander in chief, Agamemnon, King of Mycenæ, about a captive girl, Briseis, and sulks in his tent, to the great loss of the Greeks, until he is aroused by the death of his dearest friend, Patroclus. Then he hurls himself into the battle and slays the slayer, Hector, the chief bulwark of Troy, with whose solemn burial the poem concludes.

The *Odyssey* relates, likewise in 24 books, the surprising experiences of Odysseus (see ULYSSES) as, after the 10 years' siege of Troy, he wandered for 10 years more, ever yearning to see the rocky isle of Ithaca, his home. (See ITHAKI.) Underplots describe the life of his faithful wife, Penelope, persecuted by the importunate wooing of rude suitors, and the adventures of his son, Telemachus, who in the tenth year goes forth in search of his father. In the end Odysseus returns, joins Telemachus, slays the suitors, and is at last recognized by Penelope. A literature does not thus begin with two long artistic and skillfully constructed epics. (See GREEK LITERATURE, I, *The Age of Epic Poetry*.) We must assume behind the *Iliad* shorter epic ballads such as the bard Phemius in the *Odyssey* (book 1) chants to the suitors, and Demodocus recites at the Phæacian court (*Odyssey*, book viii), hymns to the gods, and songs of the "glory of men," such as Achilles, idle in his tent, sings to the music of a lyre won from the spoils of a captive town (*Iliad*, ix). The systematic mythology of the poems, the number of clearly defined personalities which they present, the profusion of detail about things and persons and places, their literary art, poetical diction, and mastery of the hexameter—all these things presuppose a long historical and literary development. But of this we know nothing except by analogy and inference from the poems themselves. The manifestly spurious ancient "lives" of Homer are clearly in many cases fashioned from minor poems attributed to "Homer." Homer, they tell us, was born of the nymph Critheis and the river Meles (at Smyrna) and hence was called Melesigenes. The name Homer was variously

derived from the Greek word for hostage, because, said the story, he was a hostage in youth, or from a dialectic word for blind, because he lost his sight. Homer, the "lives" continue, wandered from city to city of Asia Minor, earning his bread by reciting his poetry or by "teaching," and immortalized by name in his poems many of those who treated him kindly. Some poems he actually gave to others who won fame by them—to Stasinus of Cyprus, e.g. he gave as his daughter's dowry the *Cypria* (qv), one of the so-called Cyclic Epics, of which only a few fragments remain. He died, as an oracle had foretold, through chagrin at his inability to read the riddle of the fishermen "What we caught we left, what we caught not we bring," which referred not to fishes but to an animal more "familiar to man." After his death,

"Seven cities claimed the mighty Homer dead,
Where living Homer begged his daily bread"

All this and much more is fable. Modern scholars ask, rather, What is the origin of epic poetry in Greece? Can we detect in the *Iliad* traces of the ballads or shorter lays out of which we may conceive it to have been composed? Can we break up the *Iliad* into two chief groups of lays—the wrath of Achilles proper, and the general picture of the siege of Troy, by which this original framework was enlarged? What features of style, language, and manners, if any, mark the *Odyssey* as later than the *Iliad*? What parts of the *Iliad* most resemble the *Odyssey* in these features? Can we dissect the *Odyssey* into a "return of Odysseus" and a "Telemachiad"? Was the "story of Achilles" originally composed in Thessaly in the Æolic dialect, then transferred to the scene of the struggles of early Greek colonists in north-western Asia Minor, and finally Ionicized, enlarged, embellished, and chanted by minstrels in the halls of Ionian nobles and merchant princes on the Lydian coast? Does the *Odyssey* reflect the travelers' tales brought back to Ionian seaports by the first navigators of the Euxine and the Mediterranean? What is the precise relation of the life depicted by Homer to the traditional legend of early Greek history on the one hand, and on the other to the apparently similar civilization revealed at Troy, Mycenæ, and Tiryns by the spade of Schliemann (qv), and conjecturally carried back to the third millennium B.C. by recent discoveries in Crete? See ARCHAEOLOGY, II, *Minoan, or Ægean, Period*.

These questions are debated by specialists, but with little unanimity of result. Meanwhile the *Iliad* and the *Odyssey* abide. They may be studied (1) as a picture of early Greek life, (2) as literature; (3) in their historic influence.

Homer is the most objective of poets. In him mind has not yet been turned back upon itself. It is a mirror of the world. If the heroes dine, the ox is consecrated to the gods, slain, cut up, roasted, carved, and served up in our presence. We assist at all the details of the hero's toilet or of his arming for battle. Homer does not enumerate the parts of a ship or a bed, but he shows us Odysseus building the craft that is to bear him away from the isle of Calypso, or the bed whose secret reveals his identity to Penelope. We watch every step in the launching of the vessel that bears Chryseis back to her father. We are not merely told that the ox sacrificed by Nestor has gold-tipped horns;

we see the goldsmith come with the tools of his craft to lay on the gold. In consequence, we know the life of the Homeric man more intimately than that of any other primitive people—than that of the Hebrews or of our own Teutonic ancestors. This lore has been collected in three huge double volumes of Homeric "Realien," or real things, by the German scholar Buchholz (*Die homerische Realien*, 3 vols, Leipzig, 1871-73, 2d ed., 1887), and every history of Greece contains its chapter on early Greek life, religion, government, and manners, drawn from the same source. And this wealth of concrete detail is a striking, if not the chief, literary quality of Homeric poetry. Homer does not "beat in the void his luminous wings in vain." He does not analyze and refine. He is not dominated by any one great unifying religious or patriotic idea, as is Vergil or Dante or Milton. He does not delay to moralize or reflect except in brief pregnant sentences. He flows on and on in a broad, pellucid stream of narrative, description, and, above all, action. "The multitude of things in Homer is wonderful," says Hazlitt—"the splendor, the truth, the power, the variety." The great gods of Homer—Zeus, Apollo, Athena, Hera, Poseidon—have remained for 3000 years as ideal types for all subsequent poetry and sculpture. His personages—Achilles, Hector, Nestor, Odysseus, Helen, Andromache, Penelope, Nausicaa—live for the imagination to-day as no others save those of Shakespeare's greatest tragedies. The berserker battle rage and impassioned eloquence of Achilles still stir the sluggish blood like wine. The great pathetic or dramatic episodes—the parting of Hector and Andromache, the death of Sarpedon, the horses of Achilles mourning for Patroclus, Hecuba baring her bosom to her son from the walls of Troy, the dirges for Hector—are still the despair of imitators. The *Odyssey* is yet the most interesting storybook in the world. In short, the Homeric poems are still, as Matthew Arnold said, "the most important poetical monument existing." The most distinctive literary quality of that poetry is due to its intermediate position between the literary epic, as *Paradise Lost*, and the supposedly spontaneous popular epic, as the *Edda*, the *Kalevala*, or the *Chanson de Roland*. It has all the simple, childlike charm of the one, all the lucidity, architectonic order, and noble diction of the other. The primitive feelings still preserve their freshness and force, but they appeal to us through the medium of a noble and dignified art. But though an artist, and perhaps a conscious artist, the Homeric poet is not, like his successors, Apollonius of Rhodes, Vergil, Tasso, Milton, conscious of an inimitable model, of a long line of predecessors, and of a code of critic-formed rules. Matthew Arnold's four canons of Homeric style are well known. Homer, he says, is rapid, plain, and direct in syntax and words, plain and direct in matter and ideas, and yet withal eminently noble—a master of the grand style in simplicity. There is space only to mention some minor traits: (1) the stereotyped epithets, "cloud-compelling Zeus," the "wine-dark" or "unharvested" sea, the "rosy-fingered dawn," "the swift-footed Achilles," the "red-cheeked ships"; (2) the peculiar Homeric simile which, suggested by one point of resemblance, is continued for the sake of the picture into details where the likeness between the things compared ceases. It is cleverly imitated by Matthew Arnold in

HOMER
FROM AN ANTIQUE BUST IN THE LOUVRE, PARIS

Sohrab and Rustum There are nearly 200 such similes in the *Iliad*, many of them containing precious detail about Homeric life. Those drawn from lions and the chase are particularly vigorous. To the Greek Homer was Bible, Shakespeare, Milton, and Domesday Book in one. Later forms of poetry were looked upon as evolutions or borrowings from Homer. He was the foundation of education, and many cultivated Greeks knew the *Iliad* by heart. Even in the prime of the Attic drama professional rhapsodists recited the *Iliad* and the *Odyssey* to enthusiastic audiences of thousands. Ethical reflection took its first texts from Homer and was largely occupied in the criticism of the conduct and character of his personages. Puerile religious ideas presented themselves in the form of a censure by Plato and Xenophanes of Homeric anthropomorphism, and the allegorical interpretation of literature was invented as a reconciliation. The beginnings of literary and linguistic criticism among the Greek sophists attached themselves to Homeric problems. Lexicography probably originated in books of Homeric glosses. The conception of text criticism arose in the effort to establish a sound Homeric text. And the critical science of the great Alexandrian scholars, Zenodotus, Aristophanes of Byzantium, and Aristarchus, had its origin and achieved its greatest triumphs in the study of Homer.

It is in the modern world that the famous Homeric Question begins (if we ignore slight anticipations by Bentley and Vico), with F. A. Wolf's Latin *Prolegomena ad Homerum*, published in 1795. This was partly called forth by the recent publication of the Venetian scholia, which revealed how much the true text had been debated by the critics of antiquity. Wolf also collected stray notices in ancient authors to the effect that Solon or Hipparchus required the rhapsodists to recite Homer in due succession or from prompting, and that Pisisstratus first reduced the scattered poems of Homer into one body. He inferred that the *Iliad* and the *Odyssey* were not originally composed as we have them, but were put together out of preexisting materials. He confirmed this view by the argument (now refuted by facts) that writing was unknown, or at least rare, in early Greece, and that a long epic could not have been composed without writing. Since Wolf's time Lachmann, Hermann, Nitzsch, Grote, Christ, Leaf, and a host of others have elaborated theories of the composition of the *Iliad*. The debate between the partisans of lays stitched together and an original framework expanded and interpolated often degenerated into a logomachy. The tendency now is towards the second hypothesis. Proof is in the nature of things unattainable. For the present status of the question and bibliographical information concerning studies of the question, reference may be made to Scott, review of Rothe, "Die Ilias als Dichtung," in *The Classical Weekly*, iv (1911), and review of Rothe, "Die Odyssee als Dichtung und ihr Verhältnis zur Ilias," ib., vii (1914), and Shewan, "Recent Homeric Literature," in *Classical Philology*, vii (1912). These two writers, in these and other papers in recent volumes of *Classical Philology*, the *Classical Quarterly*, the *Classical Weekly*, and the *American Journal of Philology*, argue strongly for the unity of the *Iliad* and the *Odyssey* as the work of a single period, even of a single author. On the

other side consult Prentice, a review of Drerup, "Das fünfte Buch der Ilias. Grundlagen einer homerischen Kritik," in *American Journal of Philology*, xxxiv (1913). Meanwhile Chadwick, *The Heroic Age* (Cambridge, 1912), comparing Greek and Teutonic epics and examining the antecedents and environments of the heroic age in Greece about 1000 B.C., and the sources of Teutonic poetry in the third to the sixth centuries A.D., holds that similar conditions produced, with no suspicion of imitation, strikingly similar results. He believes that the Homeric poems reflect the age of the kings as epics based on the court poems of the heroic age itself.

The imitation of Homer through Vergil by Tasso, Camões, and Milton is too large a theme for our space. The critics of the seventeenth and eighteenth centuries elaborated rules for the correct epic which have been entertainingly parodied by Macaulay in his prophetic account of the "Wellingtoniad." Pope's translation (about 1720) long remained a classic and the model of poetical diction. It of course failed to satisfy the taste of the romantic revival at the end of the century or to meet the demands of the new scholarship born about the same time in Germany. Many attempts have been made to supersede it in popular favor, but, despite its artificial rhetoric, it still remains for the majority of English-speaking readers the one poetical translation of Homer. The early versions of Hobbes and Ogilby are of interest only to professional students of literature. Chapman is praised on the faith of Keats's noble sonnet and because of occasional spirited passages and exquisite lines. But the rugged rhythms, the obscurity of the syntax, the fantastic Elizabethan conceits, and the long uninspired tracts of doggerel make him intolerable in continuous perusal. Cowper, in his blank-verse version, aimed at uniting Miltonic stateliness with fidelity to Homeric simplicity, but succeeded only in being pompous and dull. Since the publication of Matthew Arnold's classic lectures *On Translating Homer*, we have had, among others, the estimable blank-verse translations of Lord Derby and of Bryant, and Way's spirited rendering in rhymed anapaestic hexameter. No definitive translation of Homer is possible, for every generation must reinterpret him in order to blend Homeric sentiment with its own in the measure demanded by its taste. Of late the majority of readers prefer the literal prose versions in the slightly archaic and consciously simple English of Lang, Leaf, and Myers (*Iliad*), and Butcher and Lang (*Odyssey*).

Bibliography The needs of the English student will be best met by Seymour, *Introduction to the Language and Verse of Homer* (Boston, 1889), Monro, *A Grammar of the Homeric Dialect* (2d ed., Oxford, 1891), Jebb, *Introduction to Homer* (Boston, 1893), Lang, *Homer and the Epic* (London, 1893). Full bibliographies may be found in the discussions of Homer in the various histories of Greek literature, especially in Christ-Schmid, *Geschichte der griechischen Literatur*, vol. i (5th ed., Munich, 1908). Consult also the article "Homeros," in Pauly-Wissowa, *Real-Encyclopädie der classischen Altertumswissenschaft*, vol. viii (Stuttgart, 1913). A suggestive paper on the world's study of Homer is that by Smyth, "Epic Poetry," in *Greek Literature* (New York, 1912).

Good text editions are those of Dindorf-

Hentze, Cauer, Van Leeuwen, Monro, and Allen. A good annotated (English) edition of the *Iliad* is that of Leaf (2 vols, 2d ed, London, 1900-02), and of the *Odyssey* that of Hayman (ib, 1882) and that of Merry Riddell and Monro (2 vols, Oxford, 1886-1901). An excellent annotated edition in German is that by Ameis-Hentze (Leipzig, undergoing revision again in 1914). The fullest Homeric lexicon is the *Lexicon Homericum* of Ebeling (Leipzig, 1885), or in English the Homeric Dictionary, by Autenrieth-Keep (New York, 1891). For the general study of Homeric antiquities, consult Buchholz, *Homische Realien* (3 vols, 2d ed, Leipzig, 1887). Helbig, *Das homerische Epos aus den Denkmälern erläutert* (2d ed, ib, 1887). Andersen-Engelmann, *Pictorial Atlas to Homer* (New York, 1892). Reichel, *Ueber homerische Waffen* (Vienna, 1894). Keller, *Homeric Societiy* (London, 1902). Bériard, *Les Phéniciens et l'Odysée* (Paris, 1902-03). Browne, *Handbook of Homeric Study* (London, 1905). Seymour, *Life in the Homeric Age* (New York, 1907). Robert, "Topographische Probleme der Ilias," in *Hermes*, xlii (1907). See EPIC POETRY. GREEK LITERATURE, and the articles on the various authors and scholars, ancient and modern, mentioned in the article above.

HOMER, APOTHEOSIS OF 1 A celebrated relief containing many figures, now in the British Museum. It was found in the Appian Way in the seventeenth century and probably dates from the first century A.D. 2 A large picture by Ingres (q.v.), now in the Louvre.

HOMER, LOUISE (c 1872-). An American dramatic contralto, born in Pittsburgh, Pa. Her maiden name was Louise Dilworth Beatty. She began her musical studies in Philadelphia. In 1894 she was studying singing with Wm. L. Whitney in Boston, and harmony with Sidney Homer, whom she married the following year. After two more years of study with Madame Koenig at Paris she made her début at Vichy as Leonora in *La Favorita* (1898). In the spring of 1899 she appeared at Covent Garden and in the fall at La Monnaie in Brussels. Her success at the Metropolitan Opera House of New York during her first season in 1900 was so emphatic and lasting that she continued thereafter to be a regular member of the company. With a voice of great compass, remarkably even in the different registers, she combines a fiery temperament and more than ordinary histrionic ability.

HOMER, SIDNEY (1864-). An American composer, born in Boston. He received his first musical instruction from G. W. Chadwick in Boston. Then he spent five years studying in Europe, three years being devoted to the study of composition under Rheinberger at the Königl. Musikschule in Munich. From 1888 to 1896 he lived in Boston as a private teacher of harmony and counterpoint. There Louise Beatty (subsequently famous as Louise Homer, q.v.) became his pupil and in 1895 his wife. He also gave lecture recitals on symphonies and the music dramas of Wagner. As a composer, he is known only for his songs, although he wrote some works in the larger forms, he did not publish them.

HOMER, WINSLOW (1836-1910). An American genre and marine painter, one of the foremost and the most typical of his school. He was born at Boston, Feb. 24, 1836, but passed his boyhood at Cambridge, Mass., then a small town, where his passion for outdoor life had

full scope. At 19 he entered a lithographer's shop and after two years set up for himself in Boston, designing illustrations for *Ballou's Monthly* and for Harper and Brothers, who offered him a salaried position, which was declined. In 1859 he removed to New York, and, while supporting himself by illustrating, he attended the night class of the National Academy of Design under Cummings. From Frederic Rondel, a French painter usually reputed his master, he had just four lessons. On the outbreak of the Civil War, in 1861, he went to the front as a special war correspondent and artist for *Harper's Weekly*. His election as associate (1864) and member (1865) of the National Academy came during the period of his earliest oil paintings of war and camp subjects, such as "Rations" (1863), "The Bright Side" (1865), and, most celebrated of all, "Prisoners from the Front" (1865). In 1867 he made his first trip to Europe, exhibiting the two last-named pictures with much success at Paris, Brussels, and Antwerp. Ten months spent in Paris were without influence upon his art, and on his return to New York he continued to illustrate for the Harpers until 1875. He painted a number of genre subjects, chiefly of New England village life and of negro life and character, studied during a sojourn at Petersburg, Va. These two groups include "New England Country School", "Snapping the Whip", "The Two Guides," an Adirondack subject, "A Visit from the Old Mistress" (1876), now in the National Gallery, Washington, "The Camp-fire."

His interest, however, turned more to subjects relating to the sea. In 1880 he painted at Gloucester, Mass., and in 1881-82 at Tyne-mouth on the east coast of England, depicting the life of the fisher folk in a series of remarkable aquarelles and several oil paintings, such as "Mending the Nets," "Watching the Tempest," and "A Voice from the Cliffs." In 1884 he settled permanently at Prout's Neck, near Scarborough, Me., entering upon his great career as the painter of the ocean and the fisher folk. His incomparable series of paintings began with "The Life Line" (1884), Elkins collection, Philadelphia. This was followed by "The Fog Warning" (1885), Boston Art Museum, "Lost on the Grand Banks" (1886), "Undertow" (1886), "Eight Bells," "The West Wind," "A Summer Night," Luxembourg Museum, Paris, the "Northeaster" and "Cannon Rock," both (1895) in the Metropolitan Museum, New York, "The Fox Hunt," Pennsylvania Academy, Philadelphia, "High Cliff, Coast of Maine" (1894), National Gallery, Washington, "Lookout—All's Well," Boston Art Museum, "The Maine Coast" (1895), Metropolitan Museum; and "On a Lee Shore" (1900), Providence—the two last often considered his masterpieces. His solitary life in Maine was enlivened by constant association with his brothers, varied by winter journeys to Florida, the Bahamas, and Cuba, resulting in a brilliant series of water colors, some of which are in the Brooklyn Museum, by trips to the Adirondacks and the Province of Quebec, the waters and fishes of which he has studied in marvelous manner. His numerous aquarelles are scattered throughout public museums (New York, Boston, Brooklyn, Worcester, etc.) and private collections. He received gold medals at the World's Fair, Chicago (1892), at Pittsburgh (1896), Philadelphia, and the Paris Exposition (1900), and was

a member of the American Academy of Arts and Letters

Winslow Homer is the most typically national of all American painters. Self-taught in his technique, marked by the complete absence of foreign influence, he is no less national in his subjects and his powerful and direct presentation. The chief characteristic of his art is its absolute verity, its uncompromising presentation of nature. His color is strong and sure, sometimes harsh, but always true, especially in the values. But his pictures lack tone (except in so far as nature provides it), and therefore lack the decorative quality. Both draftsmanship and composition are excellent. In water color his technique is a marvel of boldness and facility.

Bibliography The chief monograph on Winslow Homer is by W. H. Downes (Boston, 1911). Other descriptions of his life and work are by M. Van Rensselaer, *Sea Portraits* (New York, 1889), C. H. Caffin, *American Masters of Painting* (ib., 1902), Samuel Isham, *History of American Painting* (ib., 1905), Mecklin, in *International Studio* (ib., 1908).

HOMERIDES, hō-mēr'i-dēz, or **HOMERIDÆ** (Lat., from Gk. Ὅμηριδης, *Homēridēs*, descendant of Homer, from Ὅμηρος, *Homēros*, Homer). The name of a family or clan in the island of Chios, often mentioned. Strabo says that they claimed descent from Homer, and that they were adduced by the Chians to prove that Homer himself was a Chian. The name *Homēridēs*, however, is used by Pindar and by others frequently to mean persons who recite the Homeric poems, i.e., rhapsodists (qv), and it is in this sense that the name is commonly used. The *Homēridēs* of Chios have played a large part in the theories of some scholars as to the transmission of the Homeric poems, but there is no evidence that they were a guild of poets or even of rhapsodists. Consult Christ-Schmid, *Geschichte der griechischen Literatur*, vol. 1, pp. 35, 70 (5th ed., Munich, 1908).

HOME RULE. A term in British politics, designating the particular movement, begun in 1870, to secure for Ireland a local legislature and thus recognize and satisfy the persistent sentiment of Irish nationality. The question of Home Rule, ignored by Pitt in the Act of Union of 1800, was revived by O'Connell's agitation for repeal. With the failure in 1848 of that movement, hostility to British rule passed from the field of constitutional exertion to that of violence and revolution. But neither the doctrinaire fiasco of 1848 nor the plots of the Fenians brought any realization of the national aspirations. After 20 troubled years of conspiracy and secret crime the concession by Gladstone of Church disestablishment and land reform called the thoughts and hopes of the Irish people once more to constitutional activity. In 1870, a year after the Act of Disestablishment was passed, and while Gladstone's first Land Bill was still under discussion in Parliament, the first step was taken in the movement for Home Rule.

On May 19 in that year there assembled at the Bilton Hotel, Dublin, a number of Irishmen of the better class, representing all shades of political and religious belief. The dominant element was Protestant and Conservative. Discontented with the concessions made by Glad-

stone's government, they were ready to consider some plan for taking out of British hands the control of Irish affairs. After free discussion it was resolved "that the true remedy for the evils of Ireland is the establishment of an Irish Parliament, with full control over our domestic affairs." In accordance with this opinion a permanent organization was soon afterward effected, under the name of 'The Home Government Association of Ireland.' Its declaration of principles announced as its only object the obtaining of a distinct Parliament for Ireland, to regulate her internal affairs, while leaving to the Imperial Parliament all questions affecting the colonies, foreign relations, and the stability and defense of the Empire. With this declaration the movement for Home Rule was formally inaugurated.

The history of the Home Rule movement from 1870 to the present time may be divided into five periods: first the leadership of Isaac Butt (1870-79), second, the merging of Home Rule into the land agitation (1879-86), third, the adoption of the principles by the Gladstonian Liberals (1886-93), fourth, the Conservative policy of "killing Home Rule by kindness", fifth, the passage of the Government of Ireland Bill by the Asquith ministry in 1914.

First Period This was the time of development and definition. From the outset the Home Rule idea was favorably received among the better classes of the Irish people, though ancient religious antipathies often blocked the way. Among the lower classes—those particularly in which Fenianism had found its chief support—the new form of constitutional agitation was slow to inspire confidence. Under the direction of Isaac Butt, however, who had made himself popular by his legal services in behalf of arrested Fenians, considerable progress was made, and at by-elections several Home Rulers, including Butt himself, were elected to Parliament. In the fall of 1873 the Home Government Association was replaced by the Irish Home Rule League, a new and more comprehensive organization, whose skillful management secured the return of 60 Home Rulers in the general election of 1874. For the next five years, under the leadership of Isaac Butt, they acted as a distinct party when Home Rule or Irish interests were at stake, but on other questions followed their individual preferences. In fact, during this period, outside of Ireland, there was very little interest in the subject, and English Liberal and English Conservative alike had voted against Butt's annual motion for an Irish Parliament. But an awakening was to come, when Parnell, who entered the Commons in 1875, began to advocate his policy of "obstruction," applying it—aided by a little group of followers—to all questions alike, whether Irish, English, or Imperial. In this course he was opposed by Butt and the majority of the party at that time, but through this policy Parnell succeeded in arousing the English people to a discussion of the subject and in winning, partly perhaps by means of the hatred he excited towards himself on the part of the old British parties, the enthusiastic support of Irishmen to a degree which Butt's milder course had never done.

Second Period Butt died in the spring of 1879. The Home Rule party chose as his successor William Shaw, whose methods it was known would be those of Butt. But Parnell

was the rising man in Irish circles. In this same year, by throwing himself heart and soul into the land agitation and assuming the presidency of the Land League, he became the idol of the Irish masses. During the four succeeding years Home Rule was entirely overshadowed by the great agrarian issue. The general elections of 1880 showed an increase of the Home Rule delegation in Parliament from 60 to 68. But the extreme views of Parnell and his followers on the land question tended to alienate the moderate element in the party, already disgusted with his parliamentary tactics. During the desperate struggle made by the Parnellites against the Coercion Bill in January, 1881, Shaw and his followers formally withdrew from the Home Rule party in Parliament. This action was significant of a great change in the character of the party outside of Parliament. By connecting Home Rule with the land question Parnell drew to his support a great following, which Butt had never won, but he lost the Conservative and aristocratic element, which had practically inaugurated the movement. A Catholic peasantry instead of a Protestant middle class became the chief support of the party. With this absorption of the larger element one end was achieved which has been a source of about equal glory and reproach to Parnell—the physical-force faction, hitherto apathetic, was drawn into the constitutional agitation. The Irish National League, organized Oct. 17, 1882, was the formal expression of the Parnellite policy. Its programme combined essentially the principles of the Home Rule League and those of the recently suppressed Land League. In the elections of 1885 the success of Parnellism was demonstrated. The Nationalists returned 86 members to the House of Commons and secured the balance of power between the Liberals (333) and the Conservatives (251). Of the 103 members from Ireland, 85 were followers of Parnell.

Third Period. With an absolute Liberal majority in Parliament, so skillful a leader as Gladstone had found it almost impossible to transact business in the face of Nationalist obstruction. Now that Parnell held the balance of power and could displace ministries at will, the conduct of the government on any principle known to British practice seemed hopeless. On Jan. 27, 1886, the Nationalists aided the Liberals to overthrow Lord Salisbury's government, just as in the preceding year they had joined the Conservatives against Mr Gladstone. The Conservatives now made advances looking to an understanding between the Nationalists and themselves, but without results. On the other hand, Gladstone, after careful consideration and consultation, decided to accept Home Rule as a Liberal principle, so on the 8th of April he brought in his famous Home Rule Bill. In it was embodied the long-sought provision for a distinct legislative body for Ireland, with powers extending to all subjects except those specifically reserved to the Parliament at Westminster. At the same time a sweeping measure for land purchase was announced, with the declaration that the two should be inseparable, together forming a complete scheme for the settlement of the Irish question. Parnell, with certain qualifications, accepted the bill on the part of the Irish Nationalists, and his party threw themselves heartily into alliance with the followers of Gladstone. The question of Home Rule now

became one for the people of Great Britain to settle. With the adoption of the Irish demand by Gladstone, a great section of the Liberals declined to follow their old leader. Protesting against anything which looked like a step towards separation of the two islands, they took the name of Liberal Unionists and ultimately entered into alliance with the Conservatives. Gladstone's bill was defeated on the second reading by 343 to 313, 93 Liberals voting in the negative. Upon the appeal to the constituencies the adversaries of Home Rule gained a majority of 113 over the combined Gladstonians and Nationalists. Lord Salisbury assumed power with a policy of coercion, with possibly some eventual measure of concession in reference to local government in Ireland. Home Rule remained the most prominent issue throughout the four succeeding years, the Gladstonians expressing confidence in the ultimate support of a British majority, a belief which the by-elections seemed to justify, as the Liberals gained 16 seats in 99 contests. In the winter of 1890-91 a divorce case in which Parnell was correspondent brought much odium upon him and raised the question of his retirement from the leadership of his party. Gladstone announced that he could not hope to hold the Liberals to the Nationalist alliance unless Parnell resigned. The latter rejected all suggestions of his own withdrawal and by his course alienated a large section of his parliamentary followers. The result was a schism in the Irish Nationalist party, which made the future success of the Home Rule movement exceedingly doubtful. The death of Parnell, in October, 1891, only served for the moment to intensify the animosity of the Parnellite faction towards the majority of the Home Rulers, who accepted the leadership of Justin McCarthy (qv). The elections of July, 1892, resulted in a Liberal majority in the House of Commons of 40, so that Gladstone again became Premier, and in March, 1893, introduced a bill granting Home Rule to Ireland. It provided for an Irish legislative body of two houses, the members of the Upper House to be chosen by electors having a property qualification, and for complete self-government in local matters. The difficult question of Ireland's representation in the Imperial Parliament was first decided in favor of the "in-and-out" plan—Irish members voting on some questions, not on others—but later in favor of a reduction of its membership in the House of Commons from 103 to 80, with the same rights as other members. The bill passed the Commons September 1 (301 to 267), but was overwhelmingly defeated in the Lords, receiving only 41 votes out of a total of 450. Gladstone resigned in March, 1894, and Lord Rosebery assumed the premiership, professing adherence to Home Rule, but doing nothing for it during his ministry, which came to an end in June, 1895.

Fourth Period. This period opened with the Conservatives in power, the Home Rulers split into cliques and factions, and the Liberals demoralized and lukewarm towards the cause of the Irish Nationalists. The Conservatives, believing that Irish discontent had its source in economic conditions, in poverty and want, passed, under the cry of "killing Home Rule by kindness," a land act which simplified the rent problem, provided for land purchase, tended to bring a peasant proprietor class into being, and in general ameliorated economic conditions. In

1898 a Local Government Bill was introduced, and became a law in 1899, which placed county and municipal governments in the hands of the people, with provisions for an almost universal suffrage. Owing in part to improved conditions, in part to these reforms, public agitation had almost ceased, and it seemed as if "Balfourian amelioration" was on the point of success, when the Boer War broke out. Under the impulse of this war the warring Irish factions came together, accepted John E. Redmond as a common leader, revived their demand for an Irish Parliament, and in the election of 1900 chose 81 members to the House of Commons to press their cause. The benevolent attitude of the Unionist ministry was further exemplified in the important Land Act of 1903. (See IRISH LAND LAWS.) In 1904-05 much discussion in Parliament was aroused by a scheme for the gradual establishment of self-government propounded by the Irish Reform Association under the name of Devolution. It was assailed by the Protestant minority as being equivalent to Home Rule. The accession of a Liberal ministry under Sir Henry Campbell-Bannerman, December, 1905, was regarded as distinctly favorable to the Irish cause, inasmuch as the Premier and a number of leading members of the cabinet were avowed supporters of Home Rule. It was understood, however, that the government would not permit a sudden disruption of the union, though acquiescing in a policy of "Home Rule by installments." The Liberal-Unionist party attempted to make Home Rule an issue in the general election of 1906, but without success. In that election the Nationalists returned 83 members to Parliament.

Fifth Period. The defeat of the Unionists in the general elections of 1906 marks the beginning of a new era of Liberal government and reform. The following year Mr. Birrell's proposed Irish Councils Bill, giving considerable latitude to the Home Rulers, was denounced and rejected at a national convention in Dublin and was therefore withdrawn. The general elections of 1910 placed the Liberal and Unionist parties in positions of almost exact equality in the House of Commons, while the Nationalists held the balance of power and controlled the fortunes of Mr. Asquith's government. Conscious of power and supported by the Labor party in the House of Commons, the Irish members insisted that Home Rule be given precedence over all other measures. While speculation was rife as to the government's Home Rule plans, agitators in Ulster were not idle, for the Unionists of that province, led by Sir Edward Carson, appointed a committee to draw up a provisional government for Ulster, which should come into operation if the Home Rule measure was passed.

On April 11, 1912, Mr. Asquith introduced the Government of Ireland Bill. While asserting the supreme authority of the Imperial Parliament, it provides for a bicameral Irish Parliament—the Senate of 40 members nominated in the first instance by Great Britain and succeeded, as their terms expire, by appointees of the Irish Executive, and the House of Commons, 164 in number, to be elected by the Irish constituencies. The executive authority is vested in the King, represented by the Lord Lieutenant and an Irish ministry named by Parliament. The Irish Parliament is empowered to make all laws for Ireland, but cer-

tain classes of legislation are removed from its jurisdiction, such as peace, war, treaties, army, navy, militia, trade navigation, coast defenses, coinage, stamps, weights, measures, copyright, religion, and Freemasonry. The Irish constabulary are to remain under Imperial control for six years after the passage of the act. The following services would likewise be excluded for the present, the land-purchase tax, old-age pensions, national insurance, postal savings banks, and the service of public loans before the passage of the act. In the Imperial Parliament Ireland is to have 42 members, which number, in view of the divided authority, fiscal, legislative, and executive, set up by the bill, might be sufficient to guard her own reserved interests. While in the committee stage, the bill was so amended as to permit the principle of proportional representation—all constituencies electing three or more members to the Irish House of Commons and the entire Irish Senate after five years to be chosen by this method. The bill passed its third reading in the House of Commons on Jan. 16, 1913. On January 30 it was rejected by the Lords by a vote of 326 to 69. Following the rejection of Sir Edward Carson's amendment, excluding Ulster from the provisions of the Home Rule Bill, the Ulster Volunteers proceeded to add to their numbers and equipment, aided by Unionists from Great Britain. Realizing that Home Rule must come, the Belfast Trade Unions and other representative bodies protest that they are not in favor of exclusion. They maintain that the real source of hostility to Home Rule is not fear of religious persecution but the financial arrangements of the proposed law. The financial margin allowed is too small to enable the Irish Parliament to effect the many reforms required without taxing heavily either the land or commercial business, and as agriculture will be in control, they believe the onus will fall on the commercial interests of Ulster. The industrial workers of Belfast likewise fear they will be at the mercy of a parliament which will have no interest at all in maintaining a high level of labor conditions, for the Irish Parliament will be dominated, not by representatives of the agricultural laborers, but of the tenant farmers, who, so far as they are interested in employment at all, are interested as employers and pay the lowest wages in the United Kingdom.

The bill, reintroduced in the summer session, passed its third reading in the Commons on July 17. Upon the reopening of Parliament on Feb. 10, 1914, the government announced its intention of passing the Government of Ireland Bill, for the third time, during the session without submitting it to the test of a referendum or a general election, as the Unionists demanded. Premier Asquith, on March 9, proposed that those counties of Ulster which should by a referendum so determine be excluded from the provisions of the act for six years. The resignation of Colonel Seeley, Undersecretary of State for War, after the remarkable disaffection of the higher officers of the British forces in Ireland, led to the assumption of the war portfolio by Mr. Asquith himself, and the official recognition by the Irish party of the National Volunteers, a semimilitary organization of Irish Catholics. The bill passed the House of Commons for the third and last time on May 25. It was then sent to the Lords, who refused to

act until the amending measure was before them. Radically modified, it passed its third reading in the Upper House on July 15. Five days later the Commons took up the measure as amended for extended consideration. The King, in his efforts towards an amicable adjustment, called a conference of the leaders of all parties. As the extremists refused to make any concessions in the interests of peace, the conference ended in failure. On the following Sunday a force of the Kings Own Scottish Borderers, sent from Dublin to disarm some National Volunteers at Howth, were stoned by a mob on their return. The troops fired a volley of ball cartridges, killing four people and wounding from 30 to 50. Anger and indignation in England and Ireland were so intense that Mr Asquith postponed all consideration of the Home Rule Bill until the excitement and passion had abated. Just as the Irish situation was becoming serious, the great European War of 1914 broke out. The Irish question immediately vanished from public view. In the face of danger both sides patriotically united to defend the Empire. John E. Redmond, the leader of the Irish party, declared in Parliament that every British soldier could now be removed from Ireland without danger to public order.

HOMESICKNESS See NOSTALGIA

HOMESTEAD (home, AS. *hām*, Goth. *hams*, OHG *heim*, Ger. *Heim*, connected with Lith *kemas*, Gk *κῆμα*, *kōmē*, village, Skt *ksēma*, abode, from *ks*, to dwell + *stead*, AS. *stede*, Goth. *staps*, OHG *stat*, Ger. *Statt*, place, ultimately connected with Eng. *stand*). In law, an estate in land, used as a home by the tenant or owner thereof, and to a greater or less extent protected by law from the claims of creditors. This right of exemption of the "homesteader," as he is termed, is a modern privilege created by statute and was unknown to the common law. It does not exist in England, but is peculiar to the United States, where it is everywhere recognized, excepting in Rhode Island, Pennsylvania, Delaware, Maryland, and the District of Columbia. It does not constitute a distinct form of estate in land, but belongs to

the class of exemptions from the claims of creditors, which, originating in the common law, has been greatly extended by the humane policy of American law. See EXEMPTION, HOMESTEAD LAWS.

HOMESTEAD. A borough in Allegheny Co., Pa., on the Monongahela River 7 miles southeast of Pittsburgh, on the Pittsburgh and Lake Erie, the Bessemer and Lake Erie, the Pennsylvania, and the Union railroads (Map Pennsylvania, B 6). It has one of the largest steel plants in the United States, employing about 7000 men and producing both structural steel and nickel-steel armor plate, and a machine factory. There is a Carnegie library. Settled in 1871, Homestead was incorporated in 1880, the date of the charter now in operation, which provides for a mayor, elected every three years, and a unicameral council, in whose power rests the appointment of chief of police, street commissioner, and water-works engineer. The water works are owned and operated by the borough. In 1892 Homestead was the scene of a notable strike, which was attended by such rioting as necessitated the interference of State troops. Pop., 1900, 12,554, 1910, 18,713, 1914 (U. S. est.), 21,256.

HOMESTEAD LAWS. Homestead laws in the United States are of two classes—those enacted by Congress and those enacted by State legislatures. The primary object of the first class is to enable citizens without capital to acquire homes. The main object of the second class is to secure homes, once acquired, against the claims of creditors. Legislation of the first class has done much to stimulate the settlement and improvement of wild, unoccupied land. That of the second class has saved countless families from pauperism.

The Federal homestead laws began with the Act of 1862, now a part of the United States Revised Statutes (§§ 2289-2317). Their policy is to give portions of the public lands to those who will settle, cultivate, and make permanent homes upon them. Any person who is the head of a family, or who is 21 years of age and is a citizen of the United States, or who has filed his declaration of intention to become such, may acquire a tract of unappropriated public land, not exceeding 160 acres, on condition of settlement, cultivation, and continuous occupancy as a home by him for the period of five years, and of the payment of certain moderate fees. It is expressly declared that no lands acquired under this statute shall in any event become liable to the satisfaction of any debt contracted prior to the issuing of the patent therefor by the government to the settler. This provision was inserted for the purpose of protecting debtors and of inducing them to settle upon the public domain. Its constitutionality was questioned, but was sustained by the courts. It would be difficult to point to any enactment of Congress more wise in conception, more just in policy, and more beneficial in its results than this homestead statute and its amendments. Under their provisions more than 85,000,000 acres of unoccupied public lands have been transferred by the United States to homestead settlers.

The term "original entry" refers to the proceeding by which a person enters a tract of land as his homestead. Its important features are the filing of an affidavit, prescribed by statute, with the register of the land office in which the applicant is about to make the entry, and the

payment of a fee of five dollars if his entry is for not more than 80 acres, or of 10 dollars if it is for more than that quantity. The "final entry" refers to the proceedings connected with the issue of a certificate of title or patent by the United States to the person making the original entry, or to his widow, heirs, or devisees. Ordinarily the patent does not issue until the expiration of five years from the date of the original entry, and then only upon furnishing the evidence required by statute of the actual occupancy of the land and its cultivation by the claimant during that period. Provision is made, however, for shortening this term by "commuting," i.e., paying the minimum government price for the land. Upon such payment the homesteader may obtain a patent at any time. It is also provided that the term which a homestead settler served in the United States army, navy, or marine corps, "during the Rebellion," or in "the Spanish War," or "in suppressing the insurrection in the Philippines," may be deducted from the five years required to perfect his title and to receive a patent for his original entry.

State homestead laws are, as has been said above, in their objects and tenor quite different from those of the Federal government. Their aim, it has been judicially declared, "is to provide a place for the family and its surviving members, where they may reside and enjoy the comforts of a home, freed from any anxiety that it may be taken from them against their will, either by reason of their own necessity or improvidence or from the importunity of their creditors." This policy of protecting citizens and their families from the miseries and demoralizing influences of destitution, of fostering the disposition to improve and to take pride in a permanent homestead, has commended itself to both legislators and judges. The former have enacted laws providing for large exemptions to the homesteader, while the latter have, with few exceptions, construed such laws very liberally in his favor. In most of the States the benefits of this legislation are confined to families, although in a few Commonwealths they are extended to any resident, whether he has a family dependent upon him or not.

State legislation provides three distinct ways in which a homestead may be secured to the family against the debts of its owner. The first method is by a prescribed form of public notice properly executed and recorded. It must contain a statement of the facts showing that the person making it is the head of a family, a statement that such person resides on the land and claims it as a homestead, a description of the land, and an estimate of its actual cash value. The second method is by actual occupancy and use. The third method is by a proceeding in a court of justice. Its principal characteristics are an application to a designated court, a notice to creditors, and a judicial decree setting apart certain property as a homestead.

It is not to be understood that homestead property is exempted from every sort of claim against its owner. As a rule, it is subject to debts contracted before the homestead was duly recorded or set apart as such, to the liens of mortgages and judgments which were on the property when it was set apart, to claims for unpaid purchase money for the property, as well as for such improvements to the property

as entitle the creditor to a mechanic's lien (*q v*) thereon, and to taxes and assessments for public improvements.

The amount of land which may be exempted under homestead laws varies in the different States. In some the limits are those of acreage, in others those of cash value. The former range ordinarily from 40 to 160 acres, the latter from \$500 to \$5000. Consult Thompson, *Homesteads and Exemptions* (San Francisco, 1886), and Waples, *Treatise on Homesteads and Exemptions* (Chicago, 1893).

HOME, SWEET HOME. A popular song by John Howard Payne, in his opera, *Clari, or the Maid of Milan*, first produced in 1823. The music of the song is by the composer of the opera, Sir Henry Bishop, who is said to have adapted it from an old Sicilian air.

HOMEWARD BOUND. A novel by J. Fenimore Cooper (1838).

HOMICIDAL (*hōm'i-sīd'al*) **MANIA.** A popular term for the impulse to take life in one mentally disordered. In manic-depressive insanity, in general paresis, in paranoia, and other insane conditions, the homicidal impulse is not infrequent. Indeed, in normal mental action the desire to kill is not infrequently present, but is controlled. In the various stages of some insanities this control is either diminished, or through hallucinations or delusions the motive is stronger and uncontrollable, and murder results. It is impossible to determine beforehand whether an insane person will or will not take another's life. Often such an act is apparently the first symptom of the insanity. The obvious lesson is that the slightest symptoms of disturbed mental action should be carefully noted and proper precautions taken to prevent accidents. This caution is particularly pertinent in the case of puerperal women in whose family there has been any taint of insanity.

HOMICIDE, *hōm'i-sīd* (OF., Fr *homicide*, from Lat *homicidium*, manslaughter, from *homo*, man + *cedere*, to kill). The killing of one human being by the act, procurement, or neglect of another. In primitive communities the killing of another does not subject the slayer to criminal prosecution by the state. The act is thought of, not as an offense against the common weal, but simply as a wrong to the slain man's kindred—a wrong which they are at liberty to redress by vengeance upon the slayer or his kindred. But this policy leads to the perpetuation of blood feuds and to great waste of human life. Accordingly, at a very early time, the practice is introduced of buying off the injured kindred, or appeasing the feud by a money payment. Then a scale of compensation is fixed either by custom or by legislation, graduated generally by the rank of the person slain. In Anglo-Saxon law this is known as *wergild* (a man's price). At first the acceptance of such compensation is left to the choice of the injured kindred. They may take it and stay the feud, or they may reject it and enforce their right of private vengeance. But as the state grows more powerful, and the death of its citizens is felt to be a harm to the common weal, public authority compels the injured kindred to accept the compensation and not to pursue the feud. Then comes the final stage of legal development, in which the unlawful taking of human life is considered as primarily a wrong to the state, a public offense which cannot be

compounded by private bargain See AVENGER OF BLOOD, BLOOD FEUD, BLOOD MONEY, ASYLUM, WERGILD, ETC

As appears from the definition given above, homicide is a generic term, comprehending not only the crimes of murder and manslaughter (qq v), but also the taking of a human life under circumstances justifying the act or in a sense excusing its commission Killing under such circumstances, not amounting to murder or manslaughter, is described as justifiable or excusable homicide While the distinction between these has in law been wholly done away with, the early common law made an important distinction between excusable and justifiable homicide The slayer in the latter case was not liable to any punishment, while in the former he was In other words, homicide, if not committed under circumstances justifying the act, was, however excusable on moral grounds, still a criminal offense Just how far it subjected the slayer to criminal punishment is, however, uncertain Lord Coke declares that it rendered him liable to death, but Blackstone and Stephen insist that his liability did not extend beyond the forfeiture of goods At present neither excusable homicide nor justifiable homicide is punishable at all, but the two terms are still retained in use in England and in many of the United States as marking a convenient distinction between two distinct classes of innocent, or noncriminal, killing At common law excusable homicide was of two kinds—killing by accident or misfortune, and killing in self-defense Justifiable homicide was of three kinds—killing by a public officer in conformity to a judicial sentence, killing by an officer or his assistant when necessary to overcome unlawful resistance to legal process, or to the performance of a legal duty, including killing by military forces in time of war or riot, and killing to prevent the commission of an atrocious crime of violence While the common-law definition of these forms of homicide has been more or less modified by statute, it remains substantially the same, both in England and the United States

Even unintentional homicide is not excusable unless it is committed without legal fault on the part of the slayer The killing may not have been premeditated or intended—it may have been accidental—yet if it resulted from the slayer's unlawful conduct, as in connection with the commission of burglary or robbery, it is not a case of excusable homicide, but of manslaughter or murder, as the case may be So, too, homicide is justifiable only when it is inflicted in strict accordance with lawful authority A sheriff who inflicts the death penalty upon a convict in a manner not authorized by the judicial sentence which he undertakes to execute does a criminal, not a justifiable, act An officer cannot justify the unnecessary killing of even the worst malefactor that is resisting arrest Nor is a person at liberty to take the life of a brutal assailant unless he can show that he had reasonable ground to believe that the assailant was about to commit a felony or do some great personal injury to the slayer or to some member of his family or other person in his presence, and that there was imminent danger of the assailant's accomplishing his design.

1905). F Wharton, *Laws of Homicide* (3d ed., Chicago, 1907), and the authorities referred to under CRIMINAL LAW

HOMILDON, hōm'īl-don, or **HUMLEDON** (hūm'b'l-don) **HILL** An elevation near Wooler, in Northumberland, England, not far from the Scottish border, noted as the scene of a battle in which the English, under the Earl of Northumberland and his son, Harry Hotspur, overthrew a Scottish army under the command of Sir Murdoch Stewart and the Earl of Douglas, Sept 14, 1402 The victory at Homildon Hill was soon followed by the rebellion of the Earl of Northumberland and his son See HENRY IV

HOMILETICS (from Gk *ὁμιλητικός*, *homilētikos*, relating to conversation, from *ὁμιλία*, *homilia*, conversation, from *ὁμιλεῖν*, *homilein*, to converse, from *ὁμιλος*, *homilos*, assembly, from *ὁμός*, *homos*, similar + *ἵλη*, *ilē*, *εἶλη*, *eilē*, company, from *εἰλεῖν*, *eilēin*, to crowd together) As the term is now used, the science of sermon writing In early Christian times discourses were less formal than they became later (see HOMILY) and so were properly called homilies The earliest Christian writer on homiletics is St Augustine, whose book *De Doctrina Christiana* is in some sense an adaptation of profane rhetoric to sacred uses Rabanus Maurus and Isidore of Seville also incidentally treat the subject, but the nearest approach to a systematic treatment in mediæval literature is to be found in Humbert, *De Eruditione Concionatorum* St Carlo Borromeo's *Instructiones Pastorum* was a part of his general scheme for the improvement of clerical education, and in the ecclesiastical course, as well of Catholics as of Protestants, homiletics occupies an important place Books on homiletics have been written by Bautain, Broadus, Claude, Dabney, Hoppin, Kidder, Phelps, Shedd, Storrs, Vinet, and many others An important series of volumes have resulted from the Lyman Beecher lectureship (at Yale) on preaching, among the writers being Henry Ward Beecher (1871), Phillips Brooks (1876), Washington Gladden (1886; 1902), G A Smith (1898) Lyman Abbott (1904), J H Jowett (1912), C S Horne (1914)

HOMILIA'RIMUM (ML, from Lat *homilia*, Gk *ὁμιλία*, *homilia*, conversation, homily). A collection of homilies for the use of the clergy, either to read to their congregations or for their own edification The use of homilies of others dates as early as the sixth century, and in the eighth century collections were in use The homilies of Leo I were used at an early time Collections were made in the eighth and ninth centuries by Alanus, Abbot of Faria, Smaragdus, Abbot of St Michaels, Haymo, Bishop of Halberstadt, Rabanus Maurus, and Eric of Auxerre The homilies of the Venerable Bede were in familiar use among the clergy in all parts of the West, and we find in the letters of the early mediæval time traces of an interchange of sermons, original or otherwise, between bishops and clergy, even in distant countries Alcuin made an *homiliarium*, which, strangely enough, considering its author, passed out of mind and was only discovered in 1892. What since the fifteenth century has been called his is really a revision of that by Warnefried mentioned below One of the many reformatory measures of Charlemagne was a compilation of homilies under the title of *Homiliarium*, which was made under his direction by the deacon,

Paul Warnefried, a monk of Monte Cassino and one of his chaplains. It was compiled in the end of the eighth century and contains homilies for all the Sundays and festivals of the year. It is the most famous of these collections. Maximus of Turin (fifth century, homilies in Migne, *Patrol Lat.*, LVII) is more drawn upon than any other author, but Bede comes next, and then Leo the Great, Gregory the Great, Augustine, and others. The language was, of course, Latin. Many synods directed the clergy to translate these sermons for their flocks, and the collection continued in use for this purpose down to the sixteenth century. It was printed at Speyer in 1482 and again at Cologne in 1537 and is reprinted in Migne, *Patrol Lat.*, xcv. Alfred the Great translated the homilies of Bede into Anglo-Saxon, and Ælfric added many others. A collection of English homilies turned into verse, that they might be more readily remembered by the people, appears to have been composed about the middle of the thirteenth century. This collection, affording a metrical sermon for every Sunday and festival day in the year, exists in manuscript, and a portion of it was edited with introduction and notes by John Small, librarian to the University of Edinburgh (*English Metrical Homilies*, Edinburgh, 1862). When the Reformation was introduced into England, the unfitness of the clergy to preach was so keenly felt that a book of homilies was prepared and sent forth by authority of Edward VI (1547), and again under Elizabeth (1563) a second book, and the reading of these homilies was enjoined. The two books were reprinted at Oxford, 1859. See **HOMILY**, **HOMILIES OF THE CHURCH OF ENGLAND**.

HOMILIES (hōm'ī-līz) OF THE CHURCH OF ENGLAND. A collection of sermons, the first part of which was published in 1547, the first year of the reign of Edward VI, to be read in the churches, partly in order to supply the defect of sermons, but partly also to secure uniformity of doctrine and to guard against the heterodoxies, old and new, which threatened the unconsolidated Church. The second part was published in 1563, at the same time with the Articles, under Elizabeth. The titles are 21 in number. The homilies are not now read in churches, but they are frequently appealed to in controversies as to the doctrine of the Anglican church on the points of which they treat. The precise degree of authority due to them is matter of doubt. Consult Griffiths, *Homilies Appointed to be Read in Churches* (Oxford, 1896).

HOMILY. In ecclesiastical usage, a discourse held in the church and addressed by the minister to the congregation. The practice of explaining in a popular form the lessons of Scripture read in the synagogues had prevailed among the Jews and appears to have been adopted in the Christian churches from the earliest times. The discourses employed for this purpose were of the most simple character, but with the exception of one ascribed to Hippolytus (qv), we have no sample of this form of composition earlier than the homilies of Origen in the third century. Taking these as a type, the early Christian homily may be described as a popular exposition of a portion of Scripture, accompanied by moral reflections and exhortations. It differs from the sermon (Gk λόγος, Lat *oratio*), whose form was influenced by the rhetoric of the schools, in eschewing all oratorical

display and in following the order of the scriptural text or narrative instead of being thrown into the form of a rhetorical discourse or a didactic essay. The schools of Alexandria and Antioch appear to have been the great centres of this class of sacred literature, and in the early centuries and mediæval times many preachers continued to use the homiletic form, and even in the modern Church many have regarded it as the best medium of scriptural instruction. See **HOMILIARUM**, **HOMILETICS**, **HOMILIES OF THE CHURCH OF ENGLAND**.

HOMINE REPLEGIANDO, hōm'ī-nē iē-plē-ji-in'do (ML., for replevying a man). The title of an old writ in English law, meaning 'to bail a man out of prison'. It was an ancient form of the writ of habeas corpus, by the later form of which, as now employed, it has been superseded in England and generally in the United States. In a few of the American States, however, the older writ has recently been revived in an amended form, as being better adapted to the purpose of securing the release of a prisoner on bail than the more usual writ of habeas corpus (qv).

HOMING (hōm'ing) PIGEON, or **HOMER**. The name among fanciers for that breed of domestic pigeon, also called "carrier," used in carrying messages and in long-distance races. The name refers to its propensity for returning to its home with the utmost possible speed and directness when liberated at a distance. See **PIGEON**.

HOMINIDÆ (Neo-Lat nom pl, from Lat *homo*, man). The family to which man belongs, and which, together with the various families of monkeys, baboons, and apes, forms part of the order PRIMATES. Among the characters which distinguish the Hominidæ are (1) the posture is completely erect, (2) the anterior appendages are provided with hands, the posterior with feet, (3) the feet have the inner digit greatly enlarged and nonopposable, forming a great toe, (4) the body is sparsely haired, except on the top of the head, (5) the lower jaw has a prominent ridge, the chin, (6) the facial angle exceeds 60°, (7) the brain is more than double the size of that of apes, and the cranial capacity three times as much, (8) the teeth stand in an uninterrupted series without a space in front of the upper incisors, (9) man has the power of speech. In his general organization man is so closely related to the higher apes that it is difficult to draw a hard and fast line between the Hominidæ and the lower groups. (See *Anthropoid Apes*, under **APE**.) In the zoological classification living races are considered as *Homo sapiens*. Various specific names have been proposed for extinct types of man, as *H. primigenius*, *H. heidelbergensis*, *H. aignacensis*, *hauseri*, *H. moustereensis*, *hauseri*, *H. eoanthropus dawsoni*. A complete scheme of classification will be found under **MAN**, **SCIENCE OF**.

HOMMEL, hōm'mel, FRITZ (1854-) A German Orientalist, born at Ansbach. He was educated at Leipzig and in 1877 became connected with the library of Munich and was made docent of the university, in which he was appointed professor of Semitic languages in 1885. His principal writings, aside from contributions to Oriental journals, are: *Die Namen der Säugethiere bei den südsemitschen Völkern* (1879), *Zwei Jagdinschriften Assurbampals* (1879), *Die semitischen Völker und Sprachen* (1883), *Geschichte Babylonens und Assyriens* (1885); *Die babylon-*

nische Ursprung der ägyptischen Kultur (1892), Aufsätze und Abhandlungen arabistisch-semitologischen Inhalts vols I-III (1892-1901), Sudarabische Chrestomathie (1893), Die altisraelitische Ueberlieferung in inschriftlicher Beleuchtung (1897); Sumerische Lesestücke (last ed, 1899); Der Gesträndienst der alten Araber (1900), Die alorientalischen Denkmäler und das alte Testament (2d ed, 1903), Grundriss der Geographie und Geschichte des alten Orients (1st part, 1904), Geschichte des alten Morgenlandes (2d ed, 1908)

HOMME QUI RIT, L', lôm' kē rē' (Fr. The Man who Laughs) A romance by Victor Hugo (1869), the story of a boy whose face has been mutilated so that he always has the appearance of laughing

HOMŒOCE/LA See HETEROCE/LA

HOMŒOPATHY (from Gk. *ὁμοπαθήθεια*, *homoiopathēia*, similarity of feeling, from *ὁμοπαθής*, *homoiopathēs*, subject to like feeling, from *ὁμοιος*, *homios*, similar + *πάθος*, *pathos*, feeling) A distinctive system of medicine elaborated by Samuel Hahnemann (q.v.) upon the suggestions of a number of predecessors and published in 1796 His chief dicta enunciated at that time were as follows

"Every powerful medicinal substance produces in the human body a peculiar kind of disease, the more powerful the medicine, the more peculiar, marked, and violent the disease" "We should imitate nature, which sometimes cures a chronic disease by superadding another, and employ, in the disease we wish to cure, that medicine which is able to produce another very similar artificial disease, and the former will be cured, *similia similibus*" He was brought to this conclusion through observing the toxic effects of drugs, as recorded in the various works on *materia medica*, which he was translating from English into German, and by experiments made upon himself and others in corroboration. It is not claimed that Hahnemann first noted similarity of drug action and diseased condition, for many times in previous medical history had isolated instances been noticed, but he was the first to urge a general application of his principles and to state the propositions upon which was based the new treatment In 1806, in a treatise entitled *The Medicine of Experience*, he indicated the name by which the new system of treatment should be known, and thenceforward "homœopathy" designated the science and art, as did "homœopathic" the practitioner.

In 1810 he published the *Organon of Rational Medicine*, which became and remains the embodiment of the fundamental methods of homœopathy These fundamentals may be stated briefly thus

1. Proving of medicines upon the healthy
2. Selection and administration of medicines according to the law of similars.
3. The single remedy
4. The minimum dose

A medicine is "proved," according to the homœopathic method, as follows A fluid extract or a tincture of a drug is selected for proving Of this medicinal preparation a dose of one drop, two drops, or five drops is given to a healthy person at certain intervals, during which the person notes his symptoms Gradually increasing doses are administered until the experimenter is satisfied and a set of tables of symptoms, believed to be caused by the drug in

the healthy person, has been compiled These tables of symptoms are then compared with symptoms noted in various diseases Upon discovering that a disease presents a similar set of symptoms to those noted by the healthy person as caused by the test drug, the homœopathist argues that this drug will be the remedy for this disease His method of reasoning is that if a drug produces certain symptoms in health it will cure a disease which causes similar symptoms Upon this basis lies the fundamental law of similars," generally stated in Latin, *similia similibus curantur*

In the way just described Hahnemann proved upon himself and others more than 90 drugs Societies were formed for the purpose, and since his death many medicinal substances have been tested to learn toxic, pathogenic, and curative power, if any Thus, each drug had its pathogenesis, or "picture," and the one corresponding to the totality of diseased symptoms as elicited from the patient by the physician, if administered, would, according to the homœopathic claim, result in a cure No two drugs having precisely the same picture and no two patients the like totality of symptoms, he therefore individualized his cases and declared that a single remedy should be given Later in life he modified this to some extent and, recognizing the *genus epidemicus*, prescribed without seeing the patients, as in the cholera epidemic of 1831

When he began prescribing according to his law, he gave massive doses, but, believing that the human system when diseased is much more sensitive than in health, he gradually lessened the quantity Then it was that he wrote the *Spirit of the Homœopathic Doctrine*, in which he argued the morbid cause of disease and the dynamization of remedies In regard to disease, Hahnemann recognized the *morbid cause*, which, acting upon the *morbid properties* in the tissues, developed disease Therefore, he argued, disease is a morbid property developed into an active pathological state by the influence of a corresponding morbid force Likewise regarding drugs, his idea was that the drug forces are cosmic principles or agents of the same order as the disease-developing forces, the germinal principles inherent in the plant correspond with the morbid properties in the tissues, and drugs correspond with the fully developed disease He believed that the morbid cause is in closer affinity with the drug than with the tissues of the organism, and this union secures the restoration of the organism to a state of physiological harmony He said, 'As the human organism, even in health, is more readily influenced by drugs than by natural morbid agents, this influence is felt in the highest degree by an organism which is properly predisposed by disease, provided the artificial drug disease is homœopathic to the natural malady Hence the smallest dose of the remedial agent is sufficient for a cure, for the spiritual power of the medicine does not in this instance accomplish its object by means of quantity, but by potentiality and quality, a larger dose might be injurious for this reason, that a larger dose does not only not overcome the morbid affection more certainly than the smallest possible dose of the homœopathically administered agent, but likewise imposes a complex medicinal disease, which is always a malady, though it runs its course in a shorter time" Herein lie the doctrines of small doses and "medicinal aggravations." From this mode of

accounting for a cure in accordance with the law of similais, there naturally followed the "potentization" of drugs, according to Hahnemann.

The attenuation was accomplished in the following manner. If the drug was a vegetable substance, a strong tincture was made and called mother tincture. Of this, two drops were taken, added to 98 drops of alcohol, and agitated. This was marked "first dilution." Two drops of this, with 98 drops of alcohol constituted the second dilution, the third in a similar manner, and so on. This constituted what was known as the centesimal scale. Some preferred adding one drop of tincture to nine drops of alcohol, the label being first decimal, second, third, etc., according to the number of attenuations desired. Insoluble substances were triturated with sugar of milk in the proportion of one grain of the drug to 99 of sugar, or 9, as the physician deemed best. When the fifth trituration was reached, the substance, now claimed to be soluble, was dissolved in distilled water, and the further process carried on with alcohol as in the case of tinctures.

Hahnemann writes, quoting from the first American edition of the *Organon of Medicine* (Philadelphia, 1836) "Diseases are *dynamic* [spiritual] aberrations, which our *spiritual* existence undergoes in its mode of feeling and acting—that is to say, *immaterial* changes in the state of health" (p. 19). "A homœopathic dose, however, can scarcely ever be made so small as not to amend and, indeed, perfectly cure" (p. 157). "It will stand good as a homœopathic rule of cure, refutable by no experience whatever, that the *best dose* of the rightly selected medicine is ever the *smallest*" (p. 187). When describing the preparation of "potences" of fluid dilutions, the author says "These manipulations are to be conducted thus" (by adding 2 drops of a preceding "potence" to 98 drops of alcohol and shaking twice) "from the first up to the thirtieth or decillionth development of power, which is the one in most general use" (p. 200). "The effect of shaking, on homœopathic medicines, 'is so energetic that latterly I have been forced by experience to reduce the number of shakes to two, of which I formerly prescribed ten to each dilution'" (p. 205). "The best mode of administration is to make use of small globules of sugar, the size of a mustard seed, one of these globules having imbibed the medicine, and being introduced into the vehicle, forms a dose containing about the three-hundredth part of a drop, for three hundred of such globules will imbibe one drop of alcohol." "By placing one of these on the tongue, and not drinking anything after it, the dose is considerably diminished. But if the patient is very sensitive, and it is necessary to employ the smallest dose possible, and attain at the same time the most speedy results, it will be sufficient to let him smell once" (p. 207).

The directions for smelling a "remedy" are as follows. "The patient should hold the phial containing the globule under one nostril, when one momentary inhalation of the air in the phial is to be made, and if the dose is intended to be stronger, the same operation may be repeated with the other nostril" (p. 191). Hahnemann considered mesmerism a homœopathic remedy. He says, "This curative power, of whose efficacy none but madmen can entertain a doubt, which through the powerful will of a well-intentioned individual influences the body of the patient by the touch, acts homœopathically, by exciting

symptoms analogous to those of the malady" (p. 210).

In 1813 an epidemic of typhus fever occurred in Leipzig, during which it is said that 73 patients were allotted to Hahnemann for treatment. Of these it is claimed that but one died. Many of his claims were denied, and many of his ideas were ridiculed. As a result of the opposition of the apothecaries' guild, he was forbidden to prepare his own medicines for pay. In spite of all opposition he and his pupils continued their practice and gave the remedies gratuitously when they were not allowed to take pay. Finally opposition and social ostracism so discouraged Hahnemann that he left Leipzig in 1820 for Rothen, where under the patronage of the Duke of Anhalt, he had a certain vogue. Up to this time homœopathy was centred in the person and teachings of Hahnemann, but now that he was absent, his pupils, already having become doctors of medicine, began, in 1821, the publication of the first homœopathic journal, the *Archiv of the Homœopathic Method of Curing*. This publication was continued until 1843. The growth of homœopathy in Germany has ever been slow. In Austria homœopathy was first officially known in 1819, in which year the Emperor Francis I decreed that the method should be forbidden. Afterward it was tacitly permitted, and the decree was revoked in 1837. Since 1846 there has been no governmental interference with individual preference. Homœopathy was introduced into Russia in 1823. There, as elsewhere, its pioneers were laymen and its growth has been slow. It was introduced into Great Britain in 1827 by Quin, a physician. Shortly after, the medical opposition was so great as to prevent those who desired to practice it from obtaining a decree entitling them to register as physicians. At present there are no restrictions placed upon any person desiring to practice this system, but there are no legally incorporated schools for instruction. In France homœopathy was first systematically tried in the year 1830. It steadily grew in favor until 1835, when Hahnemann, settling in Paris, gave the cause a powerful impetus. He grouped around him a large number of able men, and until his death in 1843 Paris was the Mecca of homœopathy.

The laws of France, as of most countries in Europe, discriminate against homœopathy, and no place of public preferment or emolument is allowed its adherents. As a rule, homœopathic medical colleges are not legalized in European countries.

In the United States and in other young countries homœopathy has been most active. Dr. Hans B. Gram, a native of Boston, educated at Copenhagen, first began the practice of homœopathy in New York City. The novel method was adopted by many, and many became earnest advocates of the system. Later, and about the same time, there came into notice men and women, generally and very largely of the laity, who, without knowledge of disease or of science, began to report cures with the aid of homœopathic "remedies." Domestic practice was so easy by means of a cabinet of phials filled with globules and a book giving complete instruction for the use of homœopathic medicines as adapted to any symptoms, without the need of a diagnosis of disease, that the new cult grew rapidly. Soon there came from over the sea men who had learned the science and art from Hahnemann and his associates, and, as a help to the more perfect

understanding of this way, the first homœopathic college was established at Allentown, Pa., in the year 1835. While the converts to homœopathy have never been subjected to positive repressive legislation, yet they have been buffeted by the same storm of opposition as greeted their brethren in other lands. In order that the cause might be strengthened and physicians record progress, the publication of the *American Journal of Homœopathy* was begun in 1835. The American Institute of Homœopathy, the oldest national medical association in the country, was organized in 1844, though there were already societies in the States of Pennsylvania, New York, and Massachusetts. The existence of most of the local societies is mainly due to the suggestion and fostering care of the American Institute, to which they annually report.

In 1914 there were in the United States about 15,000 homœopathic physicians, and 10 medical colleges in which homœopathic therapeutics were taught. These schools had an attendance of 794 students and graduated 154. Considering its age, homœopathy is especially rich in theoretical and practical literature. The most exhaustive work on any division of the subject is the *Encyclopædia of Materia Medica*, by the late Prof. T. F. Allen, M.D., of New York City. Every department of medicine has been treated by homœopathic authors. Perhaps the chief factor in the spread of homœopathy in the United States, especially in the newer portions of the West, is the equality of all schools of medicine and all qualified practitioners before the law. For many years homœopaths in America taught only therapeutics and practice, and as a result all the earlier, and for many years most of the well-equipped, native American physicians were graduates of the regular school. Finally homœopathic medical schools were established, in which all the branches of medicine were taught, and the inexplicable terms "homœopathic surgeon" and "homœopathic obstetrician" came into use. The influence of the school has been waning for some years. In 1883 the *Hahnemannian Monthly* said: "A few years ago the editors of the *New York Medical Times* dropped from the title of their journal the distinctive word 'Homœopathic'; now they boldly urge the renunciation of the word as applied to our school of medicine. If we are emancipated from the thralldom of sect, we shall not only save our school from imminent dissolution, but shall also become an integral part of the medical profession of the day, honored as true, broad, liberal, progressive physicians. But if we cling to a name which by no means represents the catholicity and spirit of the new school, we are doomed to annihilation."

In the large cities of the Eastern States great numbers of graduates of homœopathic medical schools have taken courses of study in post-graduate departments of regular medical colleges, and afterward, while retaining the term "homœopathic," practice medicine principally according to the regular principles, using "old-school" drugs in "old-school" dosage. The number of exclusively homœopathic physicians is much less now than it was 25 years ago.

Whether due to its influence or not, since the advent of homœopathy the repulsiveness in taste and appearance as well as the size of the dose of old-school remedies have been greatly modified; and in a vast number of cases suggestion and encouragement, together perhaps with place-

bos, have taken the place of active medicinal treatment, and natural recuperative power has worked the cure. It is certainly true that the two schools have drawn nearer to each other, and each one has adopted something of the *materia medica* of the other. Few and rare to-day are the practitioners who adhere to the higher potencies of Hahnemann.

The terms "allopathy" and "allopathic" came into use after the invention of the words "homœopathy" and "homœopathic" and were used by the adherents of the new school in designating the old school and its practitioners, through a mistaken idea. The terms are etymologically incorrect. Consult W. H. King (ed.), *History of Homœopathy and its Institutions in America* (4 vols., New York, 1905), and S. C. F. Hahnemann, *Organon of the Rational Art of Healing* (1b, 1913). See the article **HÄHNEMANN**.

HOMŒOPATHY, AMERICAN INSTITUTE OF The oldest national medical organization in the United States, its first session having been held in New York City on April 10, 1844. Its objects are the reformation and augmentation of the *Materia Medica* and the furthering of the principles of homœopathy. It had (1914) 3048 members, representing every State in the Union, besides Canada, divided into bureaus on various lines of medicine and surgery, and meets annually in the large cities of the country. The institute publishes annual volumes of "Transactions," including reports and original papers. President (1914), Byron E. Miller, M.D., Portland, Oreg.

HOMOGENEITY, LAW OF The product of two homogeneous integral functions of the m th and the n th degree respectively is a homogeneous, integral function of the $(m + n)$ th degree. The value of this principle in checking the process of multiplication of homogeneous functions is evident. The notion of homogeneity may be extended to irrational and fractional functions. In this case the degree is determined by introducing a factor k into each variable and observing the degree of the factor k in the resulting function.

HOMOGRAPHY. See **HOMONYMS**.

HOMIOIUSION, $h\acute{o}m\acute{o}i-\acute{o}\acute{o}'s\acute{i}-\acute{o}n$. See **HOMOIOUSION**.

HOMOLOGATION (from *ML. homologare*, to homologate, from *Gk. δμολογέιν, homologein*, to agree, from *δμολογος, homologos*, agreeing, from *δμός, homos*, same + *λόγος, logos*, word, from *λέγειν, legen*, to say). In the civil law, the judicial confirmation of an award, or of an accounting, or any other administrative or judicial proceeding, which was taken or performed without competent authority, or whose authority is in doubt. In Scots law the term denotes any act or course of conduct which confirms an act which would otherwise be invalid. Thus, an informal deed, though ineffectual in itself, may yet, if acted on by one or both parties, be set up and enforced against the party. In this sense, then, homologation is the equivalent of a form of estoppel (*qv*) in English and American law. To constitute homologation a clear knowledge of what the party is doing is necessary.

HOMOLOGOUS SERIES. See **HYDROCARBONS**.

HOMOLOGY (from *Gk. δμολογία, homologia*, conformity, from *δμολογος, homologos*, harmonizing, from *δμός, homos*, same + *-λογία, -logia*, account, from *λέγειν, legen*, to say) 1. In biology, a term used to indicate structural corre-

spondence based on blood relationship, as opposed to analogy, which is applied to functional resemblance, such as that between the wings of a bird and those of a butterfly. Different sorts of homology have been recognized. There is the homology of the different parts of the body, viz., serial homology, as of the front and hind paired fins of fishes, or the arms and legs of man, antimeric homology, as of the petals of a flower or the right and left sides of the body. There is homology of corresponding organs in different individuals. This is most certain in individuals of the same species, somewhat less certain between genera and families, often doubtful between orders and classes, usually speculative between phyla. The criteria of homology are (a) The criterion of connections. A part having similar relations in two species and making similar connections is homologous in the two cases. (b) The criterion of structure. Homologous parts have a fundamental similarity of structure. (c) The criterion of development. Homologous organs arise from the same germ layer in corresponding parts of the body and develop in the same fashion. Despite these clear-cut criteria, homologies are practically often very difficult of determination, particularly beyond the limits of a class.

2 In geometry, figures which are in perspective are often spoken of as homologous, because the centre and axis of perspective introduced by Poncelet were called by Chasles centre and axis of homology. (See PERSPECTIVE, CENTRE, AXIS.) The term "homologous" is also used in the sense of "corresponding." Thus, corresponding sides or angles of similar polygons are said to be homologous.

HOMONYMS (Fr. *homonyme*, Lat. *homonymus*, from Gk. *ὁμώνυμος*, *homónymos*, having the same name, from *ὁμός*, *homos*, same + *ὄνομα*, *ónoma*, name). Words that agree in form, but differ in origin and meaning. A familiar example of this class of words is *sound*, which in its different meanings goes back to the Latin *sonus*, Scandinavian *sund*, and Anglo-Saxon *gesund* and *sundian*, or the verb *beor* and the noun *beor*. Many homonyms are often distinguished by the accent, as *absent*, the adjective, and *absent*, the verb. Strictly speaking, these are not homonyms, but homographs, since the exact correspondence is confined to the spelling. A third term is also used—"homophones," words that agree in the sound, but not necessarily in the spelling. Thus *write*, *wright*, and *rite*, or *meat*, *meat*, and *mete*, are homophones.

HOMOOUSSION, *hómō-ōs'si-on* (Gk. *ὁμοούσιον*, *homooousion*, consubstantial, from *ὁμός*, *homos*, same + *οὐσία*, *ousia*, essence). A term of Greek theology, employed against the Arians at the Council of Nicea (325 A.D.), to denote that in the doctrine of the Trinity the Son is "of the same essence [or substance] with the Father." According to the received text of what we call the Nicene Creed, the article in question reads: "And [I believe] in one Lord Jesus Christ, being of one substance with the Father." The word *homooousion* is much older than the Council of Nicea. Not to speak of its employment by Gnostics, like Basilides, it is found in the writings of Irenaeus, in the latter half of the second century, and not infrequently in the third century. It was rejected by a synod held in Antioch, against Paul of Samosata (268 or 269), where it seems to have borne a meaning somewhat different from that which was applied to

it by Athanasius. In the fourth century the word aroused a long and bitter controversy. The Athanasian party defended it, the Arians attacked it on every side. In the progress of the struggle various alternatives were proposed. Some extreme Arians wished to substitute *heteroousion* (of a different substance) for *homooousion*, thus affirming the direct opposite of what the orthodox party insisted upon. Others, less radical and largely indifferent to the real issue involved, suggested the colorless term *homoion* (similar), meaning simply the Son 'is like' the Father. The greater part were willing to go so far as to use the word *homooousion* (i.e., the Son is 'of a like essence, or substance,' with the Father). This use of *homooousion* gave rise to the epigram that the quarrel was over a diphthong, but the serious theological problem was whether the Church worshiped one divine being in two persons, or two divine beings, God and Christ. After nearly 60 years of theological warfare the Church, at the Council of Constantinople (381), reaffirmed its allegiance to the *homooousion* doctrine and now applied it not simply to the Son, but also to the Holy Ghost, thus completing the dogma of the Trinity, which has ever since remained the orthodox faith of Christendom.

Consult I. A. Dorner, *Doctrine of the Person of Christ* (Edinburgh, 1861-63), K. J. Hefele, *History of the Christian Councils from the Original Documents*, translated from the German and edited by W. R. Clark (ib., 1871), J. H. Newman, *The Arians of the Fourth Century* (5th ed., London, 1888), Athanasius, *Select Works*, translation in the *Nicene and Post-Nicene Fathers*, 2d series, edited by Schaff and Wace, vol. iv (New York, 1892), Dubose, *The Ecumenical Councils* (2d ed., ib., 1897); Adolf Harnack, *History of Dogma*, vol. iv (Boston, 1898), J. F. Bethune-Baker, *Meaning of Homooousios in the Constantinopolitan Creed* (New York, 1908). See ARIUS, ATHANASIUS, CHRISTOLOGY, NICENE CREED.

HOM'OPHONES See HOMONYMS, HOMOPHONY.

HOMOPH'ONY (Gk. *ὁμόφωνος*, *homophōnos*, having the same sound, from *ὁμός*, *homos*, same + *φωνή*, *phōnē*, sound). The style of modern music where one voice or melody predominates. The other voices are not independent, but serve chiefly to furnish the harmonic basis for the leading voice. Thus it is directly opposed to the older polyphony (qv), where all voices were independent and of equal importance. See ANTI-PHONY; MONODY.

HOMOPLASY (from Gk. *ὁμός*, *homos*, same + *πλάσις*, *plasis*, molding, from *πλάσσειν*, *plassein*, to mold). A term proposed by Lankester to express, as he says, "the parallelism of genetically distinct organs." Its meaning by some is expressed by the word "convergence," now in frequent use. It is due to the action of similar or identical habits or environment on a part or parts of an animal or on the entire animal. Lankester's definition is: "When identical or nearly similar forces, or environments, act on two or more parts of an organism which are exactly or nearly alike, the resulting modifications of the various parts will be exactly or nearly alike." Lankester illustrates homoplasy by the case of the remarkable coincidence in the pteropod mollusks and cephalopod mollusks of appendages around or near the mouth provided with suckers. Osborn asserts that homoplasy

has been confused with "parallelism" and "convergence," which may affect absolutely non-homologous structures. *Homoplasmy*, he says, should be confined to structures in which there is an element of homology. *Convergence* may be restricted to cases of "parallelism" between animals of entirely unrelated groups or classes, like the following. marsupial mice, and other animals of that group exactly resemble placental mice, etc., whales resemble fishes owing to their similar adaptation to the water. Many cases of so-called mimicry (qv) appear to be instances of convergence. Legless lizards may be mistaken for snakes. There are multitudes of such examples, and the resemblance or parallelism is so exact as to have often misled well-trained zoologists.

HOMOPTERA (from Gk. *ὁμός*, *homos* same + *πτερον*, *pteron*, wing). A suborder of the Hemiptera, including insects with wings (when present) of uniform thickness throughout. It contains some of the most destructive of insects and others that are the most beneficial. It includes the cicadas, lantern flies, spittle insects, leaf hoppers and tree hoppers, plant lice, scale insects, and others. A few of the scale insects furnish materials that are useful to man, such as cochineal lac and wax. A famous scale insect is the "San Jose" scale, and the mealy bugs of greenhouses are well-known representatives of this group. See HEMIPTERA. BUG, COCHINEAL, APHID, CICADA, FROTH FLY, SCALE INSECT.

HOMOSPORY (from Gk. *ὁμός*, *homos*, same + *σπόρος*, *sporos*, seed—lit., spores similar). A word generally used only in connection with such plants as have a distinct alternation of generations (qv.). The sexless generation (sporophyte) in the alternating series produces spores, which in turn produce the sexual generation (gametophyte). Among the liverworts and mosses (Bryophytes), and in most of the ferns and their allies (Pteridophytes), these spores are all alike in appearance and power, each in germination producing a gametophyte which bears both male and female organs. The term contrasts with "heterospory" (qv.), a condition in which the sporophyte produces two kinds of spores, unlike in size and power, the larger of which produce female gametophytes, the smaller male gametophytes. All the seed plants (Spermatophytes) are heterosporous, as well as the water ferns, quillworts, and little club mosses among the Pteridophytes. Isospory is the same as homosporous.

HOMOTAXY, or **HOMOTAXIS** (from Gk. *ὁμός*, *homos*, same + *τάξις*, *taxis*, arrangement, from *τάσσειν*, *tassein*, to arrange). A geological term which signifies a similarity in the succession of strata in different regions as shown by the included life forms.

HOMS, *hōms*, or **HEMS**, *hēms* (Lat. *Emesa*). A city of Syria, situated near the right bank of the Orontes, 1860 feet above sea level, 36 miles south of Hamah by rail (Map Turkey in Asia, C 3). A branch railroad line to Tiupoli on the coast was opened by a French company in 1911. The old town, built chiefly of black basalt, has crowded houses and narrow streets and is surrounded by old half-ruined walls and commanded by a ruined citadel. Although there are now no ancient buildings, numerous fragments of columns with Greek inscriptions, and the foundations of ancient baths with specimens of mosaic pavements, remain. The town has considerable trade in silk, cotton, oil, and gold ware,

and has also some manufactures. Pop (est.), 60,000, including about 16,000 Christians. Homs (ancient Emesa) was celebrated chiefly for its splendid temple of Baal the god of the sun, one of the priests of which, Elagabalus, or Heliogabalus, was raised to the Imperial throne of Rome. Under the walls of Emesa Zenobia was defeated by the Emperor Aurelian in 272 A.D. The city was taken by the Saracens in 636, when its old Semitic name, Hems, was revived. In 1099 the Crusaders rode through its opened gates. Here the Egyptian army, under Ibrahim Pasha, defeated the Turks in July, 1832.

HOMURAI, *hō'mōo-rī*. See HORNBILL.

HONAN, *hō'nan'* (Chin., south of the river). One of the 18 provinces of China proper, bounded on the north by the provinces of Shansi and Chili, on the east by Shantung, Kiangsu, and Anhui, on the south by Hupeh, and on the west by Shensi (Map China, K 5). It lies between lat 32° and 37° N and long 110° and 116° E, area, 67,954 square miles. The eastern part is comparatively level and belongs to the Great Plain, while in the western section spurs of the Fu-niu Range of mountains with a southeast trend are found. Its principal river is the Hoang-ho, which traverses the northern part from west to east. The soil is fertile and, in addition to the usual cereals, produces cotton, hemp, indigo, and tobacco. Patches of the remarkable formation called loess (qv) by Richtenhofen and "lake loam" or terrace deposit by Pumpelly are found in both the northern and southern parts. Honan is rich in minerals, iron, lead, tin, copper, etc., and has enormous deposits of anthracite and bituminous coal, which is mined only by native methods. It has been recently proposed to develop the mines by modern methods. The capital, Kaifeng (or Kaifung), is situated 11 miles south of the Hoang-ho and near the point where in 1853 the river burst its banks and took a new course to the northeast through Shantung to the Gulf of Pechili, instead of southeast through Kiangsu to the Yellow Sea, as formerly. Kaifeng is a station on the new *Lu-Han* or Hankow-Peking Railway. It is noted for its ancient colony of Jews, who built a synagogue there as early as 1183 (See KAIFENG). Colonel Mamford (1905) reported that the Chinese of this province wished railroads and had other progressive ideas. Pop (Chinese est.), in 1910, Minchengpu, census, 22,375,000. Construction on the Kaifeng-Honan Railway began in 1905, and the road was opened to traffic in 1908. It is 140 miles long and forms a junction at Chenchow with the Peking-Hankow Railway. It is in a prosperous condition, and several extensions are planned. As Honan is a rich province without navigable rivers, its prosperity will largely develop with advancing railway construction.

HONDA, *ōn'da*. A city of Colombia, situated on the Magdalena, in a mountainous region, 55 miles northwest of Bogotá. The town has a very hot climate, as the surrounding mountains shut off the cool winds. It is important as the head of navigation, and the transit point of the trade for Bogotá, as well as the depot for the tobacco and quinine from the Ambalema District. Pop, 1912, 8225. Honda received its town charter in 1643. In 1805 it was destroyed by an earthquake.

HONDA, *hōn'da*, YORITSU (1848-1912). A Japanese Methodist Episcopal bishop and educator. The son of a chief of the Samurai class in his

province, he was born at Hiro-saki on the island of Hondo. When a student in Yokohama, he was converted to Christianity, and in 1872 he was baptized and became a charter member of the first Protestant church organized in Japan. For some time he was a member of the local assembly of his province. In 1878 he was ordained a local elder of the Methodist Episcopal church—the first minister of the denomination in his country. After going to the United States to attend Drew Theological Seminary in 1889 and 1890, he returned to be president of the Aoyama Gakuin, or Anglo-Japanese College of the Methodist Episcopal church. In this position he remained until the Methodist church of Japan was organized in 1907, when he was elected its first Bishop. An ardent Y. M. C. A. worker, he twice represented his country in World's Student Federation conferences in Europe, in 1910 he was again in America, as fraternal delegate to the general conferences of the Methodist Episcopal Church South and of the Methodist Church of Canada. In the same year he was a member of the World's Sunday School Convention at Washington, D. C., and of the World Missionary Convention at Edinburgh. For many years the Christians of Japan selected him as their representative on all important public occasions.

HONDECOETER, hōn'de-kōŭ'tēi, MELCHIOR D' (1636-95). A Dutch animal painter. His grandfather, GILLIS (died 1627), was a landscape painter at Amsterdam, and his father, GISEBERT D'HONDECOETER (died 1653), painted animals. Melchior was born at Utrecht and studied under his father and his uncle, Jan Weenix (q.v.). From 1659 to 1663 he lived at The Hague and after that at Amsterdam, where he received the freedom of the city in 1688 and resided until his death, April 3, 1695. He stood in high favor with the Dutch magnates, and while at The Hague was employed by William III. afterward King of England, to paint his menagerie. His grandfather had made a considerable name in that form of art. Hondecoeter painted every kind of animal, but his favorite subjects were cocks, hens, ducks, and peacocks, which he delineated with wonderful correctness and truth. He depicts, with great charm, motifs like the maternity of the hen, and he even lends beauty to subjects like "cockfights" and "Ducks in a Pond." No one has excelled or even equaled him in painting the feathered tribe. The landscapes which he introduced as backgrounds to his pictures are equally true to nature and finished with a delicate lightness and transparency of touch that harmonize admirably with the subject of the piece. The museums of France, Germany, and Austria and the private and public collections of England have fine examples of his work, but his masterpieces are at Amsterdam and The Hague. His most celebrated work is "La plume flottante" (Floating Plumage) in the Museum of Amsterdam, representing a pond full of waterfowl.

HONDO, hōn'dō, or **HON-SHU**, hōn'shyōŭ (Chūno-Jap., chief island). The name of the chief island of the Empire of Japan, often, but incorrectly, called Nippon or Nihon. Nippon is not the name of any one island, but of the entire Japanese Empire. The application of the erroneous name Nippon to the chief island originated with Kaempfer (q.v.), the Jesuits who wrote previously to him knowing Japanese geography too well to use the misleading term. Of late years the Japanese, studying geography in

the Western fashion, and seeing the necessity of a name for their chief island, have called it Hondo. Hondo lies between lat 24° 14' and 41° 33' N and long 130° 44' and 142° 14' E and has an area (with its isles) officially computed in 1894 at 87,482 square miles, with a population (1908) of 37,414,281. It comprises the encircles of Tokaido, Kinai, Tosando, Hokurikudo, Sanindo, Sanyodo and one province of Nankaido (the other four provinces of this encirc forming the island of Shikoku). For administrative purposes Hondo is divided into 34 fu and ken (or prefectures), 429 districts, 41 large cities, 930 towns, and 9219 villages. Of its taxable area in acres, 5,521,175 are in rice fields, 3,874,410 in arable land, 758,320 in building lots, and 14,697,336 in forest, 2,234,766 various, besides 501,188 acres of untaxed land. Its shape is a crescent, with horns towards Asia. A remarkable difference in climate is noted between the eastern and the western halves of Hondo—the former, under the influence of the Kuro-Shiwo, or gulf stream of the Pacific, being mild and warm, the latter, receiving the cold winds and under the influence of cold currents, having a more severe climate. The promontories of Hondo are now dotted with well-equipped lighthouses, and the island is well supplied with railways and telegraphs.

HONDURAS, hōn-dōŭ'ras, *Sp. pron. ñn-dōŭ'ras*. A republic of Central America, bounded by the Caribbean Sea on the north and northeast, Nicaragua on the southeast, Salvador and the Pacific Ocean on the southwest, and Guatemala on the west (Map Central America, D 3). Area, estimated at about 44,274 square miles. It is a mountainous country, a plateau in the interior, with low coast lands. The only plains of important extent are along the coasts of both oceans and on the lower courses of a few rivers. The widening of river valleys in the interior results in small plains, many of them at a considerable elevation. The mountains occupy a proportionately larger area than in neighboring Guatemala, but the ranges are inferior in extent and height, though some peaks rise to about 8000 feet. Volcanoes have recently played a smaller rôle than in any other country of Central America, though there are a number of extinct volcanoes one of which formed the island of Sacategrande in the Gulf of Fonseca. In the west half of Honduras young eruptive rocks cover as large an area as all the other geological formations together, while in the east half very little of the surface is formed of volcanic outpourings of recent geological times, though the older eruptive rocks are largely represented, particularly in the north. The coasts have a long Atlantic and a small Pacific frontage. The Atlantic ports are Trujillo, Ceiba, and Puerto Cortes. Amapala has one of the best natural harbors on the Pacific coast. The water parting between the Atlantic and Pacific rivers is far to the south, so that most of the drainage is to the Atlantic Ocean. Some of the Atlantic rivers are navigable, among them being the Coco or Segovia (known also as the Wanks), which forms part of the boundary with Nicaragua.

In the interior the climate is healthful and on the whole temperate. The coast lands, owing to their small elevation, have a much higher temperature. Honduras is swept by the trade winds and receives an enormous quantity of rain. The tropical vegetation is very luxuriant. The broad Atlantic coastal lowlands, however, re-

ceive much less rainfall than the mountain regions of the interior, where most of the water vapor brought by the east winds is condensed. The result is that though the eastern lowlands are covered with vast forests of mahogany, cedars, and other cabinet woods, in which also sarsaparilla and other medicinal plants abound, vegetation in the east is not so luxuriant as in the higher regions inland, where there are boundless forests of pines and other conifers so dense that one may travel for days without being able to see more than 100 yards in any direction. The dry season prevails from November to May, the Pacific coast being the drier. The Atlantic coast is not healthful for the white race, and its products are mainly those of the forest and tropical fruits. The interior, from 1500 to 7000 feet, produces tropical products in the lower zone, coffee in the middle zone, and the products of temperate climates in the upper belt. Numerous relics of a former civilization are found in some districts, most of them being the ruins of temples and other religious edifices.

For fauna, see NEOTROPICAL REGION

Mineral Resources. The country is richer in minerals than any other Central American state excepting Nicaragua. They include gold, silver, copper, zinc, iron, lignite, etc. Lack of capital and energy, however, has prevented large development. The mining activities are practically confined to the washing of gold from the rivers and the production of some silver in the southern part of the country, these metals being the largest exports.

Agriculture. The soil is very rich, but, in spite of its unusual fitness for agriculture, Honduras is the most backward state of Central America. The natural conditions are conducive to the cultivation of almost all the products of Central America, but the sparsity of population as well as the lack of transportation facilities stand in the way of agricultural development. More attention is paid to stock raising and to the cultivation of bananas and other fruits in the Atlantic coastal region than to any other branch of farming. Steamers carry a large quantity of bananas and coconuts to the United States. Tobacco, sugar, maize (the chief food staple), coffee, rice, etc., are all grown in quantities sufficient to supply the local demand, and considerable coffee is sold abroad. The almost prohibitive export duties have brought about a considerable increase in the live stock of the country. The exports of live cattle, however, as well as of hides, are not unimportant. Sheep, goats, and swine are few in number.

Transportation. With regard to transportation facilities the situation in Honduras is worse than in any other of the Central American states, although the natural obstacles in the way of a railway line from coast to coast are less than in most of the other states. The construction of a narrow-gauge line from Puerto Cortés on the Atlantic to the Gulf of Fonseca on the Pacific was begun in 1868 by an English company, which had secured from the government a land grant of 10 square miles per mile of road constructed, and extensive mining and lumbering privileges. Bonds to the amount of \$30,000,000 were issued and sold, but the work was discontinued after about 60 miles, or one-fourth of the road, had been constructed. Since then all efforts to resume construction have been unsuccessful, and the part completed, between Puerto Cortés and La Pimienta, has been operated with

varying success by several companies. A mule train is three weeks on the road between Puerto Cortés on the Atlantic and the Pacific port of Amapala, a journey that would take less than a day by rail. There are a number of other short railways, bringing the total mileage of the Republic to about 150. A number of concessions have been granted in order to improve the means of communication. There are a number of tolerable wagon roads, and a macadamized road connects Tegucigalpa with the port of San Lorenzo, but most of the traffic is still carried by mules. The telegraph lines of the country had 3812 miles of wire in 1912.

Commerce. The commerce of Honduras is less than that of any other Central American state, this being due largely to the general backwardness of the country. The imports in 1912 were \$4,317,314, of which 67 per cent came from the United States and lesser amounts from Great Britain, Germany, and France, in the order named. The exports in 1912 amounted to \$3,080,128, of which 88 per cent went to the United States and small amounts to other Central American states, Germany, and Great Britain, in the order named. The chief articles of import are foodstuffs, cotton manufactures, iron and steel manufactures, and chemicals. The largest single item of export is bananas, and then follow, in the order given, gold and silver cyanides and ores, coconuts, cattle, hides and skins, coined silver, coffee, rubber, tobacco, sarsaparilla, and cabinet woods.

Government. The constitution of Honduras, as promulgated in 1904, provides for a republican form of government. The executive power is vested in the President, elected by popular vote for a term of six years. The Chamber of Deputies, which is intrusted with the exercise of the legislative power, is composed of deputies elected directly for four years, at the rate of one deputy for every 10,000 inhabitants. The President is assisted in his duties by a cabinet of ministers. For administrative purposes the Republic is divided into 17 departments and one territory, administered by governors appointed by the President. The administration of justice is in the hands of a supreme court, situated at the capital, and a number of minor tribunals and justices of the peace. Municipal affairs are controlled by councils, elected by a direct vote of the people. The capital is Tegucigalpa.

Finance. The chief sources of revenue are customs duties and the spirits, powder, and tobacco monopolies. The revenue for 1913-14 was estimated at 4,824,000 pesos, and the expenditure at the same amount, of which about one-third was spent by the Department of War. The finances of the country are in a deplorable condition, owing to the expenditures incurred during the war with Salvador and Guatemala and to the continuous civil strife as well as to general mismanagement. Thus, the external debt of the country amounted on Jan. 1, 1914, to £5,398,570, while the arrears of interest at the same period amounted to £18,295,399, bringing up the foreign indebtedness of the country to £23,693,969. The internal debt amounted in 1912 to 6,625,206 pesos silver.

Defense. Military service is obligatory upon every able-bodied citizen between the ages of 18 and 40. The standing army, in 1910, had about 2000 men, and the reserve numbered 54,000 officers and men.

Population. The population of Honduras was

566,017 (official estimate) in 1911, exclusive of (uncivilized) Indians. Most of the population are called aboriginal Indians. The number of persons of pure European descent is very small. Religious freedom is provided for by the constitution, and no religion is officially recognized by the state. The prevailing religion is Roman Catholic, but there are also a number of Protestant churches. Education is supported by the state to a considerable degree, but the facilities are far from adequate. In 1911-12 there were 890 primary schools, with 35,703 pupils. At Tegucigalpa there is a university with faculties of medicine, science, law, and political science, at Comayagua there is a school of jurisprudence. There are four high schools, a normal school, and a school of arts and crafts, situated at Tegucigalpa, besides departmental colleges that receive subventions from the government. There are also normal and high schools at Juticalpa, Santa Rosa, and Santa Barbara. There is an agricultural school at Danli and a school for the manufacture of cigars and cigarettes at Tegucigalpa. As regards penal and charitable institutions, there are a penitentiary and general hospital at Tegucigalpa, also a hospital at Amapala.

History. The coast of Honduras was discovered by Columbus in 1502. The first settlement was made in 1524 by Cristóbal de Olid, a lieutenant of Cortés, sent to take possession of the country in the name of his commander. Olid founded the town of Triunfo de la Cruz and set up an independent government. Cortés set out in person to bring Olid to terms, and after a tedious march of six months over the mountains and rivers of Mexico and Central America, he reached the little colony in the spring of 1525. There he reinforced the colonists and founded the town of Natividad de Nuestra Señora, on Caballos Bay, returning to Mexico in 1526. A royal governor was appointed to rule the province. The mines of Honduras were valuable, but under Spanish government the colony developed slowly. In 1539 the province was made an audiencia of the Captaincy General of Guatemala. The laws enacted for the protection of the natives were systematically disregarded. In 1821 Honduras revolted from Spain and was annexed to the Mexican Empire. In 1823 it joined the federation of Central American states which was formed in October of that year and lasted until 1839, when it was finally dissolved. In 1849-51 Honduras formed a union with Salvador and Nicaragua, which ended in 1863 in war between the contracting parties. Between 1856 and 1860 the usual course of internal dissension was interrupted by the filibustering exploits of William Walker (q.v.). In 1871 war broke out between Honduras and Salvador and Guatemala, and after peace was declared, in 1874, a revolution in the interests of the ex-President, Medina, took place. Other states interfered, and the Guatemalan candidate, Soto, acted at first as provisional President and was elected to that office in April, 1877. In 1880 the national capital was removed from Comayagua to Tegucigalpa, and Soto was reelected President. In 1899 General Sierra was chosen President for the term ending in 1903. He was succeeded by Gen. Manuel Bonilla. In July, 1906, there was a sharp five days' war between Honduras and Salvador on one side and Guatemala on the other. (See GUATEMALA.) In 1910 there was a revolt under General Valladares, who seized

Amapala. The next year ex-President Bonilla led a revolt, and the United States intervened to secure an adjustment of the difficulties. President Miguel R. Dávila resigned, and General Bonilla was elected for another term, assuming office Feb. 1, 1912. Disturbed conditions continued, and in 1913 United States marines were landed to protect American property. President Bonilla died on March 31, 1913, and was succeeded by the Vice President Francisco Bertrand.

HONDURAS, BAY OF. An inlet of the Caribbean Sea, between British Honduras, Guatemala, and Honduras. It forms several inlets, receives Belize and Motagua rivers, and contains the island of Turneffe and the Bay Islands, off the coast of Honduras.

HONDURAS, BRITISH. See BRITISH HONDURAS.

HONE, PHILIP (1780-1851). An American merchant and politician, born in New York City, where, with his brother, he built up a profitable business as an auctioneer. In 1816 he established the first savings bank in New York, was mayor of the city in 1826, and founded the Mercantile Library Association. He had been a Federalist, joined in the formation of the Whig party, and, it is said, gave it that name. He was prominent in national politics, opposed Jackson, and later condemned abolition. He wrote a diary for the years 1828 to 1851, which, edited in part by Tuckerman (1889), gives valuable impressions of life in New York and of the early days of the Whig party.

HONE, WILLIAM (1780-1842). An English author and bookseller, born at Bath. He was brought up in the strictest piety, even learning to read and write from the Bible. When 10 years old, he was apprenticed to a London attorney, but afterward set up as bookseller. He gained a contemporary notoriety by his satires on the government, which were illustrated by Cruikshank. For his parodies on the Prayer Book in his *Political Litany* (1817) he was prosecuted, but acquitted. His *Political House that Jack Built* (1819) ran through 54 editions.

Withdrawing from politics, he produced works of more permanent value, as. *Ancient Mysteries* (1823), a new edition of Strutt's *Sports and Pastimes* (1830); *Every Day Book* (1826-27), *Table Talk* (1827-28), *The Year Book* (1832), and many cheap and popular reprints. During his last years he frequently preached. He died at Tottenham. Some of the most characteristic of Hone's works have been reprinted by W. Tegg. *Every Day Book*, *Table Talk*, and *Year Book* (1873), and *The Three Trials*, an account of his prosecution by the government (1876). Consult *Early Life and Conversion of William Hone*, by Himself, edited by his son (London, 1841).

HONES (AS *hân*, Icel *hein*, stone, ultimately connected with Lat *cuneus*, Gk. *kónos*, *kónos*, wedge, Skt *sûna*, whetstone, from *sû*, *sî*, to sharpen), or **WHETSTONES**. A particular class of stones used for the purpose of sharpening edge tools, such as razors, knives, scythes, etc. They are usually cut into pieces of convenient size according to their intended uses. The finest kind of hones are those called oil-stones, these are hard, compact, and so very siliceous that they readily wear down the hardest steel, they are varieties of slate, derived from the argillaceous schists of the Paleozoic period. These stones are found in Turkey, Bohemia, Persia, in the Harz Mountains, in Styria, in the United States, Spain, Peru, and in Siberia. In Great Britain several localities yield hone stones of excellent quality, and none better than the celebrated Water-of-Ayr stone, which is much used for polishing copper plates as well as for hones. The hones used for sharpening scythes, etc., are usually made of coarse-grained sandstone. One of the best American stones for hones comes from Arkansas. In addition, there are artificial stones formed from abrasive materials, which possess advantages for certain purposes. See **ABRASIVES**.

HONESDALE. A borough and the county seat of Wayne Co., Pa., on the Lackawaxen River, 44 miles by rail northeast of Scranton, on the Delaware and Hudson and the Erie railroads (Map Pennsylvania, L 3). It has several public parks. Honesdale has extensive cut-glass manufactories. It manufactures also boots and shoes, silk and woolen goods, axes, foundry products, elevators, flour, paints, concrete blocks, etc. Pop., 1900, 2864, 1910, 2945.

HONEST GEORGE. A nickname given to George Monck, first Lord Albemarle.

HONEST MAN'S FORTUNE, THE. A play by Fletcher and Massinger and possibly others, performed in 1613 and printed in 1747.

HONEST MAN'S REVENGE, THE. See **ATHEIST'S TRAGEDY, THE**.

HONEST WHORE, THE. A play in two parts by Dekker, and perhaps Middleton, the first part of which was published in 1604. The earliest extant edition of the second part was not printed until 1630.

HONEY (AS *humg*, OHG. *honag*, *honang*, Ger *Honig*, of uncertain origin). A thick, sweet liquid, of more or less pronounced flavor, produced by bees of various kinds and by other insects. The neuter or working bees gather the nectar from the nectaries of flowers (and other sweet substances if flowers are lacking), extracting it by means of the proboscis and passing it into the crop or honey bag. The bee disgorges the honey into the cells of the comb. Apparently the sweet substance undergoes some change

in the honey bag, as honey differs in flavor from the nectar of the flowers from which it is gathered. The consistency of honey varies with age and is influenced by its source, that from some flowers being much thicker than that from others. The flavor also varies with the source from which it is gathered—that from clover, sweet clover, basswood, or linden flowers, e.g., being very agreeable, that from buckwheat is darker colored and less liked by some. Age also affects the flavor. Some honey which at first has a weedy taste loses this on keeping.

Honey has, on an average, the following percentage composition: carbohydrates, 81.2, water, 18.2, protein, 0.4, and ash, 0.2. The carbohydrates are made up of dextrose and levulose in about equal proportion. Honey sometimes contains a little wax and some aromatic bodies, which give it flavor. The best and newest honey is clear and contained in a white comb. Older honey is of a yellowish tone and sometimes darker. On standing, dextrose sometimes crystallizes out from liquid honey and renders it opaque or often thick. The composition of honey varies somewhat according to the food of the bees, their age, season, etc. It is a favorite article of diet, owing to its sweet taste and agreeable flavor. The actual food value depends upon the sugars (carbohydrates) present. Like all other carbohydrate foods, it is a source of energy. Honey has a fairly high fuel value, on an average—1520 calories per pound. It is, however, generally eaten for its flavor rather than for its true food value. To the ancients, who were unacquainted with sugar, it was very important, being used in ways as sugar is now. Taken in moderate quantity, honey is wholesome and laxative. Persons suffering from digestive disorders often find that it aggravates their symptoms, and there are persons in health who, owing to some idiosyncrasy, cannot eat honey without distress. Its therapeutic action is probably not very great, but it is frequently employed in mixtures prescribed for allaying coughs and in various agreeable cooling drinks used in febrile and inflammatory affections. It finds many uses in cookery, particularly in making cakes and confectionery. Some sorts, as certain German Christmas cakes and honey cakes, are very popular. It should be mentioned that honey occasionally possesses poisonous properties, due to the flowers from which it was gathered. The poisonous honey of Trebizond is gathered from *Azalea pontica*. In America poisoning has occurred from eating honey gathered from laurel (*Kalmia latifolia* and *Kalmia angustifolia*). Many other instances of poison honey are on record.

Honey is marketed in the comb and also extracted from it. The latter, sometimes called "strained" honey, was formerly often adulterated with commercial glucose. Since pure-food legislation was enacted, both national and State adulteration of honey has become uncommon in the United States. See also **BEE**.

HONEY BADGER. See **BADGER**.

HONEY BEAR (so called from its fondness for honey). The sloth bear of India (*Melursus labiatus*). One of the native names is aswail. See **BEAR**.

HONEY BEE. See **BEE**, **BEE KEEPING**.

HONEY BERRY. See **MELICOCOA**.

HONEY BUZZARD, or **PERN**. A large hawk of the genus *Fernus*, peculiar in having the lores closely covered with feathers, which over-

lap one another like scales. The food of honey buzzards consists, not of honey, but chiefly of bees, wasps, and their young, in quest of which these birds dig up the ground to get at the nests of the insects. They feed also partly on other insects and less frequently on lizards, small birds, and the like. The several species are natives of the Old World.

HONEYCOMB (AS *hunicamb*, from *hunig*, honey + *camb*, connected with *comb*, OHG *kamb*, *champ*, Ger *Kamm*, *comb*, Gk *γόμφος*, *gomphos*, OChurch Slav *zambŭ*, Skt *jambhya*, tooth). 1. See BEE, HONEY. 2. In a gun, a pitting of the exposed surfaces of the bore due to the corroding or rusting action of the residuum from smokeless powder. It results in inaccuracy and finally in unserviceability unless great care is taken to clean the gun after each day's use. The word is sometimes used for what is more properly called *erosion*, which is the mechanical removal of the superheated exposed surface of the bore effected by the frictional action of the gases of explosion under enormous pressure and with great velocities. No permanent cure for *erosion* has been devised. The modern gun on this account has a very limited life unless relined with a new bore, a remedy sometimes resorted to.

HONEY CREEPER. A bird of the family Cœrebidæ, a passerine family of tropical and subtropical America, especially abundant in the West Indies. They are small birds, 4 or 5 inches in length, but usually of very handsome plumage. The colors are frequently brilliant, blue being especially common. The bill is very slender, sharp, and often decurved, and the tongue is deeply bifid and penicillate. The honey creepers are very closely allied to the American warblers, of the family Mniotiltidæ, so common throughout the United States. About 40 species are known, one of which, the banana quit, has occasionally strayed to Florida. They probe the corollas of flowers for the minute insects contained therein, possibly also eating honey, and often hover before them like humming birds, which some of them hardly exceed in size or fall below in brilliance. Consult Gosse, *Birds of Jamaica* (London, 1847), and *A Naturalist's Sojourn in Jamaica* (ib, 1851).

HONEYDEW. A term applied to the sweetish secretion which under certain conditions drips from the leaves of some trees. It is a form of "bleeding" which appears only when an abundant supply of atmospheric moisture (reducing evaporation) and a high temperature permit the development of a considerable sap pressure in the live cells. Some kinds of manna are the dried honeydew or the saccharine exudations of certain plants. Very generally this exudation, as it dries, coats the surface of leaves and branches with a clammy film to which everything brought by the atmosphere adheres, thus closing the pores of the plant and impairing its health.

The name "honeydew" is often applied to a saccharine secretion of certain insects, notably the plant lice, the flea lice (Psyllidæ), certain scale insects and white flies (Aleyrodidæ), and certain leaf hoppers or tree hoppers. Of the latter, *Proconia* (*Oncometopia*) *undata* secretes the most abundant supply and is the cause of the phenomenon often described as "weeping trees." The honeydew secreted by all of these insects is frequently very abundant, giving the foliage and bark of trees a glistening appearance and fre-

quently attracting swarms of bees, ants, wasps, and other honey-loving insects. Sometimes, when very abundant, as when sugar cane is attacked by leaf hoppers, bees collect the honey dew to such an extent as to impair the quality of the honey. Honeydew affords a welcome nidus for the spores of certain of the smut fungi, and an affected tree is likely soon to become black with smut. Thus, an olive orchard in California or southern Europe, the leaves of which turn black, will almost always be found to be infested with a scale insect (*Lecanium oleæ*) which secretes a quantity of honeydew. Orange and lemon plantations sometimes suffer great injury from the abundance of honeydew. See APHID.

HONEY EATER, or **HONEY SUCKER**. A name sometimes given to some of the Oriental sunbirds (q v), but also the common name of a large family of birds nearly allied to these and peculiar to Australia and the islands of that part of the world. This family, Meliphagidæ, of the order Passeres, has a long curved sharp bill (see Plate of CREEPERS), not so slender as in humming birds and sunbirds, the tongue terminates in a pencil of delicate filaments the better to adapt it for sucking honey from flowers or juices from fruits. These are a part of the food of the honey eaters, but they also devour insects in great numbers. They are birds of elegant form and generally of gay plumage. Most of them have a long and broad tail. They are vivacious and active and keep up a continual chattering. Over 200 species of this family are known, arranged in about 25 genera. Examples are elsewhere described under BELL BIRD, BLOOD-BIRD, PARSON BIRD, ETC. Cf FLOWER PECKERS and see POLLINATION.

HONEY GUIDE, **INDICATOR**, or **MOROC**. The popular name of a family of birds ranked in the vicinity of the barbet (q v) and the woodpecker (q v), but differing from these families in characters which show a slight approach to cuckoos, and also, in some respects, to creepers. About a dozen species are known, mostly natives of Africa, and found in almost all parts of it, but one species occurs in India, one in Malacca, and one in Borneo. They have acquired their name from guiding men to honey, a curious instinct prompting them to flutter near the traveler with frequent repetitions of a cry which resembles the syllable *cherr*, and it is said that if followed they almost always lead to a place where a bees' nest may be found. This story has been denounced as fabulous, but reliable observers vouch for its truthfulness. The birds are very fond of honey and always reap a harvest after man has once opened up a bee tree and taken what honey he wants. It is said that the Kaffirs never fail to leave a generous meal for the bird which has guided them to the tree. The honey guides are small birds of dull plumage and rather stout bill. They generally build pensile nests and lay white eggs; but some species are said to lay their eggs in the nests of other birds, as the European cuckoo and the cowbird do. See Plate of TROGON, HOOPOE, ETC.

HONEY LOCUST, *Gleditsia triacanthos*, also known as sweet locust and black locust, and in Great Britain as three-thorned acacia. A lofty and beautiful tree of the family Leguminosæ, a native of the rich valleys from Ontario through the basin of the Mississippi. It is not found wild on the Atlantic coast of North America, although often planted in parks and in the

vicinity of habitations. The flowers are small, greenish, and in spikes. The leaves are twice pinnate, without terminal leaflets, and derive a peculiar gracefulness from the numerous small, light-green, shining leaflets. The tree is furnished with numerous sharp triple spines. The pods are long, flat, pendulous, often twisted, the seeds large, brown, and enveloped in a pulp, which, when the pod is ripe, is very sweet. Sugar has been made from it, and when fermented it yields an intoxicating beverage, formerly in use among the American Indians. The honey locust attains a height of 70 or 80 feet. The wood resembles that of the American locust tree (see ACACIA), but is more coarse-grained. A variety is common in which the trees are nearly without thorns. The honey locust is valuable for windbreaks, hedges, and other plantations. A second species, *Gleditsia aquatica*, called water locust, is found from Kentucky and Missouri to the Gulf region and along the Atlantic from South Carolina to Florida. A third species, *Gleditsia texana*, is a large tree in Texas, where it attains a height of more than 100 feet. See MESQUITE TREE.

HONEY-MAKING ANT. Any of several species of ants of the genus *Myrmecocystus*, inhabiting Colorado, Arizona, New Mexico, and Mexico. Like other ants, they live in colonies, in subterranean nests, the entrance to which is in a small raised mound. The honey is obtained at night from small galls on oak leaves by foraging workers which come home considerably distended with honey. With the honey they feed the other workers and the young in the hill, and what is left over is communicated to a number of ants which simply serve as living receptacles. These live honey bags cling to the roof of the nest chamber and move very little, and in time their abdomens become enormously distended. According to McCook, these living storehouses merely retain the honey until it is needed by the colony during the winter, when it is given out from the surcharged crops to feed the colony. Ants with similar habits, but of the genera *Melophorus* and *Camponotus*, have been described from Australia, and still another genus (*Plagiolepis*) has more recently been discovered in South Africa. In Mexico these ants are eaten by the natives. Consult McCook, *The Honey Ants of the Garden of the Gods*, etc. (Philadelphia, 1881), Comstock, in *Standard Natural History*, vol. 11 (Boston, 1884), Sharp, in *Cambridge Natural History*, vol. vi (New York and London, 1900); Wheeler, *Ants* (New York, 1910). See ANT.

HONEYMOON, THE. A comedy in five acts, by John Tobin. It was produced after the author's death in 1805.

HONEY MOTH. See BEE.

HONEY POD. See MESQUITE TREE.

HONEY STONE. See MELILITE.

HONEY SUCKER. A bird of the family Melphagidae, or some related form, as the diamond bird, an indefinite term for a somewhat indeterminate assemblage of Oriental and Australian birds. See BELL BIRD, HONEY EATER, MOHO.

HONEY-SUCK'LE (AS *humsuoc*, *humsuge*, from *huny*, honey + *sūcan*, *sūgan*, OHG *sūger*, Ger *saugen*, Lat *sugere*, to suck), *Lonicera*. A genus of plants of the family Caprifoliaceae. The species number 100 or more, all of which are indigenous in the Northern Hemisphere. They are shrubs, often twining, and have the

flowers either in whorls or in pairs. The calyx is short and five-toothed, the corolla, tubular-funnel-shaped, five-cleft, generally two-lipped; the fruit a three-celled and many-seeded berry. About half the species of *Lonicera*, as well as many hybrids, are in cultivation. The common honeysuckle, or woodbine, of England (*Lonicera periclymenum*) is very abundant in woods and thickets in most parts of Great Britain. On account of its beautiful cream-colored flowers and their delightful fragrance the honeysuckle is often planted in shrubberies. It is said to be the "twisted eglantine" of Milton. Very similar to this is the perfoliate honeysuckle (*Lonicera caprifolium*), with whorls of paler flowers, and remarkable for having the upper leaves united so that an opposite pair form one leaf, through the middle of which the stem passes. This peculiarity is confined to the flower-bearing shoots and does not occur in the young runners; it is also most perfect near the flower. This species is a native of the south of Europe and much planted, as, although less fragrant than the common honeysuckle, it flowers earlier. There are numerous other species, natives of Europe, Siberia, and North America. The fly honeysuckle (*Lonicera xylosteum*) is an erect shrub, a native of Europe and Asia, common in shrubberies. Its branches are not infrequently used in some parts of Europe for tubes of tobacco pipes, and it is said to make good hedges in dry soils. The trumpet honeysuckle (*Lonicera sempervirens*), a twining green shrub, called in America the coral honeysuckle, is a native of the southern United States, often planted on account of its beautiful scented flowers, red on the outside and scarlet within. The Japanese honeysuckle (*Lonicera japonica*) has become established in the eastern part of the United States, having escaped from cultivation. The berries of the honeysuckle are nauseous. The name "honeysuckle" is also given to shrubs very different from this genus, but of which the flowers abound in honey, as to species of *Banksia* in Australia, *Diervilla*, *Aquilegia*, etc., in the United States. *Rhododendron viscosum* is called swamp honeysuckle in North America.

HONEY-SUCKLE ORNAMENT. See ANTHEMION.

HONEY-SUCKLE TREE. See BANKSIA.

HONFLEUR, *on'flēr'*. A seaport town in the Department of Calvados, France, on the southern shore of the estuary of the Seine, 7 miles from Havre, which lies on the opposite shore (Map France, N, F 3). It has a fifteenth-century chapel, which contains J. Jordaens's famous painting, "Jesus in the Garden of Gethsemane." The town lost much of its former commercial importance, owing to the silting of its harbor and the proximity of Havre, but since 1860 a floating basin and other harbor improvements have been installed and have revived its waning commerce. There are thriving fishing industries and a considerable trade in cattle, butter, eggs, poultry, and grain is carried on. Considerable manufactures of rope, leather, metal goods, and chemicals have grown up. The United States is represented by a consular agent. Pop., 1901, 9610; 1911, 9298. Honfleur, founded in the eleventh century, was of considerable strategical importance during the wars between France and England.

HONG-KIANG, *hōng'-kyāng'*, or WEST RIVER. See SI-KIANG.

HONGKONG, *hōng'kōng'* (Chin., Fair Har-

bor) An island belonging to Great Britain, lying off the southeast coast of China, from which it is separated by a narrow channel (one-fourth mile at its narrowest), known as Ly-e-Mun (or Caipfish Pass), at the mouth of the Chu-kiang (or Pearl) River (Map China, K 7) It is 91 miles southeast of Canton and 40 miles east of Macao Consisting of a range of granitic hills, it has little level land, its coast line is very irregular, and its shores are steep and precipitous, but broken in many places, especially on the south coast, by deep inlets, the chief of which are Ty- (or Tai-) tam and Shek-pai Wan It is about 10 miles long from east to west and nearly 4 miles in average breadth Area, about 32 square miles The highest of six mountain peaks is Victoria Peak, with an elevation above sea level of 1825 feet

Geologically Hongkong is entirely of igneous origin, its prevailing rock being a gray, rapidly disintegrating syenite, upheaved and penetrated by porphyritic rocks and basaltic trap The climate of the island is very trying to foreigners The temperature seldom exceeds 93° F, the minimum summer temperature is 75° F, but the rainfall in certain seasons is sometimes excessive, which makes the humidity very high The driest month is December, and winter generally is the most delightful part of the year The sanitary arrangements are good, but the Chinese quarter is sometimes visited by epidemics

Notwithstanding the rocky character of the island and its generally barren appearance, Hongkong possesses a rich and varied flora Bentham, in his *Flora Hongkongensis* (London, 1861), enumerates 1066 species of flowering plants and ferns, divided into 591 genera and 125 orders The fauna of the island includes a few species of kingfisher, some singing birds and rock pigeons, several varieties of snakes and lizards are found, and scorpions and centipedes abound Insect life is more plentiful and includes the mosquito and a flying cockroach from 1 inch to 1½ or 2 inches long Ants, both white and red, are abundant and destructive

The census of May, 1911, gave the population of the British colony of Hongkong (ie, including the New Territories, on the mainland) as 456,739, of which 12,075 were non-Chinese and 444,664 Chinese The Chinese boat population numbered 54,083 The city of Victoria, capital of the colony, had 7825 non-Chinese and 216,022 Chinese residents The Peak population, on the high hill rising above Victoria, numbered 723 and 1749 respectively The inhabitants of the New Territories (Kowloon Extension), on the mainland, were reported at 90,594 Chinese. Of the islands around Hongkong under British jurisdiction, Lantau had 7940, Chengchow 2734, and Lamma 1134 Chinese inhabitants, mainly agriculturists and fishermen A considerable number of Chinese come and go to and from Hongkong, in 1912 this emigration numbered 122,657, and the immigration 163,248 In the same year 4461 Chinese left Hongkong for the United States, and 6757 returned

The harbor of Hongkong, characterized by H B Morse as "one of the few harbors in the world which may be called perfect" has an area of 10 square miles The only danger lies in occasional typhoons, which were destructive in 1906 and 1908 Extensive reclamation has been undertaken, consisting up to 1903 of 65 acres at a cost of \$3,362,325 (Hongkong currency) On this reclaimed ground stand some

of the finest buildings of the colony The numerous dock accommodations are excellent, safe, and well sheltered A new dock was added in 1908, the largest in the Empire outside of England, with a length of 787 feet, a width of 77½ feet at the bottom, 88 feet wide at the top, and a depth of 31 feet at low-water spring tides It can be filled in 45 minutes and pumped out in 2 hours, 40 minutes It is built of cement concrete lined with granite, on solid rock bottom, and can be enlarged

Hongkong was declared a free port in 1842 and has remained one ever since, except for a tax on opium and intoxicating liquor It is the distributing port of the world for south China, as Shanghai is for the north The colony publishes no statistics of trade or reexports, excepting shipping In 1912 there were 488,649 vessels, of 36,735,149 tons, which entered the harbor and cleared. Foreign ocean-going vessels showed an increase over 1911 of 187, of 674,680 tons British ships and commerce led among the nations, with Japan second and Germany third Exports from the United Kingdom to Hongkong in 1913 totaled £4,358,902, and imports £676,293 Exports of the United States to Hongkong were, in the fiscal year 1914, \$10,696,214, and imports therefrom \$3,085,840 The exports from the United States to Hongkong include flour, mineral oil, and cotton goods Hongkong's exports consist mainly of rice, tea, tin, silk, cassia, sugar, preserved ginger, drugs, and feathers, and imports of cotton yarn and goods, kerosene, machinery, coal, flour, woollens, cutlery, ginseng, tobacco, and opium For trade purposes the Mexican and Hongkong dollar are legal tender In 1912 the Hongkong dollar was equal to 2 shillings

There is little agriculture done in the colony The Chinese ply such industries as fishing, boat making, glass blowing, opium boiling, the manufacture of soap, dyes, and tooth powder, wood and ivory carving, goldbeating, and the production of gold, silver, copper, iron, and sandalwood wares Hongkong is a flourishing industrial centre There are three large sugar refineries, a brewery, ice, match, soap, lard, rope, and cigar factories, flour mills, cement works, gas and electric companies, engineering works, cotton spinning and paper mills, etc, also the manufacture of drainpipes, tiles, blackwood furniture, bamboo and rattan ware Granite quarrying is an important industry, and large quantities of dressed stone are exported The prosperity of the colony is best shown by the prices demanded and received for choice harbor fronts, which bring twice the prices of similar locations in Brooklyn or Jersey City

The average strength of the military force is 4500, of the navy 2500 men In addition there is a Volunteer Reserve Association of British residents over 25 years of age Regiments stationed at Hongkong consist mainly of Indian (Sikh) troops, although from time to time famous regiments of the British army are in garrison The harbor is well fortified, all commanding approaches being mounted with the latest type of guns. A small naval squadron is maintained Hongkong is also the naval base for the British warships of the China station

In 1912 the revenue amounted to \$3,180,694 (Hongkong currency), and expenditures to \$7,202,543 To the military expenses Hongkong contributed \$1,421,352, the highest pro rata of any part of the Empire The ratable value of

the city of Victoria in 1911-12 was \$9,006,553, and the assessment for the entire colony amounted to \$11,161,390. December 31, 1912, the assets of Hongkong exceeded the liabilities by \$2,805,129 (£280,513). The public debt, Jan 1, 1912, amounted to £1,485,732. Public revenue is derived mainly from land taxes and land sales, licenses, court fees, the post offices, rent of government property, light and harbor dues, opium, etc. Important items of expenditure are public works, the military, police, sanitation, and the section in British territory of the Hongkong-Canton Railway, begun in 1907 and opened 1910, with a branch line completed in 1912.

Hongkong is a crown colony, administered by a governor assisted by an executive council of eight and a legislative council of 14, which are composed of leading government officials, with the exception of six unofficial members of the Legislative Council, two of whom are always Chinese.

There are about 75 schools under government supervision or aid with 6333 students, and 312 unaided schools, with 9764 pupils. A Technical School was started in 1906 and has 421 students. The University of Hongkong was opened in 1912, and in 1917 the Hongkong College of Medicine will be incorporated with it. The patron is the King of England, and the chancellor the Governor. The university offers courses in arts, medicine, and engineering, including instruction in Chinese and public health. It is modeled on the plan of the University of London and started with 76 students. Queen's College numbers 555 boys, mainly Chinese. Hongkong has four daily English newspapers, five weekly, including the *Government Gazette*, eight Chinese publications, one Japanese, and an annual.

The great bulk of the population is found in the city of Victoria (called by the Chinese Kwanton), which extends for nearly 4 miles along the north shore, opposite the rocky peninsula of Kowloon, about 1½ miles distant. There are the government buildings and the great business houses and warehouses, stretching along the water front or perched in terrace-like rows on the steep hillsides. The city is well built, and its roads and streets, lighted with gas and electricity are kept in good repair. There are many trees, and the authorities are actively engaged in reforestation. The European quarter is in the middle of the city, with the Chinese densely populating the lower and western parts. Notable buildings are the Government House, the city hall, built in 1866-69 by subscription and containing a fine theatre, library, and museum, the post office, the courts of justice, supposed to be the most substantial building in Asia, and the clock tower, erected in 1862. There are also a fine botanic garden, a large parade ground, and several good hotels. Two Chinese theatres give native performances. Many statues adorn the prominent points. One of the numerous hospitals was the gift of Madame Wu Ting Fang. Over a dozen churches are found, some of them very beautiful buildings, also two Mohammedan mosques, a Sikh temple, and a Jewish synagogue. The Hongkong Chamber of Commerce meets annually, and its advice is often asked by the government on matters of trade. Among clubs the principal ones are the Hongkong, Germania, Lusitano, and Nippon. There are a Philharmonic Society, a Dramatic Club, and also golf, football, polo, cricket, hockey, and two yacht clubs. The Hongkong races form the great

society and sporting event of south China. The Peak district, high up on the hill, abounds with pretty bungalows and residences, and has also a club, church, hospital, public garden, and military sanatorium. Near the summit is the summer house of the Governor. An inclined plane and steam tramway, of the wire-rope system, goes two-thirds of the way to the top, while a well-made road runs to the summit. Besides the tramway the methods of conveyance in Victoria are by jinrikishas and sedan chairs. There is an electric tramway of 9¼ miles in length running from the capital. Of other towns on the island, the most important is Aberdeen, which has a good harbor and two docks.

The New Territories (Kowloon Extension) is on the mainland. Yaumatei is the principal village, with considerable junk trade, also gas works and water works. Three regiments of Indian infantry are stationed at Tsimtsatsui, where they have a mosque. There are also fine godowns, wharves, many churches, schools, hotels, a building yard, docks and works, a brewery, and a cigar factory. Much reclamation work has been done. The city of Kowloon remains under Chinese jurisdiction by treaty agreement.

Hongkong was ceded to the British in 1842 by the Treaty of Nanking. June 26, 1843, it became by proclamation a separate colony, but was governed by the Minister Plenipotentiary to China until 1857. Four square miles of the mainland were first leased and then ceded in perpetuity by the Peking Convention in 1860. In 1898 China ceded the territory behind Kowloon peninsula on a lease of 99 years, consisting of 376 square miles—286 square miles of mainland, 90 square miles of neighboring islands. Possession was taken by the British in 1899. Consult Mayer and Dennis, *Treaty Ports of China and Japan* (London, 1867), E. J. Eitel, *Europe in China. The History of Hongkong* (ib, 1895), Norman, *The Far East* (ib, 1898), James Cantlie, *Hong Kong*, in the "British Empire Series," vol 1 (ib, 1899), W. E. Curtis, *Egypt, Burma, and British Malaysia* (New York, 1905), J. S. Thomson, *The Chinese* (Indianapolis, 1909).

HONI SOIT QUI MAL Y PENSE, ō'nē swa kē mal ē pans (Fr., Evil to him who evil thinks). An exclamation popularly believed to have been uttered by Edward III at a ball when he tied about his leg a garter which the Countess of Salisbury had dropped while dancing. The words form the motto of the Order of the Garter (q.v.).

HONITON. See LACE.

HONITON, hōn'i-ton. A market town and municipal borough in Devonshire, England, on the Otter, 16 miles northeast of Exeter (Map England, C 6). It is famous as the original manufacturing seat of "Honiton lace," and it now has a school for lace makers. The manufacture was introduced by the Lollards during the reign of Elizabeth. There are also produced bricks, tile, pottery, and iron. Pop, 1901, 3271, 1911, 3191.

HONNECOURT, WILARS DE. See WILARS DE HONNECOURT.

HONOBERTUS. See CUNIBERT, SAINT.

HONOLULU, hōn'ō-lō'ō. The capital and commercial centre of the Hawaiian Islands, situated on the south coast of the island of Oahu, in lat. 21° 18' N, and long 157° 55' W, 2089 miles southwest of San Francisco (Map Hawaii, D 2). It is wholly modern, surrounded by lux-

urnut fruit and ornamental trees and foliage, and is famed for its beauty and the loveliness of the region. It has a very healthful and mild climate, especially favorable for pulmonary troubles. The streets are well laid out, and the houses, although unpretentious, are rendered picturesque by gardens. Honolulu has about 37 miles of macadam streets. The area of its public parks is 194 acres. Among the public buildings are the royal palace, completed in the Italian style in 1882, the government buildings, several churches, a museum containing interesting remains relating to the early history of the archipelago, a theatre, and a bank. There are 32 public schools and one high school, with 233 teachers and a total attendance of 5363 pupils in 1914. Oahu College had, in 1913, 743 students and 22 teachers. Honolulu has several hospitals and a public library. There are manufactures of machinery, pineapple canneries, and a factory for transforming the algaroba bean into stock food. The town is equipped with a good water supply, electric lighting and railway and telephone service. Its water-works plant, costing \$1,300,000, and its electric-light plant are owned and operated by the Territorial government. The harbor is well protected by coral reefs. The light from its lighthouse is visible 8 leagues. The number of ships entered and cleared in the fiscal year 1913 was 835, with a tonnage of 3,004,000. Honolulu has regular steam communication with San Francisco (with which it is also connected by cable), Seattle, Vancouver, New Zealand, Sydney, and Japan. It has also wireless communication with the coast of the United States and with the principal islands of the Hawaiian group and is an important relay station in the transpacific cable system. It forms the chief outlet for the trade of the entire archipelago. It is the seat of an Anglican and of a Roman Catholic bishop and of a number of European consular agents as well as of the government officials of the islands. As late as 1815 the present capital was a mere village. In that year, at the suggestion of John Young, an Englishman, then Governor of Hawaii, it was fortified, and in 1820 it became the capital of the archipelago. Pop. 1900, 39,306, 1910, 52,183 and estimated at 60,000 in 1914. The 1910 population included 9674 Chinese, 12,093 Japanese, 6147 Portuguese, 7910 Hawaiians, 4233 Caucasian-Hawaiians, and other Caucasians, 9200. The ocean distances from Honolulu are, to San Francisco 2100 miles, to Panama 4720, to Manila 4890, to Yokohama 3400, to Sydney (Australia) 4410, to Hongkong 4920.

HONOR. In English feudal land law, an estate or lordship made up of two or more manors held by one person of the king or of some mesne lord. The several manors comprised in the honor might in their turn be held by separate tenants of the lord of the honor. Where this was the case each manor retained its independent jurisdiction, exercised through its court baron, but where the manors were not separately held, one court baron was often, though not invariably, held for the entire honor. In this case, however, the court was regarded as the court baron of each manor and administered for each its own customary law, however this might differ from the law of the other manors. See **BARONY**, **COURT BARON**, **LORDSHIP**; **MANOR**, and, generally, **FEUDALISM**.

HONOR, COURT OF. A fraternal insurance

society founded in 1895. Its objects are to furnish life indemnity to its members to encourage them in business and to promote benevolence and charity. It is governed by a body of elected delegates, one for each 500 benefit members. In 1914 the society had 1204 courts, with about 75,000 members chiefly in the North Central States. Since its organization the society has disbursed in death and disability claims nearly \$10,000,000.

HONOR, KNIGHTS AND LADIES OF. See **KNIGHTS AND LADIES OF HONOR**.

HONOR, KNIGHTS OF. See **KNIGHTS OF HONOR**.

HONOR, LEGION OF. See **LEGION OF HONOR**.

HONOR, MAIDS OF. See **HOLSEHOID, ROYAL**.

HONOR, MEDAL OF (UNITED STATES). See **MEDAL OF HONOR**.

HONOR, TITLES OF. See **TITLES OF HONOR**.

HONORIA, JUSTA GRAIA. A daughter of Constantius III and sister to Valentinian III, born about 418 AD in Constantinople. Living at Valentinian's court in Rome, she secretly invited, it is said, Attila the Hun to marry her, but as he did not entertain the proposition, she sent another invitation, and Attila, accepting it, claimed with her a portion of the Empire. As Valentinian refused to accede to such a demand, Attila invaded Gaul. Honoria's fate is unknown. For a criticism of this story, consult the *Cambridge Medieval History*, vol. 1 (New York, 1911).

HONORIUS. The name of four popes and one antipope—**HONORIUS I**, Pope 625-638. He was born of a consular family in Campania. Of his early history little is known, except that he took an active part in bringing to a close the disputes which arose in northern Italy about the controversy of the three chapters (See **VIGILIUS**). As Pope, his name is connected with the history of the paschal controversy in Ireland and with that of the early Anglo-Saxon church, and his pontificate is particularly memorable on account of the Monothelite heresy. (See **MONOTHELITISM**.) Honorius, misled, it is alleged, by a letter of Sergius, Patriarch of Constantinople, replied that the terms in controversy should not be used and even appeared to condemn the doctrine of two wills of Christ. In a decree of the sixth general council (Constantinople, 680-681) Honorius is anathematized in company with Sergius and others, of whose heterodoxy there can be no doubt. Catholic theologians, however, defend his orthodoxy, or point out that his case is not one of those in which infallibility is claimed by the Vatican decree, or that he was not Monothelite, but only sanctioned the suppression of orthodox as well as heterodox terms for the sake of peace. It was because Dollinger (qv) believed that the heresy of Honorius was irrefutably established that he could not conscientiously accept the dogma of papal infallibility, because it was retroactive and implied that there never had been a pope who was heretical. This assertion in regard to Honorius was an important factor in the Old Catholic movement. He died in 638. The controversy in the Vatican council produced an extensive literature. Consult Pennacchi, *De Honorii Causa in Concilio Serto* (Rome, 1870), Hefele, *Causa Honorii Papae* (Naples, 1870), a defense presented to the Vatican council, Willis, *Pope Honorius and the New Roman Dogma* (London, 1879), Dollinger, *Fables and Prophecies of the Middle Ages* (New

York, 1892). Mann, *The Popes in the Early Middle Ages*, vol 1 (London, 1902). Chevalier, *Repertoire des sources historiques, Bio-bibliographie s v Honorius I* (Paris, 1905). F A Gasquet, *Henry III and the Church* (London, 1905). The letters of Honorius are in Migne, *Patrologia Latina*, lxx—HONORIUS II (Lambert, Cardinal of Ostia) Pope 1124-30. He recognized Lothair of Saxony as German Emperor (see LOTHAIR III) and was unable to crush the growing power of Count Roger of Sicily in south Italy (See ROGER II). His letters are in Migne, *Patrologia Latina*, clxvi.—HONORIUS II was also the title taken by Peter Cadalous, Bishop of Parma, antipope to Alexander II, 1061. He died 1073. Consult Hauck, *Realencyclopädie*, vol viii (Leipzig, 1900).—HONORIUS III (Cencio Savelli) Pope 1216-27. He crowned Frederick II as Emperor, tried in vain to institute a crusade, and confirmed the orders of the Dominicans and Franciscans. To him we owe the famous *Liber Censusum Romanæ Ecclesiæ*, in which the income of the Church of his day is detailed. It was reprinted by Paul Fabre, *Liber Censusum* (Paris, fasc 1, 1889, fasc 2-5, 1901-04). Consult Tauge, *Die päpstlichen Kanceliordnungen von 1200-1500* (Innsbruck, 1894). His works are in Hooy, *Mémoires de la Bibliothèque Patristica* (Paris, 1879-82). Consult *Regesta*, edited by P. Pressutti (Rome, 1888-95), and, for his life, Clausen (Bonn, 1895). Knebel (Münster, 1905).—HONORIUS IV (Giacomo Savelli) Pope 1285-87. He was born in 1210 and notwithstanding his years when called to the papal see, was very energetic. Consult his life by Pawheki (Münster, 1896), and F. Gregorovius, *Rome in the Middle Ages*, vol v (London, 1900-02).

HONORIUS, FLAVIUS (384-423 A.D.) Roman Emperor of the West from 395 to 423, second son of Theodosius the Great. When, on the death of his father, 395 A.D., the Empire was divided into two parts, Honorius received the western half, with Rome as his capital, while his brother Arcadius received the eastern half, with Constantinople as his capital. Honorius was put under the guardianship of Stilicho (qv), who was for 13 years the de facto ruler of the Western Empire. Honorius at first took up his residence at Milan, later for the most part he held his court at Ravenna. In 398 he married Maria, the daughter of Stilicho. In 401 Alaric (qv), King of the Visigoths, invaded Italy. Stilicho, who was then in Germany, marched against him, and a great battle was fought at Pollentia in 403 (or 402), followed by another encounter at Verona (403). Alaric, unable to withstand Stilicho, withdrew from Italy. Another irruption of barbarians, under Radagaisus, took place in 405, which was again repelled by Stilicho, who nevertheless lost the favor of his master and was treacherously slain at Ravenna, 408 A.D. Alaric, quick to take advantage of the opportunity afforded him, invaded Italy in 408 and besieged Rome, which escaped only on the payment of a heavy ransom, and in the following year he again besieged and took it, raising Attalus to the Imperial purple as a rival to Honorius, but a little later deposing him. In 410 the Visigothic King again appeared before Rome and handed it over to be pillaged by his troops. The death of the invader in the same year again freed Italy. A new champion of the falling Empire arose in the

person of Constantius, who suppressed the rebellions of Constantine, Jovinus, and Sallustius in the northern provinces and of Heracian in Africa. He was now appointed the colleague of Honorius in the consulship and received in marriage the hand of Placidia, sister of Honorius, along with a share in the Empire (417), which he did not long enjoy, as his death took place a few months after. The Gothic and German tribes had for some time been slowly but steadily encroaching upon the Western Empire, and in the reign of Honorius, a feeble ruler, Spain, Gaul, and Pannonia, some of the finest provinces, were snatched from its grasp. In support of the Church, however, and in persecution of the heathen Honorius showed much energy. He died Aug 27, 423. Consult Bay, *Later Roman Empire* (London, 1889), and the *Cambridge Medieval History*, vol 1 (New York, 1911).

HONORS, MILITARY. The courtesies, salutes, and other ceremonies, granted as a matter of custom and regulations to civilian officials of the government, to military officers of high rank, to the national and regimental flags, to the national anthem, and to the official and military dead. These honors include playing the national anthem on ceremonial occasions, sounding "to the color" with field music or bugles, "dropping" the regimental colors or standards by way of salute, sounding "flourishes" on trumpets and "ruffles" on drums, hand salutes, salutes with cannon, visits of courtesy, escorts of honor, escort of the color, funeral escorts of honor, half-masting the flag in case of death or on Memorial Day, etc. See SALUTES.

HONORS OF WAR. Stipulated privileges allowed a capitulating enemy, formerly a chivalrous appreciation of his valor, but in later times dictated almost entirely by the political or economic phase of the question. Honors of war include the retention of arms or standards, the granting of parole, and the general treatment of the surrendered troops and stores.

HONSHU, hōn'shū. The most important of the group of islands constituting the Empire of Japan. See HONDO.

HONTAN, A L, BARON DE LA. See LA HONTAN.

HONTHEIM, hōnt'hīm, JOHANN NIKOLAUS VON (1701-90). A German Roman Catholic prelate and writer. He was born at Treves, Jan. 27, 1701. He was educated in the Jesuit school of his native city, studied canon law at Louvain under the celebrated Van Espen, and afterward taught at Treves and Coblenz. He wrote two voluminous works on the history of Treves, *Historia Trevirensis Diplomatica* (1750) and *Prodromus Historiæ Trevirensis* (1757), but his literary career is chiefly memorable for a theological essay, *De Statu Ecclesiæ et Legitima Potestate Romani Pontificis* (1763), which by the novelty and boldness of its views created an immense sensation in the theological world. The work was composed with a view to the reunion of Christian sects. The work was published under the pseudonym of Justinus Febronius (a name taken from that of Hontheim's niece, a canoness at Juvigny, who was called Justina Febronia), and the system of Church government which the work propounds has been called Febronianism (qv). The work, immediately after its appearance, was condemned by Clement XIII as well as by many individual bishops. It drew forth a number of replies, the most im-

portant of which are those of Zaccaria (1767) and Ballerini (1768) Pius VI, in 1778, required from Hontheim a retraction of these doctrines This retraction, however, was modified by a subsequent *Commentary*, published at Frankfurt in 1781, to which, at the desire of the Pope, Cardinal Gerold replied Hontheim made full submission to the Church in 1788 and died in his ninetieth year at Montquintin in Luxembourg, Sept 2, 1790 Consult Mejer, *Febionius* (Freiburg, 1885), a work biased in favor of Hontheim

HONTHORST, hōnt'hōrst, GERARD VAN (1590-1656) A Dutch portrait, genre, allegorical, and historical painter, born at Utrecht He was a pupil of Abraham Bloemaert At 20 he went to Italy and was greatly influenced by Caravaggio, it was there that he gained the sobriquet Gherardo della Notte, from his frequent painting of night scenes When he returned to Utrecht, he was made the head of the Guild of St. Luke (1623) and opened a large school An invitation from Charles I took him to England in 1628 There he decorated Whitehall with allegorical pictures and painted portraits of the royal family and of many of the English nobility On his return to Holland he decorated the palace of The Hague In the National Portrait Gallery, London, are portraits by him of the Duke of Buckingham, the Earl of Craven, the Queen of Bohemia, James Harrington, Ben Jonson, at Hampton Court, a picture of the King and Queen of Bohemia enthroned in the clouds as Apollo and Diana, with the Duke of Buckingham as Mercury (for this Honthorst received 3000 gulden, a silver service for 12 persons, and a horse). His historical and religious pictures are unimportant, and his portraits, though excellent as likenesses, sometimes lack ideality

HONVÉD, hōn'vād (Hung, land defenders) The name given in Hungary under the earlier kings to the national champions With the disappearance of these the word, too, disappeared, but in the summer of 1848 it was revived and applied first to those Hungarian volunteers dispatched to the south against the Serbs and subsequently, when the war with Austria commenced, to the whole patriotic army Since the reconstruction of the Austro-Hungarian monarchy the name "honved," or "honvédség," has been given to the militia of the Hungarian portion of the Empire In 1893 a monument was erected in their memory at Budapest See AUSTRIA-HUNGARY, *Army*

HOOBLY, hōb'blī A town in the Province of Bombay, British India See HUBLI

HOÛCH, hōg, or **HOOGH**, PIETER DE (1629-after 1677). One of the principal Dutch genre painters Recent research has shown that he was born at Rotterdam in December, 1629, not at Utrecht in 1632, as was formerly supposed According to Houbraken (qv) he was a pupil of Nicolaes Berchem; his early work, however, does not resemble this supposed master's, but rather the art of the painters of Delft and Leyden In 1653 he is mentioned as "painter and footman," in the service of Justus de la Grange, a rich merchant, with whom he lived at Delft, Leyden, and The Hague Leaving his service, the artist was married in 1654 to a girl of Delft, in which city he is recorded as member of the painters' guild in 1655 From his dated pictures showing views of Delft, we know that he probably lived there till 1665 This is the

period of his best works, painted in rivalry with Jan Vermeer The two artists were closely associated and mutually influenced each other to such an extent that their works have been sometimes confused Both are essentially painters of strong light effects, usually in interior scenes, but De Hooch usually adds the vista of a second room, brightly illuminated His colors are warmer, including a strong red, like that of Nicolaes Maes, and he uses more figures than does Vermeer in his compositions representing scenes from the home life of the middle class After his removal to Amsterdam, where his presence is recorded in 1668, his art declined He became a fashionable painter of high society in large and magnificent salons, with a superficial execution and exaggerated light effects His last-known work is dated 1677, soon after which he died Owing to the variety as well as the excellence of his works, they bring the very highest prices The Rijks-Museum, Amsterdam, has six, including the well-known "The Pantry," "Maternal Tasks," and "County House", the Berlin Museum four, including "Woman beside a Cradle", the National Gallery of London three, including "Young Woman with Five Cavaliers" He is also well represented at St Petersburg, in the Louvre, Buckingham Palace, the Wallace collection (London), and elsewhere Indeed, according to De Groot, most of his best works are in England and the United States In the Metropolitan Museum, New York, are two—"The Courtyard" Morgan collection, and "Interior with a Young Couple," Altman collection, in the Widener collection, Philadelphia, are "Woman and Child in a Courtyard" and "The Bedroom", others are in the Havemeyer, Blodgett, and Borden collections, New York

Bibliography. The best accounts of De Hooch's life and art are in Hofstede de Groot, *Catalogue of Dutch Painters* (London, 1908), and Bode, *Great Masters of Dutch and Flemish Painting* (ib, 1909) Consult also De Rudder, *Pieter de Hooch et son œuvre* (Brussels, 1914)

HOOCHENOO, hōo'chē-nō or KOOTZNAHOO A spirituous liquor concocted by the natives of Alaska and named from one of the tribes of Indians The name has been shortened by the white man to *hooch* and is used as a synonym for any ardent spirit

HOOD, ALEXANDER (1758-98) An English naval officer His first voyage (1767) was aboard the *Romney* with his cousin, Capt Samuel, afterward Viscount, Hood; but in 1772 he went round the world on the *Resolution* with Captain Cook. From 1776 to 1783 he was in active service in North America and the West Indies In 1797 he was appointed to command the *Mars* of the Channel fleet and was one of the captains put ashore by the mutineers off St Helens and Spithead The next year, when his frigate was engaged in the famous duel with the *Hercule*, Captain Hood was mortally wounded at the moment of victory

HOOD, EDWIN PAXTON (1820-85) An English Congregationalist He was born in London, Dec 18, 1820, educated privately, and became a Congregational clergyman in 1852 He held various charges and from 1880 to his death in Paris, June 12, 1885, he was pastor of the Falcon Square Church, Aldersgate Street, London He rendered conspicuous service in raising the funds for the Royal College for Incurables, his pamphlet, "The Palace of Pain"

(1885), having brought in £2000. He was the author of numerous popular volumes among others, *Lamps, Pitchers, and Trumpets*, *Lectures on the Vocation of the Preacher* (1867), a racy volume on homiletics and the history of preaching, and *The World of Moral and Religious Anecdote* (1870). He added to his books on preaching *The Throne of Eloquence*, *Great Preachers*, *Ancient and Modern* (1885) and *The Vocation of the Preacher* (1886). His agreeable book-making powers were exhibited in the biographies of John Milton (1852), Andrew Marvell (1853), Emanuel Swedenborg (1854), William Wordsworth (1856), Thomas Binney (1874), Isaac Watts (1875), Thomas Carlyle (1875), Christmas Evans (1881), Robert Hall (1881), and Oliver Cromwell (1882).

HOOD, JAMES WALKER (1831-) An American bishop of the African Methodist Episcopal Zion church. He was born in Kennett Township, Chester Co., Pa., and was largely self-educated. Entering the ministry in 1858, for two years his work was in Nova Scotia. In 1863 he was a missionary among the members of the negro race in the Union army. He was a member of the Constitutional Convention of North Carolina in 1868, and during the same year was assistant superintendent of public instruction in North Carolina. Elected a bishop in 1872 he came to be senior bishop of his church. In 1879 he was elected president of the board of trustees of Livingstone College, Salisbury, N. C. He is author of *The Negro in the Christian Pulpit* (1884), *One Hundred Years of the African Methodist Episcopal Zion Church* (1895), *The Plan of the Apocalypse* (1900), *A Second Book of Sermons* (1908).

HOOD, JOHN BELL (1831-79). An American soldier, prominent on the Confederate side during the Civil War. He was born in Owingsville, Ky., graduated at West Point in 1853 and saw service for two years in California and against the Indians. He remained in the United States army until 1861, when he resigned to accept a commission in the Confederate service. During the first years of the war he took part in the Virginia campaigns, where his gallantry gained him the rank of major general. At Gettysburg his division was stationed on the extreme right of the Confederate line and took part in some of the most desperate fighting of that bloody battle. He was severely wounded, losing the use of one of his arms. In September, 1863, he was sent to the aid of General Bragg in Tennessee and took part in the battle of Chickamauga, September 19-20, where he lost a leg. The next spring he again took the field and was made a lieutenant general in Johnston's army. During the campaign by which this general sought to impede Sherman's advance on Atlanta, Hood was engaged in several battles, and on May 25, 1864, his corps was attacked by Hooker at New Hope Church. On July 17 he was given the temporary rank of general and was appointed to succeed Johnston in command of the Army of the Tennessee, the Fabian policy of that officer having caused his removal. Sherman was exultant at this change, for he knew that Johnston's wearing tactics would now give place to a policy which would enable him to make good use of his superior fighting strength. On July 20 was fought the battle of Peach Tree Creek, as a result of which Hood was compelled to withdraw into the fortifications about Atlanta, and two days later the

battle of Atlanta followed his flank movement towards Decatur. On July 28 he attacked the Federal forces, but was again compelled to withdraw into his fortifications. After another engagement at Jonesboro, on September 1, he abandoned Atlanta, which was entered by Sherman on the 2d. Hood, after operating for several weeks along the line of Sherman's communications and moving westward into northern Alabama, crossed the Tennessee River about the end of October and began to move northward through Tennessee against General Thomas. After his attack on the Federal forces under Schofield at Franklin had been repulsed (see FRANKLIN, BATTLE OF), he proceeded to Nashville, where he found Thomas stationed with a force about equal to his own. Thomas was not prepared at the outset and for nearly two weeks the two armies faced each other. At last, on December 15, Thomas ordered the attack. The Confederates fought desperately, but were forced back all along the line. That night Hood reformed his army and the next day awaited the Federals on the Overton Hills. Owing to his strong position, he succeeded in repelling the first assault, but the second was more successful, and soon the Confederates were driven in utter rout. As a military force, Hood's army disappeared, and on Jan. 23, 1865, at his own request, he was relieved of his command. After the war he became a commission merchant in New Orleans and president of the New Orleans branch of the Life Association of America. He wrote a book entitled *Advance and Retreat*, *Personal Experiences in the United States and Confederate States Armies* (1880), and wrote a number of articles for *Battles and Leaders of the Civil War* (New York, 1887).

HOOD, MOUNT. A peak of the Cascade Range (qv), on the west border of Wasco Co., Ore. (Map Oregon, D 2). It is about 50 miles east by south of Portland, whence it is reached by rail to Hood River, 66 miles, and thence by stage to the base of the northern glaciers. It has an altitude of 11,225 feet, there are no formidable obstacles to its ascent, and the summit commands an extensive and magnificent view.

HOOD, ROBIN. The hero of a group of English ballads, which represent him as an outlaw, dwelling in Sherwood Forest, Nottinghamshire, or in Barnsdale, a woodland district in the West Riding of Yorkshire. The earliest-known mention of him is in the second version of *Piers Plowman* (about 1377), where Sloth says he "knows rymes of Robyn Hood" (*Skeat*, passus v, II 401, 402). A most important ballad of which he is hero is "A Lytell Geste of Robyn Hode," first printed in 1510, but probably to be dated considerably earlier. This poem consists of 456 four-line stanzas. Among succeeding ballads, of which Professor Child collected 39, are "Robin Hood and Guy of Gisborne," "Robin Hood and the Monk," and "Robin Hood's Death." As early as the last half of the fifteenth century Robin Hood became a popular character in the semidramatic celebrations of May Day, both in England and in Scotland, and later in the regular drama, as in Ben Jonson's beautiful pastoral *The Sad Shepherd*. Robin is the ideal outlaw, courteous, liberal, and reverent. Skillful with the bow, he shoots the King's deer, but he loves the King. He takes from the rich clergy their superfluous goods, but what he does not need himself he gives to the poor. He is chival-

rous towards all women and reveres the Virgin Mary. His chief foe is the sheriff of Nottingham. With him are Little John, Scathlock or Scarlock, Friar Tuck, Maid Marian, Much the Miller's Son, and several others. In his illness Robin goes to a prioress, who is his cousin, to be bled. She allows him to bleed to death. There is a legend that he died at Kirkless, or Kirklees, in the parish of Dewsbury (qv), and Martin Parker declares in his *True Tale* (1632) that an epitaph to him was formerly to be read at the first-named place.

Unsuccessful attempts have been made to prove the real existence of Robin. True, his career as eventually developed has all the details of authentic history, but these were taken from the ballads themselves, or from semihistorical personages, as Hereward the Wake and Wallace, and applied to Robin. Others have tried to connect the surname Hood with Woden, the chief of the Norse gods, or with Hodr (warrior), another Norse divinity. It is now rather thought to be a variant of Hodeken, an elf in Germanic folk tales. Robin is of course a diminutive of Robert. Robin Hood then seems to have been at first only an elf of the woods, about whom later gathered typical adventures of the outlaw. Robin Hood is the hero of a comic opera by Reginald De Koven (qv), and of a play, *Shriwood*, by Alfred Noyes (qv), and Tennyson's *The Foresters* has Robin Hood as its main character.

Bibliography. *Bishop Percy's Folio*, ed Hales and Furnivall, vol. 1 (London, 1867), Child, *English and Scottish Ballads* (Boston, 1883 et seq.), Pollard, *An English Garner Fifteenth Century Prose and Verse* (Westminster, 1903), Krout, *Bold Robin and his Forest Rangers* (New York, 1905), and for an attempt to prove the existence of Robin Hood, Hunter, *The Great Hero of the Ancient Minstrelsy of England* (London, 1852). Sidney Lee's article in the *Dictionary of National Biography*, vol. xxvii (New York, 1895-1901) is an important résumé of the subject, and two valuable articles were contributed by E. Brabrook to *The Antiquary*, June, July, 1906 (London, 1906).

HOOD, SAMUEL, VISCOUNT (1724-1816). An English admiral, born at Butleigh, Somersetshire. He embarked at first as captain's servant, then as seaman, was midshipman on Rodney's ship (1743), was lieutenant at 22 and post captain at 32. In 1757 he captured two French privateers and was rewarded by an appointment to a ship of his own. During his retirement from active service (1778-80) he was commissioner of the dockyards at Portsmouth, but went to sea again under Admiral Rodney, as next to him in rank upon the North American squadron. Hood took part in several famous naval battles in 1781-82, notably that of Dominica, for his share in which he was granted an Irish peerage. He was elected member of Parliament for Westminster in 1784, was made Lord of the Admiralty four years later, took command of the British fleet in the Mediterranean in 1793, was promoted to the rank of full admiral in 1794, and in 1796 was made Viscount. He was specially strong as a tactician, and, at the time of his retirement, was described as "the best officer, take him altogether, that England has to boast of." He was governor of Greenwich Hospital from 1796 until his death. Consult Laughton, *From Howard to Nelson* (London, 1899).

HOOD, SIR SAMUEL (1762-1814). A British naval officer. Having entered the navy in 1776, he took part in the fight off Ushant in 1778 and in subsequent engagements, including the capture of the French squadron in the Mona Passage in 1782. Early in 1794 his resourcefulness saved his ship, the *Junó*, from the French at Toulon. As commander of the *Zealous*, he participated in Nelson's attack on Santa Cruz in 1797 and in the Battle of the Nile. In 1801 he commanded the *Venerable* in the action at Algierias and in the victory in the Straits, in 1802 he became commodore of the Leeward Station, where he captured several islands and also the enemy's privateers and men-of-war, and in 1805 he defeated a French squadron off Rochefort, but the engagement cost him an arm. Soon afterward he was promoted to rear admiral. He reduced Madeira in 1807 and in 1808 with the *Implacable* destroyed the Russian ship *Sevolut*. A year later he was made Baronet, and in 1811 vice admiral, from then until his death he served as commander in chief in the East Indies.

HOOD, THOMAS (1799-1845). An English poet and humorist, born in London, May 23, 1799. After leaving school he was placed in a merchant's countinghouse, but, his health failing, he was sent to Dundee. At the age of 19 he returned to London and studied the art of engraving with his uncle. In 1821 he became assistant subeditor of the *London Magazine*. He contributed to it considerable verse and made the acquaintance of its brilliant staff, which included De Quincey, Hazlitt, and Lamb. His first separate publication was entitled *Odes and Addresses on Great People*, written in conjunction with J. H. Reynolds (1825). In 1826 he published *Whims and Oddities*, of which a second series appeared during the following year. In 1830 he began the *Comic Annual* and continued it for nine years. The same year he edited the *Gem*, one of the popular annuals, contributing to its pages his striking poem entitled 'Eugene Aram's Dream.' In 1824 Hood married the sister of J. H. Reynolds, and in 1831 he went to reside at Wanstead in Essex, where he wrote his novel *Tynney Hall* (1834). While there he suffered from the failure of a publisher. In 1835, now weakened in health, he went to the Continent, where he remained five years, first at Coblenz on the Rhine and then at Ostend. He, however, continued his *Comic Annuals*, started *Hood's Own* (1838), containing a portrait and reminiscences, and made Smollett's *Humphrey Clinker* a framework for some humorous sketches called *Up the Rhine* (1839). In 1840 he returned to England and began to write for the *New Monthly Magazine*, of which he became editor the following year. Here appeared "Miss Kilmansegg," his best comic poem. Withdrawing from this magazine towards the close of 1843, he started *Hood's Magazine*, January, 1844, and in the same year collected his fugitive pieces under the title of *Whimsicalities*, which were illustrated by Leech. By Christmas he took to his bed, which he never again left. During his last illness Sir Robert Peel conferred on him a pension of £100 a year, which he transferred to his wife. He died May 3, 1845, and was buried in Kensal Green Cemetery.

Hood takes a high place both as humorist and as serious poet. He excels at once in comedy and in pathos, and he sometimes curiously mingles and combines both. As a punster, he is—whether to his glory or no—supreme, he con-

nects far-separated words and ideas by the most subtle analogies and sends them loose. Much of his comedy, however, is verbal and shallow and will be soon forgotten. It is as a poet that Hood will be remembered. His "Eugene Aram's Dream," "Song of the Shirt," and "Bridge of Sighs" are among the most perfect poems of their kind in the English language. Consult *Literary Reminiscences in Hood's Own* (1st series, London, 1838), *Memorials*, edited by his daughter (ib, 1860), Eliot, *Hood in Scotland* (Dundee, 1885), W. C. Jerrold, *Thomas Hood, His Life and Times* (New York, 1909); *Works*, edited by his son and daughter (10 vols, London, 1869-73), *Poems*, edited by Ainger, in "Everley Series" (12 vols, ib, 1897), *Haunted House*, with memoir by Austin Dobson (ib, 1895). His collected works appeared in 1882-84.

HOODED CROW (so called from the marking on the head). A true crow (*Corvus cornix*) of the north of Europe, also called in England dun, or gray, and Royston crow, and in Scotland hoodie. The head, fore parts, and wings are glossy black, the remainder of the body ash color, the bill and feet black. It is slightly migratory and retreats southward in winter from the most northerly parts of Europe and Siberia when the other crows go south. Its general habits are those of the carrion crow, with which it interbreeds extensively, so that some naturalists believe the two birds to be varieties of one species. See Newton, *Dictionary of Birds* (London and New York, 1896).

The hooded crow of India is a smaller species (*Corvus splendens*) of similar appearance. It is tame to the point of being a nuisance to Europeans wherever it is numerous. Hardly a station or camp in British India, it is said, is free from a crowd of these feathered thieves. They have the amusing habit of building their nests of the wire from discarded soda-water bottles.

HOODED MERGANSER. See MERGANSER.

HOODED SEAL. A large seal (*Cystophora cristata*), inhabiting the coasts of Greenland and North America as far south as the United States. It also occurs on the coasts of Sweden and Norway and in the Arctic Ocean. It is found generally in the icy islands or floating ice fields in the open sea and visits the land in April, May, and June. About 2 inches from the extremity of the upper jaw there is a cartilaginous crest, increasing in height as it passes backward to the back part of the head, where it is about 7 inches high and has a longitudinal depression in the middle, about an inch deep. This crest is an elongation of the septum of the nose, and the true nostrils open on either side of it. It is covered by a muscular hood clothed with fur. The whole apparatus is probably defensive, but may be accessory to the organ of smell and, as the fishermen suppose, may serve as a reservoir of air while the animal is under water. The hood is wanting in the females and young. The hooded seal is polygamous and brings forth its young on the ice. It has a voice resembling the bark and whine of a dog and when attacked weeps copious tears.

HOODED WARBLER (so called from the marking on the head). One of the most beautiful and active of the American fly-catching warblers. (See WARBLER.) It is olive green above and yellow below, with the head, neck, and breast deep black. It inhabits in summer the eastern United States, where it frequents thickets and undergrowth and makes a soft, cuplike nest in

low bushes. Its systematic name is *Wilsonia citrina*. See Colored Plate of WOOD WARBLERS with WARBLER.

HOODIE. See HOODED CROW.

HOOD OF AVALON, ARTHUR WILLIAM ACLAUD WOOD, BARON (1824-1901). A British naval officer, born at Bath. Entering the navy in 1836, until 1854 he served on the *President* and the *Arethusa*, largely in the Mediterranean. In command of the *Acorn* he participated in the engagements at Fatschan, China, and in the capture of Canton in 1857, and for these services was promoted to captain in 1858. He commanded the *Pylades* in 1862-66, had charge of the school of gunnery on board of the *Excellent* in 1866-69, and then was appointed director of naval ordnance. After commanding the *Monarch* in 1874-76 he was promoted to rear admiral, was Lord Commissioner of the Admiralty in 1877-79, commanded the Channel fleet in 1880-82, became full admiral in 1885, and retired in 1889. He was made a peer in 1892.

HOOD RIVER. A city and the county seat of Hood River Co., Oreg., 66 miles by rail east of Portland, on the Columbia River, and on the Mount Hood and the Oregon-Washington Railroad and Navigation Company main lines (Map: Oregon, D 2). It contains a Carnegie library, county hospital, fine high school, and municipal water works. Hood River is in a great fruit-growing region, noted particularly for its apples and strawberries, and has saw and planing mills, evaporators, canneries, a vinegar factory, a cooperation creamery, a meat-packing plant, a concentrated cider and apple sirup factory, machine shops, and wagon works. Pop., 1910, 2331.

HOOF (AS *hōf*, OHG *huof*, Ger *Huf*, connected with OChurch Slav. *kopyto*, hoof, or with Skt *śapha*, Av. *safa*, hoof). The exterior horny covering of the foot of many animals. The healthy soundness of the horse's foot is mainly preserved by permitting it to grow uninjured by the rasp and knife, its toughness is secured, and undue dryness and evaporation prevented, by smearing daily the crust, sole, and frog with a little glycerin, or a mixture of a pound of lard and a quarter of a pound each of tar, honey, beeswax, and glycerin melted together. Softness and brittleness of the hoof, which are common sources of cracks and corns, may be remedied by the regular use of such dressings, by placing the feet for several hours daily in thick woolen swabs, kept cool and moist by frequent applications of cold water, and by encouraging a more healthy growth of horn by occasional mild blisters round the coronary band. Cracks—or sand cracks, as they are termed—mostly occur among horses much upon the road, cause lameness, and constitute unsoundness. When serious and recent, poulticing, thinning away of the crust about the crack, and perfect rest are essential. After the earlier heat and tenderness are removed, a hot iron should be drawn at right angles to the crack, both above and below, so as to separate the diseased from the sound horn. Waxed thread or fine wire should be wound round the hoof, and a sound growth of horn stimulated by a blister round the coronet. The horse's hoofs are too hard and coarse to be employed for the making of the better class of combs and buttons, for which purpose the hoofs of cattle are extensively employed. They are, however, largely used by manufacturers of prussiate of potash and artificial manures. See CORN.

HOOFEN, JAN VAN DER See HOEVEN

HOFFT, höft, PIETER CORNELISZON (1581-1647) A Dutch poet and historian, born in Amsterdam—after Vondel, probably Holland's greatest author. He was the son of an Amsterdam burgomaster, received a thorough education in the classics, and made an extensive journey through France, Germany, and Italy. After his return in 1601 he studied jurisprudence at Leyden, and was appointed bailiff of Muiden. At the castle of Muiden and in Amsterdam he gathered around him the most celebrated artists, poets, and scholars of the day, known in Dutch literary history as the "Muiden circle." He is considered one of the first, if not the first, of Dutch prose writers, despite his too frequent Latinisms. His letters are particularly charming and are free from this tailing. Among his poetical works are the pastoral play in Italian style, *Granida* (1615), the tragedies *Geeraerd van Telzen* (1613), *Theseus en Ariadne* (1614), and *Baeto* (1626). His chief historical works are *Hendrik de Groot* (1626), *Rampzaligheden der verheffing van den huize Medicis* (1636): *De nederlandsche Historien* (2 vols., 1642). The latter is one of the classics of Dutch literature and Hooft's chief work. He also translated Tacitus, of whom he was an imitator, and he is often called the "Dutch Tacitus." His *Poems* were published in 1636 (new complete edition, ed P. Leendertz, Haarlem, 1864). His erotic verse is particularly notable as being the first of this genre to appear in Dutch literature. Consult his *Breven*, edited by J. van Vloten (Leyden, 1855-57).

HOOGVEEN, hō'ge-vān' One of the ten colonies of the Netherlands, situated in the Province of Drenthe (Map: Netherlands, E 2). It has extensive peat mines and shipyards and is engaged in farming and cattle raising. Pop., 1890, 11,924, 1911, 12,691.

HOOGH, PIETER DE See HOOGH.

HOGLY, hōg'li See HUGLI.

HOOGSTRAETEN, hōc'stra'ten, SAMUEL VAN (1627-78) A Dutch painter and engraver, born at Dordrecht. He was the pupil of his father, Dirk van Hoogstraeten (1596-1640), and afterward of Rembrandt. He began as a portrait painter in the manner of his last master, but afterward was influenced by the Italian school and did landscape and still life. In this style he is reminiscent of Pieter de Hooch. In 1651 he went to Vienna and Rome and in 1662 visited England. He is the author of an *Introduction to the High Art School* (1678), which is full of admiration for Rembrandt and has preserved many of his sayings. There are pictures by him in the museums of Amsterdam, The Hague, Vienna, and Dordrecht, and in the Metropolitan Museum, New York.

HOOGSTRAETEN, hōc'stra'ten, JAKOB VAN (c 1454-1527). A Belgian priest and inquisitor, born at Hoogstraeten. After studying at the universities of Louvain and Cologne, he entered the Dominican Order and became doctor and professor of theology and prior of the order at Cologne (1507). He is widely known through his controversy with the celebrated humanist Reuchlin. Hoogstraten proposed to burn all the Jewish books, on the ground that they contained nothing but calumnies against Christ. Reuchlin persuaded the Emperor Maximilian against this course and thereby incurred the enmity of the inquisitor, who subjected him to every persecution. Thereupon there ensued the polemic war

called by Erasmus "the beginning of the Lutheran tragedy," and this was the occasion of the famous *Epistola Obscurorum Virorum*. Hoogstraten's epitaph, as composed by his enemies, is a severe arraignment of the man's character—*Hic jacet Hoogstratus viventem ferre patique quem potuerit mali, non potuerit boni*. Among his treatises are *Destructio Cabbalæ contra Reuchlinum* (1518) and *De Christiana libertate Tractatus V contra Lutherum* (1526).

HOOK, JAMES CLARKE (1819-1907) An English marine painter, born in London. He entered the schools of the Royal Academy in 1836 and was elected academician in 1860. In 1846 he won the traveling scholarship with "Rizpah Watching the Dead Sons of Saul" and went abroad for three years, working diligently at the Louvre and in Italy gaining much from Titian, Tintoretto, Carpaccio, and other Venetians. Among his best paintings are "A Dream of Ancient Venice" (1848), "A Rest by the Wayside" (1854); "A Signal on the Horizon" (1857), "A Widow's Son Going to Sea" (1859), "Stand Clear" (1860). All except the first are pastoral and idyllic English scenes. In the Tate Gallery are "Home with the Tide," "Young Dreams," "The Seaweed Rakes," and "The Stream." Hook's work is characterized by brilliant color and fresh realism.

HOOK, THEODORE EDWARD (1788-1841) An English wit and novelist, son of James Hook, a musical composer, born in London, Sept. 22, 1788. Educated mostly at private schools, he attended for a short time Harrow and Oxford. Between 1805 and 1811, while yet a boy, he produced, either single-handed or in conjunction with his father, 13 comic operas and melodramas, all of which were popular at the time. His ready wit, sparkling humor, and wonderful powers of improvisation made him the delight of society, and having pleased the Prince Regent, he was appointed (1813) Accountant General and Treasurer at Mauritius, with a salary and allowances amounting to nearly £2000 a year. These offices he held till 1818, when the discovery of a deficiency of £62,000 in the military chest caused him to be arrested and sent to England, and his effects seized and sold. The peculation, it afterward appeared, had been committed by a clerk, who committed suicide. On obtaining his liberty Hook supported himself by writing for the newspapers and magazines, and on the establishment of *John Bull*, a weekly Tory newspaper, in 1820, he was appointed its editor. From his connection with this bold, clever, and virulent print he derived during its prosperous state fully £2000 a year. In August, 1823, he was arrested for his debt to the crown, and his property sold. He remained within the rules of the King's Bench till May, 1825, when he was released from custody. In 1824 appeared, in three volumes, the first series of his *Sayings and Doings*, which yielded him £2000. A second series followed in 1825, and a third in 1828, for each of which he seems to have received about 1000 guineas. Several other novels followed—*Maxwell* (1830), *Gilbert Gurney* (1836), in part autobiographic, *Gurney Married* (1838), *Births, Deaths, and Marriages* (1839). From 1836 to 1841 he edited the *New Monthly Magazine*. He died Aug. 24, 1841. Hook's novels are sketches of contemporary manners, and as such they possess value. Exceedingly popular in their own day, they are now difficult reading, for the witty thrusts are no longer obvi-

ous. Hook himself was regarded by his later contemporaries as a jester. He is the original of Lucian Gay in Disraeli's *Coningsby* and is introduced in *Vanity Fair* as Mr Wagg. The better side of his character is given by Lockhart in the *Quarterly Review*, vol. xxii (London, 1845). Consult *Humorous Works* (ib., 1873), and Baiham, *Life and Remains of Hook* (ib., 1849, revised, 1899).

HOOK, WALTER FARQUHAR (1798-1875). An English dean and ecclesiastical historian. He was the nephew of the humorist Theodore Hook and the son of Dr James Hook, dean of Worcester. He was born in London and graduated M.A. at Christ Church, Oxford, in 1824. He took holy orders in 1821 and, after holding curacies in the Isle of Wight and in Birmingham, was vicar of Holy Trinity, Coventry, from 1828 to 1837, when he became incumbent of Leeds. Here by his tact and resourcefulness he overcame strenuous opposition on the part of Dissenters and among the working classes, who objected to compulsory Church rates, won great popularity, and in 1859, when he became dean of Chichester, left Leeds richer by 21 new churches, 29 vicarages, and 27 schools. From 1827 he was chaplain in ordinary to George IV, William IV, and Victoria, on the accession of the latter preaching in the Chapel Royal his famous sermon, "Hear the Church," of which 28 editions, numbering over 100,000 copies, were sold in a short time. Its great vogue was due to the claim that the Anglican church of the sixteenth century was a reformed church and a return to the early English church founded by the Apostles. At Chichester he wrote his most important work, *Lives of the Archbishops of Canterbury* (12 vols., 1860-76). Besides sermons and devotional works, he published *A Church Dictionary* (1842, 14th ed., 1887) and *Dictionary of Ecclesiastical Biography* (8 vols., 1845-52). His memory is perpetuated in Leeds by a handsome Gothic memorial church, completed in 1880. Consult Stephens, *Life and Letters of Dean Hook* (London, 1878).

HOOKER, NATHANIEL, or NATHANAEL (?1690-1763). A British author, born in Ireland, a friend of Pope, of Martha Blount, and of many notables of his day, and a disciple of Fénelon. He studied law, but practiced literature, beginning with a translation of the *Life of Fénelon* (1725) and *An Account of the Conduct of the Douagie Duchess of Marlborough* (1742), taken down from her dictation, and ending with a *Roman History from the Building of Rome to the Ruin of the Commonwealth* (4 vols., 1738-71), the latter half of which was not published till after his death, while the latest edition (6 vols.) came out in 1830. In 1791 a work of his attacking Chesterfield's *Letters* appeared.

HOOKER, ROBERT (1635-1703). An English physicist. He was born on the Isle of Wight and was educated at Westminster School and at Christ Church, Oxford. He assisted Boyle in the construction of his air pump, and in 1662 was appointed curator of experiments to the Royal Society. In 1664 he became professor of geometry in Gresham College, London. In 1667 he was appointed city surveyor, though his model for rebuilding the city of London after the great fire of 1666 had not been adopted. From 1677 to 1682 he was secretary to the Royal Society. Though a man of extraordinary acuteness of perception and inventive genius, Hooke did not always enjoy the esteem of his contemporaries,

owing to his peevish and excitable temper. He claimed priority—in many cases justly—to some of the most important discoveries and inventions of the time, and authorities admit that he was the first to recognize clearly that the problem of planetary motion should be treated as a purely mechanical one. He undoubtedly grasped the fundamental principle upon which Newton subsequently constructed the theory of gravitation, he failed, however, to develop it mathematically. Among his important inventions were the use of the balance spring for the regulation of watches, and many useful improvements in physical and astronomical instruments. His publications include *Micrographica* (1666), the *Lectures Cuticularæ* (1678-79), and his *Posthumous Works* (1705).

HOOKE, WILLIAM (1601-78). An English clergyman, domestic chaplain to Oliver Cromwell. He was born in Southampton, was educated at Oxford, and after one charge in Devonshire went to America and took charge of a church at Taunton, Mass. (1637-44). His next congregation was in New Haven, but he returned to England in 1656, and, as his wife was Cromwell's cousin, the Protector made him master of the Savoy Hospital in Westminster, also his own chaplain. Some of Hooke's sermons were published, as well as his *New England's Tears for Old England's Fears* (1640).

HOOKER, BRIAN (WILLIAM BRIAN) (1880-). An American author. He was born in New York City and was educated at Yale University (A.B., 1902, A.M., 1904). He served as an assistant in English at Columbia University in 1903-05 and as an instructor in rhetoric at Yale in 1905-09. He won the Cook prize in 1901 and the Heald prize in 1907, became a contributor to magazines, and wrote the libretto for an opera, *Mona* (music by Horatio Parker), which in 1911 was awarded a \$10,000 prize by the Metropolitan Opera Company. In 1912 he received an honorary M.A. from Yale, and he was made a member of the National Institute of Arts and Letters, and in 1914, together with Horatio Parker, was awarded a \$10,000 prize by Los Angeles for the libretto of an opera to be produced on the occasion of the city's centenary. He is author of *The Right Man* (1908), *The Professor's Mystery* (1911), with Wells Hastings, *Poems* (1913), *Mother of Men, Old Yale* (new ed., 1914).

HOOKER, JOSEPH (1814-79). A distinguished American soldier. He was born at Hadley, Mass., Nov. 13, 1814, graduated at West Point in 1837 in the same class with Jubal Early and Bixton Bragg, and was assigned to the First Artillery. He served in Florida and on the Maine frontier in 1837-40 and was adjutant at West Point in 1841 and of his regiment from 1841 to 1846. During the Mexican War he served as aid to Generals Persifer F. Smith, Thomas L. Harmer, William O. Butler, and Gideon J. Pillow, participated in the principal battles both of the northern and of the southern campaign, receiving the brevets of captain, major, and lieutenant colonel for gallantry, became captain in 1848, was assistant adjutant general to the Pacific Division in 1849-51 and resigned from the army Feb. 21, 1853. From that date until the outbreak of the Civil War he was in turn farmer, civil engineer, and colonel of California militia. He was appointed brigadier general of volunteers, May 17, 1861, and in March, 1862, was assigned to the command of the Second Dr-

vision, Third Corps, Army of the Potomac. On May 5, 1862, he became major general of volunteers, and at the battle of Williamsburg, Va., fought on that day, handled his division with skill and valor. Hooker's soldierly qualities won for him the sobriquet of Fighting Joe. He was active throughout the Peninsular campaign and subsequently was conspicuous in the battles of Bristoe Station, the second battle of Bull Run, and Chantilly. In the Maryland campaign, as commander of the First Corps, he took part in the battles of South Mountain and Antietam, being wounded in the latter engagement. He was appointed brigadier general in the regular army Sept. 20, 1862.

In November, 1862, he was placed in command of the Fifth Corps and at the battle of Fredericksburg (qv) commanded the entire grand division of the Army of the Potomac, comprising the Third and Fifth Corps. On Jan. 26, 1863, he was assigned by President Lincoln to the command of the Army of the Potomac. His first act was to refit and reorganize the army. In a few months he had recruited depleted regiments, supplied them with new clothing and equipments, weeded out incompetent officers, armed, equipped, and organized the mounted troops in a single corps, and in other ways had infused new life into the army.

In his new command General Hooker failed, however, to show those qualities on the battlefield which had distinguished him as a corps and division commander. With the greater part of his army he advanced against General Lee, who then had a force half the size of his own, and who was stationed south of the Rappahannock, with the intention of attacking him in flank and rear and crushing him at one blow. His plans were somewhat deranged by high water and the failure of his cavalry under Stoneman to cut Lee's communications. While in position around Chancellorsville, his right flank was surprised by the Confederate General Jackson, one corps was thrown into confusion, and after a protracted struggle, lasting from the 2d to the 4th of May, in which both armies suffered great losses, the Army of the Potomac was forced to recross the Rappahannock. While the fighting was hottest, on May 3, Hooker was stunned, a pillar against which he was leaning having been struck by a cannon ball. The disastrous result was largely due to his vacillation and his inability to cope with an emergency. (See CHANCELLORSVILLE, BATTLE OF.) After the battle Hooker and Lee stood for some time facing each other across the Rappahannock, and shortly after Lee had started on his aggressive campaign which terminated in the battle of Gettysburg, Hooker broke up his camp and followed. The pressure of public opinion in the North, however, combined with friction between General Hooker and General Halleck, and growing lack of confidence in Hooker on the part of President Lincoln caused him to offer his resignation, and on June 28, 1863, General Meade succeeded him. The government then gave him command of the Eleventh and Twelfth Corps, later combined to form the Twentieth Corps (Army of the Cumberland), and sent him (Sept. 24, 1863) to reinforce Rosecrans at Chattanooga. On November 24, in the so-called 'battle among the clouds,' at the head of his new command, he led a charge in the face of the Confederate artillery and infantry posted on Lookout Mountain. For his conduct on this occasion he was, on March 13, 1865, brevetted

major general in the regular army. He further distinguished himself under Sherman at Dalton and Resaca and in the attack on Atlanta. At his own request (July 30, 1864), he was placed on waiting orders September 28, when he was put in command of the Northern Department. On July 8, 1865, he was given charge of the Department of the East and soon afterward of the Department of the Lakes, with headquarters at Detroit, where he remained until 1867. A paralytic attack occasioned his retirement from active service (Oct. 15, 1868), with the full rank of major general in the regular army. General Hooker was a man of handsome physique and of great personal magnetism. He died at Garden City, L. I., Oct. 21, 1879. An equestrian statue of him by French and Potter stands in State House Park, Boston.

HOOKER, SIR JOSEPH DALTON (1817-1911)

One of the most eminent of English botanists, the second son of Sir William Jackson Hooker (qv). He was born at Halesworth, Suffolk, England, and graduated in medicine (1839) at the University of Glasgow, where his father was professor. Hooker's botanical work began in his father's herbarium, and his early interests were mainly in the lower groups of plants, particularly the mosses. In 1839 he was commissioned botanist to the Antarctic expedition under the command of Sir James Ross and in this capacity acquired an extensive knowledge of the floras of the south temperate and subantarctic regions. The results of this expedition were published in six large quarto volumes, under the general title *The Botany of the Antarctic Voyage of H. M. Discovery Ships Erebus and Terror in the Years 1839-1843 under the Command of Captain Sir James Clark Ross* (1844-60). Hooker also early developed an interest in fossil botany, and this was fostered by his appointment in 1845 to the position of botanist to the Geological Survey of Great Britain. He remained in the service of the survey for about two years and made important contributions to paleobotanical literature. The desire for a more extended knowledge of the flora of the Oriental tropics led him to organize a botanical expedition to India, which entered this field in 1848. Some of the results of Hooker's early observations in India were published in *The Himalayan Journals* and *Flora Indica*, the latter work being written jointly with Dr. Thomas Thomson of the Botanical Gardens, Calcutta. For 10 years after 1855 he was assistant director of the Royal Botanical Gardens at Kew. This was a decade of extraordinary activity in botanical exploration and in the study of herbarium collections. Hooker's greatest undertaking during this period was the *Genera Plantarum*, in collaboration with George Bentham (qv), the first part was issued in 1862. Upon the death of his father Hooker succeeded him in the directorship of the Kew Gardens, a post which he occupied for about 20 years. Under his supervision great improvements were made at the Gardens, the collections at the Kew herbarium were largely increased, and important publications were completed or continued. With all these duties Hooker found time for further botanical explorations in various parts of the world, including an expedition to Morocco (1871) and a visit to the United States (1877), where in company with Asa Gray (qv) an expedition was made across the continent to California. In 1885 Hooker retired from the directorship of Kew, but continued actively in

botanical work. The number of his titles exceeds 200 and includes not merely standard taxonomic publications, covering various regions of the world, but also publications in plant geography. In this field Hooker was perhaps at his best. His personal knowledge of the floras of the world was unrivaled, and his papers upon plant geography are full of originality and are regarded as a conspicuous part of the foundations of that science. He was an intimate friend of Darwin, and it was through his influence and that of Sir Charles Lyell that Darwin was induced to publish the first statement of his theory of natural selection, in 1858. He was president of the British Association in 1868 and delivered a remarkable presidential address in which he championed Darwin's theory of natural selection. He was knighted in 1877, received the Order of Merit in 1907, and was honored by numerous scientific societies at home and abroad.

HOOKER, MOUNT One of the loftiest peaks of the Rocky Mountains in Canada, situated near the boundary of British Columbia and Alberta (Map Canada, G 6). It has an estimated elevation of 15,700 feet.

HOOKER, RICHARD (c 1553-1600) An English clergyman, author of the most famous existing treatise on the constitution of the Church of England. He was born near Eweter in the year 1553 or 1554, of poor parents. He was a grave, bashful, and quiet boy, diligent in his studies and quick at learning. His early progress was so rapid that his uncle, John Hooker, was induced to aid him in pursuing his education further. With additional help from John Jewel, Bishop of Salisbury, who afterward became his patron, he was enabled to go to Oxford, where he entered Corpus Christi College in 1567. He became a scholar of Corpus Christi in 1573, was admitted to the degree of M.A. in 1577, and the same year became a fellow. The range of his learning was wide and by no means confined to theology. From the age of 19 he served as tutor, and in 1579 he was summoned, in an emergency, to deliver the Hebrew lecture, which he did so much to the satisfaction of the authorities that he continued to perform this duty so long as he remained at Oxford. For some unknown reason—perhaps through Puritan influence—he was once temporarily suspended from college, but honorably restored within a month. In 1582 Hooker took holy orders and not long after married, Walton says, to his own sorrow. This marriage put an end to Hooker's quiet and congenial Oxford life. He was now obliged to seek a parish. He received the modest living of Drayton-Beauchamp in Buckinghamshire (1584), where he lived, rather uncomfortably, for about a year. At the end of that period his fortunes were bettered by his being made Master of the Temple, London, though his preference was for a living in the country.

Hooker's London life was troubled with ecclesiastical controversy, which he disliked, yet which he would not attempt to avoid when once it was forced upon him. His colleague, Travers, represented that party in the Church of England which desired the adoption of Genevan ideas and usages, whereas Hooker stood for the episcopal establishment. These opposite views were reflected in the preaching at the Temple. "The forenoon sermon spake Canterbury, and the afternoon Geneva," was the current saying. Presbyterianism was either more popular, or else it had the better presentation, for we hear that the

congregation "ebbed in the morning" (when Hooker preached) and "flowed in the afternoon" (to hear Travers). The Puritan champion was at last silenced by Archbishop Whitgift, but the discussion was continued in print. Hooker was so deeply stirred by the question at issue that he determined to give it exhaustive treatment in book form and at once entered upon the preparation of what became the celebrated *Laws of Ecclesiastical Polity*. To carry out his design a change of scene was necessary, and Hooker sought once more the quiet of a country parish and found it at Boscombe in Hants (1591). At the same time he was made a minor prebend of Salisbury, which added to his income without increasing his labor. In Boscombe Hooker wrote the first four books of the *Laws*, and they were published in 1594. The following year he removed to Bishopsbourne in Kent, where he spent the remainder of his life. Book v of the *Laws* appeared in 1597, and there is reason to believe that the other three books were written here, although they were not published. There were to be eight books in all, according to Hooker's original plan. The *Laws* were hailed as the best defense of the Anglican position ever written. Visitors sought the author out in his retreat, but he himself was all unconscious of the important position he had come to occupy. His days were passed in quiet labor, and he continued to fulfill every duty of his parish with conscientious fidelity until his death, Nov. 2, 1600, at the comparatively early age of 47.

Hooker's reputation rests upon his writings, not upon his preaching. In personal appearance he was not prepossessing, and his manner in the pulpit was not effective. But as the author of the *Ecclesiastical Polity* he stands in the front rank of English men of letters. This work is a monument of literary style, in the formative period of English prose, besides being the most important contribution to the subject of Church government in the language. We have the first five books precisely as Hooker wrote them. The fate of books vi to viii in their completed form is shrouded in mystery. Walton relates that the manuscript was destroyed by Puritan relatives of Mrs. Hooker, but that the earlier rough drafts were preserved. From these, long afterward, the seventh and eighth books were printed. What claimed to be a sixth book appeared in 1648, along with the eighth, but most of this probably does not belong to the *Laws* at all. The whole eight books were republished, with a life of Hooker by Izaak Walton, in 1666, since which time they have passed through many editions. In substance the *Ecclesiastical Polity* is a treatise on Church and civil government. His object was to defend episcopacy, but he also states a theory of government which was fruitful in English thought. Hooker's conception of the origin of the state resembles the "social compact" theory of more recent times. The Church he holds to be simply the English state, looked at from the religious point of view. He defends the Established church system, with all its ceremonial, but he does this with singular moderation, holding it to be a matter of expediency rather than of necessity, and he invariably accords courteous treatment to his opponents. In discussing the theories of Presbyterians and Independents, he points out what he believes to be their fundamental defects, and he defends the episcopal theory on scriptural and rational grounds as well as because of its antiquity and practical success.

All succeeding writers on the English church have built upon the foundations which Hooker laid.

Hooker's *Works* (including the *Ecclesiastical Polity*, the controversy with Travers, a *Discourse of Justification*, and a few *Sermons*) were published by John Keble (4 vols., 1836). This edition superseded all previous ones. It was reissued, with improvements (7th ed.) by Dean Church and Canon Paget, in 1888. Consult Izaak Walton, *Life of Richard Hooker*, prefixed to most editions of his works (Oxford, 1836).

HOOKER, THOMAS (c1586-1647) A New England clergyman, the real founder of the Colony of Connecticut. He was born at Markfield, Leicestershire, England, and was educated at Emmanuel College, Cambridge, where he took the degree of B.A. in 1608 and that of M.A. in 1611. After holding a fellowship for some time at Cambridge, he became, about 1620, rector of a little church at Esher in Surrey. In 1626 he accepted a lectureship at Chelmsford, Essex, where he soon won renown as an eloquent preacher, but by this very prominence attracted the attention of Laud, then Bishop of London, to his Puritanism. In May, 1629, he appeared before Laud and was threatened by him with action before the Court of High Commission, and in the following year, upon being cited to appear before that tribunal, he left England and settled in Holland. In Holland he remained for three years, preaching in the English churches at Amsterdam, Delft, and Rotterdam. In 1633 he sailed for New England, on the same ship with John Cotton (qv), settling in Newtowne (Cambridge) in October of that year and being admitted a freeman in the following spring. He was chosen pastor of the first church at Newtowne on Oct. 11, 1633, and soon afterward became one of the most influential clergymen in the Colony. It was he who in October, 1635, argued with Roger Williams before the General Court. There was something of a spirit of rivalry, not only between the people of Newtowne and Boston, but between their principal pastors, Hooker and Cotton. As early as May, 1634, the people of Newtowne complained to the General Court that they did not have room enough and sought either for permission to extend their boundaries or remove to a new location, and in July they sent a small party into the Connecticut valley to find a suitable place. The matter was temporarily adjusted by the extension of the town limits, but the spirit of unrest remained, and in 1636 Mr. Hooker and his church, with large delegations from the churches at Dochester and Watertown, removed into the Connecticut valley. The Newtowne church members established themselves at Hartford, but the influence of Hooker extended also to the towns of Windsor and Wethersfield, which were settled by others who had followed his lead into the new country. It is not only as the leader and moving spirit of the new settlements that Hooker deserves to be known, but as the inspirer, if not the actual author, of the Fundamental Laws which delegates from the several river towns adopted for their government in 1639. In January, 1639, Hooker accompanied John Haynes, the first Governor of Connecticut, to Boston to confer with Winthrop concerning a proposed confederation of the New England settlements to provide for their mutual defense against the Dutch, the Indians, and the French. The year 1643 saw the result of their labors in the successful organi-

zation of the 'United Colonies of New England,' the first attempt at federal government in America. Hooker published a great many sermons and also *The Soule's Preparation for Christ* (1632), *The Soule's Implantation* (1637), *The Soule's Ingrafting into Christ* (1637), *The Soule's Exaltation* (1638), *The Soule's Vocation* (1638), *An Exposition of the Principles of Religion* (1630), *The Saint's Guide* (1645), *A Survey of the Summe of Church Discipline* (1648), a defense of the New England churches which had great influence in the development of Congregationalism in America, *An Application of Redemption* (1657), *Poor Doubting Sinner Drawn to Christ* (7th ed., 1743). A selection from his works, with memoir by E. W. Hooker, was published in 1849. Consult Cotton Mather, *Magnalia Christi Americana* (London, 1702), Johnston, *Connecticut*, in the "American Commonwealths Series" (Boston, 1878); Walker, *History of the First Church in Hartford* (Hartford, 1883), Johns Hopkins University Studies, vol. vii (Baltimore, 1889), Walker, *Thomas Hooker*, in "Makers of America Series" (New York, 1891).

HOOKER, SIR WILLIAM JACKSON (1785-1865) A celebrated English botanist. He was born at Norwich and studied branches of natural history as a pastime during his youth. In 1811 he published his first work, *Journal of a Tour in Iceland*, of which a second edition was demanded in 1813. From that time forward he was constantly busy in the publication of botanical works. His investigation of the British Jungermanniæ and mosses led to his appointment to the chair of botany in Glasgow University, where he lectured with marked success until 1841, when he became director of the Royal Gardens at Kew. Here his pronounced executive ability wrought wonders. The Gardens, which at that time consisted of 11 acres, were extended to 45, in addition to which a park of 240 acres was added; the 10 old conservatories were replaced by 25 much larger ones of more modern construction, in conjunction with Henslow, he founded the most complete museum of botany in the world, and by his enormous correspondence with and ready aid to botanists throughout the realm, Kew Gardens became the distributing point of hundreds of useful plants, which were sent there in collections and then shipped to colonies for testing. Through his efforts Great Britain has largely extended her commerce in products of the soil. Accompanying his official duties he was collecting for his private herbarium and writing books on botany which at the time of his death numbered about 100 volumes. His herbarium was purchased by the nation after his death. His name was enrolled in the lists of all scientific societies at home and abroad, and on account of his scientific acquirements he was knighted in 1836. Among his works may be mentioned *Monograph of the British Jungermanniæ* (1812-13), *Muscologia Britannica* (1818); *The British Flora* (1830, seven editions), *Flora Boreali-Americana* (1840), *A Century of Orchidaceous Plants* (1848), *Icones Plantarum*, in 10 volumes (1837-60), *British Ferns* (1862), *Garden Ferns* (1862).

HOOKER, WORTHINGTON (1806-67) An American physician, born in Springfield, Mass. He graduated at Yale in 1825 and in medicine at Harvard in 1829 and practiced in Connecticut until 1852, from which time until his death he was professor of the theory and practice of medi-

cine in Yale. He was vice president of the American Medical Association in 1864. His principal works are: *Physician and Patient* (1849); *Homœopathy: An Examination of the Doctrines and Evidences* (1852); *Rational Therapeutics* (1857). His *Child's Book of Nature* achieved a deserved reputation and is still widely used.

HOOK GAGE. An instrument invented by Uriah Boyden for measuring differences in level in a surface of water. It consists of a hook whose longer arm carries a vernier in connection with a graduated vertical scale, while the short arm terminates in a point which is adjusted in contact with the surface of the water from below, so that when the surface film is touched the point of contact is clearly and definitely indicated. Any difference in level may be read by adjusting the point at the different points and reading from the scale and vernier. In still water this instrument is said to be so delicate that a variation of 0.0001 of a foot may readily be observed.

HOOK SQUID. A squid of the family Onychoteuthidae, allied to the common squids, but having the eyes destitute of any covering of skin. The two longer arms, or tentacles, and sometimes the shorter arms, bear suckers, each inclosing a powerful hook, which is retractile, like

HOOKS OF A HOOK SQUID.

1, side view of a sucker, showing a half-concealed hook. 2, front view of same. 3, a fossil hook squid (*Acanthoteuthis speciosa*); impression of arms, traceable by the preserved hooks, in the slates of Eichstätt, Bavaria.

the claws of a cat. Hook squids are found in the Sargasso Sea, in the Polynesian seas, etc., and are much dreaded by swimmers and divers, as they are sometimes 6 feet or more long. See CEPHALOPODA.

HOOKWORM DISEASE. ANKYLOSTOMIASIS; UNCINARIASIS; EGYPTIAN CHLOROSIS; MINERS' ANÆMIA. This widespread disease is due to an intestinal parasite, uncinaria, two distinct species of which are generally recognized, viz., the Old World hookworm and the New World hookworm. The Old World variety is called *Anchylostoma duodenale*, and the American *Necator americanus* (Stiles) or *Uncinaria americana*. Generically identical but specifically distinct parasites are found in dogs, cats,

foxes, monkeys, and various other animals. In the American species the adult worm is from 7 to 11 millimeters long and possesses a dorsal and a ventral pair of strong, curved, ventral teeth, together with a pair of ventral lancets. The eggs closely resemble those of the Old World hookworm. Both parasites inhabit the small intestine, especially the jejunum and ileum, but also the duodenum and occasionally the stomach.

The eggs are laid in the intestine of the patient, are discharged with the feces, develop within 24 hours or more into a rhabditiform embryo which sheds its skin in 48 to 72 hours and again within 5 to 9 days. The worm is now the so-called "encysted larva" and has reached the infectious stage. From this time the worm takes no more food until it reaches its animal host. Infection of man takes place either through the skin or by way of the mouth. When through the skin, the larva, as experimentally demonstrated by Looss, penetrates through the skin to the circulatory system, passes with the blood through the heart to the lungs, thence to the air passages up to the larynx, from which point it gets into the alimentary canal through the œsophagus to the stomach and finally to the small intestine.

Studies of the geographical distribution of hookworm made through the agency of the Department of State show that the disease belts the earth in a zone about 68° wide, extending from parallel 36° N. to parallel 30° S. lat. Practically all countries in this latitude are infected. In six countries, viz., Wales, Germany, the Netherlands, Belgium, France, and Spain, the disease is confined to miners. In 46 foreign countries, aggregating a population of about 920,000,000, the disease is general and widespread. The total population of the infected States in the United States is about 20,000,000. Together these constitute 58 per cent of the earth's estimated population. The degree of infection varies; in American Samoa it is found in 70 per cent of the population; in the southern two-thirds of China, in 75 per cent of the population; while in India from 60 to 80 per cent of 300,000,000 population have the disease; in Ceylon, 90 per cent in many parts; in Natal, 50 per cent of the coolies on sugar and tea estates; in Egypt, 50 per cent of the laboring class; in Dutch Guiana, 90 per cent in many parts; in British Guiana, 50 per cent of all; in Colombia, 90 per cent of those living between sea level and 3000 feet, which includes most of the population; and until 1904, when the activities of the Hookworm Commission began, 90 per cent of the working population of Porto Rico were infected. The problem is thus seen to be not local, but world-wide, and, unless controlled, sanitarians believe that the disease will produce the same evil results in the United States that it has in other lands, such as India, China, and Egypt, where it has undermined the physical and mental health of the population, destroying economic efficiency and preventing social development.

In the United States hookworm disease has come to be a sanitary problem of considerable importance. According to the yearly reports of the Rockefeller Sanitary Commission for the Eradication of Hookworm Disease, infection is widespread in the following 11 States: Alabama, Arkansas, Georgia, Kentucky, Louisiana, Mississippi, North Carolina, South Carolina, Tennessee, Texas, and Virginia. Maps of the areas indicate that hookworm infection in these States

occurs in belts or zones, the heaviest showings being in eastern Virginia and the eastern part of North and South Carolina, in central Tennessee, in the southern half of Alabama and Georgia, and in the northeastern corner and southern half of Mississippi, following the sandy plain in the seaboard States. In 1913, 186,277 persons were treated for hookworm disease in these States, and for the four years during which the commission has been in action a total of 539,107 cases have been treated.

Hookworm disease occurs in all degrees of severity. If infection occurs in childhood, both mental and physical development are greatly retarded. In well-developed cases the skin is waxy white or dirty yellow, dry and parchment-like, and perspiration more or less suppressed. The mucous membranes are pale or even white, corresponding to the degree of anemia. The victims have an anxious, stupid expression with a fishlike stare. The body is apt to be emaciated, and the abdomen prominent (Edema of the face, feet, ankles, or the entire body may be present. There are generally digestive disturbances, with tenderness in the epigastric region as a marked symptom. Many individuals develop an abnormal appetite for sour articles, such as lemons or pickles, or for salt, coffee, and butter-milk, others have a perverted appetite for resin, charcoal, chalk, tobacco, ice, rotten wood, mud (dirt eaters), clay, sand, and even cloth garments and books. Stiles described one boy who had eaten three coats, thread by thread, within a year. The pulse is rapid, palpitation is constant, and dyspnea is very common among these patients. Examination of the blood shows varying degrees of anemia. The red cells are pale and become irregular in shape. The mortality average in the United States is unknown, but the Porto Rico Commission, according to Ashford, expressed the belief that 30 per cent of all the deaths in Porto Rico were due to uncinariasis. The treatment of the malady is very satisfactory, thymol, male fern, and beta-naphthol being the three principal drugs used. They are administered after the intestine has been emptied by a saline purge and must be given with great care. Eucalyptus oil and chloroform have also been given with success.

The prevention and control of hookworm in the South depend almost entirely upon sewage disposal, and the work of the Rockefeller Commission is largely concerned in teaching the people of these districts how to accomplish this end. Consult Stiles, *Report on the Prevalence and Geographic Distribution of Hookworm Disease in the United States* (Washington, 1903), id., *Hookworm Disease (or Ground-Fish Anemia): Its Nature, Treatment, and Prevention* (ib., 1910), id., *Hookworm Disease in its Relation to the Negro* (ib., 1909). The above pamphlets are issued by the United States Public Health Service. Consult also *Yearly Reports of the Rockefeller Sanitary Commission for the Eradication of Hookworm Disease*. See ANKYLOSTOMIASIS.

HOOLE, ELIJAH (1797-1872) An English Wesleyan clergyman and missionary. He went to India in 1819 and remained for 10 years. On his return to England he was appointed superintendent of schools for Ireland, in 1834 became assistant secretary of the Wesleyan Missionary Society, and in 1836 was made one of the general secretaries of the society and continued to serve until his death, a period of 38 years. He was the author of *Madras, Mysore, and the South of*

India (2d ed., London, 1844) *Yearbook of Missions* (ib., 1847), *Oglethorpe and the Wesleys in America* (ib., 1863), *Byron and the Wesleys* (ib., 1864).

HOOLE, JOHN (1727-1803) An English translator and dramatist, born in Moorfields, London. He had little education, was too near-sighted to become a watchmaker like his father, so entered the India House as a clerk (1744), was made auditor of Indian accounts, then principal auditor. He was a friend of John Scott of Amwell and wrote (1785) a life of him, and a friend also of Dr Johnson, whom he attended in his last illness. Hoole's works include: the translations, *Tasso's Jerusalem Delivered* (1763), versions of Metastasio's dramas, and Ariosto's *Orlando Furioso* (1783)—all severely criticized by Scott, Southey, and Lamb, three tragedies of his own acted at Covent Garden the life of Scott above mentioned and prefixed to Scott's *Critical Essays*, and a monody on *The Death of Mrs Woffington* (1760). His translations of Ariosto and Tasso, despite a certain stiffness and artificiality which contrast unfortunately with the fluent and melodious stanzas of the originals, have their fine qualities and still hold their own in succeeding editions.

HOOLOCK The white-browed gibbon (*Hylobates hoolock*) of northeastern India, where it leads an active life among the hill forests. It is frequently kept captive and proves a docile, cleanly, and interesting pet. The name is a native imitation of their whooping call, heard most frequently at sunrise. See GIBBON.

HOONAH, hōō'na, or HOONIAH, hōō'n'ya A native settlement on Icy Strait, Alaska (Map Alaska, M 6). It has a Presbyterian mission, and a government school with an enrollment of 111 in 1912. The inhabitants, numbering 452 in 1910, live largely through furnishing fish to the salmon cannery at that place.

HOONOOMAN, hōō'nōo-man The sacred monkey of India. A better spelling of the word is hanuman (q v).

HOOP ASH. See HACKBERRY.

HOOPER, FRANKLIN WILLIAM (1851-1914) An American institute director. Born at Walpole, N H, he studied at Antioch College (Ohio) in 1867-71 and graduated from Harvard University in 1875. He was principal of the Keene (N H) High School in 1877-80, taught natural science at Adelphi College, Brooklyn, in 1880-89, and thereafter was director of the Brooklyn Institute of Arts and Sciences. He was president of Antioch College in 1901-05 and trustee after 1899. He served as director of the Brooklyn Art Association after 1890 and of the Brooklyn Public Library from 1895 to 1904 and as a member of the Brooklyn Board of Education in 1892-99, and he also became trustee of the New York School of Agriculture, Long Island, in 1912 and of Adelphi College in 1913. He frequently lectured on biology and geology and was active in the organization of museums.

HOOPER, JOHN (c1495-1555) An English prelate and martyr. He was born in Somersetshire and educated at Oxford. He became a Cistercian monk and when the monasteries were dissolved went to London to live. He was converted to the Zwinglian form of Protestantism and, advocating his new views, had to flee to the Continent (1540) and spent some time in Switzerland under the influence of Bullinger. Some time after the accession of Edward VI he

returned to England (1549) and became a preacher in London. In 1550 he was appointed Bishop of Gloucester, but his objections to wearing the episcopal vestments caused delay and even imprisonment. In 1552 he received the bishopric of Worcester in *commendam*. On the commencement of Mary's reign in 1553 he was committed to the Fleet, where he remained for 18 months, being frequently examined before the Council, was condemned as a heretic, and burned at the stake at Gloucester, Feb. 9, 1555. He was the author of numerous sermons and controversial treatises, of which a collected edition appeared at Oxford (1855). The account of his death appears in John Foxe's *Acts and Monuments*, books x, xi (London, 1838).

HOOPER, JOHNSON J. (c.1815-63). An American humorist. He was born in North Carolina, removed early to Alabama, edited a newspaper and practiced law there, and was secretary of the Provisional Confederate Congress. In 1845 he published the *Adventures of Captain Simon Suggs*, broadly, crudely, and uncouthly humorous, yet one of the raciest books of its time, descriptive of a gambling sharp of the Southwest in the "flush times." His *Widow Rugby's Husband and Other Tales of Alabama* (1851) is less successful.

HOOPER, WILLIAM (1742-90). An American jurist and signer of the Declaration of Independence. Born in Boston, he graduated at Harvard in 1760. He studied law with James Otis and practiced very successfully in North Carolina, where he ably assisted the Provincial Government in suppressing the disturbances of 1770 and was elected to the Legislature in 1773. There he became a leader and, a year later, was elected to the Continental Congress, from which he resigned in 1777. In 1786 he was one of the Federal judges appointed to adjudicate the territorial dispute between Massachusetts and New York.

HOPESTON, hoo'p'ston. A city in Vermilion Co., Ill., 99 miles south of Chicago, on the Chicago and Eastern Illinois and the Lake Erie and Western railroads (Map: Illinois, J 5). It is the seat of Greer College, established in 1891, and has McFarren and other public parks and a Carnegie library. The city is in a fertile, agricultural region and manufactures chemicals, gas engines, cans and canning machinery, and canned goods, among its establishments being two of the largest sweet-corn canning factories in the United States. In 1877 Hoopston received a city charter, still in operation, which provides for a mayor, elected biennially, and a council. The water works are owned and operated by the municipality. Pop., 1900, 3823; 1910, 4698.

HOOPING COUGH. See WHOOPING COUGH.

HOOPOE, hoo'poo or hoo'pō (obsolete, *hoo-pop*, reduplication of *hoop*, Fr. *huppe*, OF.

HOOPOE.

huppe, *hupe*, from Lat. *upupa*, hoopoe). One of a small and singular group of birds of the warmer parts of the Old World, which take both

their common and systematic names (genus *Upupa*, family Upupidae) from their cry. In this family the bill is long and slender, the wings of moderate size or short, the legs short, the toes long, and the claws strong and curved. The common European hoopoe (*Upupa epops*) is an African bird, visiting in summer most parts of Europe and Asia, but rare in Great Britain. It is about the size of a blue jay; its plumage exhibits a fine mixture of white, buff, and black, and it has a large crest of two parallel rows of feathers. Its strange appearance and habits have caused it to figure largely in European legend and folklore. It gets its food chiefly on the ground, and one of the myths has it that its peculiar notes are made by striking the bill on the ground as the note is uttered. The nest is made in a hole in a tree or wall, and the eggs are white. The hoopoes were formerly thought to be related to the crows, but it is now generally admitted that their nearest relatives are the hornbills, although they are apparently so different. An extensive account of the curious and interesting traits of this bird is given in the *Royal Natural History*, vol. iv (London, 1895). See BIRD for other authorities. See Plate of TROGONS, HOOPOE, ETC.

Wood Hoopoe. The birds of the subfamily Iridopidae, which are found in South Africa, are nearly related apparently to the Upupidae and are known as wood hoopoes. They are arboreal, have a glossy blackish plumage, no crest, and a long graduated tail. They are said to be noisy and restless birds and to climb about on trees like woodpeckers. Like the true hoopoes, they emit at times a rather disagreeable odor.

HOOPS, HOOP SKIRT. See CRINOLINE.

HOOP SNAKE. A small snake (*Abaster erythrogrammus*) of the South Atlantic States, foolishly feared by the negroes, who say it will put its tail in its mouth, stiffen its body, and roll along like a hoop, aiming to let go of its sting-tipped tail and dart it into the first person it meets. Similar stories are told of a closely related species, the wampum snake (*Farancia abacura*), common in swampy ground in the South; and both are called horn snakes. In fact, both species are perfectly harmless and spend most of their time beneath the ground, burrowing deeply into the soil. The former is blue black above, marked with three red lines, and flesh-colored below, with black spots; while the latter is uniform bluish black above and banded with red on the abdomen.

HOORN, hōrn. A seaport of the Netherlands, in the Province of North Holland, situated on the Hoornherp, a bay of the Zuyder Zee, 25 miles northeast of Amsterdam (Map: Netherlands, D 2). It is a typical old Dutch town and has many quaint mediæval buildings, among them the Harbor Tower, St. John's Hospital, the mint, the weigh-house, the town hall, and the courthouse. Other notable edifices are the museum and the Groote Kerk (great church), the latter with a monument to Admiral Floriszoon. Hoorn was formerly one of the richest towns in Holland, the great nets for the herring fishery being employed here as early as 1416. It has now a considerable trade in dairy products and also some shipbuilding. The chief products are gold and silver work, canvas duck, tobacco, and lumber. Fishing is still followed. Hoorn is the birthplace of the navigator Willem Schouten, who named Cape Horn after his native town. Pop., 1899, 10,714; 1911, 11,244.

HOOSAC (hōō'sak) **RANGE** A spur of the Green Mountain Range in west Massachusetts, extending about 16 miles north and south on the east side of the Hoosic River valley and forming the dividing line between that valley and the Connecticut River valley (Map Massachusetts, A 2) About a mile southeast of North Adams the range, which here reaches an altitude of 2300 feet, is pierced (at an altitude of 745 feet) by the Hoosac Tunnel, about 5¼ miles long, built between 1855 and 1874 at a cost of about \$20,000,000, for part of which the State lent its credit The maximum altitude of the range, 2400 feet, is reached about a mile south of the tunnel. See **TUNNEL**

HOOSE, hōōz or hōōs A disease of sheep due to the presence of parasites (*Strongylus filaria* et al.) in the bronchial tubes It is characterized by a husky cough

HOOSIC RIVER. A river of Massachusetts, Vermont, and New York states It rises in the Berkshire Hills, Berkshire Co., Mass., flows nearly north to North Adams, and then northwest, crossing the southwest corner of Vermont, and emptying into the Hudson River about 15 miles north of Troy (Map Vermont, A 8)

HOOSICK FALLS. A village in Rensselaer Co., N. Y., on the Hoosic River, 27 miles northeast of Troy, on the Boston and Maine Railroad (Map New York, G 5) It has extensive manufactures of agricultural implements, cotton and woolen goods, shirts and collars, electric insulators, paper, and paper-making machinery Settled in 1688, Hoosick Falls was incorporated first in 1827 Under a charter of 1884, revised in 1890, the village is governed by a president, chosen every three years, and a board of trustees, elected from their respective wards The village owns its water works Pop., 1900, 5671, 1910, 5532 Hoosick Falls contains a large State park at the site of the British intrenchments at the battle of Bennington, Aug. 6, 1777.

HOOSIER (hōō'zhēr) **FROG.** See **MINK FROG**

HOOSIER SCHOOLMASTER, THE A novel by Edward Eggleston (1875), one of the first successful attempts to picture the rude surroundings of the pioneers of the Middle West

HOOSIER STATE Indiana See **STATES**, **POPULAR NAMES OF**

HOOVE, or **HO'VEN.** See **BLOAT**

HOP (from Dutch *hoppe*, Dutch *hop*, OHG *hopfo*, Ger *hopfen*, hop, of doubtful origin), *Humulus lupulus* A perennial plant which belongs to the Urticaceæ, or nettle family The single species, a native of America and England, where it is often found growing wild upon trees and shrubs, has given rise under cultivation to many varieties The hop is a dioecious climbing vine with rough stems and heart-shaped, three to seven lobed leaves. The pistillate flowers are the hop of commerce, used mainly in the manufacture of beer Hop culture is not general, like the culture of cereals, but is confined to certain areas, comparatively limited in extent, which on account of soil and climatic conditions are especially suited to the production of the crop The principal hop-producing regions of the United States are New York and the Pacific coast States Wisconsin also produces a small quantity In Europe the principal hop-growing countries are England, Austria-Hungary, Germany, France, and Belgium The hops from Kent in England and

from Saaz and Auscha in Bohemia have long been considered of the finest quality throughout the world In general, the hops are known in the European markets by the name of the locality in which they were grown This serves as an indication of their comparative quality and value

The hop may be grown on a variety of soils, but it always requires a well-drained subsoil It succeeds best on a moist, sandy loam Soil conditions are generally considered the most important factor in determining the quality of the crop In preparing land for hops it is plowed deeply and brought to a fine tilth The hop is propagated by cuttings made from the underground stems which the plant sends out near the surface of the ground These cuttings are made and set out in the spring In the United States one male plant is grown per hundred or so, but in Europe as a rule, only female plants are grown, as the presence of seeds in the hops injures the flavor of certain beers made from them The vines are either trained on poles or on wire trellises The latter method is gradually displacing the system of training on poles During the growing season the soil is cultivated to keep it mellow and retentive of moisture and for the purpose of killing the weeds Harvesting is done by hand and forms the hop grower's busy season, as the hop deteriorates when exposed too long to the weather after it is ripe The yield varies from 1000 to 3000 pounds per acre When the hops are harvested, they are immediately cured by air drying under cover or by drying in kilns constructed for that purpose The cured product is pressed into bales of about 200 pounds each and is shipped in this form to distant markets In Europe hops are generally shipped in large sacks without being baled The world's annual commercial production of hops averages about 200,000,000 pounds, of which the United States, generally the leading producing country, furnishes from 25 to 30 per cent Of the annual yield in the United

HOP

States New York and Washington produce each approximately 15 per cent, California 30 per cent, and Oregon 40 per cent.

The valuable principle of the hop is a yellowish aromatic, resinous substance called lupulin, which has been found to contain two preservative or soft resins (oleoresins) and a nonpre-

servative or hard resin. The preservative resins are the most valuable, since they are particularly unfavorable to the growth of lactic ferments, but not to the true yeast of beer. The deterioration of hops caused by exposure when mature, or by excessive drying, consists in the waste of the lupulin. For brewing, the hop must be well ripened, properly dried, and with the resin and other qualities unimpaired. Consult P. L. Simmonds, *Hops, Cultivation and Uses* (New York, 1877). Herbert Myrick, *The Hop: Its Culture and Cure* (ib., 1909), and publications of the United States Department of Agriculture.

HOP APHIS. See HOP LOUSE, HOP INSECTS.

HOPATCONG, LAKE. A picturesque body of water in Morris and Sussex Counties, N. J., 50 miles northwest of Newark (Map New Jersey, C 2). The lake is about $6\frac{1}{2}$ miles long, northwest by southeast, and generally narrow, though its shores are deeply indented by several bays, the largest of which makes its maximum width about 1 mile. It lies in a well-wooded fir and pine district, 928 feet above sea level. Its area is 2443 acres. The Musconetcong River drains it from the southwest into the Delaware, but it supplies water for the upper level of the Morris Canal, so that much of its drainage actually passes southeast into the Rockaway River. It is a popular summer resort.

HOPE. A city in Hempstead Co., Ark., 112 miles southwest of Little Rock, on the St. Louis, Iron Mountain, and Southern, the Louisiana and Arkansas, and the St. Louis and San Francisco railroads (Map Arkansas, B 4). It is in a productive cotton and fruit growing region and has compresses, cottonseed-oil mills, lumber, grist and planing mills, wagon works, cotton gins, and metal frame screen, box, spoke, stave, and handle factories. It is also an important shipping point for cotton, lumber, cattle, and hides. There are municipally owned water works, electric-light and sewage plants. Pop., 1900, 1644, 1910, 3639.

HOPE (afterward BERESFORD-HOPE), ALEXANDER JAMES BERESFORD (1820-87). An English politician and author, son of Thomas Hope and stepson of William Carr, Viscount Beresford. He was educated at Harrow and at Trinity College, Cambridge, served in Parliament for Maidstone from 1841 to 1852, was reelected in 1857, and from 1868 to his death represented Cambridge University. An independent Conservative, he opposed the abolition of Church rates, the legalization of marriage to one's deceased wife's sister, and, especially, the Reform Bill of 1867. In the debate on the last measure he broke lances with Disraeli, calling him the "Asian mystery," and getting recognition of his Dutch ancestry and poor delivery in Disraeli's allusion to "Batavian graces." A High Churchman and deeply devoted to the English church and to its control by the state, Hope bought, in 1844, St. Augustine's Abbey, Canterbury, as a missionary college, built All Saints' Church in London, and wrote on religious liberty, at the time of the excitement over Roman aggression, in the *Chronicle*, and later in the *Saturday Review*, being closely associated in both with John Douglas Cook. Hope was president of the Royal Institute of British Architects (1865-67), of the Architectural Museum and of the Ecclesiological Society. His publications include several works on Church politics, *The English*

Cathedrals of the Nineteenth Century (1861), *A Popular View of the American Civil War* (3d ed., 1861); and a successful novel, *Strictly Tied Up* (4th ed., 1886).

HOPE, ANTHONY. See HAWKINS ANTHONY HOPE.

HOPE, SIR JAMES (1808-81). A British admiral, born in Edinburgh. He was educated in the Royal Naval College, Portsmouth, and when 14 years old went as midshipman on a frigate bound for the West Indies. In 1827 he was promoted lieutenant and by 1830 had reached the rank of commander, having by that time made voyages to the Mediterranean and the East Indies. He saw service in North and South America (1833-45), and after opposing the Russians in the Baltic for two years was created rear admiral (1857) and commander of the Chinese squadron (1859-62). In 1859 he made a gallant attempt to enforce the ratification of a treaty the Peking government had entered into with France and England. He lost most of his ships and men and was himself severely wounded, but returned to the attack the following year and was successful (1860). From 1863 to 1867 he commanded in North American waters and the West Indies, and for three years (1869-72) was in charge at Portsmouth. He was made an admiral in 1870, chief naval aide-camp to Queen Victoria in 1873, and was retired in 1878, but was created honorary admiral of the entire fleet a year later.

HOPE, THOMAS (c. 1770-1831). An English author and virtuoso. He belonged to a rich family of merchants, Scottish by descent, who had settled in Amsterdam. While still a youth he traveled extensively in southern Europe and in the East and collected many drawings, chiefly of buildings and sculptures. After 1796 he made England his home. He was of assistance as a patron to Canova, Thorvaldsen, and Flaxman. He first attracted attention by the decorations which he bestowed on the interior of his mansion in Duchess Street, Portland Place, London, a description of which appears in his book *Household Furniture* (1807). In 1809 he published *Costumes of the Ancients and Architecture of Theatres*. Three years afterward appeared *Modern Costumes*, and in 1819 *Anastasis, or Memoirs of a Modern Greek at the Close of the Eighteenth Century*. Published anonymously, this last work was ascribed to Lord Byron, who said that he had wept because he did not write it. It is a brilliant romance describing adventures and manners in the East.

HOPE COLLEGE. A coeducational institution of learning at Holland, Mich. It was organized by Dutch colonists in 1857 as an academy and in 1866 was chartered as a college under the auspices of the Reformed church in America. The Western Theological Seminary was founded in 1869. In connection with the college is a preparatory school, which admits pupils who have completed the eighth grade in the public schools. Among the principal buildings of the college are Van Raalte Memorial Hall, the Carnegie Gymnasium, Graves Library, Winants Chapel, Maria L. Ackerman Hoyt Observatory, and two dormitories. The campus comprises 16 acres. The college provides five courses—classical, philosophical, natural science, modern-language English, and modern-language mathematics. There were, in 1914, 152 preparatory, 179 collegiate, and 29 theo-

logical students The faculty numbers about 25 The college had in 1914 an endowment of \$388,400 and an income of \$36,000 In the same year the library contained 22,000 volumes The degree of Bachelor of Arts is conferred In 1914 the president was Rev Ame Vennema, D D

HOPEDALE A town in Worcester Co, Mass, 74 miles southwest of Boston, on the Grafton and Upton Railway (Map Mass, D 4) The town contains the Bancroft Memorial Library and a bronze statue of Adin Ballou It has large manufacturing of cotton machinery Pop, 1910, 2188. Hopedale was founded as a religious community in 1841 by a society under the leadership of Rev Adin Ballou, in the town of Milford, Worcester Co, Mass The chief aim of the founder was to restore the original ideals of Christian life rather than to reorganize society economically A farm of 238 acres with mill sites was purchased by the society, organized as a joint-stock company. The community consisted of 28 persons, who observed strictly the rules of communism As the community increased in numbers, these rules were somewhat relaxed A board of trustees at first controlled the industries of the community, but later the several branches were farmed out to individuals The community was not a success financially, nor was social harmony long maintained In 1854 it had reached its highest point, embracing about 200 members Agriculture and several branches of manufacture were carried on Two years later the community was found to be deeply in debt, and the joint-stock company was dissolved As a purely religious organization, it continued to exist for some years, but in 1867 merged in the Hopedale Unitarian Parish, with Mr Ballou as minister, the industries founded by the society being carried on by private management Hopedale was incorporated as a town in 1886 Consult Adin Ballou, *History of the Hopedale Community* (Lowell, 1897)

HOPE DIAMOND A large blue diamond in the possession of Mrs E E McLean, of Washington, D C, and weighing $44\frac{1}{4}$ carats It is supposed to have been cut from a stone purchased from Tavernier by Louis XIV, which weighed uncut $112\frac{1}{2}$ carats and $67\frac{1}{2}$ carats after cutting The stone was lost in 1792 and came into the market in 1890, when it was bought by Thomas Henry Hope, the English banker whose daughter married the Duke of Newcastle It went into the market again in 1901, and finally in 1909 was purchased for Mrs McLean for the sum of \$180,000 Legend has been busy with the history of this diamond, and tales of ill luck to its possessor, while eagerly told, are without foundation in fact

HOPE-JONES, ROBERT (1841-1914) An Anglo-American organ builder He early applied himself to the study of electricity, became chief electrician of the English telephone companies, and was a member of the British Institution of Electrical Engineers An accomplished organist himself, and a member of the Royal College of Organists, he turned his attention to the application of electricity to organ building and produced instruments which took leading rank among their kind Hope-Jones organs have been installed in Germany, England (notably Worcester Cathedral), France, India, Australia, New Zealand, and the United States (notably Ocean Grove, N J, auditorium) In 1903 Hope-Jones came to America and built organ factories at Elmira, N Y, and later at

North Tonawanda, N Y the latter of which was sold to the Rudolph Wulitzer Company in 1914 He made Buffalo his home In September 1914, he committed suicide

HOPE THEATRE, THE A sixteenth-century bear garden, on the Bankside, Southwark, London, which was changed into a playhouse in 1581 It was restored to its former use at the Restoration, but towards the end of the seventeenth century gradually lost its popularity

HOPFEN, hō'f'en, HANS VON (1835-1904) A German novelist and poet, born and educated at Munich, where he was associated with the Munich school of poets, especially with Geibel In 1866 he moved to Berlin, where he devoted himself to literature, having already contributed to the *Munchener Dichterbuch* (1862) and written the novel *Peccetia* (1864) *Der Pinsel Mings* (1868), a satirical tale in verse, a book of essays, *Streitfragen und Erinnerungen* (1876), a volume entitled *Theater* (1889), the plays *Aschenbrotel in Bohmen* (1870) *In der Molk* (1889), the *Neues Theater* (1892-93), the tragedy *Gotin der Vernunft* (1892), the drama *Helga* (1892) and the comedy *Es hat so sollen sein* (1893), comprise his best dramatic and miscellaneous work The remainder of his writings include a score of novels and collections of stories—in which he did his best work—of which the following may be mentioned *Verdorben zu Paris* (2d ed, 1892), *Die Heuat des Herrn von Waldenberg* (2d ed, 1884), *Der alte Praktikant* (3d ed, 1891), *Die Geschichten des Majors* (3d ed, 1882), *Neue Geschichten des Majors* (1890), *Im Schlaf geschenkt* (4th ed, 1896), *Zehn oder elf* (1901), and *Gotthard Lingens Fahrt nach dem Glück* (1902) Consult Muncker, in *Westermanns Monatshefte*, vol lxx (Brunswick, 1886), and P Lindau, *Gesammelte Aufsätze* (Berlin, 1880).

HOP FLY See HOP LOUSE

HOP HORN'BEAM. See HORNBEAM

HOPHTHALMOS See HAUG J C F

HOPI, hō'p'e, or MOKI, mō'ke An interesting Pueblo tribe of Shoshonean stock, occupying seven villages upon three mesas in north central Arizona and numbering about 1900, including those of Tewa or Hano The principal villages are Walpi and Oraibi In many respects the Hopi may be considered the most interesting of Pueblo tribes They are all mesa dwellers, and their villages, situated hundreds of feet above the surrounding desert, are only to be reached by steep, adventurous trails They hold fast to their old aboriginal culture, which is of the typical Pueblo character, but better preserved than that along the Rio Grande Their ceremonies are elaborately conducted, particularly those of the 'new fire' and the various "katsina," or 'masked dances,' also the celebrated snake dance in which the performers carry living rattlesnakes in their mouths as they dance They are industrious farmers and have always in their granaries abundant stores of corn, beans, and pumpkins They also weave baskets and blankets and are skillful potters and wood carvers (See Colored Plates in articles BASKET and BLANKET) The clan system is rigid and highly developed among them According to explicit traditions, the ancestors of these tribes were builders of many of the ancient ruins in the surrounding region The people of the small village of Hano are of different language, originally being emigrants from a Tanoan pueblo in the Rio Grande

valley who left their eastern home shortly before 1700. Consult: B. I. Gilman, *Hop Songs* (New York, 1908), numerous articles in *Annual Reports of Bureau of Ethnology*, Washington, and *Anthropological Publications of Field Museum*, Chicago. See SNAKE DANCE.

HOP INSECTS. The most destructive insect enemy of the hop crop is the hop aphid. Other species are of less importance, but they sometimes do considerable damage to the plant. The hop grub or hop-plant borer (*Gortyna immanis*) is the larva of a noctuid moth which lays its eggs in the early part of the season upon the young shoots of the plant. The young caterpillars, which are slender and greenish in color spotted with black, bore into the vine just below the tip and remain at this point for some time. The head turns downward and stops growing. Such vines are called muffled heads or stag vines, and sometimes bullheads, the caterpillar at this time being called tip worm. A little later it drops to the ground and enters the stem at the surface of the ground. It is then called the collar worm, changing to a white color with black spots. About the end of July it becomes full-grown and transforms to pupa near the roots of the plant. The moth issues in the fall or in the spring.

A number of different caterpillars feed upon the foliage. The hop-vine snout moth (*Hyppena humuli*) is one of the principal forms. The larvae of two butterflies (*Polygonia interrogationis* and *Polygonia comma*) feed quite abundantly upon this plant and are known to hop growers as hop merchants, from the gold and silver markings upon the chrysalids. The zebra caterpillar (larva of *Mamestra picta*), the common woolly-bear caterpillar (larva of *Spilosoma virginica*), and the saddle-back caterpillar (larva of *Empetia stimulea*) are the remaining principal species. One of the leaf hoppers (*Tettigonia confluenta*) causes more or less damage to the foliage, and the striped flea beetle (*Phyllotreta vittata*) also damages the leaves, while the so-called red spider or spinning mite (*Tetranychus telarius*) often causes the leaves to turn yellow. The best remedy for all of these insects consists in spraying at the proper time, using an arsenical spray for the caterpillars and the flea beetle, a kerosene emulsion for the leaf hoppers, and a sulphur wash for the spinning mite. Consult L. O. Howard, "Pests of the Hop Crop," in *The Hop Industry* (New York, 1898). See HOP LOUSE.

HOPKEN, hēp'kēn, ANDERS JOHAN, COUNT VON (1712-89). A Swedish statesman. He became a leader of the Hat party, obtained a seat in the national Diet, and was one of the two commissioners who negotiated with Russia in 1741-42. In 1746 he became a senator and in 1751 accepted the premiership of Sweden. He lost his offices in the political turmoil of 1761, but in the following year was made Count, and in 1772 reentered the Senate. He is author of several biographies. Carl Silfverstolpe published a selection of his writings under the title *Grefve Hopkens Skrifter* (2 vols, 1890-93).

HOPKINS, ALBERT (1807-72). An American scientist, brother of Mark Hopkins. In 1826 he graduated from Williams College, where subsequently he was tutor (1827-29), and professor of mathematics and natural philosophy (1829-38), of natural philosophy and astronomy (1838-68), and of astronomy (1868-72). He

had charge of a scientific expedition to Nova Scotia in 1835, and two years later he directed the building of an astronomical observatory at Williams.

HOPKINS, CYRIL GEORGE (1866-) An American chemist and agronomist, born near Chatfield, Minn. He was educated at the South Dakota Agricultural College (B.S., 1890), at Cornell University (M.S., 1894, Ph.D., 1898), and at Göttingen (1899-1900). After filling several less important positions he was chemist at the University of Illinois Agricultural Experiment Station from 1894 to 1900, thereafter professor of agronomy and chief in agronomy and chemistry, and after 1903 vice director. He invented Hopkins's condenser and Hopkins's distilling tube. He was president of the Association of Official Agricultural Chemists for the year 1905-06. His publications include, besides bulletins and articles *Soil Fertility and Permanent Agriculture* (1910), *The Story of the Soil* (1911), *The Farm that won't Wear out* (1913).

HOPKINS, EDWARD (1600-57). A Colonial Governor of Connecticut, born at Shrewsbury, England. After being a tradesman in London for a few years, he came to Boston in 1637 and settled at Hartford. He was chosen Governor of the Colony of Connecticut several times during the period 1640-54. After that he lived in London. He assisted in forming the Union of the New England Colonies in 1643. He left £1000 to support grammar schools in Hartford and New Haven. With the sum of £500 left for "public ends," Harvard College, to which it was turned over, bought a township from the "praying Indians" and named it Hopkinton.

HOPKINS, EDWARD WASHBURN (1857-). An American Sanskrit scholar and philologist, born at Northampton, Mass. He graduated at Columbia College in 1878 and after studying in Germany was professor of Greek, Sanskrit, and comparative philology at Bryn Mawr College, Pennsylvania, from 1885 to 1895. In the latter year he was called to Yale University as professor of comparative philology and Sanskrit, to fill the chair left vacant by the death of Whitney. He wrote several important books connected with India. *Mutual Relations of the Four Castes according to the Manavadharma-gastram* (1881), *The Ordinances of Manu, translated from the Sanskrit* (1884), *Religions of India* (1895), *The Great Epic of India* (1901), *India Old and New* (1901), and numerous contributions to the *Journal of the American Oriental Society* and other periodical publications.

HOPKINS, ESEK (1718-1802). An American naval officer, born in Scituate, R. I. In the Revolutionary War he was at first a brigadier general in the army, but in 1775 Congress commissioned him commander in chief of the new American navy. Washington officially addressed him as admiral. He went to sea in February, 1776, with four ships and three sloops, and took the forts at New Providence, with all the guns, ammunition, and stores. On his return he seized a British schooner and a bomb brig. His later operations were less fortunate, and in January, 1777, he was dismissed from the service because he let the *Glasgow* get away from him and failed to appear before Congress when so ordered. He was afterward prominent in Rhode Island political affairs, for many years as a member of the General Assembly. Consult Field, *Esek Hopkins, Commander-in-Chief of the*

Continental Navy during the American Revolution, 1775-78 (Providence, 1898)

HOPKINS, EZEKIEL (1634-90) Bishop of Londonderry. He was born at Pinne, Devonshire, Dec. 3, 1634. His early education was conducted under Presbyterian and independent influences. He graduated B.A. at Oxford (1653) and became chaplain of Magdalen College (1656). In 1662 he conformed and was presented to the living of St. Mary Woolnoth in London. When the great plague broke out in the capital (1666), Hopkins withdrew to Exeter, where he obtained the living of St. Mary's. When Lord Robartes was made Lord Lieutenant of Ireland (1669), Hopkins went with him to Dublin and through his influence obtained the deanery of Raphoe (1670) and in 1671 the bishopric of Raphoe. In 1681 he was made Bishop of Londonderry. In the course of the siege of the town by the Irish adherents of James II, in 1689, Hopkins withdrew from the town and retired first to Raphoe and afterward to London, where he was made rector of St. Mary, Aldermanbury (1689). This charge he held until his death, June 19, 1690. His works, which have been frequently republished, comprise *Sermons, Expositions of the Decalogue and the Lord's Prayer*, and elaborate discourses on *Regeneration* and *The Vanity of the World*. The best edition of his collected works is by Pratt (4 vols., London, 1809).

HOPKINS, HENRY (1837-1908) An American Congregational clergyman and college president, son of Mark Hopkins. He was born at Williamstown, Mass., graduated from Williams College in 1858, and studied at Union Theological Seminary in 1859-60. He entered the Congregational ministry in 1861 and served as an army chaplain at Alexandria, Va., in 1861-64. Thereafter he held pastorates at Westfield, Mass., in 1866-70, and at Kansas City, Mo., until 1902, when he was chosen president of Williams College. This office he held until shortly before his death.

HOPKINS, JOHN CASTELL (1864-). A Canadian editor and author. He was born of English parentage in Dyersville, Iowa, and was educated at Bowmanville, Ontario, whither his family had removed. For some years he was a banker in Toronto, then he was a member of the editorial staff of the *Toronto Daily Empire*, and later he devoted himself to political writing for reviews and magazines, on phases of Canadian progress and British imperialism, and to biographical work and the compiling and editing of works of reference. He edited *Canada: an Encyclopædia of the Country* (6 vols., 1897-1900) and in 1902 founded and became the editor of *The Canadian Annual Review of Public Affairs*. In 1914 he was elected a fellow of the Royal Geographical Society. In addition to the works already mentioned he published *Life and Work of Sir John Thompson* (1895), *Life and Work of Mr. Gladstone* (1895); *The Story of the Dominion* (1899), *History of South Africa* (1900), *Life of King Edward VII* (1910), *French Canada and the St. Lawrence* (1913), and other works.

HOPKINS, JOHN HENRY (1792-1868). A Protestant Episcopal bishop. He was born in Dublin, Ireland, Jan. 30, 1792, came to the United States in 1801, and became an iron manufacturer in Pennsylvania. The War of 1812 having proved disastrous to the business, he studied law, and began practice in Pittsburgh,

but in 1823 he entered the ministry of the Protestant Episcopal church, in response to the call of the church in which he was vestryman. In 1831 he accepted the charge of Trinity Church, Boston, and the next year was chosen Bishop of Vermont, taking also the rectorship of a church in Burlington. He took great interest in education and made heavy pecuniary sacrifices for its promotion. After 1856 he devoted his whole time to the care of the diocese. He was a prolific writer, leaving nearly 20 published works, among which are *Christianity Vindicated* (1833), *The Primitive Creed Examined and Explained* (1834), *The Novelties which Disturb our Peace* (1844), *History of the Confessional* (1850), *The American Citizen His Rights and Duties* (1857), *A Scriptural, Ecclesiastical, and Historical View of Slavery* (1864). He was prominent in the Lambeth Conference in London in 1867. He died at Rock Point, Vt., Jan. 9, 1868. Consult his biography by his son JOHN HENRY (New York, 1873).

HOPKINS, JOHNS (1795-1873) An American financier and philanthropist. He was born of Quaker parentage in Anne Arundel Co., Md., where he lived on a farm until he was 17, when he went to Baltimore and worked for a time in his uncle's grocery. Afterward he became a merchant, with wide connections in Maryland, Virginia, and North Carolina. His credit and counsel were highly valued in financial and mercantile affairs, and he became one of the leading financial men in Baltimore. His services to the Baltimore and Ohio Railroad were of great value. Towards the end of his life, having no children, he determined to devote his fortune to the service of the public. Accordingly he founded and endowed two great institutions which perpetuate his name—Johns Hopkins University and Johns Hopkins Hospital. Johns Hopkins Medical School, founded in 1893, is part of the university and closely allied with the hospital. The total gift for these two purposes was more than \$7,000,000.

HOPKINS, LEMUEL (1750-1801). An American political poet, born in Connecticut. He practiced medicine at Litchfield and after 1784 in Hartford, where he became allied with the "Hartford Wits," Joel Barlow, John Trumbull, David Humphreys, Theodore Dwight, and others, and with them wrote *The Political Greenhouse*, *The Echo*, and—advocating strong Federal government—*The Anarchiad* (republished at Hartford, 1861). Hopkins also wrote *The Hypocrite's Hope* and *The Victim of a Cancer Quack*.

HOPKINS, MARK (1802-87) An American educator, grandnephew of the theologian Samuel Hopkins, and brother of the astronomer Albert Hopkins. He was born at Stockbridge, Mass., graduated at Williams College in 1824, was tutor there for two years, and, after studying medicine and practicing for a short time in New York, became professor of moral philosophy in Williams in 1830 and president of the institution in 1836. He resigned this position in 1872, but remained pastor of the college church and incumbent of the chair of moral philosophy. In 1857 he had become president of the American Board of Foreign Missions. Undoubtedly one of the greatest of American educators of his day, Hopkins did much to build up the prestige of Williams College and much more to develop the individual student. He was a powerful preacher and a successful lecturer. He pub-

lished *The Influence of the Gospel in Liberalizing the Mind* (1831), *The Connection between Taste and Morals* (1841) his Lowell Lectures, *The Evidences of Christianity* (3d ed., 1875), *Miscellaneous Essays and Reviews* (1847), a second series of Lowell Lectures, *Moral Science* (1802), *The Law of Love and Love as a Law* (last ed., 1881); *An Outline Study of Man* (last ed., 1893), *Strength and Beauty* (1874, in 1884 under the title *Teachings and Counsels*), *The Scriptural Idea of Man* (1883)

HOPKINS, SAMUEL (1721-1803) An American clergyman and founder of the Hopkinsian theology. He was born at Waterbury, Conn., Sept. 17, 1721. Having graduated at Yale College in 1741, he studied theology with Jonathan Edwards in Northampton, Mass., and from 1743 to 1769 was pastor of Housatonic, now called Great Barrington, Mass. He then removed to Newport, where he died Dec. 20, 1803. His writings consist of a life of Jonathan Edwards, sermons, addresses, a work on the millennium, and a system of theology, republished in Boston, 1852. He was remarkable for his simplicity, earnestness, and persevering industry. He held most of the Calvinistic doctrines, even in their most extreme form, but entirely rejected the doctrine of imputation, both the imputation of Adam's sin and of Christ's righteousness. The fundamental doctrine of the Hopkinsian system, based on Edwards' theory of virtue as "love to being," is that all virtue and true holiness consists in disinterested benevolence, and that all sin is selfishness. The self-love which leads a man to give his first regard even to his own eternal interests is sinful, so that one ought to be willing "to be damned for the glory of God." Consult his collected writings with memoir by E. A. Park (Boston, 1852), and Foster, *History of New England Theology* (Chicago, 1907).

HOPKINS, STEPHEN (1707-85). A Colonial Governor of Rhode Island and one of the signers of the Declaration of Independence. He was born in Providence, R. I., and was descended from an old English family, his great-grandfather, Thomas Hopkins, having settled in Providence about 1638. Stephen's early life was spent on a farm, and he had little opportunity to gain an education, though under the tutelage of his grandfather and uncle he learned surveying and later broadened his intellectual horizon by extensive reading. In 1732 he began his active participation in public affairs by becoming clerk of the newly constituted township of Scituate, a position which he continued to hold for 10 years. From 1732 to 1738 (excepting the year 1734) he was a representative from Scituate to the General Assembly, and upon being returned in 1741 he was chosen Speaker. He became a justice of the Court of Common Pleas in 1736 and was appointed its clerk in 1741. Six years later he was made assistant justice of the Superior Court at Newport and in 1751 Chief Justice. He was one of the Rhode Island delegates to the Albany Convention of 1754 and was a member of the committee which was appointed to draw up a "plan of union" (See ALBANY CONVENTION). In 1755 he was elected Governor of Rhode Island and was eight times reelected, serving almost continuously until 1768, when he withdrew finally from the gubernatorial contest. Meanwhile he had acquired large shipping and commercial interests, and in 1764, in answer to the proposal of Parliament to tax the Colonies, he sent to the As-

sembly a forceful tract, *The Rights of Colonies Examined*, which was forthwith published in Rhode Island and reprinted in nearly every other continental English colony. After acting as chairman of several Colonial committees, he was a member of the General Assembly from 1770 to 1775. In 1772, when the commander of the *Gaspee* was by arbitrary measures invoking that hostility which expressed itself in the burning of the schooner, Hopkins, as Chief Justice of the Superior Court, held "that no commander of any vessel has a right to use any authority in the body of the Colony, without previously applying to the Governor, and showing his warrant for so doing", and when it was proposed to send to England for trial persons charged with the burning, he declared that he would neither apprehend by his own order nor suffer any executive officers in the Colony to do so for that purpose. In 1774 Hopkins framed a bill to prohibit the importation of slaves and from 1774 to 1780 was one of Rhode Island's representatives in the Continental Congress, being one of the signers of the Declaration of Independence in 1776. He was also a member of the Rhode Island Council of War and a delegate to numerous New England conventions. He died in Providence, July 13, 1785. He wrote *A True Representation of the Plan Formed at Albany for Uniting all the British North American Colonies* (1755) and *An Historical Account of the Planting and Growth of Providence* (originally published in the *Providence Gazette* in 1762 and 1765), which, though a fragment, is of considerable value. It has been republished in the *Collections of the Massachusetts Historical Society*, vol. ix (2d series, Boston, 1822), and in the *Collections of the Rhode Island Historical Society*, vol. vii (Providence, 1885). Consult Foster, *Stephen Hopkins, a Rhode Island Statesman* (ib., 1884, forming nos. 19 and 20 of the Rhode Island Historical Tracts).

HOPKINS, WILLIAM (1793-1866). An English geologist and mathematician, born at Kingston-on-Soar, Nottinghamshire. Graduating B.A. in 1827 and M.A. in 1830 from St. Peter's College, Cambridge, he early distinguished himself as a teacher of mathematics. After 1833 he devoted much time to the application of mathematics to physical geology, as in the motion of glaciers, transport of erratic blocks, and in earth movements producing faults and fissures. In 1850 he received the Wollaston medal. He served as president of the Geological Society in 1851 and of the British Association for the Advancement of Science in 1853. He published *Elements of Trigonometry* (1833) and various important papers on geology.

HOPKINS, WILLIAM JOHN (1863-) An American author. He was born at Bedford, Mass., and was educated at the Friends' Academy, at Harvard University, and at Massachusetts Institute of Technology. He early published *Telephone Lines and their Properties* (1893) and *Preparatory Physics* (1894), but he came to be known as a writer of stories. His books include *The Sandman Series* (4 vols., 1902-08), *The Airship Dragonfly* (1906), *The Clammer* (1906), *Old Harbor* (1909), *The Meddlings of Eve* (1910); *The Indian Book* (1911); *Concerning Sally* (1912), *Burbury Stoke* (1914), *The Doers* (1914).

HOPKINSIANISM. See HOPKINS, SAMUEL. **HOPKINSON, FRANCIS** (1737-91). An

American politician, jurist, and miscellaneous writer, born in Philadelphia, Pa. He is best remembered for his *Battle of the Kegs* (1778), a humorous ballad based on an incident in the Revolutionary War. He was educated at the College of Philadelphia, admitted to the bar in 1761, and a few years later he spent a year in England, where his cousin was then Bishop of Worcester. Returning to Philadelphia, he practiced law, was active in learned societies, declared his republican sympathies, and, having removed to New Jersey, was made delegate to the Continental Congress (1776). He took part in drafting the Articles of Confederation and signed the Declaration of Independence. He held various offices under the Federal government, was Judge of Admiralty for Pennsylvania (1779-89), suffered an impeachment which failed, and was district judge there (1790-91). Hopkinson was a man of exceptionally varied accomplishments. He composed music for his facile songs, painted, was a dilettante in popular science, a humorist, and a political pamphleteer. His works were collected in three volumes (Philadelphia, 1792). Besides the *Battle of the Kegs*, his most popular production was a short prose allegory of the relations between the Colonies and the mother country, entitled *A Pretty Story* (1774). He was father of Joseph Hopkinson (qv). Consult A. R. Marble, *Heralds of American Literature* (Chicago, 1907).

HOPKINSON, JOHN (1849-98). An English physicist and electrical engineer. He was born at Manchester, England, and received his education at Owens College, Manchester, and at Trinity College, Cambridge, where he graduated with honors in 1871 and was appointed fellow and tutor. Commencing practical engineering, he soon became interested in electrical engineering and was led to many important investigations. He was made a fellow of the Royal Society of London in 1878, and in 1890 was awarded by it a royal medal for researches in electricity and magnetism. He was at the time of his death a member of the Councils of the Institutes of Civil and Mechanical Engineers and professor of electrical engineering in King's College, London. Among his most important researches are those in which he showed the effect of temperature upon the magnetic properties of various metals. He was an authority in the theory and practice of dynamo-electric machinery and discovered the method of employing the so-called "characteristic curve" in discussing such problems. This curve is obtained by taking the electromotive forces as ordinates and the current as abscissas and serves for the dynamo the same purpose as the indicative diagram in the case of the steam engine. He was the author of *Dynamic Electricity* (1884), *Original Papers in Dynamo Machinery and Allied Subjects* (1893), and many papers on various electrical and engineering subjects, which, with a memoir by his son, were collected and published in 1901. With one son and two daughters he was killed in an accident while climbing the Alps.

HOPKINSON, JOSEPH (1770-1842). An American jurist, born in Philadelphia, Pa. He graduated at the University of Pennsylvania in 1786 and in 1791 began the practice of law at Easton, Pa., but soon removed to Philadelphia, where he rose to the front rank in his profession. He was the leading counsel in the famous suit of *Rush v. Cobbett* in 1799 and de-

fended Judge Chase in his impeachment before the Senate in 1800. From 1815 to 1819 he served as a Federalist Representative in Congress, where he distinguished himself in the debates on the tariff and the Seminole War and strongly opposed the rechartering of the United States Bank. In 1828 he was appointed by President Adams a district judge, an office which he held until his death. For several years he was president of the Philadelphia Academy of Fine Arts and vice president of the American Philosophical Society, to each of which he contributed many papers of interest. In 1837 he was a member of the Pennsylvania Constitutional Convention and served as chairman of its Judiciary Committee. His legal essays and decisions were long accepted as authoritative, but he will be longest remembered for his national song, "Hail Columbia," written in 1798, which attained immediate popularity and did much to fortify waving patriotism.

HOPKINSVILLE. A city and the county seat of Christian Co., Ky., 71 miles northwest of Nashville, Tenn., on the Louisville and Nashville, the Tennessee Central, and the Illinois Central railroads (Map Kentucky, C 6). It is the seat of McLean College, Bethel Female College (Baptist), founded in 1854, and of the Western Kentucky Asylum for the Insane, and contains a Carnegie library, Odd Fellows Home, Peace and Latham parks, and a fine post office, city hall, and courthouse building. The city is engaged principally in tobacco manufacture and trade, but has a considerable business also in flour, wheat, corn, hay, dairy products, and live stock. Hopkinsville was settled in 1797, incorporated in 1798, and adopted the commission form of government in 1914. Pop., 1900, 7280, 1910, 9419, 1914 (U. S. est.), 10,328.

HOPLOPHONEUS (Neo-Lat., from Gk *ὅπλα*, *hopla*, arms + *φόνιος*, *phonios*, murderous). A Miocene fossil cat, found in the White River formation of Colorado, Wyoming, and the Dakotas. See **SABRE-TOOTHED TIGER**.

HOP LOUSE. A very destructive aphid or plant louse (*Phorodon humuli*), found commonly

WINGED MIGRANT, THIRD GENERATION

on the hop plant and called in England hop fly. In certain years this insect causes an almost total loss of the hop crop in parts of England and New York and a number of years ago forced the abandonment of this industry in Wisconsin. About 1890 it made its first appearance in the States of Oregon and Washington and has since done great damage. The winter eggs are laid on plum trees in the neighborhood of the hopyards

These eggs hatch in the spring at the time when the buds are about to burst, and three genera-

The tenth or eleventh generation is winged, flies back to the plum, and gives birth to true sexual females which are wingless, but which mate with winged males which fly in from the fields. The winter egg is then laid once more upon the plum twigs. (See ALTERNATION OF GENERA-

birth to living young which, agamic and wingless, give birth to individuals like themselves.

dilute kerosene-soap emulsion or a fish-oil soap wash. See HOP INSECTS.

HOP O' MY THUMB The diminutive hero of a popular fairy tale, taken from Perrault's *Contes des fées*, the popular sources of which are the classic stories of Ulysses and Polyphemus and of Theseus and Ariadne.

HOPPER, DE WOLF (1858-) An American comedian, born in New York City. He first appeared on the stage in 1878 in *Our Boys*, and he first starred in *Castles in the Air* in 1890. Subsequently he played leading rôles in *Wang* (1891), *Panjandrum* (1893), *Dr. Syntax* (1894), *El Capitán* (1895) in which he made his first appearance in London in 1899, *The Charlatan* (1898), *Happyland*, *Mr. Pickwick*. After 1900 he took part in revivals of *Wang* and *Panjandrum*, appeared in the title rôle of *The Pied Piper* (1908), toured and played in New York in *A Matinee Idol* (1909-10). For several years he starred in his own company. Later he joined the Gilbert and Sullivan Opera Company, which from 1911 to 1913 was responsible for a notable revival of *Pinafore*, *Patience*, *The Mikado*, *The Pirates of Penzance*, *Iolanthe*, and Millocker's *The Beggar Student*. Of this company, which included many "stars," Hopper was perhaps the leading figure. In such parts as those of Dick Deadeye and Ko-Ko his ability to realize the comic possibilities approached genius.

HOPPER, ISAAC TATEM (1771-1852). An American philanthropist, prominent in the anti-slavery movement. He was born in Deptford Township, Gloucester Co., New Jersey, Dec. 3, 1771. At 16 years of age he was apprenticed to an uncle in Philadelphia to learn the trade of a tailor. In early manhood he became an active and leading member of the Pennsylvania Abolition Society, founded by Franklin, Rush, and others, and was also an overseer of a school for colored children, secretary of a society for the employment of the poor, inspector of a prison, guardian of abused apprentices, and a friend of the insane. He belonged to the Society of Friends, and in the division which occurred in 1827-28 he acted with those who were called Hicksites, influenced much, no doubt, by his great regard and admiration for Elias Hicks as an earnest antislavery preacher, in 1829 he went to New York to take charge of the bookstore opened by the Hicksite Friends. His activity in opposition to slavery exposed him to much abuse and even imperiled his life, but this did not in the least abate his zeal. In 1841 he gave up the charge of the bookstore and was appointed treasurer and office agent of the American Antislavery Society, and so continued until 1845, when he became the first agent of the New York Prison Association. Declining years and ill health compelled his resignation in February, 1852. He died in New York, May 7, 1852. Consult his life by L. M. Child (New York, 1881).

HOPPER, NORA (Mrs. W. H. Chesson) (1871-1906). An Irish poet of that group of Irish writers who collectively constituted the movement known as the Irish Literary Revival. (See *IRISH LITERATURE, in English*.) Her *Balads in Prose* (1894) made an immediate impression. Her verse is characterized by the delicacy of sentiment, grace, wistfulness, and intensity which belong to the Celtic temperament. She published in addition to the book named, *Under Quicken Boughs* (1896), *Songs of the Morning* (1900), and *Father Felix's Chronicles* (1907). *Selected Poems* (1906) con-

tains, besides her verses, an introduction by F. M. Hueffer and a biographical note by her husband, W. H. Chesson, who edits the book.

HOPPE-SEYLER, hop'pe-zi'ler, FELIX (1825-95). A German physiologist and chemist, born at Freyburg-on-the-Unstrut and educated at Halle, Leipzig, Berlin, Prague, and Vienna in medicine and natural history. After five years as assistant to Virchow and director of the chemical laboratory of the Berlin Pathological Institute, he became professor of applied chemistry at Tübingen (1861) and (1872) of physiological chemistry at Strassburg. He wrote *Handbuch der physiologisch- und pathologisch-chemischen Analyse* (7th ed., 1902), *Medizinisch-chemische Untersuchungen* (1866-71), *Physiologische Chemie* (1877-81). Consult Baumann and Kossel, *Zur Erinnerung an Felix Hoppe-Seyler* (Strassburg, 1895).

HOPPIN, AUGUSTUS (1828-96). An American book illustrator, born in Providence, R. I. He graduated at Brown University in 1848 and was admitted to the bar, but soon gave up the law and went abroad to study art. Upon his return he devoted himself to drawing on wood and to the illustration of books, in which he was successful. His pictures in *Nothing to Wear* (1857), *Potiphar Papers* (1853), and *The Autocrat of the Breakfast Table* are widely known. He published several volumes of sketches and novels, among the latter *Recollections of Aunt House* (1881) and *Married for Fun* (1885).

HOPPIN, JAMES MASON (1820-1906). An American educator and writer. He was born at Providence, R. I., graduated at Yale in 1840, at Harvard Law School in 1842, and at Andover Theological Seminary in 1845, studied for some time abroad, and was pastor of a Congregational church at Salem, Mass., from 1850 to 1859. From 1861 to 1879 he was professor of homiletics at Yale, where he was also professor of the history of art from 1879 to 1899, when he became professor emeritus. Among his publications are *Old England: Its Art, Scenery, and People* (1867), *The Office and Work of the Christian Ministry* (1869), *Life of Rear-Admiral Andrew Hull Foote* (1874), *The Early Renaissance and Other Essays on Art Subjects* (1892), *Greek Art on Greek Soil* (1897); *The Reading of Shakespeare* (1904).

HOPPNER, JOHN (1758-1810). An English portrait painter. He was born in London, April 4, 1758. His mother was one of the German court attendants. Her husband is said to have accompanied George II to England as physician to the household and as such to have lived at St. James's. At any rate, young Hoppner was brought up there, was a choir boy in the Chapel Royal, and was given an annuity by George III in 1775 to enable him to study at the Royal Academy. It was generally believed that he was the natural son of the King. Hoppner's marriage to an American girl, Miss Phœbe Wright, in 1781, is said to have cost him the King's favor and to have been the cause of his receiving notice to "quit his apartments in Buckingham House, with the intimation that his bills would be paid up to a certain date." After losing the King's favor he apparently ranged himself definitely with the Prince of Wales on the side of the Whigs as against the Tories. In 1791 his rival Lawrence was made principal painter in ordinary to the King, and Hoppner was appointed portrait painter to the Prince of Wales in 1793 and elected member of the Royal

Academy in 1795. As a result of the Prince's patronage, many of Hoppner's finest portraits are in the state rooms of St James's Palace, among them "The Prince," the "Duke and Duchess of York," "Lord Rodney," and "Lord Nelson." Paintings by Hoppner in the Metropolitan Museum, New York are "Lady with the Coral Necklace" and "Mrs Bache" (See BACHE, SARAH). In the Morgan collection loaned to the Metropolitan Museum is one of Hoppner's finest pictures, that of the three Godsal children, engraved in mezzotint by J Young in 1790 with the title "The Setting Sun." In the National Gallery, London, is the portrait of the beautiful Countess of Oxford, friend of Lord Byron. In the National Portrait Gallery, London, are "Baron Colchester," "Baron Grenville," "William Pitt," "William Smith." While Hoppner was a pupil and an avowed follower of Reynolds, he had a marked personality of his own, and his portraits of women and children are distinguished for sentiment and poetical warmth. His portraits of men, with the exception of Lord Nelson and a few others, are colder and less intimate. For many years his work was neglected, but to-day the best of it stands beside that of Reynolds, Gainsborough, Romney, and Lawrence. Those of his pictures that are still in good condition show that his reputation as a brilliant colorist was deserved. Noteworthy is his use of luminous golden browns, as in the portrait of the Godsal children. While his drawing was seldom accurate, he had a knack for modeling in paint and getting a lifelike effect. But he was apt to flatter his subjects by eliminating or modifying facial blemishes, and most of his women have the romantic interest that is aroused by an appearance of gentle melancholy. Consult J C Van Dyke, *Old English Masters* (New York, 1902), McKay and Roberts, *John Hoppner, R.A.* (London, 1909), an exhaustive folio volume elaborately illustrated, with catalogue raisonné, W McKay, *Works of John Hoppner* (New York, 1914).

HOP TREE (*Ptelea trifoliata*). An American shrub of the rue family, called also shrubby trefoil, wafer ash, and wingspeed, which grows in rocky places from New York and Ontario to Minnesota and southward. It usually grows from 6 to 10 feet in height, but when well trimmed and cultivated sometimes attains a height of 30 feet or more. The leaves are trifoliate, the leaflets pointed, and downy when young, the flowers, which grow in terminal cymes, are greenish white and have a disagreeable odor. The fruit has a broad wing which resembles that of the elm and is very bitter, but does not possess the aromatic and bitter principle of the hop. nevertheless, it is said to have been used as a substitute for hops in making beer. The bark and root are of some repute in medicine. When dried, the bark has a peculiar, somewhat aromatic smell and a bitter, pungent, acrid taste. The bark contains an acrid, bitter oleoresin, starch, albumin, a yellow coloring substance, and salts of lime, potash, and iron, also the alkaloid berberine, probably the tonic principle.

HOPWOOD, SIR FRANCIS JOHN STEPHENS (1860-). An English administrator. He was educated at Louth, was admitted a solicitor in 1882, became assistant law clerk (1885) and assistant solicitor (1888) to the Board of Trade, and, after serving a year as private secretary to the President of the Board of Trade, in 1893

was made Secretary to the Railway Department. He was British delegate to the International Railway congresses of 1895 and 1900, was sent on important missions to Canada and the United States, and served on royal commissions—on shipping rings, London traffic, canals, electoral reform, etc. In 1901-07 he was Permanent Secretary of the Board of Trade and then Under-secretary of State for the Colonies. In 1911 he was named "additional civil lord" on the Board of Admiralty, a nonpolitical appointment in an attempt to reorganize the board, and in 1912 he became Privy Councillor. He was knighted in 1901.

HOQUIAM, hō'kwi-am. A city in Chehalis Co., Wash., on Gray's harbor, 90 miles by rail southwest of Tacoma, on the Chicago, Milwaukee, and St. Paul, the Northern Pacific, and the Oregon-Washington Railroad and Navigation Company systems (Map Washington, A 3). It is surrounded by timberlands, has a fine harbor, and is an important shipping point for lumber products, salmon, canned sea clams, and furs. The chief industrial establishments are shipyards and large lumber and shingle mills. Hoquiam has a Carnegie library and a fine high-school building. It adopted the commission form of government in 1911. Pop., 1900, 2608, 1910, 8171, 1914 (U. S. est.), 10,540.

HOR, hōr. A mountain where, according to one tradition, Aaron (q.v.) died (Num. xx, 22 ff., xxiii, 38 f., Deut. xxxiv, 50). Josephus (*Ant.*, iv, 4, 7) and Eusebius (*Onom.*, 303, 144) located this mountain at Petia, northwest of Wadi Musa, where a peak bears to-day the name of Jebel Harun (mount of Aaron). There is a structure on the top of the mountain within which is a sarcophagus covered with black cloth. One of the sides is partly exposed, and there is a Hebrew inscription in square characters on the marble slab. The tomb is not older than the Moslem possession. But the sanctuary is evidently old, and there is no reason to doubt that it was ascribed to Aaron long before the time of Josephus. Schmidt has suggested that the figure of Aaron was connected with this mountain even before David's conquest of Edom, and that another centre of his veneration was Moserah (Jebel Madhera) in the Negeb, where he also is said to have died (See AARON). There is no mountain by the name of Hor in the Lebanon Range. The Greek version shows that Hor in Num. xxxiv, 7 is simply caused by ditto-graphy. Consult Schmidt, in *Hibbert Journal* (London, 1908), id., "Kadesh Barnea," in *Journal of Biblical Literature* (Boston, 1900), Musil, *Arabia Petrea, I. Edom* (Vienna, 1906), Dalman, *Petra und seine Heiligtümer* (Leipzig, 1911).

HORA, hō'ra, hō'ra (c. 1740-85). A Ruman patriot and national hero of Transylvania, sometimes called *Nikla Urss*, Nicholas the Bear. With Juon Kloska and George Kriszán, he roused the people to rebellion against the Imperial order for general conscription (1784). The uprising spread until 30,000 men had joined. But Imperial troops were hurried in in such numbers that the revolt failed; the three leaders were captured, and Hora was killed. Hora's exploits form the theme of popular Ruman songs.

HORACE, ō'ras'. A five-act tragedy in verse, by Pierre Corneille, produced in 1640. It is founded on the old Roman legend of the Horatii and Curiatii.

HORACE, hō'ras (QUINTUS HORATIUS FLAC-CUS) (65-8 B.C.) A Latin poet, born at Venusia, on the borders of Lucania and Apulia. His early years were thus passed amid a picturesque environment of mountain, forest, and stream, which made a deep impression upon his mind and strengthened that love of nature which so often finds expression in his verse. To the men and the women of Apulia, also, he ascribes all the characteristic Italian (Roman) virtues. Horace's father was a *coactor*, a collector of taxes or of money due for goods sold at public auctions, and by his thrift was successful not only in buying his own freedom, but also in acquiring a small estate and an income which enabled him to give to his son the best education Rome itself could offer. Thither, at an early age, Horace went with his father, who in his affection and devotion to his son's interests made himself the boy's comrade in the daily round of study and play and helped to form his son's standards of life and conduct by his own shrewd comments upon men and manners. It was naturally the *mos maiorum* rather than any abstract ideal of which the freedman pointed out the advantages, but the familiar talks had their desired effect in the rise in Horace's mind of an instinctive aversion to excess of every sort, and trained him, besides, in habits of keen observation and pointed though kindly criticism. It was then customary among young Romans of birth and means to complete their education by what may be called a university course in the schools of philosophy at Athens or in those of oratory at Rhodes, and so, between 18 and 20, Horace took up his residence at Athens, listened to the exposition of conflicting philosophical theories, and entered into the social life of his fellow students. Purely speculative problems attracted him as little as they did the average Roman, nor had he, in fact, much relish for the technicalities of any philosophical system. The paradoxes and social eccentricities of the Stoic thinkers, e.g., long made it difficult for him to do justice to the real moral elevation of their essential principles. But he had already become profoundly interested in the practical problem of how to order one's life aright, and his stay at Athens confirmed this taste for ethical inquiry. At this time, too, he must have come to know more intimately the work of Alcæus (qv), Sappho (qv), Archilochus (qv), and the other Greek lyric poets who were to be his models in the *Epodes* and the *Odes*.

But these peaceful and congenial pursuits were suddenly interrupted by the news of the assassination of Cæsar in March, 44, and the subsequent arrival of Brutus in Athens to secure recruits for the republican cause. Brutus, himself a lover of letters and an eager student of philosophy, was received with enthusiasm and was so much taken with Horace's promise that the latter, despite his youth and lack both of family connection and of military experience, was made a staff officer and ultimately served in the campaign of Philippi as *tribunus militum*. That decisive defeat and the suicide of his chief seem to have convinced him of the futility of further effort in the republican cause, and he made his way back to Rome, where, finding that his father's estate had been confiscated, he obtained employment as a clerk in the quaestor's office. It was the darkest period of his life, and, as the earliest of the *Epodes* show, the bitterness of his feeling found unrestrained ex-

pression in the verses which, in his own words, poverty drove him to write. But he was so fortunate as to win the regard of Vergil and Varius, who two or three years after his return to Italy, introduced him to Mæcenas. Nine months after the first interview Mæcenas again sent for the young writer and bestowed upon him the friendship that saved Horace for poetry.

But it was in metrical prose rather than imaginative poetry, as he himself viewed his work, that Horace first tried to gain an audience. Early training and the mood of the moment combined to make the choice of satire almost inevitable. Lucilius (qv), a member of the Scipionic circle, had for the first time in Latin literature used the old *melange* form of Ennius (qv) as a vehicle for witty and often stinging criticism of the political and the social life of his time. The range of topics was naturally exceedingly wide, the treatment often dramatic and cast in the dialogue form, the metres varied, though in the end the hexameter decidedly predominated. The new *satira* (see SATIRE) was marked by at least one original and noteworthy feature. This was the establishment of a personal and intimate relation between Lucilius and his reader, so that the frankest revelation of the poet's inmost feelings seemed yet free from egotism and consistent with self-respect. It was thus natural that Horace should be strongly attracted by Lucilius, though, with a mind already much occupied with the niceties of phrase and cadence, he could not but feel that, despite all its vigor and charm, the work of the older poet was sadly lacking in artistic finish. To write in the manner of Lucilius, but with a more perfect art, was the end Horace proposed to himself and achieved in the *Satires* (*Sermones*, "*causætes*," as he calls them), of which the first volume, containing 10 pieces, appeared about 35 B.C. The second, containing eight pieces, published about 29 B.C., is far superior in execution to the first and shows Horace at his best in this kind of writing. In reading this volume we are listening to an accomplished man of the world, intimately acquainted with human nature, whose whims and weaknesses he probes with delightful humor. He is exceedingly fond of the weapon of irony, which he uses against himself quite as often as against others, and every page reflects his sunny nature, genuinely tolerant and charitable. These "talks," however light in their touch, have yet a definite and serious purpose. It is the art of living that is ever under discussion, and, as he studied others, so also Horace studied most minutely the nature best known to him (his own), so that one of the special charms of the *Satires* is the presence of this constant self-analysis. Of egotism in the sense of vanity or selfishness Horace was of all men the most devoid, but he was nevertheless a watchful and ever interested observer of the motions of his own mind. He saw himself as he saw everything else (to borrow the words of Mr. Andrew Lang), with the lucidity of genius, and loved to put himself on terms of confidence with his readers.

One notices already in the *Satires* an attitude of mind that became characteristic and was later both to limit his range and to widen his appeal as a lyric poet. He takes counsel of his head rather than of his heart and distrusts enthusiasm, especially about ideas, as if warmth of feeling, not held carefully in check by reason,

rendered impossible that equipose through which alone one may hope to see things as they really are. This is true of even his friendships, where he is tenderness and loyalty itself. But this studied moderation of thought and utterance is the fruit of experience and self-discipline. His earliest attempts in lyric verse show all the ardent temper of youth and are marked by an exuberance of phrase in striking contrast with the wonderful compression of his later work. In these *iambi*, as he called them, published about 30 B.C., Archilochus (qv) is his model, though not more than half of the 17 poems that Horace deemed worthy of preservation show the personal animosity associated with the name of the Greek poet. With one exception, the seventeenth, they are written in couplets, the second verse of which forms a refrain (*epodus*, *ἐπωδός*) to the first, and thus they came in time to be known as *Epodes*. (See *EPODE*.) Immature as they are as a whole, and interesting chiefly as the first lyric essays of the Horace of the *Odes*, three certainly reveal poetical power of no mean order—the idyllic second, with its sudden turn to satire at the close, the fifth, with its extraordinary picture of the sorceress Canidia, and the sixteenth, with its passionate appeal to his countrymen to forego civil strife.

Shortly after the appearance of the first book of the *Satires*, Mæcenas presented Horace with a small farm among the Sabine hills, in the valley through which the cool Digentia flows south to join the Anio near the market town of Varia, the modern Vico-Varo. Perhaps no gift ever exercised a more important influence upon a man's career. It was not merely that he was thus enabled to devote himself wholly to his art without thought of pecuniary return. The farm was his *ars*, his sure retreat from the fatigues and distractions of the great world. The peace of nature, loved since the days of Venusia, entered into and possessed his soul, and the pure air—it was about 2000 feet above the sea—renewed his physical strength, of which, as the years passed, he had to take increasing care. He has immortalized the farm and, indeed, the whole valley in his affectionate praise. One may doubt whether he could have been happy without active participation in the brilliant life of the capital, but much of what is truest and best in the inspiration of the *Odes* and the *Epistles* is due to the many quiet days spent with his books in *Sabinis*. Excavations made in 1912-13 have settled, Italian archaeologists claim, the site of this Sabine farm. The results of these excavations have not yet, however, been officially and fully set forth to the world, for partial accounts, subject to correction later by the official publication, consult Haight, *The Classical Weekly*, vii, 85-86 (New York, 1914).

The 88 lyrics that are comprised in the first three books of the *Odes* were undoubtedly privately circulated among his friends previous to their final collection and publication in one little volume in the year 23. Their composition extended over about seven years, for the earliest that can be dated with certainty (i, 37) was written upon the receipt at Rome of the news of Cleopatra's suicide, and few, if any, could have preceded this. They were the outcome of long and loving study of the great Greek lyric poets, especially Alcæus and Sappho, of the early Greek classical period rather than of the Alexandrian age. But, while their form is similar to that of the Greek lyric poets, their content is vitally

different in its effect, and it is difficult to define precisely the nature of that unfailing charm which almost from the moment of their appearance they have been universally felt to possess. Shelley, in his *Defence of Poetry*, following a famous passage in Plato's *Phædrus*, and Sidney, in his *Apologie for Poetry*, both maintained that "poets are so beloved of the gods that whatsoever they write proceeds of a divine fury." But nothing could be more alien to Horace's temper than this. He has neither the passion of Burns or Catullus in the expression of feeling, nor the absorbed and ecstatic earnestness of Lucretius in urging the claims of the true philosophy of life, nor yet the imaginative and mystical power of Vergil. Gray, however, a poet whose method of composition resembled Horace's in its critical deliberateness—in the second poem of the fourth book of *Odes* Horace compares himself to a bee that with infinite labor gathers its sweets from many a flower—says in one of his letters "Extreme conciseness of expression, yet pure, perspicuous, and musical, is one of the grand beauties of lyric poetry." The three adjectives here used are peculiarly appropriate to Horace's work, indeed, no other lyric poet in Latin literature has so exquisite a verbal technique. The *Odes* abound in phrases of such perfect finish that no change save for the worse seems possible, phrases which have been the common property of educated men for centuries. *Persicos odi, puer, apparatus; carpe diem, dulce et decorum est pro patria mori, vivere fortes ante Agamemnona, matre pulchra filia pulchrior, nil desperandum, splendide mendax, dulce est desipere in loco, post equitem sedet atra cura*—to give a complete list would be almost to quote the *Odes* entire. Yet it is all a *curiosa felicitas verborum*, as Petronius (qv) aptly described it, the effects are carefully and minutely wrought out by a mind trained in the nicest apprehension of the color values of words and an ear attuned to all the subtleties of cadence. And no artist was ever more alive to the delicate shades of meaning that words gain from their context. Partly, no doubt, from the difficulties inherent in the use of foreign metres, but more especially because of his own liking for moderation and simplicity, the vocabulary which he has chosen to employ is notably limited. Yet the oft-recurring words produce so different an effect in their ever-changing settings that one does not notice the repetition. The themes themselves are even more limited in their range than the vocabulary, but upon the few that he selects he plays variations of surpassing beauty. There is nothing transcendental, nothing of what Poe held to be the essence of poetry, "no mere appreciation of the beauty before us, but a wild effort to reach the beauty above." The *Odes* are rather the expression of idealized common sense, and just for this reason Horace has been in all ages the favorite poet of minds the most diverse, for none makes a surer appeal to the finer sensibilities of humanity in its everyday moods. In a word, he speaks to the world of subjects which the world fully understands, in words and forms of surpassing beauty.

In the *envoi* to the first three books of the *Odes* (iii, 30), Horace expresses his entire confidence in their abiding fame, and with this achievement his lyrical impulse seems to have satisfied itself. A new series of "talks" engaged his attention, cast, however, in a different literary form, that of the letter. These *Epistles*, of

which the first book appeared towards the end of 20, or, at the latest, in 19, do not differ much from the *Satires* in the subjects discussed. Conduct is more than ever "three-fourths of life." But the years of reading and reflection have brought truer insight and greater breadth of view. He is still a searcher after the philosophy of life (his mind was far too independent to accept any creed formulated by others), but he urges with tactful insistence the elementary principles of whose truth he has become convinced. The humor is kindlier and more subtle; in fact, one is often in doubt whether he is speaking in jest or earnest, so that he has the inexhaustible charm of one whose secret is never wholly surprised. He is no idealist; it is rather the doctrine of the mean, the *aurea mediocritas*, that he so winningly inculcates. Not even virtue itself is to be sought beyond the bounds of reason, as indeed Aristotle had claimed long before him. Both the language and the metre of the *Epistles* show the effects of the seven years devoted to lyric composition. There is the same wealth of terse and happy phrase, and the hexameter, which even in the *Satires* was an immense advance upon the rhythm of Lucilius, is always smooth and often musical.

The death of Vergil in 19 left Horace by general consent the greatest living poet, and it was as such that in 17 Augustus commissioned him to write the hymn for the religious festival of the Secular Games (q.v.). The result to modern ears may seem rather stiff and unimaginative in spite of the technical excellence of the verse, but to the great Roman audience—we must remember that the *Carmen Sæculare* (q.v.) was chanted in the open air—there must have been something peculiarly impressive in the linking of the old liturgical formulas with the new faith in the city's Imperial destiny. Two years later, at the personal request of the Emperor, he composed two odes in celebration of the victories of Drusus (see *Drusus*, 3) and Tiberius (q.v.), the stepsons of Augustus, over the Rhæti and Vindelici, and, about the same time, two others in praise of the beneficent results for Italy of Augustus' reign. But Horace, though he had long been a sincere supporter of the new régime, was ill fitted for work of this kind, and these poems, especially the first two, show the laboriousness that not infrequently attaches to the official odes of a poet laureate. To give them permanence, he added 11 fugitive pieces (one of which, however, the seventh, on spring, is a perfect gem), and published this fourth book of the *Odes* in 13.

According to Suetonius, the charming bit of literary criticism which opens the second book of the *Epistles* was written to meet a complaint of Augustus that to him alone Horace had dedicated nothing. It is in substance an attempt to show that no true parallel could be drawn between the development of poetry in Greece and that at Rome, and that the work of the modern school, of which he regarded Vergil, Varius, and himself as the best representatives, marked the highest level yet reached of artistic achievement. (On the struggle between the new and the old in Latin literature, consult Knapp, "Archaism in Aulus Gellius," in *Classical Studies in Honor of Henry Drisler*, 135 ff., New York, 1894.) In the second of the two epistles of this book he sets forth at length with characteristic irony and indirection the reasons why henceforth lyric poetry must give place to the

"rhythms and harmonies of real life." The latest of his letters and the one which is most nearly a formal essay is that addressed to the Pisos. It is generally known as the *Art of Poetry* (*Libri de Arte Poetica*), though this title seems not to have been given to it by Horace himself, and is, indeed, scarcely appropriate, for only one branch, the drama, receives any systematic treatment. The discussion has all the sanity and breadth of judgment that mark the moral epistles, and is in effect another defense of the poetic ideals of the Augustan school.

Of the details of the closing years of his life we have no record. The death of Mæcenas, who in his last words commended his lifelong friend to Augustus was a severe shock. Horace, who had once (*Carmina*, ii, 17) prayed that they might not be separated in death, did not long survive him, dying on the 27th of November, 8 B.C. He was buried on the Esquiline, close to the tomb of Mæcenas.

Mr Mackail (*Latin Literature*, 118-119) has admirably summed up the significance of Horace's work: "Among the many amazing achievements of the Greek genius in the field of human thought were a lyrical poetry of unexampled beauty, a refined critical faculty, and, later than the great thinkers and outside of the strict schools, a temperate philosophy such as we see afterward in the beautiful personality of Plutarch. In all these three Horace interpreted Greece to the world, while adding that peculiarly Roman urbanity—the spirit at once of the grown man as distinguished from children of the man of the world, and of the gentleman—which up till now has been a dominant ideal over the thought and life of Europe."

Bibliography. The *editio princeps* was published at Venice in 1470. The most important editions before Bentley were those of Lambinus (last ed., Coblenz 1829), Cruquius (Antwerp, 1578), and Heinsius (Leyden, 1612). Richard Bentley's edition, first published at Cambridge in 1711 (3d ed., Berlin, 1860), made a new era in Horatian criticism. The best critical edition of the text is that of Keller and Holder (2 vols., Leipzig, 1864-70). Keller issued a second edition of the first volume (*Odes, Epodes, and Carmen Sæculare*) in 1899 and also a supplementary volume of text discussion, *Epilegomena zu Horaz* (Leipzig, 1879-80). The best general editions are those of Orelli revised by Hirschfelder and Mewes (4th ed., 2 vols., Berlin, 1886-92, with Latin notes and complete word index), Kiessling (2d ed., 3 vols., ib., 1890-97, vol. 1, the *Odes*, in 5th ed., 1908, vol. 11, the *Satires*, in 4th ed., 1910), Müller, *Odes and Epodes* (Leipzig, 1900), *Satires and Epistles* (1891-93), Wickham, *Odes and Epodes* (3d ed., Oxford, 1896), *Satires and Epistles* (1891); Schutz (Berlin, 1880-83, vol. 1, containing *Odes and Epodes*, 3d ed., 1889). The *Odes* have been edited separately by Nauck (13th ed., Leipzig, 1889), Page (4th ed., London, 1890), Smith (Boston, 1895, 1903), Shorey (ib., 1898, 1910), Bennett (ib., 1901), Moore (New York, 1902), the *Satires* by Kruger (14th ed., Leipzig, 1897), Palmer (4th ed., London, 1891), Rolfe (Boston, 1901), Morris (New York, 1909), the *Epistles* by Wilkins (3d ed., London, 1889), Morris (New York, 1911). Porphyrio's *Scholæ* have been edited by Holder (Innsbruck, 1894), those of the Pseudo-Acron by O. Keller (2 vols., Leipzig, 1902-04).

The translations of Horace are all inferior to the original. Among the best are those of Francis, entire (London, 1778), Lord Ravensworth, *Odes* (ib. 1858), Martin, entire (Edinburgh, 1888, with an interesting memoir and good illustrative notes), Conington, *Odes and Epodes* (3d ed., London, 1893), Lord Lytton, *Odes and Epodes* (ib., 1869); *Satires and Epistles* (1892), Sargent, *Odes* (Boston, 1893), De Vere, *Selected Odes and Epodes* (London, 1893), Gladstone, *Odes* (New York, 1894), Bennett (London, 1914). A sumptuous edition of the *Odes and Epodes* is that of the Bibliophile Society (6 vols., Boston, 1901-02), with introduction, life, and Latin text, translated and annotated by "eminent scholars, statesmen, and poets." Pope's *Satires and Epistles of Horace Imitated* is very brilliant (best ed. by Pattison). Conington translated also the *Satires and Epistles* (London, 1869; frequently reprinted). Interesting is C. W. F. Cooper, *Horace's Odes Englished and Imitated by Various Hands* (ib., 1880).

The most valuable literary treatment of Horace is Sellar's *Horace and the Elegiac Poets* (Oxford, 1892). Good also are Plüss, *Horazstudien* (Leipzig, 1882), and Boissier's *The Country of Horace and Vergil* (trans. from the French, London, 1896). There are good chapters on Horace in Patin, *Études sur la poésie latine* (3d ed., Paris, 1883), Nettleship, *Lectures and Essays* (1st series, Oxford, 1885), Tyrell, *Latin Poetry* (Boston, 1895), Mackail, *Latin Literature* (New York, 1900), Duff, *A Literary History of Rome* (London, 1909). For further bibliographical material, consult Teuffel, *Geschichte der römischen Literatur*, vol. II (6th ed., Leipzig, 1910), and Schanz, *Geschichte der römischen Literatur* (3d ed., Munich, 1911). Consult also A. C. E. Allinson, *Roads from Rome*, 72-106 (New York, 1913).

HORÆ (Lat., hours, from Gk. ὥραι, *Hōrai*, seasons). In ancient Greece, goddesses of the seasons of the year, at first with special reference to the farmer. At Athens they seem to have been originally two, Thallo and Carpo, the goddesses of the blossoming and of the ripening fruit. In general they were at first three, Eunomia, Dike, Eirene (Good Order, Justice, Peace), whose names show that the ethical side of their nature, as guardians of the due order and peaceful succession of natural processes, has become prominent. In the legend they are daughters of Zeus and Themis, guardians of the gates of Olympus, attendants upon the gods. They bring flowers and fruits to mortals and are closely connected with the Charites (qv) or Graces. In the Hellenistic time the Horæ became more closely connected with the seasons, and now the number is increased to four, to each of whom are given attributes appropriate to a special season. These four Horæ, however, rarely appear in literature until the late epic of Quintus Smyrnaeus and Nonnus. The fiction of 12 Horæ for the hours of the day is also very late and cannot be found in art with any certainty. Consult: Rapp, in Roscher, *Lexikon der griechischen und römischen Mythologie* (Leipzig, 1886 et seq.), Preller-Robert, *Griechische Mythologie*, vol. I (Berlin, 1894), Jolles, in Pauly-Wissowa, *Real-Encyclopädie der classischen Altertumswissenschaft*, vol. VIII (Stuttgart, 1913). See HOURS, BOOK OF.

HOR/APOLLO, or **HOR/APOLLON** (Lat., from Gk. Ὑραπόλλων, *Horapollōn*). An Egyp-

tian who wrote on Greek grammar, probably in the fourth century A.D. He lived in Alexandria and at Constantinople and wrote commentaries on the Greek poets Sophocles, Alcæus, and Homer. Another Horapollon lived at the close of the next century. It is uncertain whether we should ascribe to the former or to the latter the extant work on hieroglyphics, in two books, professedly a Greek translation of the work in Egyptian of one Horapollon, or possibly Horus, which has some value to the Egyptologist. There are editions of the work on hieroglyphics by Leemans (Amsterdam, 1835), and by A. T. Cary, with English translation and notes (London, 1840).

HORATII, hō-rā'shī-i. According to Roman legend three Roman brothers, born at one birth, cousins to the Curiati, of Alba Longa, also three brothers born at one time. Their mothers were twins who had been married on the same day and gave birth to their sons at the same time. During the Roman wars, when Clulius, the Alban King, and Tullus Hostilius, the Roman King, were in conflict, it was decided to leave the issue to a personal combat between these brothers. Two of the Horatii were soon slain, and the third brother, feigning flight, was pursued by the Curiati, all wounded, whom he slew one by one. The sister of the Horatii was betrothed to one of the Curiati and had made for him a beautiful mantle. As the victor entered the gate of Rome bearing his spoils, he was met by his sister, who, upon recognizing the cloak in her brother's hands, broke out in lamentations. Enraged that she should prefer her lover to her country, her brother slew her on the spot, and her body remained unburied until passers-by covered it with stones. Horatius was condemned to be scourged to death, but was afterward pardoned. The story is given by Livy (I, 24-26); behind the pure myth lies the fact of the close union in early times between Rome and Alba Longa and the later subjection of Alba Longa.

The famous Horatius (Cocles), who, with Titus Herminius and Spurius Lartius, in 507 B.C., so gallantly defended the Sublucian bridge against the army of Lars Porsenna (qv), King of Clusium, while their companions broke down the bridge behind them, was a worthy descendant of the survivor of the three Horatii. Consult Pais, *Ancient Legends of Roman History* (Eng. trans., Chicago, 1906).

HORATIUS COCLES, hō-rā'shī-ūs kō'klēz. See COCLES, HORATIUS, HORATII.

HÖRDE, hēr'de. A town of the Prussian Province of Westphalia, situated on the Emsche, 2 miles by rail from Dortmund (Map Germany, B 3). In the vicinity are productive iron and coal mines, and the town has important iron and steel works, foundries and coke ovens, employing over 8000 men. Pop., 1900, 25,126, 1910, 32,791.

HORDEIN, hōr'dē-in (from Lat. *hordeum*, barley). A substance that can be extracted from barley. It is a mixture of starch, cellulose, and a little nitrogenous matter.

HORDEOLUM. See STYE.

HORDEUM. See BARLEY.

HOREB, hō'rēb. See SINAI.

HOREHOUND (AS *hār'hūne*, from *hār*, hoar + *hūne*, hoarhound), *Marrubium*. A genus of plants of the mint family. The species are mostly herbaceous perennials, natives of the south of Europe and the East. One species, the

common or white horehound (*Marrubium vulgare*), is found generally throughout Europe, except in the more northern regions, and in the United States, growing in waste places, waysides, etc. It is about 1 to 1½ feet high, bushy, with roundish, ovate, crenate, wrinkled leaves and whorls of white flowers. The whole plant has a whitish appearance, from the down with which its leaves are covered. It has an aromatic but not very agreeable smell. It is tonic, stimulant, and laxative, and is popularly and efficaciously used for

HOREHOUND.

coughs, as an infusion as a sirup with sugar, or as a candy. In England the name 'horehound' is applied also to another plant, *Ballota nigra*, sometimes called black or fetid horehound, also of the family Labiata, and of a genus very closely allied to *Marrubium*. It closely resembles the white horehound in taste and possesses similar medical properties. A third British plant, *Lycopus europaeus*, a plant of the same family, is sometimes called water horehound and is also known as gypsywort. All these species have been introduced in the United States, and, in addition, six or eight species of *Lycopus*, or water horehound, are rather abundant.

HORGEN, hör'gen. A town in Switzerland, on Lake Zurich, 10 miles southeast of Zurich (Map Switzerland, C 1). Surrounded by vineyards and fruit orchards, it is a thriving industrial centre, with manufactures of cotton and silk goods and chemicals. Pop, 1900, 6914, 1910, 8006.

HORICON. The Indian name of Lake George, N. Y.

HORITES. An ancient people who dwelt in and around Mount Seir before the Edomites came there (Deut. 11, 22, 23). Biblical tradition preserves a recollection that the Horites formed a group of seven tribes (Gen. xxxvi. 20-30). They are said to have been smitten by Chedorlaomer and the kings of the East when they attacked Sodom in the days of Abraham (Gen. xiv. 6). They seem to have been absorbed by the Edomites, among whom several Horite clans continued to exist. The name is probably identical with the *Haru* of the Egyptian inscriptions. If so, it appears that the Horites also occupied territory in the West Jordan country, as the name seems to apply to the whole of southern Syria. Folk etymology explained it as "cave dwellers"; but this is doubtful, as is also the attempted identification with the *Harri* or Aryans, found among the Mitannians. Consult Ed Meyer, *Die Israeliten und ihre Nachbarstämme* (Halle, 1906), and Bohl, *Kanaanäer und Hebräer* (Leipzig, 1911). See EDOM.

HORIZON (Lat. *horizon*, from Gk. ὁρίζω, pres. p. of ὁρίζω, *horizein*, to bound, from ὅρος, *horos*, boundary). 1. In popular language, the

circular line formed by the apparent meeting of earth and sky. Astronomers call this the *sensible horizon*, distinguishing it from the *rational horizon*, i.e., the circle formed by a plane passing through the centre of the earth, perpendicular to the plumb line, and produced to meet the heavens. 2. A term in geology, referring to a bed or beds which are characterized by some special forms of fossils found in them.

HORLA, ôr'la', LE. A story dealing with madness, by Guy de Maupassant (1887), who himself became insane in 1892.

HORMAYR, hör'mir, JOSEPH. BARON (1782-1848). An Austrian historian, born at Innsbruck. He studied law at the University of Innsbruck and afterward entered the Ministry of Foreign Affairs at Vienna. In collaboration with Archduke John he published a number of pamphlets against Napoleon, and in 1809, as intendant in the army commanded by John, he incited the popular uprisings in the Tirol, Vorarlberg, and Salzburg. After the truce of Znaim he returned to Vienna and devoted himself to historical work until his unauthorized attempt to stir up another revolt among the Tyrolese led to his being arrested at Metternich's command. On his release the Emperor made him court historiographer, but his imprisonment had so embittered him against Metternich that in 1828 he accepted the position of Councillor in the Bavarian Ministry of Foreign Affairs. Four years afterward he was sent to Hanover to represent the Bavarian government and in 1837 was transferred to Bremen. In 1846 he was given charge of the government archives at Munich. His intimate connection with public men and events during one of the most interesting periods of European history gives a peculiar value to his writings, many of which deal with subjects of which he had a first-hand knowledge. His publications include *Allgemeine Geschichte der neuesten Zeit, vom Tode Friedrichs des Grossen bis zum zweiten Pariser Frieden* (1817-19, 2d ed., 1831), the much criticized but highly entertaining *Lebensbilder aus dem Befreiungskriege* (1841-44), and *Das Land Tirol und der Tirolerkrieg von 1809* (1845).

HORMIZD, hör'mist, or **ORMAZD**. The name of several kings of Persia. See SASSANIDÆ.

HOR'MOGO'NIA (Neo-Lat. nom. pl., from Gk. ὁρμος, *hormos*, chain + γόνιμος, *gonimos*, productive, from γόνος, *gonos*, seed). A term applied to the fragments into which the filamentous colonies of certain blue-green algae separate, each of which produces a new colony. See CYNOPHYCEÆ.

HORMONES, hör'mönz (Gk. ὁρμάω, *hormaō*, I excite). A name applied by Sterling and Baylies to certain secretions which are supposed to act as "chemical messengers" between glands having an internal secretion (e.g., the pituitary body, thyroid gland, and suprarenal capsules) and to harmonize their activities. Schafer holds that the term should be restricted to those principles which promote glandular activity, applying the term "chalone" (from Gk. χαλᾶω, *chalaō*, I relax) to the principles which check activity. Consult Biedl, *Internal Secretory Organs* (New York, 1913).

HOR'MOS (Gk. ὁρμος, *hormos*, chain). A Greek dance in honor of Diana and supposed to have been instituted by Lyeurgus. The dancers, both men and women, were entirely nude and wound through the public streets, a young couple leading. The rhythmic steps were now towards

the east and now towards the west, and the dance is therefore believed by some to have had astronomical significance. The figures were chaste and beautiful, and the nudity of the women was defended by Plutarch, who said he wished to have them become the equals of men in all respects and "learn to despise the opinion of the vulgar." The name was also applied to an ancient Scottish dance.

HORMUZ See ORMUZ

HORN (AS *Icel*, OHG *horn*, Ger *Horn*, Goth *hairn*, Runic *horna*, horn, connected with Ir, Welsh *corn*, Galatian *ἀρνον*, *harnon*, Lat. *cornu*, horn, and ultimately with Gk *κέρας*, *keiras*, Skt *śṛṅga*, horn, as well as with Lat *ceruus*, AS *heorot*, Eng *hait*) (1) A modification of the cuticle observable in man and most other vertebrated animals, and (2) a special adaptation of this substance to form appendages of the head in certain mammals. The word has many other applications, more or less remote from this, in zoology as elsewhere. Thus, the chitinous material of the harder parts of insects is frequently termed horn, whereas the tortoise shell, which is truly of this nature, is rarely so designated. The projections from the prothorax of stag and other beetles, the feelers or ovipositors of other insects, the eye stalks of snails, frontal feathers (plumicorns) of owls, the projecting front teeth of the narwhal, etc., are frequently called horns, though all are different in both substance and function from the true horns to which this article is restricted.

Nature and Service of Horn Horn is the connective tissue of the epidermis hardened and thickened and in some cases mixed with or composed of agglutinated hairs. Its purpose is to form a resisting or protective surface or a tough tool or weapon. The whole, or principal part, of the epidermis may become of this nature, as is the case in the hide of armadillos and the scaly anteaters, ancient and modern, in serpents and lizards (whose scales are horny), and in the turtles which supply tortoise shell (qv). In the higher ranks it constitutes the whalebone developed from the palate of the baleen-bearing whales, becomes the protective sheath of the mandibles forming the serviceable beaks of birds and turtles, and, by more or less completely insheathing and extending the outermost bone of each digit, forms nails, claws, and hoofs (see NAIL), strengthening and arming the fingers and toes of such reptiles as have feet, of all birds, and of all the mammals except whales. Horn enters also into spurs on the legs and other parts of certain animals, forms one or more shields or weapons, or both, on the head; and callosities elsewhere, such as on the heel of man (and the corns on his toes), the knees of camels, etc., as use and habit call for a hardening of the cuticle to resist wear and relieve pressure. Further particulars as to these structures will be found in the articles BIRD, *The Beak*, CORN, INTEGUMENT, NAIL (nails, claws, hoofs, spurs, etc.), SKELETON, SNAKE (scales, rattle, etc.), TORTOISE SHELL, TURTLE, and under HORNS. The chemical composition of the various horny tissues is exhibited in the table accompanying this article.

These tissues differ slightly in the quantity of inorganic matter which they contain, but the difference does not vary much beyond 1 per cent. Hair yields from 0.54 to 1.85 per cent of ash, containing, among other ingredients, peroxide of iron and a little silica. In feathers the quan-

tity of silica is very considerable, and it is doubtless to this constituent that the shaft in a great measure owes its strength and hardness.

Horny Tissue appears as a variety of tumor upon different regions of the human skin, but especially upon the face and occasionally in dermoid cysts. These manifestations are considered as warts, of which the epidermal cells are intimately united in the same manner as in the nails, and they are classed with warts, corns, and some naevi, under the term "corneous papillomata." The tendency to horny excrescences on the skin is rare and belongs to advanced age. There is a disease of the skin called hystriicismus, which is a peculiar variety of papillary hypertrophy, with hornifying of the epidermis of such a nature that it resembles short porcupine quills. Horny excrescences occasionally break and fall off spontaneously, but they grow again if not cured radically by the excision of the portion of skin upon which they are located.

Economic Uses of Horn The horns of animals enter largely into the manufacture of many useful and ornamental articles and are employed for useful and ornamental purposes. The principal horns employed are those of the ox, sheep, and goat. These are quite different in structure from the antlers of various deer, which are really bone and resemble ivory in structure. More like true horns are hoofs, claws, nails, and quills. Horns have but 2 or 3 per cent of earthy matter, while bones have over 50 per cent. Horn can be softened and split into thin layers or laminae or pressed into molds. As it recovers its peculiar character of flexibility, toughness, and transparency when cold, it is particularly adapted for a great variety of purposes. It can also be dyed various colors. A solution of gold in aqua regia dyes it red, a solution of nitrate of silver in nitric acid, black, a paste of red lead, made with a solution of potash, colors it brown, so that with a proper arrangement and application of these materials, the most admirable imitations of the much more costly tortoise shell can be produced, which, indeed, it resembles in structure. The more common vegetable dyestuffs, as logwood, brazilwood, barwood, saffron, indigo, etc., will also color horn, but neither so permanently nor so brightly as the metallic materials.

By long-continued soaking, the horns of all the animals above mentioned can be softened, and those of the sheep and goat can easily be split into several layers after they have been soaked and boiled. These layers can not only be flattened out by putting them between smooth iron plates heated and placed in a press, but can be welded together firmly by pressing their edges together between polished copper plates and then plunging them for some time into boiling water and then into cold water. This property enables the horn worker to use up the smallest cuttings with profit. Another valuable property of horn is that when heated it can be pressed into a die and not only takes a beautiful sharp impression, but if left in the die until cold it retains it. In this way it is employed in making handles for umbrellas, knives, forks, and a variety of other articles. Combs are made out of the flattened sheets, and beautiful carvings were made out of the solid parts of buffalo horns. Ox horns, too, are sometimes of fine quality and color and are fashioned into drinking cups and other articles, often highly orna-

mental Before the horn is softened for manufacture the solid tip is usually sawed off, to be treated separately This is usually sawed into blanks to be used for buttons and other purposes These blanks are heated, pared, heated

Stanislaus Leszczynski, his successor, he remained as Ambassador In 1705 he was made counselor to the King In 1710 he became Prime Minister and favored the calling of the estates. After the death of Charles XII he per-

HORN A musical instrument, belonging to the family of brass wind instruments and distinguished by a cupped mouthpiece, a flaring bell, and a narrow, conical tube which is between 9 and 18 feet long and is twisted back on itself The natural or French horn (qv), although having an exceedingly tender, sonorous tone, was a very imperfect instrument and is now entirely superseded by the valve horns The horn is built in almost any key, there are horns in A, B \flat , C, D, E \flat , E, F, G Its range is from C to c² As the horns (except the one in C) are transposing instruments, lower tones than C can be obtained by using different horns For instance, on the low B \flat horn the note C sounds B \flat , on the E \flat horn E \flat , etc The music for horns is always written in the G clef, except the very low tones Strange to say, the tones written in the bass clef are always written an octave lower than the actual sound In the smallest orchestra there are always two horns The ordinary symphony orchestra has four, and Wagner employs as many as eight When four horns are used, the first and third are written on the same staff in the score, and the second and fourth together on another staff What kind of horns are employed depends upon the tonality of the composition and also to some extent upon the modulation within the tonality Thus, a composer writing in C major might employ two horns in C and two in F or two in C and two in G Some modern masters use the F horns for all keys A peculiarity in writing music for horns is that no key signatures are used All music is written in C, and every chromatic alteration is specially marked Muted tones can also be produced upon the valve horns They have a peculiarly ominous sound and are sometimes employed in dramatic works to express situations of fear, horror, mystery, etc In view of the expressiveness of the instrument and the beautiful and varied effects obtainable it is somewhat surprising that composers have practically neglected it as a solo instrument Schumann wrote a quadruple concerto for four horns with orchestra, op 86, and R Strauss a horn concerto, op 11 Beethoven and Brahms employed it with splendid effect in their chamber music Consult V Mahillon, *Le cor* (Brussels, 1907), and J Blakley, *The French Horn* (London, 1909)

HORN, hörn, ARVID BERNHARD, COUNT (1864-1742) A Swedish statesman, born at Vuorentaka, Finland. After seeing service on the Continent for several years, he joined the Swedish army and was rapidly promoted to be general of brigade (1700). He assisted in the deposition of King Augustus of Poland (1704), and under

sued the latter's sister, Ulrica Elnore, to submit to an election before she could ascend the throne and later imposed on her the constitution of 1719 The years when he was marshal of the Kingdom were spoken of afterward as the "time of Arvid Horn," so successful had the country been under his leadership He retired from active life in 1738 Consult Svedelius, *Arvid Bernard Horn* (Stockholm, 1879)

HORN, CAPE See CAPE HORN

HORN, GUSTAF, COUNT (1592-1657) A Swedish general, born at Orbyhus He studied at the universities of Rostock, Jena, and Tübingen, entered the army in 1612, and served in the Russo-Swedish War (1612-14) In 1630 he commanded half the army of Gustavus Adolphus in the advance of that monarch upon Frankfurt-on-the-Oder He directed the Swedish left in the battle of Breitenfeld, in 1631, and participated in the defeat of Tilly's army on the Lech In 1634 he was completely defeated, together with his ally, Bernhard of Weimar, at Nördlingen and made a prisoner by the Imperialists He was not released until 1642 He later distinguished himself in the war against Denmark Consult *Seine Briefe*, edited by Sondén (Stockholm, 1897).

HORN, PAUL (1863-1908) A German specialist in modern Persian philology, born at Halle His education was at the university in that city, where he devoted himself chiefly to Oriental and linguistic studies and received the degree of Ph D in 1885 In 1889 he became privatdocent and in 1900 professor at the University of Strassburg He wrote *Die Nominalflexion im Avesta und den altpersischen Keilinschriften* (1885); *Sassanidische Siegelsteine* (1891); *Die Denkwürdigkeiten Schah Tahmāsp's* (1891); *Grundriss der neupersischen Etymologie* (1893); *Neupersische Schriftsprache* (1898); *Die deutsche Soldatensprache* (1899); *Geschichte Irans in islamitischer Zeit* (1900); *Geschichte der persischen Literatur* (1901); *Geschichte der türkischen Moderne* (1902); *Die persischen Gedichte des türkischen Sultans Selim* (1904); "Die türkische Literatur," in *Die Orientalische Literaturen* (1906).

HORN, HOORNE, HOORN, or HORNES, or, PHILIP DE MONTMORENCY-NEVELE, COUNT OF (c 1518-68) A Flemish statesman and soldier born at Nevele Trained to arms under Charles V, he distinguished himself in the war against the Schmalkaldic League and later accompanied Philip II on his travels in Germany, Italy, Spain, and England At the battle of Saint-Quentin (1557) Horn did brilliant service as commander of the artillery Later he accompanied Philip to Spain, but in 1561 returned to Brussels, as Councilor of State In this capacity he sided with Egmont and the Prince of Orange

in opposition to Cardinal Granvella and the Spanish party. He urged on Margaret of Parma to a policy of concession, and, having been sent to Tournay to reestablish order there, he showed a spirit of toleration which won for him the regard of the patriotic party, but increased the animosity of the Ultramontanes. The failure of Egmont (qv) and Horn to throw in their lot with the Spanish party was, however, fatal. When the Duke of Alva arrived, the two noblemen were treacherously seized and, after an illegal trial before the Council of Blood, were executed in the great square of Brussels, June 5, 1568. Besides the contemporary chronicles, consult Juste, *Le comte d'Egmont et le comte de Hornes* (Brussels, 1863), the popular account by Schiller, "The Trial and Execution of Counts Egmont and Horn," in his *Works*, vol. iv (Philadelphia, 1883), *Cambridge Modern History*, vol. iii (New York, 1905), also the histories by Motley and others, cited under NETHERLANDS.

HORN, VAN DE, or VAN (1635-83). A Dutch buccaneer. After studying seamanship on board of merchant vessels at the age of 24 he bought one of his own and set up as a pirate. Next he became a sailor of fortune, serving whichever European power would pay him most highly, and it was chiefly France that engaged him to wage war upon Spanish ships by fair means or foul, generally the latter. He was with De Graff in the despoiling of Vera Cruz (1683), but fought a duel with him over the division of plunder and died from the results of the wound that he received.

HORN'ADAY, WILLIAM TEMPLE (1854-). An American zoologist, born at Plainfield, Ind., and educated at the Iowa State Agricultural College and in Europe. In 1875-79 he was collecting naturalist for Waid's Natural Science Establishment, Rochester, N. Y., and he served as chief taxidermist of the United States National Museum in 1882-90 and as superintendent of the National Zoological Park in 1889-90. After some years in the real-estate business at Buffalo, N. Y., he was appointed director of the New York Zoological Park in 1896. He became president of the Wild Life Protective Association and was president of the American Bison Society in 1907-10, through his efforts, especially in the direction of legislation, much was done to protect wild birds, game, seals, bison, and wild life in general. Besides numerous magazine articles, he is author of *Two Years in the Jungle* (1885, 7th ed., 1901), *Free Run on the Congo* (1887), *The Extirpation of the American Bison* (1887), *Taxidermy and Zoological Collecting* (1891), *The Man who Became a Savage* (1896), *Guide to the New York Zoological Park* (1899), *The American Natural History* (1904, rev. ed., 4 vols., 1914), *Camp-Fires in the Canadian Rockies* (1906), *Camp-Fires on Desert and Lava* (1908), *Our Vanishing Wild Life* (1913), *Wild Life Conservation in Theory and Practice* (1914).

HORN'NAU, BARON VON. See GERBERT, MARTIN.

HORN'BEAM' (*horn* + *beam*, AS *beam*, OEG *boum*, Ger *Baum*, tree, connected ultimately with Gk. *phyein*, to grow, Skt *bhū*, to become), *Carpinus*. A genus of the family Betulaceae, which consists of trees with compact, tough, hard wood, almost smooth whitish-gray bark, deciduous leaves, and monocious flowers. The common hornbeam, or white beech,

of Europe (*Carpinus betulus*), very frequent in moderately moist shady woods of many parts of Europe, is a beautiful tree which attains a height of 60 to 100 feet. It has ovate, acuminate, almost triply serrate leaves, and the small nutlike fruit is subtended by large deeply three-partite bracts. The wood, which is much used by carpenters and wheelwrights, is white, very hard, uncommonly strong and tough, and therefore suitable for bearing heavy strains. It takes a very fine polish and, when well stained, might readily be mistaken for ebony. In the earth, or where exposed to the changes of the weather, it is not very durable. It burns readily and is one of the best kinds of firewood, it affords an excellent charcoal, and the ashes yield much potash. The young stems, by reason of the dense growth of their twigs, are very suitable for forming live fences and bowers, and as it bears clipping well, the hornbeam was often employed to form live walls, formerly fashionable. The genus is represented in North America by *Carpinus caroliniana*, a small tree 25 to 40 feet high, which occurs from Quebec to Florida and west to Minnesota and Texas. Its wood is very hard, dense, and heavy, and is one of the toughest woods of the Northern States. It is known as hornbeam, blue beech, water beech, and ironwood. The hop hornbeam (*Ostrya virginiana*) is of much the same habit, range, and properties. It is of slow growth and is seldom planted, although a very ornamental tree. This tree is also known as ironwood and leverwood.

HORN'BILL'. The name of an African and East Indian family of large birds, forming the family Bucerotidae and remarkable for the enormous size of the bill and for a large bony protuberance (epithema, or casque) with which it is usually surmounted. The bill is curved, broad at the base, compressed towards the tip, the bony protuberance on the upper mandible assuming different forms in different species. Two subfamilies are sometimes recognized—the Bucerotinae and the Bucerotinae. The former are African, have the casque hollow, and are of terrestrial habits. They are described under GROUND HORNBILL. The latter contain the "true" or typical hornbills, of which there are many genera and species scattered over north-western Africa, India, and the Oriental region. All are rather large birds, the biggest 5 feet in length from the tip of the beak to the end of the tail, have long full tails and strong feet, fitted for arboreal habits. Their colors are mainly black and white, the great bills are yellow, often strongly marked with red and black. They are omnivorous and in captivity show an ostrich-like voracity, swallowing anything offered, bones and all. The food is always caught in the tip of the bill, then tossed into the air and recaptured. In nature they feed largely upon flowers and fruit, cut from their fastenings by the saw-edged beak. Their flight is slow and heavy, but it may be long sustained. The bird is very noisy, the sound of the wings of a large hornbill being audible for a mile, and when two or three are flying together the noise is said to resemble that made by a steam engine.

Breeding Habits. Some, if not all, of the species have the remarkable habit of imprisoning the female during incubation. This is done by stopping up the entrance to the nest, which is in a hollow tree, with mud or excrement. There seems to be some doubt whether it is done

HORNBILLS AND TOUCANS

1. FLAT-CASQUED HORNBILL (*Hydrocorax planicornis*); male.
2. RHINOCEROS HORNBILL (*Buceros rhinoceros*).
3. ARIEL TOUCAN (*Ramphastos ariel*).
4. MEXICAN TOUCAN (*Ramphastos carlinatus*).
5. CRESTED TRUMPETER HORNBILL (*Bycanistes cristatus*).
6. PAPUAN WREATHED HORNBILL (*Phylidoceros plicatus*); male.

from the outside by the male, using mud, or from the inside by the female, using her own excrement. Perhaps the method differs in different species. In any case a small opening is left through which the female can extend her bill and secure the food which the male brings. Such nests are an excellent protection against enemies and are said to be used repeatedly. The young are born naked.

This remarkable method of nidification is connected with a strange feature of bird economy first noticed and studied by Bartlett, who shows (*Proceedings Zoological Society of London*, 1869) that hornbills at intervals cast the epithelial layer of their gizzards—a layer formed by the secretions of certain glands. This is ejected entire in the form of a bag, the mouth of which is closely folded, and which is filled with the fruit the bird has been eating. Whether these castings form a nutritious and partly digested supply of food for the sitting female is not known. Consult Newton, *Dictionary of Birds*, London, 1896.

Species. The bird ordinarily presented as the hornbill, *Buceros rhinoceros*, from the East Indies, is shown on the accompanying plate. It was known and quaintly described, from preserved heads alone, by Pliny and the naturalists of the Middle Ages. A closely allied species (*Buceros sylvesteris*) is a native of Java. Another style of casque, the flat table, is shown in Fig 1 of the plate (*Hydrocorax planicornis*, of the Philippines), which illustrates almost equally well the "homurai" of India (*Dichoceros bicornis*), whose plate casque is bent into a trough and terminates in two horns in front. This familiar species is found eastward to Sumatra, where also, among other kinds, lives that solid-casqued one (*Rhinoplax vigil*) out of whose 'helmet' ivory-like ornaments are carved. This seems to be a remarkable species in several ways. Another curious form of beak is that of the Papuan *Rhytidoceros plicatus*, in which the top of the bill has numerous curving transverse folds. Prominent among African genera are the trumpeter hornbills, one species of which is the "crested" (*Bycanistes cristatus*). Here the beak is comparatively short. In some genera the bill approaches the shape of a toucan's and has little or no casque. Consult history of the family, with colored plates, by D. G. Elliot, entitled *Monograph of the Bucconidae* (London, 1882). An excellent popular account is given in the *Royal Natural History* (ib., 1895) and in Knowlton, *Birds of the World* (New York, 1909). See Plate of HORN BILLS AND TOUCANS.

HORNBILL CUCKOO. A channelbill (q v).

HORN'BLEND'E' (horn + blende, Ger. *Blende*, from *blenden*, to blind). A greenish-black or black variety of amphibole that crystallizes in the monoclinic system and is a ferrous magnesium-calcium-aluminum silicate. It is found both in crystals and granular masses. Hornblende is a common constituent of various igneous rocks, such as granite, syenite, diorite, and those of more basic composition. Hornblende schist and hornblende slate are varieties of rocks that contain hornblende with more or less feldspar, quartz, or mica. The black crystallized varieties of hornblende are sometimes called *schorl* and may be cut into ornaments. The term "hornblende" was formerly used to designate the entire group of the amphiboles, and the term is still used by petrographers in a

somewhat broad sense to include a great number of the rock-forming amphiboles.

HORN'BLENDITE. An igneous rock of granitic texture very largely composed of hornblende. Hornblende occurs in the so-called Cortland series of eruptives in the Highlands of the Hudson River, near Peekskill, N. Y.

HORN'BLOW, ARTHUR (1865–) An American playwright, born in Manchester, England. Educated in England and in France, in 1889 he came to the United States, where he was connected with various newspapers until 1900. He then became editor of the *Theatre Magazine*. He translated certain writings of Marcel Prevost and of Gabriele d'Annunzio, novelized several of Charles Klein's plays, including *The Lion and the Mouse* (1906), *The Third Degree* (1909), *John Marsh's Millions* (1910), *The Gamblers* (1911), *The Money-Makers* (1914); collaborated on various plays, and is sole author of *The End of the Game* (1907), *The Profligate* (1908), *By Right of Conquest* (1909), *The Mask* (1913), *The Price* (1914).

HORN'BLOW'ER, or HORNWORM. A local name in the southern United States for the tobacco worm (*Phlegethontius carolina*). See TOBACCO WORM.

HORN'BOOK'. The primer for learning the elements of reading, used in England before the days of printing, and common down to the time of George II. It consisted of a single leaf, containing on one side the alphabet large and small, in black letter or in Roman, often followed by a number of monosyllables. Then came a form of exorcism and the Lord's Prayer and the Roman numerals. The leaf was usually set in a frame of wood, with a slice of transparent horn in front, hence the name. There was a handle usually with a hole for a string, whereby the apparatus was slung to the girdle of the scholar. Sometimes the leaf was simply pasted against a slice of horn. At first the leaf was of vellum, with the characters in writing, later, of paper and printed. The hornbook was prefaced and ornamented with figures of the cross and hence came to be often called *christ-cross-row*, or *crisscross-row*. Common as hornbooks at one time were, copies of them are now exceedingly rare. Consult G. W. Tuer, *History of the Hornbook*, with illustrations and facsimiles (London, 1897).

HORN'BOSTEL, HENRY (1867–) An American architect. Born in Brooklyn, N. Y., he graduated from the School of Architecture of Columbia University in 1891 and studied four years at the Ecole des Beaux-Arts, Paris. As a member of the architectural firm of Palmer and Hornbostel, he was collaborative architect notably of the Manhattan and Queensborough bridges in New York City, of the Carnegie Technical Schools, of the University of Pittsburgh, and the Memorial Building at Pittsburgh, Pa., and of the State Education Building at Albany, N. Y. He served as an assistant in architecture (1897–1900) and as lecturer (1900–03) at Columbia, and later he became professor of architecture in the Carnegie Technical Schools.

HORN'BY, SIR GEOFFREY THOMAS PHIPPS (1825–95). An English admiral, son of Admiral Sir Phipps Hornby (1785–1867), born at Winwick, Lancashire. He entered the navy when he was 12, was present at the bombardment of Acre, served in 1844–46 under Wyvil, who was at that time engaged on the east coast of Africa in suppressing the slave trade, and

was flag lieutenant to his father in the Pacific from 1846 to 1850. He was promoted to the rank of captain in 1852. Six years later he was appointed to the *Tribune*, then at Hong-kong, but immediately afterward was ordered to Vancouver Island, where the right to the island of San Juan was in dispute between Great Britain and the United States. Subsequently he saw almost continuous service in European waters. He was promoted to flag rank in 1869, became vice admiral and Lord of the Admiralty in 1875, and two years later was put in command of operations in the Mediterranean. In February, 1878, he "proceeded to Constantinople," in spite of the protests of the Turkish government, and prepared to meet any attack on the city by Russia. He was made an admiral (1879), president of the Royal Naval College (1881-82), and admiral of the fleet (1888). Consult the life by his daughter, Mrs Edgerton (London, 1896).

HORNBY, JAMES JOHN (1826-1909) An English educator, born at Winwick. He was educated at Eton and at Balliol College, Oxford, after his graduation being elected fellow of Brasenose. From 1853 to 1864 he served as principal of Bishop Cosin's Hall at the University of Durham. He then returned to Oxford for a short time as classical lecturer, in 1867 became second master of Winchester School, from 1868 to 1884 was head master of Eton, and thereafter until his death was provost.

HORNE, C SILVESTER (1865-1914) An English Congregational clergyman, born at Cuckfield, Sussex. He was educated at Glasgow University and studied theology at Mansfield College, Oxford. In 1889-1903 he was minister of Kensington Chapel and then of Whitefield's Church, Tottenham Court Road, until January, 1914, when his health began to fail. In the spring of 1914 he delivered the Lyman Beecher lectures on preaching (*The Romance of Preaching*) at Yale University, and he died near Toronto. In 1910-11 he had been chairman of the Congregational Union, and from 1910 on he was a member of the House of Commons (the only member who was a clergyman with a charge) from Ipswich, being an "unpenitent Radical," a supporter of woman suffrage, and a home-ruler. He wrote on the history of the Free churches and of the London Missionary Society, and in 1914 published *Pulpit, Platform, and Parliament* and *The Romance of Preaching*.

HORNE, GEORGE (1730-92) An English bishop, born at Otham. He was educated at Oxford and spent the greater part of his life there, being elected president of Magdalen College in 1768 and in 1776 vice chancellor of the university. He was made dean of Canterbury in 1781 and in 1790 Bishop of Norwich. From 1771 to 1781 he was chaplain in ordinary to the King. His only important work, *A Commentary on the Psalms* (1771), exhibits a deep acquaintance with Hebrew and biblical lore and is marked by a spirit of earnest piety. He wrote many pamphlets against such antagonists as Sir Isaac Newton, Hume, Adam Smith, and David Law, all of whom he ludicrously underrated. He adopted the views of John Hutchinson (qv) and wrote in his defense.

HORNE, RICHARD HENRY, or HENGIST (1803-84). An English author. He was born in London, received a military education, and served as a midshipman in the Mexican navy during the war of that country with Spain. After a

few years spent in adventurous wanderings he returned to England and from 1828 devoted himself to literature. In 1837 he published two tragedies, *Cosmo de Medici* and *The Death of Marlowe*, in 1843, *Onion*. An *Epic Poem*. During the period 1839-46 he carried on a correspondence with Elizabeth Barrett (afterward Mrs Browning), and her letters to him were afterward published in two volumes in 1877. With her he collaborated in the *New Spirit of the Age* (1844). A report prepared by him on the employment of children in mines and factories inspired Mrs Browning's *City of the Children*. Going to Australia in 1852, he served as a gold-fields commissioner and a magistrate and published *Australian Facts and Figures* (1859). Returning in 1869, he wrote thereafter a number of books, few of which were of any special note.

HORNE, THOMAS HARTWELL (1780-1862) An English Bible scholar. He was born in London, Oct 20, 1780, was educated at Christ's Hospital, and became clerk to a barrister. His leisure hours were devoted to study and to miscellaneous literary labors. In 1818 he published his *Introduction to the Critical Study and Knowledge of the Holy Scriptures* (12th ed, 1869), a work which procured for him admission into orders without the usual preliminaries. This book was long a standard work, but is now antiquated. In it he presented the results of 17 years of hard work. In 1824 he became senior assistant librarian in the department of printed books in the British Museum. In 1831 he became a prebendary of St Paul's Cathedral, in 1833 rector of the united parishes of St Edward the King and Martyr and St Nicolas Acons, London. He resigned his assistant librarianship in 1860. He died in London, Jan 27, 1862. Consult his life by his daughter, Mrs S A. Cheyne (London, 1862).

HORNED DACE A fish. See DACE.

HORNED FROG. One of the large toadlike South American frogs of the genus *Ceratophrys*, especially *Ceratophrys cornuta*, which has horn-like protuberances on the head. It is one of the most beautiful frogs known. The ground colors are black, brown, and green, with an orange stripe over the head and back, and these colors are irregularly and most pleasingly arranged and blended. Various other gaudy and interesting species are known in the American tropics. See Colored Plate of FROGS AND TOADS, under TOAD.

HORNED GREBE. See GREBE.

HORNED HOG. See BABIRUSSA.

HORNED LARK. See SHORE LARK.

HORNED OWL. Any owl with plumeorns, i e, tufts of upright feathers on the top of the head which simulate horns. The eagle owls (qv) are thus distinguished, and then American representative is commonly called the great horned owl. Other horned species are mentioned and illustrated under OWL. See Plate of OWLS, REPRESENTATIVE.

HORNED PHEASANT. A sportsman's name in India for the tragopans (qv), especially the black-headed species (*Tragopan satyra*), common in the eastern Himalayas. The name is given because of the presence of two fleshy horns on the head which become very conspicuous at the breeding season.

HORNED POUT. See BULLHEAD, CATFISH.

HORNED RATTLESNAKE, or SIDEWINDER. See RATTLESNAKE.

HORNED SCREAMER. A bird See SCREAMER

HORNED TOAD, or HORNED LIZARD The common name of several short-legged, depressed, toadlike horny lizards, all of which occur in North America. According to Cope and others, there are two genera, *Phrynosoma* and *Anotia*, containing about 20 species, 10 of which occur in the United States. *Anotia* differs from *Phrynosoma* only in the fact that the tympanic drum is concealed by a scaly integument. Horned toads range from British America into Mexico. They feed mainly on insects, which they capture with a rapid thrusting out of their mucilaginous tongues. They are sluggish, harmless lizards, with little power of self-defense save their pointed scales, which, when bristled up, are a disagreeable mouthful for snakes, their most formidable foes. They will, however, fight and even kill a snake small enough to be an even match.

Horned toads at rare intervals exhibit a most interesting habit of self-defense, the ejection of jets of blood from the corner of the eye. Ditmars gives some details of such an occurrence which took place when a specimen from Mexico was being measured. This handling seemed greatly to excite the creature which 'finally threw the head slightly upward, the neck became rigid, the eyes bulged from the sockets, when there was a distinct sound like that produced if one presses the tongue against the roof of the mouth and forces a small quantity of air forward. This rasping sound, consuming but the fraction of a second, was accompanied by a jet of blood at great pressure. It hit the wall, 4 feet away, at the same level as that of the reptile. The duration of the flow of blood appeared to be about one and a half seconds, and towards its termination the force gradually diminished, as noted by a course of drops down the wall and along the floor to a position almost under the spot where the reptile had been held. The stream of blood seemed to be as fine as a horsehair and to issue from the eyelid, which was momentarily much swollen. For some time after the performance the eyes were tightly closed, and nothing could induce the lizard to open them. Within two minutes after it was placed on the ground the protruding aspect of the eyeballs and the swelling of the eyelids had disappeared. Most surprising was the amount of blood expended. The wall and floor showed a course of thickly sprinkled spots about one-eighth of an inch in diameter. There were 103 of these spots."

The majority of the species are desert inhabitants and escape pursuit by hiding beneath the prickly agaves, yucas, and cacti of the plains. Other species live in cedar and pine belts. Both those forms that live on the bare stones or sand of the plains and those that occur in the pine belt are remarkably well protected by resemblance to their background. The young, a dozen or more at a time, are born from eggs, which are laid by the mother only an hour or so before they are ready to hatch. When the little ones emerge, they are able to begin at once to catch and eat minute insects. Both young and old make interesting pets, largely because of their amusing irascibility, and can be taught to take flies from the hand and do other simple things. Consult Bryant, "The Horned Lizards of California," in *University of California Publications*, ix (Berkeley, 1911).

See LIZARD, and Plate of IGUANA AND OTHER AMERICAN LIZARDS.

HORNED VIPER. See VIPER

HORNEL, hōr'nēl, EDWARD ATKINSON (1864-) A Scottish painter of landscapes, flowers, and foliage, with children. He was born in Australia, of Scottish parents, and he was brought up and lived practically all his life in Scotland, at Kirkcudbright. He studied for three years in the art school at Edinburgh, and for two years at Antwerp under Professor Verlat. Returning from Antwerp in 1885, he met George Henry (qv) and associated himself with the Glasgow school. Hornel and Henry collaborated upon "The Druids," a procession of priests bringing in the sacred mistletoe, gorgeous with polychrome and gold. The two worked side by side to achieve decorative splendor of color, Hornel boldly and freely employing texture effects produced by loading and scraping, roughening, smoothing and staining. In 1893-94 the two artists spent a year and a half in Japan, where Hornel learned much about decorative design and spacing. Towards the close of the nineties his colors, while preserving their glow and richness, became more refined and more atmospheric, and his drawing more naturalistic combining sensuous appeal with emotional and poetic significance. In 1901 he declined election to the Royal Scottish Academy. There are examples of his work in the museums of Buffalo, N. Y., St. Louis, Toronto, Montreal, Glasgow, Edinburgh, Leeds, Manchester, Hull, Bath, and Liverpool.

HORNELL. A city in Steuben Co., N. Y., on the Canisteo River 93 miles southeast of Buffalo, on the Erie, and the Pittsburgh, Shawmut, and Northern railroads (Map New York, C 6). It has a free academy, a public library, hospital, courthouse, sanitarium, and public parks, and manufactures brick, silks, white goods, railway supplies, furniture, beer, electrical machinery, sash, doors, and blinds. The government is administered under a revised charter of 1906, which provides for a mayor in whose power, subject to the consent of the council, rest the appointments to subordinate offices, and a unicameral council. The water works are owned by the city. Settled in 1790, Hornell was part of Canisteo and was called Upper Canisteo until 1820, when it was incorporated as a separate town under the name of Hornellsville, given in honor of Judge George Hornell, who was prominent in the town's early history. Pop., 1910, 13,617, 1914 (U. S. est.), 14,341.

HORNER, FRANCIS (1778-1817) A British statesman and economist, born in Edinburgh. He entered Edinburgh University in 1792, but left (1795) before finishing his course to take up the study of law, and was called to the Scottish bar in 1800. Later, in 1807, after a course at Lincoln's Inn, London, and a telling application to the study of philosophy and economy, he began practice in the western circuit of England. Entering Parliament for Wendover in 1806, he sided with the Whigs, gaining special prominence in the debates on questions of finance and political economy. Horner was much interested in the "bullion" question which arose in 1810 and was chairman of the committee which drew up the first report on the subject. The recommendations embodied therein failed of adoption, but, as a result of his influence, restrictions were placed upon the issue of paper money, thus paving the way for the

success of Peel's Currency Reform Bill in 1841 Horner was one of the three original founders of the *Edinburgh Review*, to which he was a frequent contributor. He died at Pisa, where he had gone to regain health, after a short but brilliant career. Consult Horner, *Memours and Correspondence of Francis Horner* (Boston, 1853).

HORNER, LEONARD (1785-1864) A Scottish geologist and publicist, born in Edinburgh and educated at the university of that city. He joined his father's linen business in 1804 and moved to London, but his chief interest was in science. In 1808 he became a fellow of the Geological Society, of which he was president in 1846 and in 1860, and in 1853 he was elected a fellow of the Royal Society. He returned to Edinburgh in 1817 and there founded the School of Arts in 1821 and helped to organize the Edinburgh Academy. During this period he took a very active part in the educational and political reform movements of Scotland. He was a warden of London University from 1828 to 1831, lived for a time in Bonn, Germany, and from 1833 to 1853 rendered notable service as chief factory inspector. He was author of many papers on geology, education, and the employment of children.

HORNER, RALPH CECIL (1854-) A Canadian religious leader. He was born in the township of Clarendon, Pontiac Co. Quebec, and was educated at the National School of Elocution and Oratory, Philadelphia. Ordained a Methodist minister in 1887, he filled several pastorates, specially emphasizing the evangelistic side of his work during the latter part of his career in the Methodist church. Disapproval of his attitude in this respect led to his suspension in 1895. As a result, he became the founder of a denomination called the Holiness Movement Church, which has duly constituted conferences in Ontario, Manitoba, and Michigan, and supports missionaries in China and Africa. He established also, in 1895, the Holiness Movement College at Ottawa. He published several tracts and religious books.

HORNER, WILLIAM EDMONDS (1793-1853). An American physician, born in Warrenton, Va. He graduated at the University of Pennsylvania in 1814, served as assistant surgeon in the United States Navy during the War of 1812, and from 1831 until his death was professor of anatomy in the University of Pennsylvania. In 1847 he founded St. Joseph's Hospital. In 1824 he announced the discovery of the muscle (tensor tarsi) known as Horner's muscle. He published a number of medical works, including *Pathological Anatomy, Practical Anatomist* (1856), *Special Anatomy and Histology* (8th ed, 1851), *The United States Dissector* (5th ed, 1856); and superintended the preparation of an *Anatomical Atlas* by Henry H. Smith (1844).

HORNER, WILLIAM GEORGE (1786-1837). An English algebraist. He was educated at Kingswood School, near Bristol, and afterward became master there. He also established a school at Bath (1809), where he remained until his death. He had no university training and was not a profound mathematician. He is known solely for his discovery of the ingenious algorithm for approximating the roots of higher numerical equations, which was made known in a paper read before the Royal Society in 1819 and published in the *Philosophical Transactions*. The process is commonly known in

England and America as *Horner's method* and may be found in any higher algebra. Related to it is a process of synthetic division which also bears his name. While this process of approximating the roots of a numerical equation was unknown in Europe at the time of Horner's discovery, it was known to the Chinese algebraists in the thirteenth century. It is given by Ch'in Chiu-shao in 1247 and was used by several later writers in China and Japan.

HORNES, ORN, PHILIP, COUNT OF See HORN.

HORN/NET (AS *hynnet*, *hurnitu*, OHG *hornuz*, *hornaz*, Ger *Horniss*, connected with Lat *crabro*, OChurch Slav *srūsheni*, Lith *szurszone*, hornet, OChurch Slav *srūsha*, Lith *szurszi*, wasp, less plausibly connected with *horn*, either from its antennæ or from its buzzing sound). A name applied to several large stinging insects belonging to the family Vespidae and genus *Vespa*. They differ from *Polistes*, the other common genus of this family, in having larger, thicker bodies and always inclosing their nests with a grayish paper covering. In color they are usually black or dark brown, conspicuously ornamented with white or yellow. The hornet builds its nest, which is in the form of a number of combs placed one above another, in a hole in the ground, or in the open, attached to the branches of a tree, or under the eaves of buildings. Its manner of constructing the nest and caring for the young is the same as that described elsewhere under the title WASP. It is among the most voracious of insects, eagerly laps up all sorts of sweets, and seizes and devours other insects of various kinds. One of the most common species in the United States is *Vespa maculata*, which builds its great nest in the branches of trees. It is very vigilant, and especially irritable when attending to the duties of its nest. The females may often be found hibernating in the autumn and winter in decaying wood.

The European hornet (*Vespa crabro*) has been accidentally introduced into the United States and has established itself in the vicinity of New York City. Its spread has been very slow, and although its original introduction and establishment must have taken place many years ago, it is still apparently restricted to an area of little over 100 miles square. See WASP, and consult the authorities there referred to.

HORNE-TOOKE, JOHN See TOOKE.

HORN FLY.

The adult horn fly, and a cow's horn about the base of which is clustered a swarm of the flies.

HORN FLY A European fly (*Hamatobia serrata*), which was imported into the United

States in 1886 or 1887, multiplied with excessive rapidity, and soon spread over the entire country. It breeds in cow dung and with very great rapidity and prolificacy. It is a biting fly and greatly annoys cattle. The name "horn fly" is derived from a habit which the flies have of clustering in great numbers so as to form black bands around the bases of the horns of cattle. They do not damage the horns, as has been supposed, but simply rest in this location, where they cannot easily be reached by the cow. Consult Osborn, *Insects Affecting Domestic Animals* (Department of Agriculture, Washington, 1896), Lintner, "The Cow-Horn Fly," in *The Country Gentleman* (London, 1897), Parrot, "Horn-Fly Remedy," in the *Kansas Farmer* (Topeka, 1899).

HORNIMAN, hŏr'ni-man, ANNIE ELIZABETH FREDERICKA (1860-) An English dramatic manager. She was born in Forest Hill, Kent, and was privately educated and studied art at the Slade School, London. In 1894 she attempted her first dramatic experiment at the Avenue Theatre. In 1904 she provided the Irish National Theatre Society with a theatre—the Abbey Theatre, Dublin—at her own expense, and subsidized it for a term of years. In 1908 she bought the Gaiety Theatre of Manchester and made of it a repertory house, the first (as it was the first endowed theatre) in England. Her company was very successful, appearing in London at the Coronet Theatre in 1912-13 and giving there Stanley Houghton's *Hindle Wakes* and *The Younger Generation* and Galsworthy's *The Mob*.

HORN'ING, LETTERS OF. In Scots law, a writ which issues to compel a party to execute or carry out a judgment or decree of the court. The writ was formerly the only form of enforcing civil decrees by imprisonment. The process has been shortened, and other forms of execution are now more commonly employed. The title of the writ is derived from the ancient custom of denouncing a person disobeying the writ with three blasts of a horn. This was technically called "putting him to the horn."

HORNITOS, ōr-nē'tōs, or **HORNOS**, ōr'nōs (Sp., little ovens). The name given to the low oven-shaped hillocks which emit smoke and vapors, and which occur in great numbers on the sides and in the neighborhood of the large volcanoes of South America.

HORNPIPE. See BLACK GUM.

HORNPIPE. A lively English dance, originally in $\frac{3}{4}$, later in $\frac{4}{4}$ time. The universal peculiarity of the music was the length of the final note in each phrase. Its history can be traced back to the sixteenth century in England and to about 1740 in Scotland. During the eighteenth century it was widely popular, but since then it has been distinctively a sailor's dance. Chaucer speaks of the hornpipe as a musical instrument, but little is known about it. The general belief is that it was a rude instrument made from the horn of an ox. Consult H. Balfour, *The Old British Pipe and Hornpipe* (London, 1890), and F. Galpin, *Old English Instruments of Music* (Chicago, 1911).

HORNS. Under this term are commonly confused two very distinct structures forming outgrowths on the head of ungulate animals, to which order they are confined. The word ought not, strictly, to include the bony antlers of deer or the giraffe, since these, although to a certain extent epidermal outgrowths, consist of

true bone built up from blood deposits and are not at all transformed cuticle or "horn." Nevertheless, as Beddard points out (in *Mammalia*, London, 1902), the difference is one of degree rather than of kind. The simplest condition is seen in the giraffe, each of whose paired horns is a straight, bony outgrowth, the os cornu, originally separate from the skull, but becoming permanently fused with it early in life and is covered with wholly unmodified furry skin. In deer there is the same os cornu, which may here be branched and never becomes fused with the skull, but, on the contrary, is shed and renewed annually and is covered with a skin modified into "velvet" (see DEER) which decays and drops off as soon as the horn core (antler) is perfected. Between these two falls possibly the extinct *Suotherium* (q.v.), and certainly the modern pronghorn (q.v.). Here the bony core (os cornu) is fixed as in the giraffe, but begins to be branched as in the deer, and it is covered by a sheath formed of agglutinated hairs, the hairy skin beginning from the tip of the horn and proceeding downward, gradually transforming into perfect horn, which is shed and renewed annually. This is an isolated case, but connects the giraffe and deer with the Bovidae, or proper "hollow-horned" ruminants (Cavicornia). In this family the males of every species, and in most cases the females also, possess upon the top of the skull protuberances of bone into which air cells often extend from the frontal sinuses. These are called horn cores and form the support of the cornubus sheaths that cover and often extend far beyond them. They are not present at birth, for obvious reasons, but begin to grow immediately afterward. The horn sheaths grow with them and continue, even after they have reached normal size, to push out at the base as fast as they wear away at the tip. Their form and position on the head is characteristic of each group: round and lateral in the oxen, slender, retrocurved, or twisted, and somewhat compressed or sharply keeled in most antelopes, heavy, cross-ridged, triangular in section, and often spiral in the sheep and goats, and so on.

Evolutionists regard horns as in most cases a secondary sexual character. An examination of the fossil history of the tribe shows that these appendages have been gradually acquired, and it is only recently that the females of many forms, now provided with small horns, have acquired them by heredity. Moreover, castration or injury to the reproductive organs is likely to affect the growth and size of the horns. Lastly, among the deer, where the does (except in the reindeer) are hornless, these appendages are acquired just previous to the mating season and are dropped when the breeding season is over. Their service as weapons of defense and offense is therefore largely, if not primarily, in contests with each other for the supremacy of the herd—i.e., in the combative process of sexual selection. They are, nevertheless, in many instances powerful weapons in resisting and attacking outside enemies. The spearlike thrusts of the lowered horns of an enraged sable, or other large, long-horned antelope, are feared even by lions and leopards, which more than once have been killed by them. The goring power of a bull is irresistible. A heavy sheep, armed with its great horn coils, is a "battering ram," indeed, not to be despised. Many horns, however, seem to be ornaments rather than

weapons of value, or tools helpful in various ways, as snow shovels, for one pertinent example, among the remainder. Some of the great extinct ungulates of Tertiary time had very powerful horns, especially *Coryphodon* and the group of great Dinocerata, where in some cases a pair upon the forehead was supplemented by one or a pair on the snout. At present a ruling distinction between the artiodactyls and perissodactyls is, that in the former the horns are always paired and on the forehead, while in the latter they are set on the nose and are single or two in number, one behind the other. This is the case with the rhinoceroses, where the horn is a growth from the skin of the nose, composed of a solid mass of agglutinated hairs, based upon a knob of the underlying nasal bones.

HORNSEY, hōrn'zī. A suburban municipality of London, England, 6 miles north of St Paul's (Map: London, C 7). It is a favorite holiday resort, contains several parks, a public library and branches, museum, and public baths, and is chiefly composed of the homes of the working class, most of which are under municipal control. It was incorporated in 1903 with a mayor, 10 aldermen, and 30 councilors. Pop., 1901, 72,056. 1911, 84,592.

HORN SILVER. A term applied to the mineral cerargyrite (q.v.) on account of its waxy or resinous lustre.

HORN SNAKE. See HOOP SNAKE.

HORNSTONE. A variety of quartz, resembling flint, but more brittle, and having a structure that is more splintery. This variety of quartz is also frequently called *chert*. See QUARTZ, *CHERT*.

HORN'TAIL. One of a group of hymenopterous insects forming the superfamily Siricoidea. They are distinguished from the sawflies by the fact that the fore shanks have only one spur at the tip instead of two. They are called horn-tails because the end of the body with the adults usually bears a spine or horn. The ovipositor is fitted for boring, and the eggs are usually laid in the woody tissue of trees and plants. The larvæ feed beneath the outer bark. The group is not a large one, but contains a number of common and interesting species in the United States. The large pigeon tremex, e.g., is often a rather serious enemy to certain shade trees, such as the elm, sycamore, oak, and maple. The holes of this borer may be recognized by their regular, evenly cut shape. Another species is known as the willow-shoot horn-tail (*Phyllæus integer*) and does much damage by ruining the terminal shoots of osier-willow plantations in parts of the United States. The families included in this group are the Oryssidae, Siricidae, Xyphidridæ, and Cephidæ. Consult: L. O. Howard, *Insect Book* (New York, 1905), V. L. Kellogg, *American Insects* (2d ed., 1908); J. H. and A. B. Comstock, *Manual for the Study of Insects* (8th ed., Ithaca, 1909).

HORN'NUNG, ERNEST WILLIAM (1866-) An English novelist, born in Middlesbrough, Yorkshire. He passed two years (1884-86) in Australia. In 1893 he married a sister of Sir A. Conan Doyle. After returning to England he began a series of adventure novels. Among them are *A Bride from the Bush* (1890), *Irahe's Bushranger* (1896), *The Rogue's March* (1896), *The Amateur Cracksmen* (1899), *Dead Men Tell No Tales* (1899), *The Belle of Toorak* (1900), *The Shadow of the Rope* (1902), *Dennis Dent* (1903), *Stingaree* (1905), *A Thief in the*

Night (1905), *Mr. Justice Raffles* (1909), *Fathers of Men* (1912), *Witching Hill* (1913), *The Crime Doctor* (1914).

HORN-YHEAD. One of the most widespread and numerous of American minnows (*Hybopsis lentuchiensis*). It is a graceful, highly colored fish, 6 to 9 inches long, the fins all pale orange without a black spot, and the males in spring marked with a crimson spot on each side of the head. The distinguishing feature, however, is the tubercle-covered crest on the top of the head of the adults, and especially of the males in nuptial dress. It is a congener of the silver chub and is known as river chub, or jerker, in some places.

HORODENKA, hō'rō-dēn'ka. A town in the Austrian Crownland of Galicia, on an affluent of the Dniester, 33 miles north-northwest of Czernowitz (Map Austria-Hungary, J 2). It has an agricultural school, linen-weaving factory, potash and soap works, makes vinegar and brandy, and does considerable business in cereals. Pop., 1910 (district), 56,864.

HOROLOG'GIUM. The name given by the Greeks and the Romans to devices for measuring time. Consult the article "Horologium," in Smith, *A Dictionary of Greek and Roman Antiquities*, vol. 1 (3d ed., London, 1890). See CLEPSYDRA, *HOROLOG*.

HOROL'OGY (from Lat. *horologium*, Gk. *ὥρολόγιον*, from *ὥρολόγος*, *hōrologos*, telling the hour, from *ᾠρα*, *hōra*, hour + *λόγος*, *logos*, word, from *λέγω*, *legō*, to say). That branch of applied science that has for its object the measurement of time. Although it is easy to look back on a period when time, according to the modern conception of it, as measured by hours and minutes and seconds, was unknown, yet we find progress early made in the measurement of larger periods of time, by observations of the heavenly bodies, and although, in the later progress of astronomy, it is found that the movements of the more conspicuous heavenly bodies do not afford accurate marks for the equable measurement of time, they were, for practical objects, sufficient, and afforded at least a better measure of time than any other phenomena which came under the observation of mankind. Thus, time was early divided into years, according to the motion of the sun among the constellations, into months, according to the motion of the moon relatively to the sun's place in the heavens, and into days, by the alternate light and darkness caused by the rising and setting of the sun. It was long, however, before any accurate measure was found for a division of the day itself. The earliest measure employed for this purpose that we can trace is the shadow of an upright object, which gave a rough measure of time by the variations in its length and position. This suggested the invention of sundials. Another means early adopted for the measurement of short periods of time was by the quantity of water discharged by dropping from one vessel into another. Instruments for measuring time on this principle were called clepsydræ (see CLEPSYDRA). The running of fine sand from one vessel into another was found to afford a still more certain measure, and hence the invention of the hour-glass (q.v.). King Alfred is said to have observed the lapse of time by noting the gradual shortening of a lighted candle. It is not very easy to trace to its source the history of the invention to which the modern clock owes its

parentage the earliest clock, however, of which we have a complete description, and perhaps the earliest which attained any distinct superiority over the rude contrivances already mentioned, was the clock of Henry Vic (De Vick or De Wyck), a German, erected in the tower of the palace of Charles V, King of France, in 1379.

For the description of this first mechanical timekeeper, and for the subsequent history of clock and watch making, see CLOCK WATCH PENDULUM, ESCAPEMENT. The history of the science of horology and of the mechanical art of the clock, watch, and chronometer maker are so intermingled that they cannot be considered separately. They may therefore be found under these heads. See also TIME, STANDARD, TRANSIT INSTRUMENT.

HOR/OSCOPE (Fr *horoscope*, from Lat *horoscopus*, from Gk *ὠροσκοπεῖν*, *hōroskopein*, *ōroskōpeion*, *hōroskopion*, horoscope, from *ὠροσκόπος*, *hōroskopos*, one who observes the hour of a birth, from *ὥρα*, *hōra*, hour + *σκοπεῖν*, *skopein*, to view). In astrology, strictly speaking, that part of the ecliptic which is ascendant or rising in the east at the moment of an occurrence whose outcome is to be calculated, such as the birth of a child, thence, more generally, the figure of the heavens, constructed with this as starting point, on which the subsequent predictions are to be based. See ASTROLOGY.

HORR, GEORGE EDWIN (1856-) An American Baptist theologian, born in Boston. He graduated from Brown University in 1876 and studied at Union Theological Seminary (1876-77) and at Newton Theological Institution (BD, 1879). Ordained to the Baptist ministry, he held pastorates at Tarrytown, N Y (1879-84), and at Charlestown, Mass (1884-91), from 1891 to 1903 was editor in chief of the *Watchman*, and thereafter was professor of Church history at Newton, and after 1903 also president. He became president of the Watchman Publishing Company and contributing editor of the *Watchman-Examiner* and is author of *God in the Heart* (1903), *The Training of the Chosen People* (1907), *The Great Ministry* (1908).

HOR/ROCKS, or **HOR/ROX**, JEREMIAH (c1617-41). An English astronomer, born at Toxteth Park, near Liverpool. He entered Emmanuel College, Cambridge, in 1632 and remained there until 1635, devoting himself principally to the study of astronomy. In the latter year he returned to Toxteth and commenced, under extremely unfavorable circumstances, his original observations. In 1639 he was appointed to the curacy of Hoole, Lancashire, and in that village, on Nov 24, 1639 (O S), he made his famous observation of the transit of Venus—the first observation of this phenomenon ever made. Hearne, in his memoranda, tells us how Horrocks was called away, during his observation of the transit, "to his devotions and duty at church," the day being Sunday. Newton, in the *Principia*, bears honorable testimony to the value of Horrocks's astronomical work, especially commending his lunar theory as the most ingenious yet brought forward, adding, "and if I mistake not, the most accurate of all." Horrocks is frequently mentioned by the scientific men of the seventeenth century, the observation of the transit is by no means regarded as the most important of his astronomical achievements. He died suddenly at the age of about 23,

on Jan 3, 1641. Hevelius printed Horrocks's Latin treatise entitled *Venus in Sole Visa* in 1662. In 1672 Horrocks's fragmentary works were published under the auspices of the Royal Society, being edited by Wallis, with the title *Jeremiae Horroccii Opera Posthuma*, etc. Other works of Horrocks's perished in manuscript. Consult Wharton, *Memoir of the Life and Labours of the Rev J Horrox* (London, 1859).

HOR/SA. See HENGEST.

HORSE (AS *hors*, OS, Icel *hross* OHG *ros*, Ger *Ross*, possibly connected with Lat *cursus*, to run, less probably with Skt *lāṇḍ*, to spring, Gk *ῥοπαῖς*, *ropai*, wanton dance, or with AS *hrēodan*, OHG *rusten*, Ger *rusten*, to adorn). The term is usually applied only to the domestic horse (*Equus caballus*), but it is also sometimes used as a general term for other members of the Equidae (q v), which include the ass, quagga, and zebra. The characteristics which distinguish the horse from its nearest relatives are the long mane, the long hairs at the base of the tail, and the callosities on the inner side of the hind legs just above the hock.

There are two general types of horses (1) the northern dun, which includes the dun pony of Norway, the Celtic pony, and the wild pony of Mongolia, and (2) the southern, which includes the Arabian, Barb, and thoroughbred. The horse was domesticated in Asia long before the Aryans migrated to Europe, but was a later acquisition than the ox. The wild horse furnished abundant food for man in Europe during the Neolithic period, but had been domesticated before Cæsar went to Britain.

Professor Ewart believes that at least four wild species have contributed to the making of modern breeds. (1) *Equus robustus*, adapted for a forest life, (2) *E przewalskii*, the steppe horse, which still exists in a wild state, (3) *E agilis*, specially adapted for life on plateaus and deserts, (4) *E sivalensis*, the Sivalik horse, that lived in the upland valleys of northern India. For early use by man, see PALEOLITHIC PERIOD. According to the inscriptions on monuments the horse was introduced into Egypt at the time of the Shepherd kings. His use, however, was very limited, both the Egyptians and Assyrians confining the use of the horse to warfare. Subsequently, however, his services to man increased, and he became an emblem of rank and an object of luxury or sport as well as an aid in war.

The speed of a horse is its greatest asset because it is its chief value to man. It is the recognition of this value that has been the important factor in the evolution of the horse, an animal especially plastic in the hands of the breeder. His size, form, action, and instincts are subject to modification to a degree unknown in that of any of the other larger species. During his early history modifications of type were due to the changing conditions of warfare, but to-day the principal variations of type are to a far greater extent due to the exigencies of commerce or the demands of sport. It has been suggested that the different breeds of the modern domestic horse have been developed out of the interbreeding of several original wild species; this, however, is only conjecture. What is known is that domestic breeds have existed in Europe from prehistoric times, and also that they have been improved continually by blending with Oriental horses.

Arabian horses are divided into three classes, which have been recognized as subbreeds since

the fifteenth century. The genuine Arabian is found in the region from Damascus to the Tigris as well as in Arabia proper. The breed is found in its greatest purity and excellence in the stables of the Sultan of Turkey. The Turk, or Turkish horse, found in portions of European Turkey, but principally in Asia Minor, was of considerable importance in the seventeenth century, but it has deteriorated very much since then. The Barb is a native of the Barbary States, whence its name. It is found in greater perfection among the Moors, who introduced the Barb blood into Spain during their rule in that country and so improved the Spanish horse that for several centuries it occupied the first place throughout Europe. Spanish horses of this stock brought to America by the Spaniards are regarded as the progenitors of the mustangs and the other wild breeds common to Mexico and California. (See section on *The Horse in America*.) About the middle of the sixteenth century Italian and Spanish horses (the former heavy types, and the latter, owing to their Barb blood, very much lighter and fleet) were in the greatest demand. It is during this period that horsemanship (qv) began to be studied as a science, the first book concerning which was published by Grisoni in Italy in 1552. The Italians were also the first to take up the teaching of horsemanship as an accomplishment, after which riding came into vogue throughout western Europe. The English thoroughbred is spread over a larger portion of the earth to-day than is that of any other breed. It is used more than any other to improve the blood of horses of general utility throughout the world, and, according to statistics, more capital is influenced by it than by any other two or three breeds combined.

The history of English horse breeding has been divided into three periods: the first extending from the earliest records to the end of the sixteenth century; the second from the accession of James I to the first year of the *Stud Book* (qv), 1791 (in which period the thoroughbred came into existence), and the third period extending to the present time, in which the thoroughbred has become a clearly defined as well as a pure breed. The original British horse was a small pony, shaggy and hardy and rarely more than 14 hands high, but the importation of stallions from Spain, Italy, and France improved the breed from time to time. During the Crusades and the consequent general use of heavy armor, which continued up to about the year 1600, large horses came into vogue. A knight in armor, together with his horse accoutrements, weighed from 350 to 425 pounds, so that during the age of chivalry all breeding was directed towards improvements in the size of the horse. Stallions under a certain size were condemned by law, and, in 1217, 100 stallions were imported from Normandy, and for nearly 500 years subsequently size was sought for rather than speed; thus laying the foundation of the different modern breeds of British draft horses. What was the case in England was equally so with the nations of western Europe and their horses, so that the horse of this period is particularly remarkable for its broad chest, heavy neck, and round buttocks. With the appearance of gunpowder and firearms, and the disappearance of armor, these breeds became useless for the purpose of warfare, which now demanded fleetness as a first essential. They passed, however, to a greater sphere of usefulness and to-day constitute the heavy draft breeds

known as the Dutch and Flemish, the Percherons (qv) of France, the Clydesdale of Scotland, and the cart and shire horse of England. See *SHIRE HORSE*.

Before the days of the tournaments in England large horses were scarcely known, but the needs of the knights compelled the keeping of a sufficient number, so that by intermixture with smaller native animals the size of the British horse gradually increased, but the result proved that, although they were bigger, they did not nearly possess the qualities of the smaller horse. During the Crusades the excellence of the Saracen horses deeply impressed the British Crusaders, who brought many Asiatic horses with them on their return to England. The Eastern horses were Barbs, Turks, Arabs, and Persians, not more than 14½ hands high, and it is to them that the English horse owes in part its present conspicuous qualities. Laws were passed to promote the breeding of large horses by improving the type of British ponies. During the reign of Henry VIII it was ordained by law that no stallion less than 15 hands and no mare less than 13 hands should run wild in the country. Colts two years of age and under 11½ hands high were not permitted to run on any moors, forests, or commons where mares were pastured, and to guard against any mishaps it was further ordered that at Michaelmas the magistrates of the neighborhood were to search the countryside, the forests, and the commons, for the purpose of destroying all stallions under the required height, as well as "all unlikely tits, whether mares or foals." Prelates and nobles, and every one whose wife wore a velvet bonnet, were compelled to do then "leaping and riding upon stallions not less than 15 hands high." There were two classes of horses throughout the country—the first a "very indifferent, strong, slow, heavy draft horse," and the second "light and weak." Private matches were often arranged, showing that speed was becoming a greater factor than size and weight.

Although there had been public horse racing in Elizabeth's time, it was not until James I ascended the throne that horse racing was legally established. He introduced into England the Markham Arab, which was known to be a purebred animal, and in many other ways did much to improve the breed of horses. A distinction was drawn between race horses and common horses, the race horses were trained for their competitions, and 140 pounds was the average weight of a professional jockey. During the reign of Charles I a memorial was presented to the King bewailing the gradual disappearance of stout horses fit for the defense of the country, by stating that the breed of strong horses was likely to disappear unless measures were taken for their propagation. The tournament was no more, the pack horse had practically disappeared, the introduction of the coach had removed a large part of the pack from the horse's back, and everything was done to encourage cross breeding with foreign importations. From such ancestors the modern thoroughbred has descended. After the civil wars and during the reign of Charles II the race courses at Newmarket and at Datchet Mead, near Windsor, were laid out, and the King himself became the first great supporter of the turf. The most conspicuous English horseman of this time was the Duke of Newcastle, who in 1667 published his celebrated work on horsemanship, the reading of which is said to have so im-

terested Charles that he became the largest individual importer of foreign blood in the country. The Stuart kings maintained magnificent studs and constantly employed purchasing agents to secure the best Oriental blood but, unfortunately, the pedigree of many of these animals is largely a matter of tradition, owing to the fact that the *Stud Book* had not been issued. In spite of the infusion of foreign blood, however, the English race horse in the time of the Stuarts was a clumsy-looking animal in comparison with the pure Oriental type or with the race horse of to-day. He was strong and of large build, but neither as elegant nor as swift on the racecourse as was the Barb. The combination of native English stock and such horses as the Helmsley Turk, Byerly Turk, Pace's White Turk, D'Arcy's White Turk, Selaby Turk, and by such Barbary stallions as Dodsworth, Carwen, Bay Barb, Greyhound, Compton Barb, and Toulouse Barb, produced a horse remarkable for its well-proportioned locomotive parts, legs, shoulders, etc., strong carcass and deep chest, the typical animal of speed and endurance.

Since the middle of the eighteenth century the practice of interbreeding with Oriental blood has been discontinued, and although half-bred horses were raced until the first part of the nineteenth century, the thoroughbred has, ever since the foundation of the "racing calendar," been the recognized race horse, and his pedigree has been strictly and authentically kept. During the seventeenth century speed was not the sole qualification of a race horse, it was required to have strength and endurance. From racing matured horses at long distances it was an easy transition to shorten the length of the course and increase the speed of the horse, besides which the element of gambling entered into the sport, and it soon happened that three-year-old horses were used in the races. It was found, however, that they could not "stay" the old four-mile course, so that of necessity the distances had to be reduced to accommodate the horses. The result of this policy is seen in modern horse racing (qv), in which two-year-old horses developed for speed alone take part in races over courses less than half a mile in length.

The Horse in America. Fossils of the fore-runner of the horse have been found on the American continent, but it is generally believed that the American horse of to-day is the descendant of animals brought here by Europeans and the first settlers. Cortés used but few horses in his Mexican conquest, but undoubtedly some of them became progenitors of the American wild horse and similarly the horses abandoned by the unfortunate Ferdinand de Soto near the Texas border became the progenitors of all the wild horses of North America. Recent discoveries of fossils in South America have led some to believe that at least one type of South American horse is indigenous. (See HORSE, FOSSIL.) The character and action of the American horse will be found fully described under THORNTON and PACER.

The earliest colonists of Virginia were not remarkable as pioneers, so that it is not surprising to learn that their first supply of domestic animals (including horses) was consumed as food. Although there had been several shipments of horses from London down to about 1640, in 1646 there were only between 200 and 300 horses of both sexes in the Colony. In 1656 the exportation of mares was prohibited by law,

but in 1667 the restriction was removed. The horses of the period are described as having been of hardy and strong quality, but undersized, and, like the horses in other Colonies, they were branded and turned loose to find their own subsistence. Owing to the rapidity of their increase, they were soon very numerous and became practically wild, so much so that at the close of the seventeenth century it was as common as well as profitable sport to hunt wild horses, for an animal without a brand became the property of its captor. On the island of Chincoteague, off the coast of Virginia, there are still in existence bands of wild horses, and only within recent decades has there been any attempt to domesticate any of their number. They are of all colors and uniform in size, not averaging over 13 hands, and are accounted for in their present location as being the descendants of a band of Virginian wild horses which located there when it was a peninsula and had their retreat cut off when time converted what had been a peninsula into an island. Notwithstanding occasional efforts to increase its size, the Virginian horse retained the characteristics of its English ancestor.

The settlers of New Netherlands brought their horses from Utrecht. They were larger, better, and more valuable, so far as prices were concerned, than the English horses of the other Colonies, but were not regarded as being as good for saddle work. The two breeds soon intermixed, and a larger breed resulted, for at the time of the Revolution the average height was 14 hands and 1 inch. Horse racing was introduced by Governor Nicholls, of New York, in 1665. He established a racecourse on Hempstead Plains, L. I., which was the first official and properly organized racecourse on the continent. It is supposed that the horses were of the Dutch breeds, because the people attending were largely of that nationality. The English race horse was not at that time thoroughly developed and in any case was not imported into New York until nearly 100 years afterward. The New England Colonies played a very important part in the development of the modern American horse. In 1629 the first horses were imported into New England from the proprietary company in London. In 1635, 27 mares and 3 stallions were shipped from Holland and sold in Salem, and five years later conditions were such that the colonists were enabled to export a shipment of 80 animals to Barbados. It has been ascertained, from an investigation covering the period 1756-59, that the average height of horses was 14 hands 1 inch, and that three-fourths of the total number were pacers and one-fourth trotters. The founders of Hartford, Conn., brought horses with them (1636), and in 1653 the General Court at New Haven ordered all horses to be branded and instituted a system of public saddle horses for hire. The average size was 13 hands and 3 inches. Roger Williams and the settlers of Rhode Island Colony (1636) obtained their horses from Massachusetts and succeeded so well in the breeding of them that in 1690 horses were their principal export, and they shipped them to all the Colonies of the coast. Pacers were raised in Rhode Island and were widely known as Narragansett pacers. Trade with Canada was not permitted, but there is no reason to doubt that an occasional trade was made, whereby a Narragansett pacer changed owners for the consideration of a bale of peltry, such as only the French Canadian could offer.

Racing was especially encouraged in Rhode Island, and thus was developed the speed that made then horses famous. In 1768 the average size of a Narragansett was 14 hands and 1 mch. In the early part of the seventeenth century the Pennsylvania horse was the largest and heaviest horse in the country, but 100 years later they seem to have ranked in both respects below the horses of all the other Colonies. Up to 1750 the average size in eastern Pennsylvania was about 13 hands and 1½ inches. Philadelphia boasted the speediest and finest horses, and pacers were the most fashionable and popular. New Jersey supplied itself from New York and Pennsylvania,

a stallion, Justin Morgan, that was foaled at Springfield, Mass., in 1793.

The American horse was for 200 years the sole means of inland travel and the great essential to all business in and between the various Colonies of the country. Improved roads have made him a driving horse, and none of the inventions of modern times, from the introduction of railroads to bicycles and horseless vehicles generally, has affected his popularity or his value. To the superficial observer it would appear as if improved means of vehicular transport would diminish the breeding of horses as well as decrease their value, but thus far such has not been the

case. Good horses have a higher value than ever, and as the demand for cheap or poorly bred horses diminishes, the better bred ones survive, and what is lost in number is more than balanced in breed and consequent value. (See BREEDING.) The principal families of racing horses are the Bashaws, Clays, Black Hawks, Hambletonians, Mambrino Chiefs, Pilots, American Stairs, and Blue Bulls. (See TROTTER, PACER.) The most prominent types of the pony include the Shetland, Galloway, Welsh, Dartmoor, Exmoor, and Canadian breeds. (See PONY.) See also ASS, MULE, SHIRE HORSE, PERCHERON HORSE, ETC.

Types, etc. The *hackney* is, strictly speaking, not a breed, but a type, indigenous to the eastern counties of England, bred chiefly for carriage purposes. It is of excellent symmetry of proportion and is capable of a very true rhythm in action, although it is slower and heavier than the roadster, it is faster and much lighter than the middle-weight draft

HEAD—1, muzzle, 2, nostril, 3, forehead, 4, jaw, 5, poll

NECK—6, crest, 7, throat, or windpipe

FORE QUARTER—8, shoulder blade, 9, point of shoulder, 10, bosom, or breast, 11, true arm, 12, elbow, 13, forearm (arm), 14, knee, 15, cannon bone, 16, back sinew, 17, fetlock, or pastern joint, 18, coronet, 19, hoof, or foot, 20, heel

BODY OR MIDDLE PIECES—21, withers, 22, back, 23, ribs (together forming the barrel, or chest), 24, 24, circumference of chest, called the girth, 25, the loins, 26, the croup, 27, the hip, 28, the flank, 29, the sheath, 30, the root of the dock, or tail

HIND QUARTER—31, hip joint, or whorlbone, 32, stifle joint, 33, lower thigh, or gaskin, 34, the quarters, 35, the hock, 36, point of the hock, 37, the curb place, 38, the cannon bone, 39, the back sinew, 40, pastern, or fetlock joint, 41, coronet, 42, foot, or hoof, 43, heel, 44, spavin place

and by the beginning of the eighteenth century racing had become so common as to be a nuisance, so much so that in 1748 there was enacted a law for the suppression of "running, pacing, and trotting races." The year before the Colony of Maryland, which had in all probability received its supply of horses from Rhode Island, Pennsylvania, and Virginia, passed a similar law. North and South Carolina secured then horses from Virginia. In Canada horses were received from Picardy, France, in 1665, and it is assumed they were largely of the English type. Many of them are supposed to have been pacers, but whether they were, or whether, as is sometimes argued, the Canadian pacer is derived from the illicit trading with Rhode Islanders for their Narragansetts, is a question much discussed. The Morgan horse is a type which has had deserved popularity. It originated from

horse. A well-bred hackney should be properly balanced in fore and hindquarters and middle piece. Since 1890 there have been large importations of this breed to America, although the hackney has been known here by occasional single importations since 1822. It has been especially valuable in the breeding and development of the American trotter. The *cob*, another useful type, is a native of Norfolk and Lincolnshire in England and is a stoutly built, short-legged animal of from 13.3 to 14.3 hands high. It is smaller than the hack and larger than the pony. The *Galloway* is a horse common to Wales and North Britain. It seldom ranges above 14 or 14½ hands in height and is not a particularly valuable animal. Specimens below 13 hands are called ponies. The *hunter* is not required to be a thoroughbred animal, although where the hunting warrants it he is

frequently thoroughbred, or half bred at least. He is chosen to suit the country over which he is hunted as well as to carry the weight of his rider. In any case he should have the following characteristics: a lean head and neck, firmly set on good oblique shoulders; a strong back and loin, deep body, wide hips, good quarters, and firm legs and feet. Among horse-men the following terms are in use: A *stallion* is a male horse, and when desexed is termed a *gelding*. A *mare* is the female. Animals of both sexes when young are termed *foals*, the male foal is a *colt*, and the female a *filly*. Young animals become "of age" when the outer incisors (corner nippers) are developed. A horse is *aged* when in its eighth or ninth year, a fact determined by the front teeth. The period of gestation is 11 months, the foal usually being dropped in the spring.

Indications of Age. It is very difficult, if not impossible, to formulate any rules by which the age of a horse may be accurately determined. To an expert horseman the lightness and elasticity of step of the animal under examination will afford a general clew, or, better still, the contour of the lower jaw, which grows more and more angular with increasing age. It is to some structure of the animal little liable to change, however, that we must look for any very accurate gauge, and the only structure answering that requirement is that of the teeth, which must be examined according to the following rules. The six teeth, or nippers, situated in the front of the lower jaw, are the ones examined to determine the question, although the tushes are a partial indication and are sometimes used in arriving at a decision. In this article the two middle nippers will be referred to as the central nippers, the ones on each side of these as the middle nippers, and the ones at each end of the group as the corner nippers. At two and a half years of age the permanent central nippers are just through the gum, the temporary middle and corner nippers still remaining, one year later the permanent middle nippers are in evidence, and between the fourth and fifth year the corner nippers will be through. About this time changes will be noticed in the condition of the earlier teeth, e.g., the middle pair look as the central pair did at two and one-half years, and the central nippers are showing signs of wear. Between the ages of five and nine considerably more experience is necessary for an accurate judgment than has been required before. At nine years of age the previous oval shape of the teeth becomes more triangular, at 10 the central nippers take a pronounced triangular shape, and the middle pair give evidence of a like tendency, followed at 11 years by the growth of the corner nippers in the same direction. The tushes become rounded at the points, and the nippers are longer and project more, the central nippers being completely triangular. The signs of wear and tear, and the growth of the evidences already described, continue with increasing age, so that at 20 years the nippers are all exceedingly triangular, projecting forward to a great degree, and are very long.

The Character, or temperament, of a horse cannot be discerned short of actual experience, by any known formula or given rules; for while the experienced horseman may judge approximately by noting the shape of the face and head and the expression of the eyes, he will, as a rule, be unable to explain the method or rules upon which

his conclusions are based. Like men horses are of different dispositions and exhibit such varied characteristics as pride, dignity, intelligence, stupidity, courage, cowardice, etc. Generally stated, an intelligent horse shows considerable width between the eyes, which latter are very prominent. The width between the ears is taken to indicate courage and strength of character, and roundness and elevation between the eyes as denoting a mildness of disposition. A timid horse is usually narrow between the ears, and a stupid one narrow between the eyes.

Diseases of the Horse. No other domestic animal is so large a sharer with humanity in the accidents and dangers incident to modern civilized life as the horse. It is practically a co-partner with man in every detail of his life and work, and yet no other animal suffers so much from ignorance, abuse, maltreatment, and quackery. Modern civilization is doing much to alleviate the condition of the less fortunate of his kind, notably the various societies for the prevention of cruelty to animals. (See CRUELTY TO ANIMALS, PREVENTION OF.) The practice of veterinary medicine has become one of the most exacting and advanced of professions, and diseases long considered incurable are now amenable to treatment. In European countries the horse is an object of governmental solicitude, as much for his value as a factor in warfare as for purely humanitarian reasons, and a careful census record is kept (particularly in Germany) of the number, pedigree, and value of the horses throughout each country. The government of the United States, through its Department of Agriculture, alone of all the nations of the world has compiled a special *Report on the Diseases of the Horse*, which is published as a guide and aid in the cultivation of a proper knowledge of the care and treatment of the animal. Below are described some of the more prevalent diseases, which will be found more fully treated in the above-named publication. See also DISEASES OF ANIMALS.

The Teeth.—Dentition covers the period during which the young horse is cutting his teeth, usually from birth up to the age of five years. As a rule, the horse has more difficulty in cutting the second, or permanent, teeth than he has with his first, or milk, teeth. With regard to the latter the mouths of young horses should be frequently examined in order that the milk teeth may not remain too long and thus cause the permanent teeth to grow in crookedly. Toothache is rare with the average horse, and then only where a tooth is allowed to decay. Usually it is only observed in the molar teeth and may be discovered by the evidences of pain given by the horse when feeding or drinking cold water.

Diseases of the Mouth.—1 *Lampas* (qv) . a swelling of the mucous membrane of the hard palate, projecting in a more or less noticeable ridge immediately behind the upper incisors. 2 *Stomatitis* . an inflammation of the mucous membrane of the mouth, generally produced by irritating medicines, foods, or other substances, such as often follows in the case of city horses from eating out of ash barrels. 3 *Glossitis* an inflammation of the tongue very similar to stomatitis both in origin and in symptoms. 4 *Ptyalism*, or salivation, is an abnormal and excessive secretion of saliva, often caused by irregular teeth, inflammation of the mouth or tongue, or the use of medicines, and occasionally by the eating of second-crop clover. 5 *Pharyngitis*

(qv) an inflammation of the mucous membrane lining of the back part of the mouth, or pharynx 6. *Paralysis of the pharynx*, or, as it is more generally called, paralysis of the throat, is a disease first discovered from the fact that the animal is unable to eat, and the manger is found to contain much saliva and frothy food that has been returned through the nose

Diseases of the Esophagus, or Gullet—It will be found in the vast majority of instances exhibiting these diseases that the cause is the introduction into the organ of foreign bodies too large to pass, or else that there are present erosions and ulcerations of the throat (followed by constriction or narrowing of the gullet) caused by the administration of caustic medicines not thoroughly diluted. The designations "pharyngeal," "cervical," and "thoracic choke" are used to denote where the obstruction is located, the symptoms varying according to the position of the agent responsible for the choke

Diseases of the Stomach—1. *Stomach staggers* (see STAGGERS), or gorged stomach (*Impaction*) distention of the stomach caused by food, in which the stomach loses the power of contracting upon its contents 2. *Tympanites of the stomach* a disease corresponding to that of "hoven" or "bloat" in cattle, and frequently due to the overloading of the stomach with young, succulent herbage, which, after its arrival in the stomach, liberates quantities of fermentation gas sufficient to distend the stomach seriously Overfeeding is a very frequent cause of stomach bloat, particularly if the overfeeding is followed immediately by hard work The symptoms are very much the same as for stomach staggers, and the treatment must be at once vigorous and immediate. As a rule, cases of this trouble occur away from the stable Absorbents are of some service, and charcoal may be given in any quantity Chloral hydrate in doses of one ounce in a pint of water as a drench is well adapted to the treatment of wind colic Diluted alcohol or whisky or aromatic spirits of ammonia may be given in one-ounce doses at short intervals 3. *Rupture of the stomach* powdered opium in one-dram doses may be given every two or three hours, thus keeping the stomach as quiet as possible The case should be kept under the observation of a skilled veterinarian 4. *Bots* there are so many opinions extant concerning this disease, many of which are erroneous, that it will repay any owner of stock to make a careful study of it With regard to the insect itself, see BOT, GADFLY Of the numerous insect parasites on solipeds, the gadflies (*Estridæ*) are the most important The species responsible for the above-named disease infest chiefly the stomach and duodenum—the small gut leading from the stomach Nearly all country horses, as well as those experiencing their first year in the city, have the bots, but the common opinion that bots frequently cause colic pains is erroneous, although they may occasionally do so If in large enough numbers they may sadly interfere with digestion. The animal may not thrive and emaciation may follow, but beyond this they are harmless 5. *Indigestion* indigestion is imperfectly performed digestion, which in the horse causes symptoms closely resembling those of dyspepsia in man A great cause of indigestion with the horse is found in the food itself (See section on *Care of the Horse*) The teeth are in many instances to blame, their sharp, irregular, or decayed condition preventing any perfect

mastication, and causing the animal to swallow his food before it receives the requisite admixture of saliva The principal seat of indigestion is in the stomach or small intestine It is characterized by an irregular appetite, refusal of food or gorging, and a disposition to eat unusual substances, as wood, salt, bedding, and frequently his own feces The animal loses flesh, and the skin becomes hard and dry and hidebound The treatment usually consists of a careful regulation of food as regards quality, quantity, and time of feeding, and an exercise of similar care as regards the water supply The condition of the mouth and teeth must also be attended to, and the teeth if sharp or irregular must be rasped down, or extracted if decayed If the indigestion is caused by ravenous eating, the animal should be fed from a manger sufficiently wide to allow the spreading of the grain, which will usually compel the horse to eat slowly Frequently a cathartic is given at the outset

Intestinal Worms—Worms are very frequently found in young horses as well as in those that are weak or debilitated They almost invariably exist in horses pastured on low, wet, or marshy ground as well as in those that drink stagnant water The most common form of intestinal worm is the lumbricoid worm, which closely resembles the common earthworm It is white or reddish in color, measuring from 4 to 12 inches in length and varying in thickness from the size of a rye straw to that of a cigar, being thickest at the middle and tapering towards each end At first slight colicky pains are noticed, or a vigorous switching of the tail, and frequent passages of manure, the animal does not shed its coat and is hidebound and pot-bellied He will be particularly fond of salt and will bite at the woodwork of his stall, the bowels are irregular, either constipation or diarrhœa being present Among the best medicines for worms are santolin, turpentine, tatar emetic, infusion of tobacco, and bitter tonics Whatever remedy is given, it will be found much more effective if administered after a long fast, and then the worm medicine must be supplemented by physic to force out the worms There are many varieties of worms, the treatment for which is usually along the lines above described

Spasmodic, or Cramp, Colic is the name given to colic which is produced by contraction or spasm of a portion of the small intestines It is usually caused by indigestible food, foreign bodies, excessive drinking of cold water when overheated, drafts of cold air, etc To insure correct treatment, it is very necessary to keep in mind the type of horse, the force of the attack, the intervals of ease or violent pain, the temperature and pulse, and a frequent attempt to urinate, which will prevent the confounding of this with any other form of colic The treatment indicated is any antispasmodic medicine, of which probably there is none better than chloral hydrate given in a dose of one ounce in a half pint of water as a drench *Flatulent colic, tympanites, wind colic, bloat*, are common among animals subject to sudden changes of food, careless feeding or treatment, too much green food, or any other food that has become stale and sour See ENTERITIS

Hernia—There are several kinds of herniæ, not all of which, however, are to be regarded as serious or dangerous Abdominal herniæ, or ruptures, are divided into reducible, irreducible, and strangulated, according to their condition, and

into inguinal, scrotal, ventral, umbilical, and diaphragmatic, according to their situation. In many instances treatment is not necessary, or, where the hernial sac is extensive, treatment is ineffective. A good deal will depend on whether any one is present when the hernia happens, as to the possibilities of a perfect cure. Umbilical hernia, or diaphragmatic hernia, calls for the most skilled treatment, and even then little or nothing can be done.

Acute Inflammation of the Kidneys—The causes of this disease are many and varied. Congestion occurs from retained products passed through the kidneys during recovery from inflammation of other parts, or fevers. Detained urine, and the possible production of ammonia and other irritants, are also frequent causes. The symptoms consist of fever, stiffness of the back, straddling gait, difficulty in lying down, rising, or walking in a circle. The recognized treatment is as follows: removal of any cause that can be discovered, then, if suffering from high fever, the removal of from two to four quarts of blood, which should be followed as much as possible by throwing the work of the kidneys on the bowels and skin.

Catarh, or Cold in the Head—A fluid discharge from the mucous membrane. Inflammation, as a rule, extends to the membrane of the sinuses of the head, and of the larynx and pharynx, causing the added complication of sore throat. Frequently the eyes are also affected. At the first stage of the attack the membrane is dry and irritable, followed by a watery discharge from the nostrils. Fever, more or less, makes its appearance, which is usually detected by placing a finger in the animal's mouth. In itself the disease is not very serious, but if neglected or treated wrongly may become complicated and dangerous. A few days of cessation from work, together with pure air and good food, is regarded as the best treatment.

Roaring (qv)—A chronic disease, evidenced by a loud, unnatural noise in breathing, and caused by an obstruction to the free passage of the air in some part of the respiratory tract. External causes are nasal polypi, thickening of the membrane, the pharyngeal polypi, deformed bones, paralysis of the wing of the nostril, and, more than anything else, paralysis of the muscles of the larynx.

Grunting—A horse is usually first tested by veterinarians for grunting, when, if the fault is discovered, he will be further tested for roaring. Grunting is a sound emitted during exhalation, when the animal is suddenly moved or struck at.

High Blowing is distinctly a nasal sound, but it must not be confounded with roaring, it is a habit and does not constitute unsoundness. In the same class should be placed whistling and thick wind.

Bronchitis, or Inflammation of the Bronchial Tubes—While the causes of this disease are of the same order as for other diseases of the respiratory organs, some special causes are the inhalation of irritating gas or smoke, and fluids or solids gaining access to the parts. It is also occasionally associated with influenza, or fever, and frequently supervenes a common cold or sore throat. The animal appears dull, the appetite is partially or wholly lost, the head hangs, and the cough, at first light, is succeeded by a high rasping cough. He prefers to stand with his head to a door or window to secure fresh air and persists in standing. He has more or less thirst,

and frequently the mouth will be found full of saliva. The first step in the treatment of the disease is to secure a pure atmosphere and comfortable quarters whenever possible. A well-ventilated box stall will be found the best. The body should be covered with a blanket according to the season of the year, the legs should be hand-rubbed until they are warm, then flannel bandages applied to the knees and hocks. If the legs cannot be made warm after hand-rubbing, take any liniment used for sore throat and thoroughly rub in, after which the legs should be covered with bandages. It will be well to rub the same liniment over the chest, the elbow, and shoulder blade, and from the elbow below to within about 6 inches of the ridge of the backbone above. *Pleuropneumonia (qv)* may attack both lungs, but, as a rule, one lung only is affected.

Diseases of the Eye—It is impossible to overestimate the value of sound eyes in a horse, for not only does disease or injury depreciate the selling price of the animal, but it is a great source of danger at all times. Some diseases, like recurring inflammation or moon blindness, as it is called, are congenital. The structure of the eye is that of a spheroidal body, flattened behind. The posterior four-fifths is inclosed by an opaque, strong, fibrous membrane, which has on its inner side a more delicate membrane consisting principally of blood vessels and pigment cells, which in its turn is lined by the extremely delicate and sensitive expansion of the retina. The anterior fifth of the globe of the eye bulges forward from what would have been the direct line of the sclerotic, forming a segment of a much smaller sphere than is inclosed by the sclerotic. There are four straight muscles of the eye, and two oblique and one retractor, enabling the eye to turn inward, outward, upward, and downward, and when all act together the eyeball is drawn deeply into its socket. One of the most common diseases is inflammation of the eyelids, which is caused usually by exposure, bites, or stings of insects, pricks with thorns, or by a whip or club, or as a result of infecting inoculations. All the known causes may ordinarily be divided under the following heads: (a) inflammations due to constitutional causes, (b) those due to direct injury, mechanical or chemical, and (c) those due to inoculation with infecting material. The local treatments ordinarily advised consist of astringent, soothing lotions (sugar of lead, 30 grains, laudanum, two teaspoonfuls, rain water, boiled and cooled, one pint), applied with a soft cloth kept wet with the lotion and hung over the eye by tying it to the headstall of the bridle on the two sides. The horse should be fed from a high manger, so as to help the return of the blood from the head, and his diet should be laxative and nonstimulating. For a sty or boil of the eyelid, the practice is to apply a poultice of camomile flowers, with the addition of a few drops of carbolic acid. The poultice should be applied in a very thin muslin bag. Wounds such as torn eyelids, caused by the horns of cattle, or perhaps by teeth, or by nails, or the barbs of wire fences, are also frequent. In such cases the edges should be brought together as promptly as possible, so as to secure union without any unsightly distortions. It is an operation that requires experience and skill.

Lameness—By this is meant any irregularities or derangements of the functions of locomotion. There are innumerable forms of lameness,

the sources of many of which are so obscure as to defy location until the resulting disease has gained sufficient headway to be serious. In veterinary nomenclature each two of the legs, as referred to in pairs, are denominated a biped, the two forelegs being the anterior biped, and the two hunder the posterior, the two on one side are designated the lateral, and either the front or the hind biped with the opposite leg of the hind or the front biped, forms the diagonal biped. In health each biped as well as each individual leg has to perform an equal and uniform duty and carry an equal share of the total weight of the body, so that the result ought to be a regular, evenly balanced, and smooth displacement of the body. According to the rapidity of the motion of the animal in different gaits, each single leg is required at certain moments to bear the weight which had the moment before rested on its congener, or again the legs of one biped may be required to carry the weight of its opposite biped. Beginning with diseases of the bones as a common source of lameness, the "splint" (qv) will be found to be of the commonest occurrence. Indeed, a horse which does not possess one or more belongs to a very small minority. The splint is a bony enlargement on the cannon bone, between the knee or hock and the fetlock joint. *Ringbones* (qv) usually result from heavy labor before the animal was of sufficient age, and consequently before the bones were sufficiently ossified, or else from bruises, sprains, or other forms of violence. *Sparin* (qv), or exostosis of the hock joint, is a disease of the most serious kind for many reasons, not the least of which is the slowness of its development and the insidiousness of its growth. *Fractures* are of less serious consequence in the horse than in man, but nevertheless they are always a matter of grave import and demand at once a most skillful treatment. *Windgalls* (qv) is a name given to the dilated bursa found at the posterior part of the fetlock joint. *Sprains* are diseases of the muscles and tendons. Ordinarily the cause of a sprain may be attributed to a fall or overstrain, and subsequent soreness, swelling, and suspension of functions. Rest is the prime essential, the treatment consisting of local applications, stimulating liniments, counterirritation, and occasionally firing. Lameness of the shoulder from spain is the most frequent and is popularly described as slip of the shoulder. With draft horses it frequently is caused by the effort necessary to move off a heavily loaded vehicle. In the great majority of cases a rest is all that is necessary to effect a cure. Under the general classification of diseases of the fetlock, ankle, and foot are to be found many of the most common as well as most fatal (so far as the value of the animal is concerned) diseases known to veterinary science. Many horses are predisposed to injuries and diseases because of imperfectly formed feet, in consequence of which they are peculiarly liable to diseases of this character. Flat-footed horses are liable to corns, pumiced sole, bruises of the sole, and kindred troubles, owing to the fact that the soles of their feet have little, if any, convexity. The flat foot has no arch, so that the weight of the animal falls on the entire plantar surface instead of on the wall, which allows of little, if any, elasticity in the sole. In *clubfoot* the feet have the wall set nearly perpendicular, and consequently the heels stand high and the fetlock joint is either thrown for-

ward or knuckled, and the weight of the animal is thrown onto the toes. In *crooked foot* one side of the wall is higher than the other, causing the animal to be pigeon-toed as well as making it "interfere." *Interfering* is when one foot in action strikes the opposite leg. *Knuckling* is another fault, which causes stumbling, and while not always an unsoundness in itself, yet frequently leads to fracture of the pastern. It is a partial dislocation of the fetlock joint and is caused more often by heavy work in hilly districts or fast work on race tracks or hard roads than anything else. The principal remedy for all faults of conformation will be found in suitable horseshoeing, which subject is discussed at some length under *HORSESHOEING*. *Sprains of the fetlock* are the consequence of knuckling or any diseases which interfere with proper locomotion, such as *navicular disease*, *chronic laminitis*, *contracted heels*, *side bones*, or such external causes as a rut or hole in the road, or any accident which causes the animal to fall. For slight injuries cold-water bandages and a few days' rest will be found sufficient. Should there be severe lameness or much swelling, a stream of cold water playing upon the leg will be found very beneficial. On the subsidence of the inflammation a blister should be applied to the joint. When the shoe of the hind foot strikes the heel or quarter of the forefoot, the animal is said to *orencach*, a trouble common to trotting and running horses. When the hind foot catches well back on the heel of the forefoot, the horse will frequently be thrown on his knees or the shoe torn from the forefoot—an accident known colloquially as *grabbing*. The art of the shoeing smith is demanded if future injuries are to be avoided. Wounds should be dressed with tincture of aloes, oakum, and a roller bandage and in any case the animal should never be driven at a very fast gait unless his heels and quarters are protected with quarter boots. Heavy or draft horses are liable to calk wounds, caused from tramping either on themselves or each other. Good shoeing and the use of boots will be found the best remedy. *Quittors* (see *QUITTOR*) are authoritatively divided into four classes: (a) Cutaneous quittor, (b) tendinous quittor, (c) sub-horn quittor, and (d) cartilaginous quittor. *Thrush* (qv) is more common with draft horses than any other breed and is usually caused by a filthy, ill-kept stable. *Corns* are injuries to the living horn of the foot, appearing in that part of the sole which is included in the angle between the bar and the outside wall of the hoof. They are described, according to the character of the conditions which follow the primary injury, as the dry, the moist, and the suppurative. The disease is confined almost exclusively to the forefeet, because of the greater weight which they support, and because the heel of the forefoot in action first strikes the ground and thus receives much more shock or concussion than the heel of the hind foot, in which the toe first makes contact with the ground. Faulty shoeing is the great predisposing cause, or else the presence of small stones or other objects between the sole and shoe. Lameness caused by bruises of the frog is best treated by putting the foot at once in a bath of cold water in order to prevent supuration, and this will frequently be effective if the disease is caught at the beginning. If supuration, however, has already commenced, the horn of the frog and of the bars and branches of the sole, if necessary, is to be pared thin in

order that the foot may be poulticed and all pressure removed. When the lameness has subsided and the exposed part is covered by a new layer of horn, the foot may be shod. Punctured wounds of the foot are of everyday occurrence, and when they, as frequently happens, involve the more important organs contained in the hoof no disease or wound can be more serious. Most frequently a "picked-up" nail is the cause of trouble and again the wounds may happen from sharp pieces of rock, glass, wire, etc. The nearer the injury is to the centre of the foot, the more possibilities there are of disastrous results. Punctured wounds of the anterior parts of the sole are the more dangerous because of the possibility of injury to the coffin bone, the most serious wounds being those which puncture the centre of the foot. Sometimes it happens that a nail has penetrated the frog and remained there for several days without causing lameness, the first evidence of an injury betraying itself when the foot is being cleaned. It must be remembered that, if the injury is not too deep, suppuration will be established before lameness develops, so that the feet should always be most closely scrutinized. Should the coffin joint have been penetrated either by the external cause or by the process of suppuration, an acute inflammation of the joint will follow, which will be invariably accompanied by high fever as well as loss of appetite. In all cases of punctured wounds the horn near the seat of injury should be thinned down, a free opening created for the escape of suppurated matter, and the foot itself placed in a poultice. Where the injury is not serious, recovery in a few days' time is ordinarily assured, but where serious injuries have been inflicted, the foot should be treated to a cold bath or the stream of cold water described in the treatment for quittor (q.v.). *Contracted heels*, or, as it is more frequently called, hoofbound, is common among saddle horses and those kept on hard floors in dry stables. Ordinarily but one foot is affected at a time, and one of the forefeet principally. The disease itself is an atrophy or shrinking of the tissues of the foot, which diminishes in particular the diameter of the heels. Another very prevalent cause is faulty shoeing, although it sometimes happens that it results from other diseases of the foot, as, e.g., thrush, side bones, coins, etc. The disease is indicated by a pinched and shrunken frog, high heels, long bars, straight walls, and hoof so dry that it is almost impossible to cut it. The treatment consists first of all of preventive measures. The feet are kept moist and the horn is prevented from drying out by the use of moist sawdust, occasional poultices of boiled turnips, and a free use of greasy hoof ointments on the sole and walls of the feet. Careful shoeing, however, will be found to be one-half of the cure. *Sand cracks* may happen on any part of the wall, although usually they appear directly in front and are called *toe cracks*, or on the lateral parts of the walls and are known as *quarter cracks* (q.v.). The latter usually affect the forefeet, and the former the hind feet. A sand crack, which is a solution of continuity or fissure in the horn of the wall of the foot, may be superficial, involving only the outer parts of the wall, or it may be deep, involving the whole thickness of the wall as well as the soft tissues beneath. The disease is most serious when it involves the coronary band and may be further complicated by hemorrhage, inflammation of the laminae, suppura-

tion, and gangrene. The predisposing cause of sand cracks is the relative dryness of the horn, although excessive dryness is not more dangerous than alternate changes from damp to dry. Other predisposing causes are heavy shoes, large nails, and bad shoeing in general, together with such diseases as canker, quittor and suppurative coins. Very little can be done in the way of prevention, but the suppleness of the horn may be maintained by the use of ointments, damp floor, bedding, etc., as well as by proper shoeing. After the fissure has made its appearance, all efforts should be directed to prevent its growing longer and deeper, the usual method being to arrest all motion in the edges. A very simple appliance for holding the borders of a toe crack together is the *vachette clasp*. This is made of stiff wire and is strong enough to prevent all motion in the borders of the crack. Where these instruments cannot be obtained, a good substitute is to drill a hole through the horn across the fissure and close the crack by means of a thin nail made of tough iron and neatly clinched at each end.

Care of the Horse Careless and improper feeding and watering are responsible for most of the digestive disorders with which the horse may be troubled. With the horse digestion takes place principally in the intestines, and in selecting food for a horse the anatomical arrangement of its digestive organs and the physiological functions they perform should be carefully studied. All food should be wholesome and clean, the animal should be fed regularly and, because of his small stomach, in small quantities and frequently. A horse should never be fed too soon after a hard day's work. He may be given a small quantity of hay, but one or two hours should elapse before he gets his regular meal. When it is contemplated to change the food, care should be taken to make the change very gradually, and in any case the quantity of food given must be in a direct proportion to the amount of labor performed. Should the horse stand several days in the stable, his food should be of a more laxative nature. The following foods are considered the best: the best hay for horses is "timothy," preferably that about one year old, of a greenish color, and possessing a sweet aroma. A horse fed on grain should be allowed from 10 to 12 pounds of good hay a day. Wheat and rye chaff should never be used. Of the grain foods, oats easily take the precedence. The best oats are one year old, plump, short, hard, bright, and sweet. They are given either whole or crushed. A fair allowance for the average horse is about 12 quarts of good oats a day. Wheat and rye should not be used except in small quantities and mixed with other grains or hay. The bran of wheat is the one most used, although its value is variously estimated. It is always fed with other grains and tends to keep the bowels open. Corn on the cob is generally used as food for horses affected with "lampas." It is better given ground and fed in quantities of from one to two quarts at a meal, mixed with crushed oats or bran. Linseed is occasionally fed with other foods to improve the condition of the skin and keep the bowels open. It is of particular service during convalescence. Steamed or boiled roots and potatoes are frequently used as an article of food, but carrots make the best diet, particularly during sickness. Grass is the natural food of the horse, but it is not sufficient to keep it in condition for work. The amount of water re-

quired by the horse varies according to the character of his food, but, roundly stated, about eight quarts a day will be a fair average. When resting, water should be given three times a day, when at work, more frequently. The very prevalent impression that when a horse is warm he should not be allowed to drink is very erroneous. No matter how warm a horse may be, it is always safe to allow him from 6 to 10 swallows of water. The danger is not in the water, but in the excessive quantity that the animal will take when warm, if not restrained. It should not be given when ice cold. The total number of horses in the United States continues to increase despite the fact that much of the service formerly rendered by horses is now performed by the automobile. The number on farms in 1914 was estimated by the Department of Agriculture at 20,962,000 against 16,736,059 in 1904, the value, in 1914, \$2,291,638,000 against \$1,136,940,000 in 1904. The number in cities was, in 1910, 3,182,789 against 2,936,781 in 1900.

HORSE A miner's term, applied to any intruded material which is the apparent cause of a sudden interruption in the continuity of a mineral that is being quarried, as when a dike of igneous rock cuts across an ore body. In vein mining a detached mass of rock which fills the vein is called a horse, while colliers apply the term to the shale which replaces the coal bed, as well as to such interruptions as seem to have been the channels of small streams, and which were subsequently filled up by the clay that formed the roof of the coal.

HORSE On shipboard, an iron jackstay or rail used as a guide for a traveler or as a securing bar, usually called a *horse rail*. Also the old name for a footrope on a yard. The secondary footrope at the end of a yard is still called the *Flemish horse*.

HORSE, FOSSIL Remains of horses, often of extinct species, have been found in the cave beds, river gravels, bone licks, and loess deposits of the Quaternary period, or Age of Man, in almost all parts of the world. In the more ancient deposits of the Tertiary period, or Age of Mammals, have been found remains of a series of ancestors of the horse which illustrate the evolution of this race through this entire geological period, a time probably of some millions of years. Fossil horses of the Age of Man are much like the existing species and are included for the most part in the same genus (*Equus*). They have been found in Europe, Asia, Africa, North and South America, but none in Australia or in the Oceanic islands, except in those which, like the British Isles, were joined to the continental mainland during the early part of the Quaternary period. With these exceptions the animal was of world-wide distribution and inhabited especially the open grassy plains and high plateaus of the interior of the great continents, at the beginning of the Age of Man. All these races were at first wild.

In the New World they apparently became extinct, for when the Spaniards invaded America, they found no horses, wild or domesticated. The Indians, who had domesticated the llama, the alpaca, and the dog, knew nothing of the horse and were astonished and terrified at the sight of the strange and unfamiliar animals which the newcomers rode. Yet, when introduced by the white races, the horse ran wild and flourished and increased greatly in the same regions where its native cousins had formerly lived, showing how well the country was suited to its needs.

In Central Asia two wild races, Przewalsky's horse and the Asiatic wild ass, or kiang (q v), persist to the present day; others were domesticated by man in the earliest times, and their use in Chaldea and Egypt for draft and riding is depicted in the ancient mural paintings. In Africa the larger species became extinct, but the smaller zebras still survive in the southern part of the continent and the African wild ass in the northern part (Somaliland).

The wild species of Europe, a small race, short-legged and shaggy-haired, was domesticated by man, for it is represented in rude prehistoric drawings scratched on bone or ivory by men of the Neolithic or Polished-Stone age.

The domesticated horses now in use are chiefly derived from the Asiatic race, but it is probable that in some breeds there is a considerable

THE EVOLUTION OF THE HORSE.

strain of this European species or variety, and it is possible also that African races may have been domesticated and to some extent mixed with the Asiatic species. The existing wild horses of North and South America, the bionchos and mustangs, are descendants of the animals brought over by the Spaniards, but it is possible that in South America some survivors of the native races still existed at the time of the discovery of the continent, and mixed with the introduced species when it ran wild.

In general, only fragmentary specimens, parts of skulls, bones, or teeth of these extinct horses have been found fossil, so that their characters are very imperfectly known. A number of complete skeletons were found in Texas in 1899, one of which was placed in the American Museum of Natural History, New York. This species, *Equus scotti*, was of the size of a trotting horse, but in proportions more like a zebra, with deep jaw, short neck and legs, and small feet. Another extinct species, the *Hippidium* of Argentina and Patagonia, was large-headed, with extremely short and stumpy legs and feet, exaggerating some of the peculiarities of the Shetland pony, although of larger size.

Tertiary Ancestors of the Horse The history of the evolution of the horse through the Tertiary period affords the best-known illustration of the doctrine of evolution by means of natural selection (qv) and the adaptation of a race of animals to their environment. The ancestry of this family has been traced nearly as far back as the beginning of the Tertiary without a single important break. During this long period of time, estimated at nearly 3,000,000 years, these animals passed through important changes in all parts of the body, but especially in the teeth and in the feet, by which they became adapted more and more perfectly to that particular environment, viz., the open plains of a great plateau region with their scanty stunted herbage, which are the natural habitat of the modern horse.

Equine Characteristics The horse (including under his name the asses and zebras, as well as the true horses—see EQUIDÆ) is unique among modern animals in the fact that it walks on the extreme tip of the central digit of the foot, corresponding to the middle finger nail of man, and that all the remaining toes have completely disappeared. The feet are greatly elongated, so as to equal the other segments of the limbs in length, and to raise the animal much higher above the ground than if he walked, as does a man or a bear, on the sole of the foot. In each foot the first and fifth digits (thumb and little finger) have completely disappeared and left no trace, while of the second and fourth digits only a small slender rudiment exists which represents the metapodial, or bone of the palm, and is called a splint. These two splint bones lie closely against the cannon bone, or metapodial of the central digit, and are not indicated on the surface of the foot. The modern horse is therefore one-toed.

The teeth are equally peculiar. There are six grinding teeth in a closely set row on each side of each jaw, the crowns of these are very much elongated, so that they can be pushed up in their sockets as fast as they wear away at the grinding surface. The grinding surface displays a complicated pattern caused by infoldings of the enamel of the tooth, the enamel edges being supported on one side by the dentine of the

tooth, on the other by a similar substance called cement, deposited on the outer surface of the unworn enamel before the teeth are extruded from the gums. This arrangement secures at all stages of wear a series of hard enamel ridges projecting a little above the surface of the softer dentine and cement, and makes a remarkably efficient grinder for the hard, dry grasses which are the natural food of the horse (qv). In the series of animals which lead up to the modern horse we can trace every step in the evolution of these marked peculiarities of teeth and feet, from an ancestor so little suggesting the horse that when first found it was named by Richard Owen, the greatest comparative anatomist of his time, *Hyracotherium* (coney-like beast). Its relation to the horse was not at all suspected and was recognized by Huxley and Marsh only when the series of intermediate stages between *Hyracotherium* and the modern horse was discovered. This first ancestor of the horse line is very much more like the contemporary ancestors of other lines of descent and indicates how all the modern quadrupeds have diverged from a single type, each becoming adapted to its especial mode of life.

Stages in the Evolution Series The *Hyracotherium* (renamed *Eohippus*) of the Lower Eocene was a small animal, no larger than the domestic cat, with four complete toes on each forefoot and three on each hind foot. There is reason to believe that the still more ancient ancestors of this and all other mammals had five toes on each foot, and in the *Hyracotherium* forefoot we find a splint bone representing the missing first digit, or thumb, while in its hind foot there is a splint bone representing the missing outer (fifth) digit, but here no trace is left of the innermost (first) digit. The proportions of the skull, the short neck and arched back, and the limbs of moderate length were very little horselike, recalling some modern carnivorous animals, especially the civets. The teeth, short-crowned, covered with low rounded knobs of enamel, suggested those of monkeys and of pigs, but not at all the long-crowned complicated grinders of the horse. Beginning with this small and primitive animal, 11 stages have been recognized from as many successive formations, showing the gradual evolution of the race into its modern form. Each stage is characteristic of its particular geological horizon. Some have been found in several parts of the world, but by far the most complete and best-known series comes from the Tertiary Bad Lands of the Western States. Besides the main line of descent, which has led into the modern horses, asses, and zebras, there were also collateral branches, which have left no descendants. Only the more important stages can be mentioned here.

The successors to the *Hyracotherium* were the *Protorohippus* and *Orohippus* of the Middle Eocene. A complete skeleton of the former animal, from the Wind River valley, Wyoming, is in the American Museum of Natural History in New York City. It is about the size of the kit fox, and much like its predecessor, the *Hyracotherium*, except that the splint representing the fifth digit in the hind foot has disappeared.

In the Upper Eocene the *Epihippus* occurs, but only fragmentary specimens have been found. These show that the middle toe was

becoming more prominent, and the side toes, especially the outer toe of the forefoot, were quite slender. Contemporary with this animal was the very much larger *Palæotherium* of Europe, related to the horses, but not in the direct line of descent.

In the Oligocene is found *Meshippus*, of which several complete skeletons are known. The various species range in size from that of a red fox to a mastiff. There are but three toes in each foot, the outer digit of the forefoot being now reduced to a splint bone and no longer appearing as a separate toe. The central toe in both fore and hind feet is much larger, and the side toes, although they still reach the ground, are quite slender and can support but a small part of the weight of the animal.

The teeth are of the crested or lophodont type, the crests higher and sharper than in the preceding genera. This constitutes the necessary intermediate stage in the conversion of the low, round-knobbed, or bunodont crown into the high, sharply crested crown with cement bracing which characterizes the later horses. See TOOTH.

In the Miocene is found *Protohippus*, in which the side toes, although still complete, are extremely small and slender and do not reach the ground. They can therefore no longer assist in supporting the weight of the animal and are merely useless rudiments. Various species range from the size of a mastiff to that of a Shetland pony. The teeth in this animal are much more like those of the modern horse, the crown is greatly lengthened, the crests or ridges being higher and more complicated, and the valleys between the ridges are filled up with a material (cement) approximating the dentine in texture and hardness. A new and very effective method of grinding is thus begun, for when the sharp enamel crests wear down, they form a double ridge of enamel supported within by dentine and without by cement, the two latter are softer than the enamel and wear away more rapidly, leaving it as a sharp projecting ridge, continually renewed with the wear of the tooth. The tooth is pushed up from the jaw as fast as it wears off on the grinding surface, so that it becomes an efficient grinder for those hard, siliceous grasses which would rapidly wear down a tooth of the old pattern to a useless stump.

In the Pliocene lived the *Platichippus*, of which very little is known, except that it was either one-toed or had the side toes reduced to extremely small rudiments, and the teeth were much like those of *Protohippus*, which it a little exceeded in size.

In the Pleistocene is found the modern genus *Equus*, of larger size, with but one toe on each foot, the lateral digits represented by splint bones, and with teeth longer-crowned than those of *Protohippus*, enabling the animal to grind hard grasses still more efficiently. Extinct species have been found in Europe, Asia, Africa, North and South America, as we have seen above.

Meaning of the Changes in Feet and Teeth. Along with the disappearance of the side toes in the evolution of the horse there is a considerable increase in the proportionate length of the limbs and especially of the lower part of the leg and foot. The surfaces of the joints, at first more or less of the ball-and-socket kind, permitting of free motion of the limb in all directions, become keeled and grooved

like a pulley, thus permitting free motion forward and backward, but limiting the motion in all other directions and increasing considerably the strength of the joint. By this means the foot is made more efficient for locomotion over a smooth, regular surface, but less so over very rough ground, of little use for striking or grasping, or the varied purposes for which the feet of many-toed animals are used.

The increased length in the lower leg and foot increases the length of the stride without decreasing its quickness, for the heavy muscles of the leg are chiefly in the upper part, and to increase the length of the lower part changes the centre of gravity of the limb very little, and it consequently swings to and fro from the socket nearly as fast, for in an ordinary step the leg swings like a pendulum, and the speed of the swing is regulated by the distance of the centre of gravity from the attachment, as that of a pendulum is by the height of the bob.

To increase the length of lower leg and foot will therefore give the animal greater speed, but it puts an increased strain on the ankle and toe joints, and these must be strengthened correspondingly, by converting them from ball-and-socket joints to ginglymoid or pulley joints. Additional strength, likewise at the expense of flexibility, is obtained also by the consolidation of the two bones of the forearm (ulna and radius) and leg (tibia and fibula) into one, the shaft of the lesser bone practically disappearing while its ends become fused solidly to its larger neighbor.

Corresponding with the increase in length of limb, it is necessary for a grazing animal that the head and neck should increase in length in order to enable the mouth to reach the ground. So in the modern horse we find the neck and head much elongated when compared with the little *Hyracotherium*, and this elongation has taken place at equal pace with the elongation of the legs. The reduction and disappearance of the side toes, and the concentration of the step on the single central toe, serve likewise to increase the speed over smooth ground. The soft yielding surface of the polydactyl foot is able to accommodate itself to a rough, irregular surface, but on smooth ground the yielding step entails a certain loss of speed. An illustration is afforded by the pneumatic tire of a bicycle, a soft tire accommodates itself to a rough road and makes easier riding, but a hard tire is faster, especially on a smooth road. Similarly the hard, firm step from the single toe allows of more speed over a smooth surface, although compelling the animal to pick its way slowly and with care on rough, irregular ground.

The change in the character of the teeth from brachydont, or short-crowned, to hypsodont, or long-crowned, enables the animal to subsist on the hard innutritious grasses of the dry plains, which require much more thorough mastication before they can be of any use as food than do the softer green foods of the swamps and forests.

All these changes in the evolution of the horse are adaptations to a life in a region of level, smooth, and open grassy plains, which are the natural habitat of the horse. The race, better fitted at first for a forest life, has become more and more completely adapted to live and compete with its enemies or rivals under the conditions which prevail in the high, dry plains of the interior of the great continents. The great increase in size, which has occurred in

almost all races of animals whose evolution we can trace, is dependent on abundance of food. A larger animal, as may be shown on ordinary principles of mechanics, requires more food in proportion to its size than does a smaller one, in order to keep up a proper amount of activity. On the other hand, a larger animal is better able to defend itself against its enemies and rivals. Consequently, as long as food is abundant, the larger animals will have the advantage over their smaller brethren and by the laws of natural selection the race will tend to become continually larger until a limit is reached when sufficient food becomes difficult to obtain and the animal is compelled to devote nearly all its time to getting enough to eat.

Cause of the Evolution. The evolution of the horse, adapting it to live on the dry plains, probably went hand in hand with the evolution of the plains themselves. At the commencement of the Age of Mammals the western part of the North American continent was by no means so high above sea level as now, great parts of it had but recently emerged, and the Gulf of Mexico still stretched far up the valley of the Mississippi. The climate at that time was probably very moist, warm, and tropical, as is shown by the tropical forest trees found fossil even as far north as Greenland. Such a climate, with the low elevation of the land, would favor the growth of dense forests all over the country, and to such conditions of life the animals of the beginning of the Mammalian period must have been adapted. During the Tertiary the continent was steadily rising above the ocean level, and at the same time other influences were at work to make the climate continually colder and drier. These conditions restricted and thinned the forests and caused the appearance and extension of open grassy plains. The ancient forest inhabitants must then either retreat and disappear with the forests or adapt themselves to the new conditions of life. The ancestors of the horse, adopting the latter course, changed with the changing conditions, and the race became finally—as we see it to-day—one of the most highly specialized of animals in its adaptation to its peculiar environment. At the end of the Age of Mammals the continents stood at a higher elevation than at present, and there was a broad land connection between Asia and North America as well as those now existing. At this time the horses became cosmopolitan and inhabited the plains of all the great continents, excepting Australia.

It is a question whether the direct ancestry of the modern horse is to be searched for in western America or in the little-known interior plains of eastern Asia. It is also unknown why the various species which inhabited North and South America and Europe during the early part of the Age of Man should have become extinct, while those of Asia (horse and wild ass) and of Africa (wild ass and zebra) survive. Man since his appearance has played an important part in the extermination of the larger animals, but there is nothing to show how far he was responsible for the disappearance of the native American species of horse.

Parallel Evolution in Other Races. It is interesting to observe that while the evolution of the horse was progressing during the Tertiary period in North America another group of hoofed animals, now extinct, the Litopterna, in South America evolved a race adapted to the

broad plains of Argentina and Patagonia, and singularly like the horse in many ways. These animals likewise lost the lateral toes one after another and concentrated the step on the central toe, they also changed the form of the joint surfaces from ball-and-socket to pulley joints, they also lengthened the limbs and the neck and they also lengthened the teeth and complicated their pattern, but, unlike the true horses, they could not form cement on the tooth, and it was by no means so efficient a grinder. This group of animals, native to South America, became totally extinct and were succeeded by the horses which immigrated from North America, which in their turn became extinct before the appearance of civilized man. Many of the contemporaries of the horse in the Northern Hemisphere, such as the camels in America, the deer, antelopes, sheep, and cattle in the Old World were likewise lengthening the limbs, lightening and strengthening the feet, and elongating the tooth crowns, to adapt themselves to the changing conditions around them, but none paralleled the horse's evolution quite so closely as did the pseudo-horses of South America.

HORSE ANT. A popular name for certain hymenopterous insects forming the family Mutillidae. They are also known as cow ants, cow-killer ants, and velvet ants. Although they resemble the true ants, they are more closely related to the social wasps, though their females are wingless and solitary in their habits. They are ferocious stingers and are clothed with hair. In their early stages some are parasitic in the nests of wild bees. The term "horse ant" is also applied in England to certain true ants of the genus *Camponotus*.

HORSE ARTILLERY. A special type of field artillery, having greater mobility than light artillery and designed especially to accompany cavalry at any gait. The organization of the United States army requires the assignment of one horse-artillery regiment (24 guns) to each cavalry division. In the great European armies the proportion of guns to sabres is usually larger. Most armies use the same calibre and weight of gun and projectile for both light and horse artillery in order to avoid the difficulty of ammunition supply if different calibres were used. Increased mobility is obtained by reducing the weight behind the six-horse team in one or more of the following ways: by individually mounting all the cannoners on horses instead of on the carriages, by using special light limbers, by reducing the

number of rounds carried in the limbers. Great Britain is an exception to the general custom. Her horse artillery is equipped with a light 13-pounder, the light artillery with an 18-pounder. In the former case the weight behind the team is 3200 pounds, in the latter 4300 pounds. The United States three-inch light-artillery equipment, which is also used for horse artillery, puts 4260 pounds behind the team. The weight of the projectile is 15 pounds. On account of its superior mobility, horse artillery may be used for promptly reinforcing any part of the line; for occupying advanced positions seized by the cavalry; with the cavalry on raids, during reconnaissance in force, in combat, and in the pursuit of a defeated army. HORSE-CHESTNUT (so called probably from the large size of the nuts; less plausibly

A HORSE-CHESTNUT TWIG.

explained from the former use of them when ground as food for horses), *Æsculus*. A genus of trees of the family Sapindaceæ, in which the leaves are large, opposite, digitate; flowers with five spreading unequal petals, and the capsule leathery, three-valved, and covered with soft spines. The seeds, of which there are from one to three in each fruit, are large and somewhat resemble chestnuts; but the habit of the tree,

its leaves and flowers, are very unlike those of chestnuts, with which it has no botanical affinity. The common horse-chestnut (*Æsculus hippocastanum*) is a much esteemed ornamental tree, extensively used as a street tree in Europe and very fre-

HORSE-CHESTNUT FRUIT.

quently planted whenever the climate is suitable, on account of its rich foliage and its erect racemes of beautiful reddish-white flowers, which are produced on the extremities of the branches and contrast admirably with the dark

green of the leaves. It is supposed to be a native of Persia or some parts of the East and was introduced into western Europe from Constantinople at the end of the sixteenth century. It attains a great size, sometimes rising to the height of 100 feet and extending its branches very widely. Sometimes they droop almost to the ground. The leaves have long stalks and five to seven obovate wedge-shaped leaflets. The wood is soft, not very strong, nor very durable in the open air, but is used for many ordinary purposes and by carvers, turners, etc. The bark is bitter and astringent, contains a bitter principle called *æsculin*, and has been used in tanning and dyeing. The seeds are unpleasantly bitter and contain so much of the saponaceous substance peculiar to this family that when reduced to powder they may be used for washing. They contain, however, a large quantity of starch, which may be extracted and freed from bitterness by means of an alkaline solution or repeated washing. This starch is prepared on a large scale and at a cheap rate in France. Horse-chestnuts have long been employed in various countries as food for live stock, which are fond of them and grow fat upon them.

In the other species of *Æsculus* which are natives of North America the foliage is very similar to that of the common horse-chestnut. Both the leaves and fruit of the American buckeye (*Æsculus glabra*) are reputed to be poisonous. This tree ranges from Pennsylvania to Alabama and west to Kansas and Texas. North America possesses a number of other species with very similar foliage, smaller flowers, and smooth fruit. In California the seeds of *Æsculus californica* are used as food by some Indian tribes, as are those of *Æsculus turbinata* in Japan. The seeds of *Æsculus octandra*, the sweet or edible buckeye, are eaten, either boiled or roasted. This species is a shrub with long and beautiful racemes of fragrant white flowers which have long projecting stamens. It is a native of the Southern States. *Æsculus pavia*, a shrub or small tree found from Virginia southward, has bright red flowers. *Æsculus indica* is a lofty tree which grows at elevations of 8000 to 10,000 feet in the Himalayas and produces seeds very similar to those of the horse-chestnut, which, although bitter, are eaten in time of scarcity.

HORSE FAIR, THE. A well-known painting by Rosa Bonheur (q.v.), exhibited at the Salon of 1853. After passing through several hands it formed part of the Stewart collection and was finally purchased by Cornelius Vanderbilt and presented by him to the Metropolitan Museum, New York, where it now hangs. There are several replicas by the artist in England and an engraving of the painting by Thomas Landseer. The canvas shows a number of horses on the road to a fair—some with riders, some led, and some free.

HORSE MACKEREL. A name given to several species of fishes of the family Carangidae, and especially in Great Britain to the scad (*Caranx trachurus*) and in the United States to the crevalle (*Caranx hippos*) The carangids are all trim, vigorous fishes and are peculiar in that the teeth, when present, are villiform or conical Usually the scales are very small, or they may be altogether wanting In many instances the lateral line is entirely or partially armed with shieldlike, overlapping plates (See Fig 2, on the Plate of HORSE MACKEREL, accompanying this article) The horse mackerels are distributed over all seas except the polar, and their remains go back to Cretaceous time, while they are profusely represented in marine strata of Eocene date They sometimes gather in enormous shoals and are captured in vast quantities in seines They are carnivorous and swift and fierce in pursuit of lesser fishes Their flesh is excellent food The typical genera are slender, compressed, mackerel-like fishes, but the family includes many others of different form, such as the amber fishes (*Seriola*), the pilot fishes (*Naucrates*), the moonfishes (*Vomer* and *Selene*), and the pompanos These are described individually under their names elsewhere Consult A C L G Gunther, *Introduction to the Study of Fishes* (London, 1880), and G B Goode, *American Fishes* (new ed, Boston, 1903) See TUNNY, CREVALLE

HORSEMANSHIP The art of managing horses It is to the Greeks that we must look for our first knowledge of the history of horsemanship, for when primitive man first ventured upon the back of a captured horse is, at the best, a matter of conjecture. The bit could not have been known before the age of bronze, but undoubtedly the first horsemen employed a halter or thong of rawhide passed through the animal's mouth in order to direct and control it According to the evidence of the Egyptian monuments, bit, bridle, harness, and chariot were employed, and we know from other sources that the bridles of the early horsemen of Egypt and Asia were considerably decorated with tassels, crests, and embroidery, in a manner both rich and elaborate, but anything approaching the modern saddle was unknown to either Egyptian, Assyrian, or Persian Instead, a decorated and fringed cloth fastened to the animal by a girth was employed to afford the horseman a seat The warlike tribes occupying the northern border of Greece are credited with the introduction of horsemanship among the Greeks, among whom the art was held in very high esteem Horse races were a conspicuous feature of their festivals and games, a note-

worthy feature in connection with which was the fact that the tact and judgment of the rider were frequently more important factors in gaining the decision than the superiority of the horse The Athenians were especially devoted to the art, and the rules of horsemanship, so far as the seat is concerned, did not differ in essence from the good horsemanship of to-day That the Greeks excelled in the exercise is evident from the fact that they were in the habit of taking all sorts of "leaps" (according to Xenophon), "across ditches, over walls, upon and from banks," and in military evolutions particularly, demonstrated their mastery of the art of equitation The stirrup was not known to the Greeks, and probably its absence helped to make them the finished horsemen they undoubtedly were The Romans undoubtedly learned the art of horsemanship from the Greeks and, in fact, ascribed the inventions of bridle and chariot, as well as attributed the first conquest of the horse, to their teachers

Medieval Horsemanship Although there is no proof of the fact, it is nevertheless probable that the saddletree had been used for pack animals from a very early date, and that the riding saddle in some form or shape was known before the fifth century B C, the era of its reputed first appearance The difficulty of mounting into the saddle encumbered with heavy armor led through a series of contrivances to the introduction of the stirrup

Modern Horsemanship. The first treatise upon the subject was that published by Federico Grisoni, entitled *Gli ordini del cavalcare* (Naples, 1550) A contemporary of Grisoni was the celebrated teacher, Pignatelli, who is regarded by many as the author of the foundation of our present system of riding Two of his pupils, La Broue and Pluvinel, became famous throughout Europe Subsequent important writers and their works in England are Blundeville, *The Four Chiefest Offices Belonging to Horsemanship* (c 1570), translations from the Italian, by Gervase Markham (1593) and Sir William Hope (1696), Thomas de Gray, *Complete Horsemanship and Expert Farrier* (London, 1639) The Duke of Newcastle's *Méthode nouvelle de dresser les chevaux* (Antwerp, 1648) was first written in English and afterward translated into the language in which it was published It was for a long period regarded as the great standard authority on horsemanship, although to-day its teaching would be regarded as impossible

Speaking generally, there are at present two forms of riding, (1) with the stirrup straps shortened so that the legs are necessarily somewhat bent, and the rider is thereby enabled to rise in his saddle when his horse is at a trot, and (2) with the stirrups let down so that the rider's legs are straight and carry practically none of his weight, with the result that he literally sits in his saddle, whatever the gait of his horse. The first-named method is commonly employed by English riders The second form is always used by the American cowboys—among the most expert riders in the world—who doubtless had it from the plains Indians, and is the one adopted by the United States cavalry It is much less tiring to the horse as well as the rider than is the method which involves more or less constant and considerable use of the rider's leg muscles

There are several methods of mounting a

horse, each one with its own distinct advantages and disadvantages. Ordinarily the young horseman is taught to mount from either side, but usually from the "near," or left, side of the horse. The common English method is to place the snaffle rein round the third finger of the left hand, grasp a wisp of the horse's mane between the finger and thumb of the same hand, placing the left foot in the stirrup, and the right hand on the cantle, then with a spring to throw the right leg over the horse, and seat oneself in the saddle, meanwhile releasing the mane. The rider next secures the curb reins in the left hand, in such a manner that the left rein is outside the little finger, and the right between the first and second fingers. When the rein has been drawn in sufficiently for the rider to feel the horse's mouth gently, the loose part, or slack, is thrown over the first finger and held between that and the thumb. In America both reins are placed in position in the left hand before mounting. The whip in mounting is held in the fork of the thumb of the left hand and afterward taken into the right hand. The manner of holding the reins differs in different countries of Europe as well as in America, the more general method, other than that of the English already described, being its exact opposite in that the curb is held inside the snaffle. An interesting variant is the method used by the cowboys of the western United States. The single curb rein with which they ride is hung over the little finger of the left hand, the "romel" or permanent quirt attached to the rein, coming up through the fork of the thumb. The hand is laid lightly on the horse's mane as the rider stands by the horse, right foreleg facing the rear, he takes the stirrup in his right hand and reverses it, inserts his left toe, and catching the projecting horn of the saddle with his right hand, swings lightly to his seat, the horse being trained to start the instant he feels the rider's weight on the stirrup. This form of mounting has been developed through the necessity of getting on half-broken and often plunging horses.

Upon mounting, the rider should firmly seat himself in the middle of the saddle, which ought to be placed well behind the rise of the shoulders, his legs, which should work in sympathy with his hands, just about covering the girth, so that when using leg pressure to the horse, it may be easily and effectively applied immediately behind the girth. The elbows should hang loosely and naturally from the shoulder, permitting a free use of the hands, which latter should always be in a position to "give and take" without compromising control over the horse, irritating, or otherwise fretting him. The action of the leg, like that of the hand, should be sensitively active and supple, exerting as little pressure as possible, but ready and in position to exert sufficient pressure to maintain the rider's seat and position under any and all circumstances. The horse must at all times be kept well up to the bit, and the rider will do well to remember that guiding the horse military fashion by the pressure of the reins on the animal's neck is not generally advised.

Pacing in America and *ambling* in England are practically the same gait. The two legs on each side rise and fall together. It does not call for any different method of riding than that employed for the walk. The *trot* is a diagonal pace, the right fore and left hind legs working together and alternately with the left fore and

right hind legs. It is possibly the most perfect pace of the horse. The body should be erect, but playing loosely from the hips, the legs must not be allowed to swing backward and forward, nor must the rider work his shoulders. The expert horseman rides by the aid of grip and balance, the former always ready should the balance be disturbed and there be any danger of a throw. The pressure of the legs should be according to the demand of the moment, ready to keep the rider from losing his balance, which latter saves the strain of a constant exercise of the grip. The *canter* is a very comfortable pace to the rider. It is not a natural pace, however, but, on the contrary, is fatiguing to the horse and particularly injurious to the animal's forelegs. When cantering in a circle, the horse should be made to lead with his inside leg, i.e. with the right leg if cantering to the right and with the left if cantering to the left. To secure this the rider when preparing to canter should pull the right rein rather tighter than the left one, so that the horse in describing a small portion of a circle will of necessity lead with the right leg.

The Gallop—In this pace the movements of the horse follow so quickly one on the other that the eye cannot detect the various positions which constitute a cadence. The first preparation for the rider is a firm seat, which should be well down in the saddle. The reins are shortened slightly, and the hands kept low, at the same time the body should be leaning slightly forward and a moderate grip maintained with the legs. Care must be taken that the horse is held together and restrained from breaking into a headlong gallop and possibly beyond the rider's control. To avoid this the reins are held somewhat tighter in the gallop than in any of the other paces.

Leaping requires good nerves as well as a good seat. The rider must be careful to maintain an upright position in the saddle until the horse is close to the jump, when (if it is a fence) he should swing well back from his hips, keeping his hands low and clear of the withers. The feet should be drawn back and never under any circumstances allowed to swing forward towards the animal's shoulders. Should the feet be forward and the horse make a mistake on landing, the rider would be more easily thrown than if his feet were in the proper position. In landing, the horse makes contact with the ground on one foreleg followed instantly by the other, after which come the hind legs. When jumping natural obstacles, such as water, ditch, etc., the general rule never to ride fast at an obstacle holds good, although expert horsemen interpret the rule to suit themselves, in any event, the rider must be careful not to pull at the reins or in any way check the horse in his effort to jump either water or ditch. Much depends on the horse in leaping, no two going at the jump in exactly the same style. One may need a little encouragement and another a great deal of steadying, so that it is an important essential for the rider to know his horse. When nearing the jump, the reins should be tightened so as to secure a firm hold of the head and at the same time make him shorten his stride so that he may the better gauge his distance. It requires some little experience on the part of the rider before he is able to tell when the horse is in his proper stride. When the animal is properly collected and is nearing

the obstacle, the hold on the reins should be relaxed, and care taken that the free action of his head or limbs is in no way interfered with by pulling, etc. On landing the rider should gently feel the animal's mouth. The horse will then collect himself, all four legs will make contact with the ground, and he will be away again without any hesitation.

The common vices of shying, bolting, kicking, rearing, etc., are much more serious in a horse kept for the saddle than in one used for driving. The horseman will usually be able to tell when his mount is about to shy, so that he will slacken the pace gently and at the same time keep a firmer hold upon the rein on the side towards which the horse is leaning. On no account should he prepare for it by giving his horse any intimation that something unusual is to happen: neither should he whip or spur, or, as is sometimes done, strike him on the head on the side towards which it is feared he will plunge. The important thing for the rider is to grip fast with the legs, preserve his balance and be careful not to hang on by the reins. If necessary, stop and encourage the horse by patting him on the neck and otherwise making much of him.

Perhaps the most dangerous vice next to rearing is that of *bolting* or *running away*, which in many instances, however, is only exuberance of spirits on the part of the horse which temporarily overcomes the control of the rider. With a skillful and ordinarily strong horseman it is very rarely that a horse runs away, but where bolting does happen the method of combating it will depend very much on the country and route the runaway selects. Where the route abounds with sharp turns or shut gates, the danger to be feared will be the running into a fence or gate, but on a road not much frequented and well known to the rider, it will generally be possible to guide the horse past any vehicle which may be met or overtaken. In such a case the rider should not hesitate to turn the rein around his hand and pull with all his strength towards the side he desires the horse to take. "Saving the mouth," though not horsemanship, is permissible, if by its employment only the runaway can be brought to a standstill. A kicking horse should be approached and treated very carefully, and if a vicious kicker should, if possible, be just as carefully avoided. The rider usually has some sort of warning, such as the laying back of the animal's ears, in which case he should sit well back and secure his grip. Only the expert horseman should attempt to ride a rearing horse, for no amount of nerve will suffice to guard the rider from the terrible injuries likely to occur if a rearing horse should fall back on him. Of all horses, the rearer should be the most carefully shunned. There is only one thing for the rider to do in such an emergency—to remember not to hold the reins tight or use them in any way as a support. On the contrary he should catch hold of the horse's mane, or place an arm round his neck and try in that manner to force him back on his feet.

Military horsemanship is designed to secure a uniformity of style and method, and the best results from both horse and rider. Long stirrups are used, the rider sits well down in the saddle, his seat being preserved largely by balance. *High school* riding is largely an accomplishment of the manege and includes skill in

horsemanship and in the performance of feats requiring a trained animal. Women are now taught to ride astride as well as by means of the sidesaddle. Hygienic reasons are advanced in favor of the former method, but authorities generally are doubtful of their reasonableness. A fair statement of the question would be that a poor horsewoman derives little benefit from either method and runs a minimum of risk of injury when riding astride. A clever horsewoman will invariably ride sidesaddle with a greater degree of comfort, enjoyment, and safety, than when riding astride.

HORSENS, hōr'sēns A seaport of Denmark, in the Province of Aarhus, situated at the head of the Fiord of Horsens, 32 miles southwest of Aarhus (Map Denmark, C 3). The town possesses a fine church with carvings of the seventeenth century, an old convent chapel, and a high school. The chief industries are weaving, ironworking, shipbuilding, and the manufacture of woodenware and lime. The town carries on an active trade, importing grain, hay, and fertilizers, and exporting dairy products, pork, and beef. Pop., 1906, 22,237, 1911, 23,843.

HORSE POWER A unit for the rate of work, or for the power represented by a force exerted through a path or distance in a unit of time, usually the minute, though sometimes the second, is taken. The term originated in the eighteenth century, when the mechanical force of expanding steam in engines was replacing the muscular force of horses in hoisting and pumping in the British mines. What number of horses formerly used would the steam engine replace? was the question asked. Experiment by Boulton and Watt using the massive dray-horses of England showed that a horse could lift 330 pounds at a rate of 100 feet per minute,

which of course was the same (if gearing were to be used) as lifting 33,000 pounds one foot in a minute, or 550 pounds one foot in one second. Accordingly steam engines at that time and since have been designed and sold on this basis. The quantity, however, must be used with reserve and care as the measure of the work which a horse can do in traction or otherwise. D'Aubuisson, taking the work of horses of lighter weight working on capstans at Freiburg, made the unit 16,440 foot pounds. Desagulier under similar circumstances made it 44,000 foot pounds. Smeaton, 22,000, Tredgold, 27,000. The horse can haul for a few seconds greatly in excess of this rate, for eight hours he will average less. A muscular man usually develops one-tenth of a horse power, but cannot keep this up all day.

In calculating horse power of mechanical motors the pressure in pounds per square inch exerted over the area in square inches which receives this pressure, when multiplied together, gives the total force in pounds. This force multiplied by the number of feet per minute through which this force is exerted gives the total of foot pounds. As often as 33,000 is contained in the total foot pounds, so many horse-power units will the motor develop. In the steam engine the mean pressure of each stroke multiplied by the piston area, each in square inches, gives the force in pounds per stroke, the stroke in feet multiplied by the number of traverses of the piston in the cylinder per minute gives the feet passed over. The product of these factors divided by 33,000 gives the horse power. In symbols

$$HP = \frac{P \cdot A \cdot L \cdot N}{33,000}.$$

The kilowatt (q.v.), or the electrical unit consisting of 1000 watts, is the electrical unit of rate of work, corresponding to 1.3405 horse power of mechanical work, and is being urged as a more defensible unit than the horse power which has been used for over a century.

HORSE RACING. The earliest recorded organized trials of speed with horses were the chariot races at the Greek national festivals, of which the most notable were the Olympic games (q.v.), held every fourth year. Greek sculpture frequently represents the horse as used for riding, apparently without a saddle in most cases, but not as so employed for sport, except as an incident to the chariot racing. On the other hand, the horses in the Roman contests were to a very great extent ridden. All the formalities of entering and of differentiation of classes and of starting were minutely laid down and followed, even to the color of the riders' uniforms. In the earlier times these Roman races were held on the open plain. There has always been a tradition in England that on Salisbury Plain, just outside Stonehenge, the remains of a Roman race course exist, and the oldest race which still takes place in England is run over a flat meadow just outside the walls of the Roman city of Chester. The natives, too, were great horsemen and charioteers, and contests were likely enough to be provoked at the feasts which the Romans took with them the world over. Their successors, the Saxons, maintained the use and training of the horse, when Hugh Capet sought the hand of the sister of King Athelstan, in the ninth century, he brought as a propitiatory present several "running horses." Fitzstephen,

in his description of the city of London, written at the end of the twelfth century, says that "races are common, of which the gentry and wealthy citizens are very fond." In the metrical romance of *Bevis of Hamtoun* we get our first account of a regular recurring annual meet of racing horses. In 1540 the mayor of Chester presented a silver bell to be given to the winner of a race five times round *The Roody*. The horse that won not only bore away the bell, but 8 or 10 pounds, "which moneys were collected of the citizens for that purpose." In the reign of James I (1603-25) public race meetings were held at Garterly in Yorkshire, Croydon in Surrey, Linton in Cambridgeshire, and on Enfield Chase. In the days of his successor, Charles I, Newmarket, now the metropolis of the racing world, first came into prominence, and Oliver Cromwell, whose farm at Coveney was only a few miles from Newmarket, bred and kept race horses. Charles II was a great patron of the turf.

The horses that practice flat racing are known the world over as thoroughbreds, yet, as a matter of fact, they are the product of cross-breeding continued for many centuries. Vegetius, who wrote in the fourth century, gave to African horses of Spanish blood the first place as chariot racers, but commended the Persian as the best saddle horse. James I bought a very celebrated Arab for breeding purposes, but the Darley Barb, imported in 1705, laid the foundation (through his great-grandson Eclipse, born 1764) of the modern turf. He was the sire of Almanza and Aleppo, but his best-known son was Flying Childers. This importation was followed by many others of sires and dams, among which the Taffolet Barb and the white-legged Lowther Barb are the best known. The Byerly Turk produced Highflyer, and the Godolphin Arab was the grandsire of Matchem. Among the horses whose names have become familiar may be mentioned Diomed (who won the Derby in 1780 and was exported to America), Bay Middleton, The Flying Dutchman, West Australian, Blink Bonny, Hermit, Galopin, Bend Or, Saint-Simon, Saint-Blais, Ormond, and Persimmon.

There is no radical difference between the methods of training horses for flat racing in England and America, except in the time of taking the foal in hand. In England the majority of foals are practically left to nature until well into the second year. In America, on the other hand, so considerate a trainer as W. E. Wishard would have them backed when weanlings at nine months and tried out when 15 months old. A thorough preparation for a great race is a long and troublesome operation, depending largely upon constitution, general capacity, and temperament. It has been found that practically the speed of almost all horses can be equalized by addition or subtraction of weight to be carried when running. See **HANDICAPPING**.

The most celebrated race course in England is Newmarket, established in 1667, where the Cambridgeshire, the Cesarewitch, the 1000-guineas, and the 2000-guineas are annually run. There are six meets there in the year, in May, July, and October, each occupying two weeks, with an interval of a week between them. The Derby (see **DERBY DAY**) has been run at Epsom since 1780, and the Oaks since 1779. The Ascot meeting has been continuous since 1727, and Goodwood since 1802. The other most im-

portant races are at Doncaster, Lincoln, Chester, and on the Curragh of Kildare, Ireland. The Jockey Club, a semipublic organization, is the flat-racing authority. In France within the last 30 years great interest has been taken in breeding and racing the thoroughbred. The Grand Prix de Paris, which is run at Longchamps, near the capital, is one of the great races of the world. Austria, too, has its enthusiasts, and in Australia flat racing is a national pastime.

In America the first and natural home of the thoroughbred was in the South, where the early settlers were of the class which in England made the breeding and care of high-mettled horses one of their delights. Many well-known horses were imported. Diomed, the Derby winner already mentioned, of the Byerly Turk blood, was one of them. He was brought over by Col. John Hoomes, of Virginia, and became the sire of Sir Archy, who in turn was the father of American Eclipse, Vingt Un, and other well-known horses. Another of these importations was Messenger, by Blais (the son of Flying Childers and grandson of the Darley Barb) out of Turf, a descendant of the Godolphin Arabian, thus combining on both sides the best thoroughbred blood in the world. Breeding continued with great success, so that in 1881 Pierre Lorillard was able to send over to England his Iroquois and win the Derby.

Even in the North flat racing flourished as early as 1812. In 1830 Barefoot, a Saint-Leger winner, found a home in Westchester, N. Y., and was raced there against his great rival, American Eclipse. The Wagner-Grey Eagle contests caused unparalleled interest there in the autumn of 1839, and Lexington and Le Comte had their famous meetings in New Orleans in 1854-55.

The Civil War was a temporary check to thoroughbred racing, and although scarcely a city of any size was without a course, it was not until the American Jockey Club was formed, with August Belmont (qv) as chairman, and Jerome Park (in 1886) was constructed by Leonard W. Jerome, that racing in the modern sense became a widely spread pastime. The Coney Island Jockey Club at Sheepshead Bay, the Brooklyn Jockey Club at Gravesend, the Brighton Beach Racing Association at Brighton Beach (all in Brooklyn), the Westchester Racing Association, at Morris Park, N. Y., the Monmouth Park Jockey Club, at Long Branch, N. J., and minor tracks at Elizabeth and Linden, N. J., followed. Enormous sums were added by the clubs to the entry fees, and racing was at the height of its popularity. The Board of Control, made up of race-track and race-horse owners, was formed, and, under the Ives Pool Law, which permitted open betting, New York City became racing mad. Scandals became frequent, and under great agitation the Ives Law was repealed. Members of the Coney Island, Brooklyn, and Westchester clubs got together and formed the Jockey Club in 1894, and stringent rules regarding racing were enacted. The Gray-Percy Racing Law was passed, and betting was made punishable by civil suit when carried on within a race track and made a felony outside its gates. A State Racing Commission was instituted (1895) and the tracks racing under the law were taxed 5 per cent of their receipts for the benefit of the agricultural fairs throughout the State. Under this control the Aqueduct, Ja-

maica, and Queens, L. I., tracks were built—the first two, new organizations and the last named, Belmont Park, a magnificent race course, to take the place of Morris Park. Saratoga's track was bought by members of the Jockey Club and restored to much of its old popularity.

The demoralizing effects of this wholesale public gambling, and the rank dishonesty of the methods under which much of the racing was conducted, finally aroused and crystallized intelligent public opinion against it in various parts of the country. In 1905 Illinois passed laws forbidding race-track betting, and this put a stop to racing in Chicago. In New York it received its deathblow in 1908 from Gov. Charles E. Hughes (qv), who, in spite of most powerful and unscrupulous opposition, forced the Legislature to pass acts (chaps. 506, 507, 131st Session, June 11) declaring horse racing for stakes a public nuisance (with certain exceptions) and making pool selling, bookmaking, betting, etc., misdemeanors. This practically put an end to racing in New York. In 1914 a decision of the Appellate Court of the State held that individuals as such could make and record bets but this decision did not materially change the effect of the law of 1908, so far as racing in the State was concerned. Consult Cook, *History of the English Turf* (3 vols., New York, 1904), Watson, *The Racing World and its Inhabitants* (London, 1904), Busbey, *Trotting and Pacing Horses in America* (New York 1904) and *Recollections of Men and Horses* (ib., 1907), Parlin, *American Trotter* (Boston, 1905), Trevathan, *American Thoroughbred* (New York, 1905), *American Trotting Register* (Chicago, issued annually). See TROTTING.

HORSE-RADISH (*Cochlearia armoracia*)

A perennial herb of the family Cruciferae, with long, cylindrical white roots of strong pungence, due to a volatile oil which resembles mustard oil. It has flower stems about 2 feet high, large, much-veined, oblong, crenate root leaves on long stalks, and elongate-lanceolate stem leaves. It grows in damp meadows in the middle and south of Europe, is naturalized in many places in America, and is cultivated for the sake of its roots, which are scraped or grated down and mixed in salads or used as a condiment. Horse-radish root is used also in medicine as a stimulant and is often useful in promoting digestion, it is also regarded as an antiscorbutic and is sometimes applied as a rubefacient instead of mustard. Since horse-radish does not produce seed, it is generally propagated by root cuttings planted in rich, moist soil and treated as an annual. The crowns are also sometimes used, but they do not produce as good roots. Horse-radish is very difficult to eradicate from the ground in which it has become established, as almost any portion of the root will grow.

ROOT OF
HORSE-RADISH.

HORSE-RADISH TREE (*Moringa pterygosperma*, by some written *Moringa moringa*). A tree of the family Moringaceae, native of India, and introduced into the West Indies and other tropical countries, in many of which it is cultivated for its fruit, which is either pickled or

eaten as a vegetable. The fresh root and the leaves suggest the odor and flavor of horse-radish—hence the common name. Its winged, triangular, globose, bitter seeds furnish about 30 per cent of a bland, inodorous, nearly colorless fixed oil of long-keeping qualities which resembles olive oil and is similarly used. At a temperature of about 32° F a deposition of its solid fats occurs, and the remaining clear fluid is removed for use in the extraction of perfumes from flowers and the lubrication of delicate machinery. The oil is known as ben oil or behen oil—a name which is said to be misapplied, since it is claimed properly to belong to the oil obtained from the wingless seeds of *Moringa aptera*, a tree native to Abyssinia and Arabia. The oil of neither species should be confounded with bene oil, which is derived from the seeds of *Sesamum indicum* (See SESAMUM). In Australia the name "horse-radish tree" is given to species of *Codonocarpus* on account of the pungency of the leaves.

HORSESHOE FALL. The name given to the portion of Niagara Falls included between Goat Island and the Canadian shore, also called the Canadian Fall. See NIAGARA RIVER AND FALLS

HORSESHOEING. An artificial protection of some kind for the horse's foot has been well said to be "one of the penalties which civilization inexorably exacts." When it is remembered that every time that a horse is shod it implies damage to the foot and that the best and most expert shoeing of necessity inflicts some injury, the importance of horseshoeing to the horse owner is evident. All authorities agree "that there is no such thing as absolute immunity from an evil which must always exist in inverse ratio to the skill displayed in the execution of the work." The value of the domesticated horse to man is in his fleetness and strength. It was early discovered, however, that his usefulness was limited by the condition of his feet, so that the history of horseshoeing is practically an account of the various devices that have led up to the modern shoe.

The entire weight of the body, as well as the pressure of every muscular effort, is largely concentrated in the feet. The nails or claws and their corresponding digits of other animals have in solipeds disappeared from atrophy, with the exception of the middle digit, which became much more developed and surrounded by an hypertrophied nail called the hoof, the structure of which is designed to meet every requirement of the animal except those that have devolved upon it since its domestication, such as constant traveling over hard roads or stony ground. Should the horn of the hoof be worn away, the structures which it was designed to protect are of necessity injured, the animal becomes lame, unable to work, and consequently ceases to have any value. According to Diodorus, Cinnamus, and Appian, entire armies were occasionally jeopardized through the breaking down of their horses by reason of worn hoofs. Xenophon sought to solve the problem by making the hoofs hard and tough, and from other Greek and Roman writers we learn that resort was had to socks or sandals (*oppopodes, embatai, carbatinar, solea*, etc.). These were clumsy as well as ineffectual means of protection; but, strangely

enough, they have their modern counterpart in the straw sandals still to be seen in various parts of the Japanese Empire. According to Beckmann, *Beitrag zur Geschichte der Erfindungen* (Leipzig, 1792), it was greatly to be doubted whether the Romans practiced, as was alleged, the art of shoeing, by attaching a metal plate or rim to the horse's foot—a doubt strengthened by the fact that on no monuments or sculptures (so far as was then known) in which horses appear could any evidence of shoeing be seen. On the other hand, a bas-relief dating from the second century, at present in the museum of Avignon, shows a chariot drawn by horses which are unmistakably shod, and Cohen, in his *Description des monnaies frappées sous l'empire romain*, tells of a medal supposed to date from the time of Domitian commemorating a cavalry victory upon which was a design of two horseshoes, surrounded by two twined serpents. Another coin, in the British Museum, from Tarentum, about 300 B.C., is supposed to represent a horse being shod. According to historical writers the horses of the Huns when they invaded Europe were shod. Some evidence that nail shoes were employed previous to the sixth century is perhaps supplied by Chifflet (*Monuments de la monarchie française*), who tells of a fragment supposed to be part of a horseshoe found by him at Tournay in the tomb of Childeric (King of the Franks, died 481 A.D.). Absolute evidence as to nail shoes in the ninth and tenth centuries is comparatively plentiful, not the least important being the *Tactica Imperatoris Leonis* of Emperor Leo VI, dating from the ninth century. There is no reason to doubt that the Arabs of the Hejra (622 A.D.) shod their horses with iron, while, according to the *Chroniques de Saint-Denis*, Charlemagne was capable of breaking with his hands an "iron" shoe belonging to his horse. In the nature of things it was not likely that shoeing with iron was at all common in the early part of the Middle Ages. William the Conqueror is believed to have introduced the art into Britain. For centuries the art of the shoemaker ranked with that of the scholar and baird in England and France, and not only noblemen, bishops, and squires, but even kings, practiced the craft. In fact, according to Solleysel (c. 1665), a knowledge of the art was a necessity for all persons of high estate, which explains the fact that many of the oldest families of England, France, and Poland have to-day a horseshoe device in their insignia. Occasionally shoeing took the form of extravagance, as when Poppæa, the wife of Nero, had her mules shod with shoes of gold—a fantastic fashion often recorded in history. As late as 1616 the English Ambassador to France entered Paris riding a horse whose silver shoes were so lightly fastened on that when he came to a spot where "eminent men or beautiful women were standing" he caused his steed to prance, and so cast its shoes, which were scrambled for by the crowd.

NORMAL FOOT READY FOR SHOEING
Illustration of healthy frog and bars

His "argentier," wearing a rich livery, replaced the shoes with similar ones just as loosely fastened.

Modern Horseshoeing. The advanced farriery of to-day owes its excellence to modern veterinary science; so that there is no longer

the frog helps to maintain the natural expansion of the hoof—a vital function which is entirely destroyed by the too common use of the "drawing knife," and which converts what should be a means of protection into a source of danger. The further fault of paring down the sole until

TOE-WEIGHT SHOE.

SHOE TO BALANCE ACTION; HIND FEET.

SIDE-WEIGHT SHOE FOR HIND FEET.

excuse for the ignorance which in comparatively recent times was universal, and which even to-day is prevalent to some extent. Notwithstanding State examinations and increased general knowledge, it is admitted that the horse's feet are unnecessarily mutilated by wholesale cutting, regardless of the anatomy, physiology, and economic relations of the parts of the hoof. This

the living structures within are almost exposed through the soft, moist, half-formed horn, which is all that the paring knife has left, is very severely condemned. Bad farriery and shoeing are frequently guilty of still further maiming the horse in endeavoring to improve upon nature by removing the bars, or "opening" the heels; such a foot becomes predisposed to contraction of the heels. In the effort to use a shoe too small for the foot the rasp is brought into play, and the foot made to fit the shoe. It is generally conceded that the outside or horny wall of the hoof, together with that portion of the sole which is in immediate contact with it, and upon which the shoe should rest, are the only portions which require paring, and then not with the knife, but with the rasp. There is considerable difference of opinion among authorities with regard to the various details of shoeing, but all are agreed on the barbarity as well as uselessness of the frog and sole mutilation already described.

The shoe should be as light in weight as the circumstances will permit, the determining factors being the weight of the horse and the nature of the work it must do. The old adage that "an ounce at the toe means a pound at the withers" is undoubtedly true in essence, but a still greater handicap is the increased concussion inseparable from progression. It is not true that a heavy shoe necessarily wears longer than a light one, while it is well known that a light shoe is just as effective as a heavy one in performing its legitimate mission of preventing undue wear of the walls of the hoof. The shoe should be made to conform exactly to the natural tread of the foot and should be permitted on no account to remain on for too long a time, as the truncated cone of the hoof, which has its base downward, constantly increases in circumference, so that in time the shoe becomes too small and a source of pain to the horse. Common errors in shoeing are the employment of too many and too heavy nails and the driving of them too high up into the walls. If shoes could be securely attached and safely worn without the use of nails, much would be gained; but although numerous alternative devices have been put on the market, the best of which fastens the shoe by means of metal bands or

practice is followed solely on the score of tradition; and, great as the financial loss has been, it is little compared to the agony which horses have endured. The frog of the hoof is designed to act as a cushion which by its elasticity protects the other structural parts from jar and harmful concussion. Normally the resilience of

stubs, none has been found to be generally satisfactory

Winter shoeing demands that the shoe be capable of affording foothold as well as protection against undue wear, and for this purpose shoes are made fashioned with toe and heel calks, or calkins. Care is necessary to avoid making the calks any larger than is absolutely necessary, or else serious injury may be done to the horse. The art of shoeing for specific purposes is of American origin and is a result of the development of the trotter. At first designed to influence speed or action, shoes are now made to remedy defects, natural or acquired, due to faulty conformation or bad habits. Shoes for racers, trotters, and speed horses generally have an adaptable variety of form and principle. Among those designed to remedy defects in the horse most generally employed in the business and pleasure of the community at large may be mentioned the scooped-toe or roller-motion shoe for the forefeet and a shoe for the hind feet, designed to do away with "forging," or "clicking." The scooped or rolled toe hastens the action of the forelegs and enables them to avoid being struck by the hind foot, while the lengthening of the branches of the hind shoes, by increasing the ground surface, retards the "breaking over" of the hind foot. A common practice to open the action is to increase the outside web of the hind shoes. The faults of "dishing" or "padding" are remedied by similar devices. The principal diseases common to neglected or faulty shoeing will be found treated under HORSE, or under their own title throughout the work.

HORSFORD, EBEN NORTON (1818-93). An American chemist, born at Moscow, Livingston Co, N Y. He graduated as a civil engineer at the Rensselaer Polytechnic Institute in 1838 and was engaged during the following year on the geological survey of New York State. In 1844 he went to Germany and studied chemistry

for two years under Liebig. From 1847 to 1863 he held the Rumford professorship on the application of science to the useful arts at Harvard College. He left Harvard to engage in chemical manufactures. He endowed the library and laboratory of Wellesley College. He was interested in antiquarian research and was generally credited at one time with having identified the site of the supposed Norse settlement Norumbega (qv) as being on the Charles River near Boston. His dictionary of the Iroquois and Algonquin languages is a valuable contribution to Indian philology. He published *The Discovery of Norumbega* (1892).

HORSLEY, HORSLEY, ALFRED E. See ORCHARD, HARRY

HORSLEY, JOHN CALLCOTT (1817-1903). An English genre painter, born in London. He studied at the Royal Academy's schools, became R A in 1864, and treasurer in 1882, retiring in 1897. He received several prizes for his cartoons at the Westminster Hall competition in 1843 and painted all fresco the "Spirit of Religion," in the House of Lords, and "Satan Touched by Ithuriel's Spear," in the Poet's Hall of the palace of Westminster. Some of his easel paintings are: "Malvolio in the Sun", "L'Allegro" and "Il Penseroso," both done for the Prince Consort, "Caught Napping", "Scenes from Don Quixote", "Healing Mercies of Christ", "Hide and Seek." During the eighties, on account of his energetic protests against nudes, he was referred to by *Punch* as Mr J C (lothes) Horsley. The color of his pictures is good, but the motives are often stained. He wrote *Recollections of a Royal Academician* (New York, 1904), and for many years was prominent in organizing the winter exhibitions of "Old Masters" at Burlington House.

HORSLEY, SAMUEL (1733-1806). An English prelate. He was born at St Martin's Place, London, Sept 15, 1733. He was educated at Westminster School and Trinity Hall, Cambridge. In 1758 he became curate to his father, then rector of Newington, and the next year succeeded to the rectory, a living which he held for 34 years, though he also enjoyed in the interval many other preferments. In 1781 he became Archdeacon of St Albans. He was a scientist as well as a theologian and first attracted attention by scientific writings. In 1779-85 he edited, with a commentary, the works of Isaac Newton. He is chiefly remembered, however, for his controversy with Dr Joseph Priestley, growing out of the publication of the latter's *History of the Corruptions of Christianity* (1782), among which corruptions was included the doctrine of Christ's uncreated divinity. Horsley reviewed the work with great severity in his charge delivered to the clergy of the archdeaconry of St Albans, May 22, 1783. Priestley replied the same year in a publication entitled *Letters to Dr Horsley in Answer to his Animadversions, etc.* In 1784 Horsley retorted in 17 *Letters from the Archdeacon of Saint Albans in Reply to Dr Priestley, etc.* These were, in return, met by a new series from Priestley. After a silence of 18 months Horsley again replied in his *Remarks on Dr Priestley's Second Letters, etc.*, and in 1789 collected and published the whole that he had written on the subject. His services were rewarded with the bishopric of St David's in 1788, whence he was translated to the bishopric of Rochester in 1793, then to St Asaph's in 1802. He died at

Brighton, Oct 4, 1806 His collected theological works were published (London, 1845)

HORSLEY, SIR VICTOR ALEXANDER HADEN (1857-1916) An English surgeon and neurologist He studied medicine in London at University College Hospital, from which in 1881 he received the gold medal in surgery He was elected president of the Medical Defense Union and of the pathological section of the British Medical Association (1892-93) and a fellow of the Royal Medical-Chirurgical Society and became a member of numerous important scientific societies at home and abroad For many years he was professor of clinical surgery and consulting surgeon at University College Hospital (emeritus, 1906), and he was professor superintendent of the Brown Institution (1884-90), Fullerian professor at the Royal Institution (1891-93), and professor of pathology at University College (1893-96) He was secretary of the Government Commission on Hydrophobia in 1885 and a year later became surgeon to the National Hospital for Paralysis and Epilepsy In 1902 he was knighted The results of his researches in cerebral localization are of the greatest value and have made him eminent He is the author of a *Report on Septic Bacteria* (1882), articles in *Heath's Dictionary of Surgery* and *Quain's Dictionary of Medicine* (1883) *Surgical Reports of University College Hospital* (1882 and 1883), "Functions of the Marginal Convulsions," in *Proceedings of the Royal Society* (1884) and *Philosophical Transactions of the Royal Society* (1888) "Analysis of Movements Produced by Stimulating Ferrier's Cortical Arm Centre" (1b, 1886-89), "On the Thyroid and Pituitary Bodies," in *British Medical Journal* (1886), *The Pathology of Epilepsy and Canine Chorea* (1885-86), "On the Functions of the Thyroid Gland," in *British Medical Journal* (1885); *Brain Surgery* (1887), "On Localization of Disease in the Cerebrum," in *International Journal of the Medical Sciences* (1887), *Hydrophobia and its Treatment* (1888), *An Experimental Investigation of the Central Motor Innervation of the Larynx* (1890), with Felix Semon, *The Structure and Functions of the Brain and Spinal Cord* (1892), *Preliminary Report on Oedema* (1893), with Boyce, *Experiments upon the Functions of the Cerebral Cortex* (1888), with Schafer

HORSTMANN, hörst'man, August (1842-) A German chemist, born at Mannheim He was educated at the universities of Heidelberg, Zurich, and Bonn, and became a lecturer in 1867 and professor in 1872 at Heidelberg He became known especially for his work in theoretical chemistry He was the first to formulate the theory of the loss of heat, and he worked out the conditions of chemical equilibrium He wrote for the third edition of *Graham-Otto's Lehrbuch der Chemie* (1885) and published *Abhandlungen zur thermodynamik chemischer Vorgänge* (1903)

HORSTS. A name introduced by Eduard Suess and now generally used by geologists to denote those blocks of the earth's crust which retain their position during the general subsidence of the structure Such blocks are bounded by faults along which the adjacent areas have sunk, leaving the included masses as protuberances The Black Forest and Vosges highlands are examples of horsts, flanked by areas of subsidence The opposite condition is found in a *graben*, which signifies a sunken block between

parallel fault lines The basin occupied by Lake George, N Y, is an example of such a depression, as shown by the series of rocky cliffs on both sides and the precipitous shore lines The middle Rhine valley has a similar character

HORT, FENTON JOHN ANTHONY (1828-92) A distinguished British theologian He was born of English ancestry at Leopardstown near Dublin, Ireland He was educated at Rugby and at Cambridge, where he was a fellow of Trinity College (1852-57) He was vicar of St Ippolyts, Hertfordshire (1857-72), and at Cambridge was lecturer (from 1872) and professor from 1878 to his death Hort was one of the most learned men of the nineteenth century He distinguished himself not only by his marvelous attainments in classical and patristic literature, but by an extensive acquaintance with botany and mathematics Nevertheless he was always reluctant to publish the results of his studies The great monument of his life work is the *Westcott-Hort Greek Testament* (1881) For more than 30 years he made the Greek text of the New Testament his chief study and at his death was one of the first authorities in the world on this subject To him textual criticism owes the clear and convincing exhibition of the principles of genealogical evidence presented in the *Introduction to the New Testament in Greek* (1881) Since his death many of his lectures have been edited and published Consult Sir A J. Hort, *Life and Letters* (New York, 1896)

HORTA, hör'ta, Portug pron ör'ta A seaport of the island of Fayal, Azores, and capital of the District of Horta (Map Spain, A 4) It has a safe and good harbor Pop, 1900, 6734. 1910, 6037

HORTEN, hör'ten, MAX (1874-) A German Orientalist, born at Elberfeld and educated at Fribourg and Bonn In 1898-1900 he traveled in Egypt and Palestine In 1911 he succeeded Jacob as professor of Oriental languages at Erlangen and in 1913 refused an invitation to become head of the Khedive's library in Cairo He edited and translated important Arabic texts, especially philosophic, and wrote *Die philosophische Probleme der spekulativen Philosophie im Islam* (1910) and *Die philosophischen Systeme der spekulativen Theologen im Islam* (1912)

HORTENSE EUGÉNIE DE BEAUHARNAIS, ör'tans' ézhá'ne' de bō'ar'ná' See BONAPARTE.

HORTENSIO, hör-tén'shī-ō A suitor of Bianca, the younger sister of Katharine, in Shakespeare's *Taming of the Shrew*

HORTENSIVS, hör-tén'shī-ūs, QUINTUS (c 350-286 B C) A Roman legislator His *Lex Hortensia*, passed in his dictatorship (286), after the plebs had seceded, decreed that the resolutions passed by the plebs (technically called *plebiscita*) were binding on the whole people, without approval by the senate, and so brought to an end the struggle between plebeians and patricians Hortensius died while he was dictator Consult G W. Botsford, *The Roman Assemblies* (New York, 1909)

HORTENSIVS, QUINTUS, surnamed **HORTALUS** (114-50 B C) A Roman advocate and orator, a contemporary of Cicero, with whom he was personally on good terms, though opposed to him in politics Hortensius had already obtained a name as an orator before he was 20, and he passed through the several grades of the public service, as *quæstor* in 81, *ædile* in 75, *præ-*

for in 72, until he obtained the consulship in 69, afterward, about 61, he withdrew largely from politics and devoted himself to pleading in the courts. In 70 he opposed Cicero in the famous case of Veires (qv), from this time he was eclipsed as orator by Cicero. He was an effective though florid orator, with a marvelous memory and a fine voice, but often showed himself unscrupulous. He wrote on oratory, composed poems and a historical work called *Annales*. None of his orations or writings has been preserved. Consult Sandys, edition of Cicero's *Orator*, p. xl (Cambridge, 1885). Sears, *History of Oratory* (Chicago, 1903), Schanz, *Geschichte der römischen Literatur*, vol. 1, part II (3d ed., Munich, 1909).

HORTI CÆSARIS. See CÆSAR, GARDENS OF **HORTICULTURAL SOCIETIES.** Associations for the encouragement of gardening. They are now numerous in almost all civilized countries, but seem to derive their origin only from the beginning of the nineteenth century, when the London Horticultural Society was formed. The society obtained a charter in 1808. The Experimental Garden of the society, the first of its kind, was established in 1817 and was removed to its present situation at Chiswick in 1822. The progress of the society was very rapid, and its usefulness is still very great. Societies of the same kind soon began to spring up in Germany and other parts of the continent of Europe and now exist in almost all parts of the civilized world. In the United States there are about 500 horticultural societies. The New York Horticultural Society, organized in 1818 and now extinct, was the first to come into existence. The American Pomological Society, established in 1850, is now one of the strongest organizations of its kind in the world. The purpose of these societies is education and the development of interest along horticultural lines.

HORTICULTURE (from Lat *hortus*, garden + *cultura*, cultivation, from *colere*, to cultivate). The branch of general agriculture that deals with the raising of fruits, vegetables, and ornamental plants. On the one hand, horticulture merges into agriculture in its restricted sense, i.e., the raising of cereal, forage, textile, and root crops, on the other into landscape gardening, which is really a fine art. To illustrate, peas raised to be used as an esculent are classed as a horticultural crop, but if grown for the dry seed they are considered an agricultural crop, the names "garden peas" and "field peas" sufficiently indicate the distinction. Again, plants raised for their intrinsic ornamental merit are properly subjects of horticulture (see **FLORICULTURE**, **FORESTRY**); but if their primary use is as units in a general landscape effect, they are subjects of landscape gardening (qv). While the development of agriculture, in the restricted sense of the term, springs from sheer necessity, that of horticulture, which serves to gratify the sense of beauty and the desire for comfort, naturally implies a state of communal or national ease, of thrift, and even luxury. This fact is emphasized by the time at which horticulture becomes industrially important in a nation's history. For it attains commercial importance in a community only when the pioneer days have passed, when the rugged soil has been educated by the practices of general farming, and prosperity seeks new channels by diversification of interests.

But horticulture is really much less simple

than may be inferred from the ordinary definition of its scope. Problems of plant physiology, of breeding and variation of plants under domestication, of the operation within its domain of natural laws in opposition or in conjunction, of the life histories of innumerable organisms, such as insects, mites, bacteria, and microscopic fungi, are closely connected with the ordinary problems of horticulture proper and render it an art of great complexity. Further, with its growth, which, especially in America, has been phenomenal, many industries such as the nursery and the seed industries, the manufacture of tools and implements, of artificial fertilizers, baskets, barrels, tins, jars, and other packages, the preparation of canned, evaporated, or otherwise preserved fruits and vegetables, storage by refrigeration, the transportation of all materials for manufacture and of the finished product—these and other industries have either sprung into existence or have been vastly increased in magnitude with the development of horticulture. Moreover, since each of its branches may be carried on in the open air or under glass by specialists, since each species, and in many instances each variety, cultivated, demands some special knowledge of its peculiar needs since a total of fully 25,000 plants, some of which have thousands of varieties, are cultivated for use or ornament: since climates, soils, and other conditions differ as widely as do details of raising, since markets are as whimsical in their demands as persons and finally, since improvements and discoveries in plants, varieties, methods of culture, marketing etc., are annually reported—it is apparent that the realm of horticulture is exceedingly broad.

The main divisions of horticulture are floriculture, or flower growing, pomology, or fruit growing, and olericulture, or vegetable growing. Each of these divisions may be further subdivided into amateur and commercial branches—the former dealing with personal ideals, the latter with commercial demands. Of course, these two are blended to some extent, and it should be noted that examples of the former are annually increasing to the no small advantage of the community, the nation, and the world.

The ancient methods of gardening were so crude, the means of disposal so limited, and the areas devoted to horticultural industry, if such it might be called, so small, that the term "horticulture," as now understood, if applied to that early gardening would be a misnomer. Not until within the past 200 years was the term more than occasionally employed, and only during the past century did it come into general use. As proof of the interest taken in horticultural matters during the nineteenth century may be mentioned the development in America of a horticultural literature. In 1800 there were very few agricultural works that devoted more than a few chapters or even pages to fruits and vegetables. The first American horticultural book was published in 1804. Not only was there at the time no periodical devoted wholly to horticulture, but there was none that had even a horticultural department. Not until 1821 did a horticultural column appear in the *Massachusetts Agricultural Repository*, the first agricultural journal printed in America. During the nineteenth century fully 600 books were published and the total number had increased to over 1200 books by 1914. During this period 500 horticultural journals were started, of which about 50 were in circulation in

1914 The tendency of recent horticultural literature has been to substitute for the long series of specific rules formerly popular a set of general principles, which, if thoroughly grasped, might enable the reader to judge as to what working method may best suit any given case under any combination of local conditions. Outside of North America, during the past century, the development of horticulture, though less marked, has been, nevertheless, very remarkable as compared with previous centuries.

HORTI LUCULLIANI See LUCULLUS, GARDENS OF

HORTI MÆCENATIANI, or MÆCENATIS. See MÆCENAS, GARDENS OF

HORTON A city in Brown Co., Kans., 49 miles north of Topeka, on the Chicago, Rock Island, and Pacific Railroad (Map Kansas, G 3) It is located in a farming and stock-raising district and has railway repair shops, machine shops, culvert and broom factories, etc. It is governed under a charter of 1887 by a mayor and a council. There are municipal water works and an electric-light plant. Pop., 1900, 3398, 1910, 3600

HORTON, ROBERT FORMAN (1855-) An English Congregational minister. He was born in London, was educated at Shrewsbury and at New College, Oxford, of which he became fellow in 1879, and where he was lecturer in history until 1883, and in 1880 became minister of Lyndhurst Road Church, Hampstead. He was chairman of the London Congregational Union in 1898 and of the Congregational Union of England and Wales in 1903. Dr. Horton delivered the Lyman Beecher lectures on preaching at Yale in 1893 and in 1909 was again in America for the seventy-fifth anniversary of Hartford Theological Seminary. He wrote many volumes—sermons, biographies, and devotional works—including *Inspiration and the Bible* (1887), *Revelation and the Bible* (1893), *The Apostles' Creed* (1895), *John Howe* (1895), *Oliver Cromwell* (1897), *Alfred Tennyson* (1900), *The Pastoral Epistles* (1901), *The Bible as a Missionary Book* (1904), *The Early Church* (1908), *Great Issues* (1909), *My Belief* (1909), *The Hero of Heroes* (1911), *National Ideals and Race Regeneration* (1912)

HORTON, SAMUEL DANA (1844-95). An American publicist, born in Pomeroy, Ohio. He graduated at Harvard College in 1864 and at

the Harvard Law School in 1868, studied in Berlin from 1869 till 1870 and was admitted to the bar in Ohio in 1871, practiced in Cincinnati until 1874 and afterward in Pomeroy. He was among the first to argue the advantage of the establishment of an international ratio between silver and gold. In 1878 he served as secretary of the International Monetary Conference assembled in Paris and was a delegate to the second conference held there in 1881. His most important writings are *The Monetary Situation. An Address* (1878), *Silver and Gold. Their Relation to the Problem of Resumption* (1880), *The Silver Pound and England's Monetary Policy since the Restoration*, together with *The History of the Guinea* (1887), *Silver in Europe* (1890)

HORTUS SICCUS See HERBARIUM

HORUK, hō'ruk. The name of a Greek pirate, also called Barbarossa (q.v.)

HORUS (Lat., from Gk. Ὄρος, Egyptian Hōr) An Egyptian deity. His name Hōr(u) is by some scholars explained as meaning "the superior, highest," but this is an improbable etymology, not more probable, perhaps, than the earlier comparison with Hebrew ḥōr (light), which is generally ridiculed at present. It is questionable where Horus had his original local cult, usually Edfu, where a large temple is still standing, is considered to have been the locality, although the god was worshiped at a great many other places. He was patron of Upper Egypt. On the very earliest monuments we find Horus as the chief god and type of the King, from the first the hawk is his symbol, and there are allusions to his antagonism to Set, so that the later theological ideas seem to be traceable to the time of the first dynasty. The original dominating position of Horus within the pantheon is shown by the fact that his hawk stands as hieroglyph for "god" in general. He appears as a sky god, then he personifies the sun, originally thought to fly over the sky in form of a hawk, and is usually represented as a young warrior with the head of a hawk, wearing the crown of Egypt. More specially he personifies the young sun, rising victoriously in the morning out of the hostile darkness. Therefore he is connected with Osiris, the sun dying in the west, and as his son he takes vengeance for his father on the powers of darkness. More rarely he is called the son of Rê, the midday sun. He is frequently called a posthumous son of Osiris, and after the nineteenth dynasty he is constantly represented as the son of Isis, who is even said to have formed him from the mutilated members of her murdered husband. Rising gloriously, Horus begins the fight with Set-Typhon, his wicked uncle, every morning—although later (partly euhemeristic) views consider the great fight between the gods as a single event, occurring at the beginning of the world. Avenging his murdered father, Horus overthrows and emasculates Set; but he loses one eye in the contest. Possibly this refers to the moon, which loses its light every month, or else the sun may be the single eye in the face of the god, i.e., the sky. The wounded eye is healed by the moon god (Dhouthi, Thoth), which means that the second eye appears in the night. The blood of the wounded eye drips down and creates plants, animals, and all good and useful things on earth. It is curious to note how Horus is differentiated in regard to his various functions and phases. We find, e.g., Harpocrates (Horus as a child) distinguished from

Harokeris (the adult Horus), Harondotes (Egyptian Harnet-hotef, the avenger of his father), Horus in Khemmis, as a babe hidden by his mother in the marshes of the Delta from the persecutions of Set, Harmachis (qv), "Horus uniting both lands", and various other forms became localized and had their special cults. Many details of the Horus myth are obscure, e.g., the legend that he once cut off the head of his mother, which may have been borrowed from an Asiatic cosmogonic myth. The later theology explained this story by the statement that Isis had set free the wicked Set after Horus had delivered him to her in fetters, and that Horus mutilated her in his indignation at her act. The moon god (see above) replaced the head of Isis by a cow's head. The story of the fight against Set-Typhon is told with a great many variations, and the wicked adversary and his many helpers resist Horus in many forms and at many places. Later, the serpent Apap, as the personification of night and the hostile ocean, became confounded with Set (qv). The later Egyptians, under Greek influence, made strange attempts to harmonize these hundreds of different, contradictory myths (Consult especially Plutarch's *De Iside et Osiride*, and the accounts given by Diodorus). Like Osiris, Horus was explained as typifying everything good in nature, although the solar meaning of most of the mythological facts was too manifest to be entirely overlooked. The planets Mars, Jupiter, and Saturn were also considered as manifestations of Horus ("the red Horus," "the brilliant Horus," "Horus the bull"). In the mythical accounts of the early history of Egypt Horus was counted as the last of the divine rulers of the land. The principal temples of Horus were at Letopolis, in Lower Egypt, at Kus (Apollinopolis Parva), and at Edfu (Apollinopolis Magna—the Greeks identified Horus with their Apollo), he was worshipped also at Ombos, Denderah (Tentyra), Damanhur (Hermopolis Parva), etc. In Imperial Rome he became as popular as Isis and the other members of the Osirian family. See PLATE of EGYPTIAN DEITIES, in the article EGYPT. Consult E. A. T. W. Budge, *The Gods of the Egyptians*, passim (London, 1904).

HORUS An Egyptian name, usually understood as that given by Manetho to the last King of the eighteenth dynasty, the Har-em-heb of the hieroglyphic inscriptions. He had been Prime Minister of several of his predecessors, and by marrying a princess he ascended the throne somewhat after 1380 B.C. The duration of his reign is uncertain, five years are assigned to him by Manetho, while according to the monuments he reigned for 21 years at least, though this may be due to an artificial reckoning. His principal buildings are the pylons in the temple at Karnak. Of military achievements only an expedition against the negroes of the Sudan is mentioned in his rock-hewn temple at Silsileh. He completed the religious reaction against the reformation introduced by Amenophis IV. Harmais, of whom Herodotus has preserved some strange popular tales, is the same person. In other places, however, Manetho gives the name Horus to the heretic King Amenophis IV (qv).

HORUS THE ELDER. See HAROKERIS.

HORVÁTH, hōr'vat, MICHAEL (1809-78) An Hungarian ecclesiastic, statesman, and historian, born at Szentes in the County of Csongrád. He entered the priesthood in 1830, but his liberal ideas led him to abandon temporarily his

priestly calling, and he became, in 1844, professor of the Hungarian language and literature at Vienna. In 1848 he was made Bishop of Csanád and in the following year, upon the declaration of Hungarian independence, became Minister of Public Education and Worship. After the collapse of the revolutionary movement he lived for a time in Paris, Brussels, and Zurich, but returned to his country in 1867. He reentered politics (1876), and until his death was a member of the Lower House of the Diet, voting with the Deák party. His principal works are *History of the Hungarians to 1823* (3d ed., 8 vols., Budapest, 1873), *Twenty-five Years of Hungarian History, 1823-48* (2d ed., ib., 1868), *History of the War of Independence in Hungary, 1848-49* (2d ed., ib., 1872).

HORWICH, hōr'ij A town in Lancashire, England, 4 miles west-northwest of Bolton. Its industries comprise railway works, paper making, cotton manufactures, bleaching works, coal mining, and stone quarrying. It owns its water supply. Pop., 1901, 15,084, 1911, 16,285.

HOSACK, hōs'ak, DAVID (1769-1835) An American physician and scientist, born in New York. He graduated at Princeton in 1789, studied medicine in Philadelphia and afterward in Europe, and was chosen professor of botany in Columbia College in 1795. In 1807 he became professor of materia medica and of midwifery in the College of Physicians and Surgeons, then newly founded, and subsequently of the theory and practice of medicine and of obstetrics and the diseases of women and children. He was the founder of the first botanic garden in the United States. He was connected with Drs. Mott, Macneven, and Francis in organizing the medical department of Rutgers College at New Brunswick, N. J., and in New York City he held various medical positions in asylums and hospitals. He was one of the founders and for 12 years president of the New York Historical Society and was a fellow of the Royal Society of Great Britain. His publications include *Essays on Various Subjects of Medical Science* (1824-30), *System of Practical Nosology* (1829), *Lectures on the Theory and Practice of Medicine*, edited by Henry W. Ducachet (1838).

HOSANNA, hō-zăn'na The cry with which Jesus was greeted at His last entry into Jerusalem, according to Matt. xxi. 9, Mark xi. 9, John xii. 13. It is probably identical with the Hebrew expression *hoshia-na* (save now), occurring in Ps. cxviii. 25, abbreviated to *hosha-na*, as the imperative in Ps. lxxxvi. 2 suggests. This expression occurs as part of the Psalter used at the Feast of Tabernacles. When this word was said, the boughs were waved. Gradually the boughs themselves came to be called "hosannas," and the day on which the hosanna prayer was said seven times came to be called "day of the great hosanna." But in the New Testament passage "hosanna" seems to be used as an acclamation, almost as "hail" in English, and the same applies to *Dadache*, x. 6. If the passage occurred in the original Aramaic gospel, a phrase meaning "Deliver now" (or "Give victory now") "to the son of David" may have been misunderstood. But grave doubts have been expressed by many scholars as to the accuracy of the tradition. As Jesus' entry took place at the Passover and not at the Tabernacle season, there would hardly be any occasion to introduce "hosanna" in the ordinary sense, and there are many difficulties in harmonizing the accounts of

this episode with the general tenor of His teaching and His apparent conception of His ministry. Consult the discussion in Dalman, *Die Worte Jesu*, vol 1 (Leipzig, 1898) id., *Grammatik des jüdisch-palästinischen Aramäisch*, p 249 (2d ed., 1b, 1905), Schmidt, *The Prophet of Nazareth* (2d ed., New York 1907)

HOSE A flexible tube or conduit, used for the flow of liquids or gases, and formed of some fabric, such as cotton or linen, with or without a lining or outer surface of India rubber. It may be also of rubber alone, or of metal spirally wound so as to form a tube. Ordinarily, however, the term "hose" is applied to tubing made of rubber with cotton or linen covering. It is used for a wide range of purposes, from the familiar hose of the lawn and garden and the fire department to the armored hose for conveying compressed air to drills and other mining machinery in the interior of the earth. A few of the purposes for which hose may be employed are given in the following list of varieties, listed in the catalogue of a large American manufacturer: air, air brake, air drill, brewing, car heating, gas, hot water, oil, pneumatic signals, steam, steam drills, tanners, water, wine.

Where pure rubber is used without some such fabric as cotton or linen, the term "tubing" is usually applied, and this is generally confined to the smaller sizes. On the other hand, in addition to being formed of various woven fabrics, the hose may be strengthened by wire, rope, or marline wound or applied by special machinery, to increase its strength, prevent excessive expansion, and resist abrasion, as when used in mines or quarries. Possibly the most important use of hose is for conveying water and especially for fire protection. For this purpose hose made of leather was used until 1839, although it is said that India-rubber hose was brought out in England in 1827. In the year 1859 hose made of cotton and having a rubber lining was shown at a fireman's parade in Manchester, N. H. This was a natural result of Goodyear's discovery of the vulcanizing of rubber in 1844. In Great Britain Charles Macintosh, of Manchester, and Thomas Hancock, of London, were pioneers in a similar branch of manufacture. The original rubber hose consisted of a single coat of solid rubber covered with folds of proved canvas. It was made by weaving cotton yarn into a belt, which was coated with rubber and then turned over a mandrel and its edges riveted with copper. This was the essential method of manufacture until 1877, the cotton being woven on flat looms, but in the year mentioned B. L. Stover, the president of the Eureka Hose Company, devised a circular loom to make a seamless tube of cotton, and since that time this process has been used, especially in the United States. For fire hose the cotton yarn is carefully selected with a staple not less than 1 inch in length and of adequate strength. It is woven to the length and thickness required. There may be several sets of fabrics employed, but all are interwoven or connected by binder threads, so that the cotton tube is essentially homogeneous and strong. The best grades, as for the fire department, have a number of sets of fabrics, termed jackets or plies, but smaller sizes require but two and sometimes merely one. The lining with rubber is performed entirely by machinery. The rubber compound, which should contain 40 per cent of pure fine Para gum, and no injurious substitutes or adulterants for fire hose, is passed through

calender rolls which are adjusted to one-third of the ultimate desired thickness. After the first sheet is rolled the second and third, of similar thickness, are pressed, and the sheets are carried to a table, where they are cut to strips of the width required, and the edges of the tube are lapped and cemented. This forms a lining, which is vulcanized with suitable mineral filler in the usual way. These rubber tubes may be faced or manufactured entirely from a single thickness and finished without a seam; but superiority is claimed for the lap and joint process, as not only can defects in the rubber be detected more readily, but with the three plies defects in one or two may be remedied. This lining tube, previous to being inserted in the walls of the jacket, is cleaned of all foreign substances and attached to a cylinder, which is forced through the cotton tube by power. The ends are then fastened respectively to a steam head and the exhaust head of a steam table, upon which the hose is stretched, and live steam is admitted, inflating the lining, and pressing it against the interior surface of the fabric. At the same time the heat softens an adhesive cement backing on the surface of the lining and attaches the latter to the jacket. The finishing process involves attaching the brass or bronze couplings of the hose and giving a final test, which in extent and severity depends upon the purpose for which it is intended, as hose is made that will stand up to 700 pounds' pressure, while at least 300 pounds must be resisted for fire service.

American fire departments use rubber-lined hose covered with a cotton jacket or with a cotton duck which is rubber-covered. The rubber-lined hose is the more durable and the more flexible and consequently can be handled with greater facility by the firemen, but it has the disadvantage of having to be dried each time that it is used. The rubber-jacketed hose, on the other hand, does not need to be dried, but it has an average life of about five years, as compared with seven years for the cotton-covered hose. Not only is it essential to have adequate strength, but a smooth interior surface, as where this is irregular there may be an extraordinary loss of pressure, amounting to as much as 25 pounds per 100 feet. This loss of pressure in the interior of the hose is a serious consideration in fire fighting. It varies with the nature of the hose and the length of time that it has been in service.

In most fire departments hose of 2½ inches' internal diameter is employed, but in the larger cities 3-inch or 3½-inch hose is available for high pressure or fire-boat service and for long lines, being especially desirable for outside service, as with the same hydrant pressure a 3-inch hose will deliver a stream of water twice as far as a 2½-inch hose. To preserve hose it must receive suitable care, must be tested under pressure at least once a year, and after use, if wet or muddy, must be cleaned and exposed to air in towers or on racks to dry. For this reason hose towers are a feature of most city fire-engine houses, and spare hose is kept stretched out in slanting ventilated racks. It should not be kept in warm rooms, and short bends in hose of any kind should be avoided. When it is stored or stowed in folds, as in most modern hose-wagons or tenders, the folds should be changed from time to time to avoid permanent set. Rubber-lined hose should have water passed through it at

least four times a year to moisten the rubber. Rubber-lined hose is liable to crack if bent while frozen, and there is probably deterioration of the rubber when exposed to intense cold.

Standard specifications for the various kinds of hose for fire protection, both public and private, have been considered and prepared by the National Board of Fire Underwriters, the National Fire Protection Association, the Associated Factory Mutual Fire Insurance Companies, all of whom have prepared bulletins and specifications, copies of which will be furnished on application to these bodies. There is a tendency towards more rigorous as well as uniform specifications on the part of the fire departments of the United States and Canada, and with the use of increasing high pressure a better quality of hose is demanded and is being furnished. Bursting hose is a serious hindrance at a serious fire and has figured in not a few American conflagrations.

It is obvious that means should be provided for joining lengths of hose, and there should be absolute interchangeability of all couplings, not only of a single fire department, but of those of adjoining towns and cities, which may be called upon to aid one another in case of a conflagration. Accordingly in America the National Fire Protection Association has recommended national standard hose couplings and hydrant fittings for public fire service which have been approved and adopted by the more important insurance, fire, water-works, and municipal-engineering associations.

For interior service, especially in dry, warm rooms, as of textile mills or the corridors of office buildings where hose must be hung, as on hose racks, for emergency service, unlined linen hose is recommended, both on the score of economy and of longer life when not used. Furthermore, it will not become stuck together by the ordinary heat of the building and is lighter and more readily used by one man. While linen is injured every time it is wet and is not suitable for lines of more than 50 or 100 feet in length on account of the interior friction, yet, if kept in a dry place, it is considered a reliable safeguard for 20 years or more. Unjacketed cotton rubber-lined hose is recommended for yard hydrants of an ordinary factory, as preferable to the thicker and heavier jacketed hose used by the city fire departments.

A large amount of hose is required in railway operation for the air brake and for steam heating. Air-brake hose is internally wired so as to provide increased strength and must be flexible and durable. In fact, while it is being tested, it is placed in a machine where the swing and kinking motion of a moving train is counterfeited. Hose designed for suction is also wired.

In the United States rubber hose is ordinarily made in lengths of 50 feet, and the sizes are indicated by the internal diameter. In Great Britain 60 feet is not an uncommon length. As rubber hose is vulcanized by the action of heat at a temperature of 250° to 260° F, it should not be used at temperatures in excess of this amount, for the intense heat of the steam is apt to harden the rubber and cause it to lose its life, elasticity, and adhesiveness. For garden or lawn hose the usual size is $\frac{3}{4}$ of an inch internal diameter, as $\frac{1}{2}$ inch presents too much internal friction, while few manufacturers make an intermediate size, which would serve many purposes, 10 to 20 grades of garden hose are

manufactured, and numerous qualities are available for customers. See FIRE PROTECTION.

HOSE, CHARLES (1863-) An English tropical administrator and naturalist, born at Wilham, Hertfordshire. He was educated at Jesus College, Cambridge, and from 1884 to 1907 was in the service of the Rajah of Sarawak, being member of the Supreme Council in 1904-07. He studied the flora and fauna of Sarawak, and it was due to his investigations and suggestions as to the cause of beriberi that Stanton and Fraser in 1909 discovered that the disease was due to polished rice. With McDougall he wrote *The Pagan Tribes of Borneo* (1912), a valuable anthropological work.

HOSEA, hō-zē'a (Heb *Yōshē'a*, deliverance). One of the prophets, whose discourses, forming the Book of Hosea, come first in the group of minor prophets. Of his life we know nothing except what may be inferred from references in the discourses. His father's name is Beeri (Hos 1), and his home is in the Kingdom of Israel. In the first three chapters he uses as an illustration a strange incident in his own life. Following a divine command, he had taken for his wife a woman, Gomer, the daughter of Diblaim, who was a harlot. What is probably meant is that she was a Kedesah, or sacred prostitute, attached to some shrine. He had with her three children, to whom, like Isaiah (qv), he gave symbolical names, Jezreel, Lo-ruhama (no grace), and Lo-Ammi (not my people), indicating his prophetic feeling concerning Israel and possibly also his growing consciousness of her faithlessness to him. She left him and seems to have fallen into the condition of a slave when Hosea found her, purchased her freedom, and brought her to his home. The interpretation of the passage referring to this transaction is not quite certain. At any rate, Hosea took her back, though without resuming marital relations with her. There is no reason to question the reality of this personal experience, or that the prophet derived from his own sorrow a keener horror of his people's faithlessness to Yahwe, but also from his own pity to his erring wife a realization of Yahwe's unchanging love for Israel. According to the heading of the book, his activity extended over the reigns of Uzziah, Jotham, Ahaz, and Hezekiah of Judah (about 777-686 B.C.) and the reign of Jeroboam II of Israel (c. 732-740). This heading is likely to come from some editor of the oracles, and grave doubts have been expressed as to its accuracy. It does not necessarily imply that Hosea's prophetic ministry began before the last decade of the long reigns of Uzziah and Jeroboam II, but if it continued into the reigns of Jotham and Ahaz, it is strange that the last six kings of Israel are not mentioned, and Hezekiah's reign seems to have begun after the fall of the Kingdom of Israel. From internal evidence it may perhaps be inferred that his oracles were uttered between 750 and 734 B.C., when Tiglath-pileser IV attacked the Northern Kingdom. Hosea addresses himself chiefly to Israel, the Northern Kingdom, and the burden of his message is the people's infidelity towards Yahwe as exemplified by their adoption of foreign rites, by political alliances that subjected the people to foreign influences, and by the general neglect of moral standards in public and private life. These conditions were brought about by the energetic political policy inaugurated by the dynasties of Ahab and Jehu, and the prophet fairly exhausts

the vocabulary in his denunciation of this policy and in predicting the dire destruction, not only of the dynasty, but of the people. The book may be divided into two parts. (1) chapters i-iii, detailing his personal experience of marriage to a faithless woman, and the application of the experience to conditions existing in the Northern Kingdom, (2) chapters iv-xiv, in which (a) the evil and licentious features in the Hebrew cult are denounced and the attendant moral degradation of the people, (b) the misrule of the kings, the riotous life of the court, and the fondness for foreign alliances are pictured in vivid colors. Many scholars hold that there are a number of later additions and interpolations to the original text of the discourses. In these supposed additions (1) references are supplied to the Kingdom of Judah, with which it appeared the prophet did not concern himself at all, and (2) the gloomy outlook is modified by holding out the hope that a remnant at least, uncontaminated by the prevailing religious and political conditions, will escape the awful doom and form the nucleus for the reconstitution of the people on the basis of true Yahwe worship and with obedience to Yahwe's laws as the corner stone. In regard to the latter group, however, it should be borne in mind that the prophet's own pity for a faithless wife had manifestly taught him to expect the same of Yahwe in his relations to Israel, though the original expressions of hope may easily have been colored in transmission. Consult the commentaries mentioned in the article MINOR PROPHETS. Cheyne, in the *Cambridge Bible for Schools and Colleges* (Cambridge 1889), Valetton, *Amos and Hosea* (London, 1894), W. R. Smith, *The Prophets of Israel* (ib, 1895), W. R. Harper, "Amos and Hosea," in *The International Critical Commentary* (New York, 1898), G. A. Smith, *True Minor Prophets* (2 vols, ib, 1906-07).

HOSEA BIGLOW. The fictitious signer of a number of Lowell's *Biglow Papers* (q v).

HOSEIN. See HASAN AND HOSEIN.

HOSEMANN, hō'ze-man, ANDR. See OSLANDER.

HO'SIERY (from *hose*, AS, OHG *hosa*, Ger *Hose*, hose, stockings). In its most limited sense this term refers to the manufacture of stockings (hose), but in its more general application it comprises all knitted goods, either made by hand or by machinery. The use of stockings originated in the cold countries of the north of Europe, and probably the first were made of skins and subsequently of cloth, they were also, until a comparatively late period, made all in one piece with the trousers, constituting trunk hose. These garments were separated, and the art of knitting was invented. It is supposed in Scotland, about the commencement of the sixteenth century, for knitting of bonnets and hose is referred to as early as 1550. Knitted stockings found their way to France from Scotland and led to the establishment of a guild of stocking knitters, who chose for their patron saint St. Eustace of Scotland. Queen Elizabeth and her court were the first to wear silk stockings, and a machine for knitting them was invented in 1598 by William Lee, of Woodbridge, Nottinghamshire, which entirely altered the hosiery trade. In 1689 German immigrants of the sect known as Mennonites set up in Germantown, Pa., their stocking frames. By 1790 the stocking industry was established at several towns in Connecticut. In 1822 the stocking in-

dustry was established at Ipswich, Mass., with stocking machinery secretly brought over from England, and in 1825 the first knitting mill was established at Germantown. From this time the hosiery industry spread rapidly and from the manufacture of stockings developed to include underwear and an ever-increasing variety of apparel as demanded by modern conditions and fashions. The hosiery product of the United States was, in 1899, \$27,420,000, and in 1909, \$68,722,000; the number of pairs produced in 1899 was 29,904,000 dozen, and in 1909, 62,825,000 dozen. See KNITTING.

HOSIUS, hō'shi-ūs (c 256-c 358). Bishop of Cordova. He became Bishop about 295 and retained the office till his death about 358. Having suffered persecution under Maximian, he was honored for his steadfast faith. The Emperor Constantine was strongly attached to him and it may be owed his conversion to him. In 324 he sent him to Alexandria to mediate between the Bishop of that city and Arius as well as to settle the dispute concerning the observance of Easter. In the following year the Council of Nicaea was called for the purpose of considering both subjects, and Hosius was one of its presiding officers. At the close of the council he drew up, or, as some say, announced the decree, signed it first, and prevailed on the Emperor to sanction it. He was president of the Council of Sardica, called in 343-344 by Constantius and Constans at the desire of Athanasius. In 355 Constantius requested him to join in condemning Athanasius, but, instead of doing so, Hosius defended him. Having persisted in this course a second and even a third time, he was at the close of the year banished by the Emperor. Two years afterward he was summoned to attend the Council of Sirmium, where worn out with extreme age and hardship, he was prevailed on to sign a document favoring Arianism, yet he steadfastly refused to condemn Athanasius. He was then allowed to return to his home and office. Consult Gams, *Die Kirchengeschichte von Spanien* (Regensburg, 1864), Hipler, *Die Biographien des Stanislaus Hosius* (Braunsberg, 1879), Harnack, *History of Dogma* (Boston, 1894-1900), Gwatkin, *Studies of Arianism* (2d ed., London, 1900), Hefele, *Histoire des conciles* (Paris, 1907).

HOSLEY, HARRY HIBBARD (?-1908). An American naval officer. He graduated from the United States Naval Academy in 1875 and was promoted to lieutenant in 1889, to lieutenant commander in 1899, and to commander in 1904. He will be remembered as commander of the towing expedition which took the dry dock *Deucey* from Chesapeake Bay to the Philippine Islands by the way of the Mediterranean Sea, the Suez Canal, and the Indian Ocean. The expedition started on Dec. 26, 1905, and after traveling 13,080 miles reached its destination at Olongapo July 10, 1906. The feat was regarded as extremely difficult because of the unwieldy nature of the great dry dock, displacing more than 11,000 tons, but although the *Deucey* broke her towing cable six times, she arrived at her destination without injury. Hosley was a supervisor of New York harbor.

HOSMER, hōz'mēr, HARRIET (1830-1908). An American sculptor. She was born in Watertown, Mass., and studied drawing and modeling in Boston and anatomy in the St. Louis Medical College. Her first important instruction in art was received in the studio at Rome of the Eng-

lish sculptor, John Gibson (qv), with whom she worked for seven years. There she modeled her original heads "Daphne" and "Medusa," executed for Samuel Appleton, of Boston. "Beatrice Cenci," in the public library of St. Louis, and "Cenone" (1855), her first full-size figure. Her spirited and original statue of "Puck" was esteemed so successful that 30 copies were ordered, among others by the Prince of Wales and the Duke of Hamilton. Her most ambitious work is a colossal statue of "Zenobia in Chains," completed in 1859. Her bronze statue of Thomas H. Benton is in Lafayette Park, St. Louis. The "Sleeping Faun," exhibited in Paris in 1867, is one of her best works. Its companion is called "A Waking Faun." A fountain in Central Park, New York, and the heroic statue of Queen Isabella of Castile, unveiled in San Francisco in 1894, are by her, as are also the "Queen of Naples" and the "Heroine of Gaeta." She invented several technical processes in connection with her art and, like her master John Gibson (qv), was a "classicist." Nathaniel Hawthorne described her picturesquely in his *Italian Notes* and in his *Marble Faun* alludes to her "Clasped Hands of the Poet Robert Browning and his Wife." For personal anecdotes and letters, consult Carr, *Harriet Hosmer* (New York, 1912).

HOSMER, JAMES KENDALL (1834-). An American author, born in Northfield, Mass., and educated at Harvard. He left the Unitarian church at Deerfield, of which he was pastor, to go to the Civil War as a private soldier and upon his return took a professorship of rhetoric and English in Antioch College. Thence he went to the University of Missouri, taught English and history for two years, and in 1874 was appointed professor of English and German literature at Washington University, St. Louis, a post he retained until his appointment as librarian of the Minneapolis Public Library in 1892. He was elected president of the American Library Association in 1902. His writings include *Color Guard* (1864), *Thinking Bayonet* (1865), *Short History of German Literature* (1878), *Memorial of G. W. Hosmer, D.D.* (1882), *Story of the Jews* (1885), *Life of Samuel Adams*, in the "American Statesmen Series" (1885), *Life of Sir Henry Vane* (1888), *Short History of Anglo-Saxon Freedom* (1890), *How Thankful was Beowulfed* (1894), *Life of Thomas Hutchinson* (1896), *Short History of the Mississippi Valley* (1901), *History of the Louisiana Purchase* (1902), and vols. xx (*The Appeal to Arms*) and xxi (*The Outcome of the Civil War*) of *The American Nation* (1907), published in 2 vols., entitled *The American Civil War* (1913). He edited *The Expedition of Lewis and Clark* (1902), *The Journal of John Winthrop* (1908), and *The Last Leaf* (1912).

HOSPICE, hōs'pīs. See INN.

HOSPIN'IAN, RUDOLF (1547-1626). A Swiss Reformed polemical writer. He was born in the Canton of Zurich. After studying there he went to Marburg and Heidelberg and on his return in 1568 combined the position of preacher with that of school-teacher. From 1576 to 1595 he was head of the famous Karolinschule attached to the Great Minster. Meanwhile he entered the lists as a doughty champion of the Reformed church against Roman Catholics and Lutherans. Bellarmine wrote against him on the side of Rome and Hutten on the side of

Luther. His fellow townsmen highly honored him. In 1588 he was made Archdeacon of the Great Minster and in 1594 pastor of the Fraumunster Church. He died in Zurich, March 11, 1626. His works were collected under the editorship of J. H. Heideffer and published in seven folio volumes (Geneva, 1681). The latest of his writings was *Historia Jesuitica* (1619, trans., *The Jesuits' Manner of Consecrating Persons and Weapons Employed for the Murdering of Kings and Princes by Them Accounted Heretics*, Dublin, 1681).

HOSPITAL (from OF *hōspital*, Fr *hôpital*, from ML *hospitale*, inn, from Lat *hospitālis*, relating to a guest or host, from *hospes*, guest, host). A place used for the shelter and treatment of the sick or wounded, old English usage, also, an asylum for orphans and helpless children or for the aged and infirm. Lepet hospitals were established in early times and were called spitals or *hospitia*.

The term "hospital" is now rarely used for those teaching and custodial institutions that care for foundlings, orphans, and the aged, destitute, etc. These are termed asylums, homes, colleges, and almshouses. A number in England retain the old name, such as Christ's Hospital in London, Heriot's Hospital, and Donaldson's Hospital in Edinburgh, St. Cross Hospital at Winchester, etc. The term "hospital" has come to be restricted to an institution in which the sick are treated, whether such illness be of the brain or of other parts of the body.

At the present time two general classes of hospital relief work are carried on in the large cities of the world. In *dispensaries* patients are treated who are able to be about and have temporary or serious illness, not sufficiently severe to confine them to bed. In *hospitals* patients are treated who must be confined to their beds, for certain times at least. Many dispensaries are associated with teaching institutions and are then termed *clinics*, and the patients who come are in some instances utilized to instruct the students of medicine. The word "infirmary" is a common English term for both dispensaries and hospitals.

Hospitals were founded in very early times. India, Persia, and Arabia had hospitals supported by their kings and rulers before the Christian era. There is good evidence that King Asoka of India in the third century B.C. commanded the establishment of hospitals, and that these hospitals were flourishing in the seventh century A.D. As far back as the earliest period of Greek history the sick are said to have been treated in the temple of Æsculapius at Epidaurus. In the early Jewish period a house for the reception of the sick was called Beth Holem. Such an institution was Beth Saida, mentioned in the New Testament. These hospitals seem to have been wooden huts. In ancient Egypt hospitals were unknown, the sick being tended at home or in temples. Plato says that the Greeks, on the other hand, maintained shelter houses for the sick in various parts of the country, supplied with attendants. The best institutions of the kind in ancient times were undoubtedly in Rome. The inscription upon a tablet discovered near Piacenza, dated in the time of Trajan, shows that the Romans not only possessed such houses, but that they were actually endowed. One of the earliest hospitals on record was probably that founded by Valens in Cæsarea between 370 and 380 A.D.

The advent and spread of Christianity in and after the fourth century gave a great impetus to all forms of public charity, but it was the monastic orders that earliest recognized the Christian necessity of systematic institutional care of the sick, out of the early monastic hospital system as its germ has grown the entire marvelous hospital system of modern times. One of the earliest of recognized hospitals was in France, and the present Hôtel Dieu of Paris is supposed to have had its origin as early as the seventh century. During the Crusades many hospitals were built, and there arose a special class, the *Hospitallers*, or knights whose duty it was to take care of the sick. The present orders of Sisters of Mercy, Sisters of Charity, and allied societies, had a somewhat similar origin. With the establishment of the schools of learning, and more particularly with the development of the study of medicine, many of the hospitals formed departments in the universities, and the university towns developed large and important hospital facilities. Bologna and the Italian towns led the way. Paris and the schools of France followed, and in England and Scotland the hospitals of London and Edinburgh were the great medical schools. Thus, St. Thomas's, of London, was established in 1553, St. Bartholomew's in 1546, where in 1609 Harvey, who discovered the real nature of the circulation of the blood, was physician, and Bethlehem in 1547. American hospitals of the United States were largely founded on English models, although the influence of the French school was not absent in the early history of the United States and Canada. It seems probable that the earliest hospital founded in the United States was the Pennsylvania Hospital, although there were earlier institutions in Canada and Mexico. Efforts were set on foot as early as 1709 to establish a hospital in Philadelphia. In 1730-31 the city almshouse was founded and did medical work, but it was not until 1750-51 that the Pennsylvania Hospital first had its actual birth. Joshua Crosby was the first president of the board of managers, and Benjamin Franklin the first clerk. The New York Hospital was the second hospital of importance. Its charter was granted in 1771. From these early beginnings there has now grown up in America a veritable forest of hospitals. Nearly every city and town has its duly appointed hospitals, and the hospitals of the United States are now acknowledged the most handsomely and thoroughly equipped in the world, they serve as models for European architects.

In most of the larger cities of the United States there are two or more hospitals that are under the control of the city government and used exclusively for the city poor. Such are the Johns Hopkins Hospital in Baltimore, the Philadelphia Hospital in Philadelphia, Bellevue and allied hospitals in New York, Massachusetts General and Boston City in Boston, Cook County Hospital in Chicago, etc. In addition to these municipal hospitals there are numerous institutions founded by private gift and by sectarian societies, such as the New York Hospital, Roosevelt, Presbyterian, St. Luke's, German, French, Mount Sinai, St. Vincent's, St. Mark's, Flower, etc., hospitals in New York, and hundreds of others in other cities. Further, there are numberless special hospitals for the treatment of separate diseases: hospitals for diseases of the eye, the ear, the nose, the throat, cancer

hospitals, maternity hospitals, hospitals for diseases of women, for diseases of the skin, and for all the various specialties. The Rockefeller Institute for Medical Research in New York City maintains a hospital which is unique in receiving only patients who, while receiving the best and most scientific medical treatment, lend themselves to further research into the various problems under investigation at the time, so that a thorough test of new remedies can be made.

The details of hospital management cannot be entered into here. The medical side of the work is usually fashioned on well-established lines. In the larger hospitals the patients are immediately cared for by the nurses (nurses are paid a small salary unless they are sisters of some religious denomination) these are under the orders, so far as the treatment is concerned of the *internes*, or young graduates in medicine who have gained this privilege by competitive examinations, and who serve in graded positions for periods of time of from one to three years. These generally reside in the hospital, receive no salary save their living, and are constantly in attendance. Furthermore, the *internes* are under the supervision of the *attending* or *visiting physicians*, who are practitioners in the city, chosen by the governing boards of the hospitals for their ability or for other reasons. These visit the hospitals at specified times and outline the plans of treatment for the patients. Their time and services are usually given gratis, always so in the municipal hospitals. Many hospitals have consulting physicians and surgeons who may be called in to diagnose rare conditions, but such appointments are usually rewards for work done in the other grades and carry with them honor and position. Furthermore, most large hospitals, especially those where teaching is carried on in connection with the care of the sick, maintain well-equipped pathological departments where constant study is made by scientific methods of specimens and material to aid in determining the disease, this being intrusted often to a group of specialists who are not concerned with methods of treatment.

In 1905 a hospital boat, with fully equipped wards, was devised and adopted by the New York City Health Department for transportation of contagious cases to the island isolation hospitals.

Chiefly within the past century a system of hospitals specially designed for the care and treatment of the insane has been established all over the world. In the United States these institutions are supported by the several States. The State of New York has 16 such hospitals, each accommodating from a few hundred to a few thousand patients. The physicians who serve in these hospitals are specialists in mental diseases and receive salaries which vary with the length of service. Very recently acute psychopathic hospitals have been established in some of the large cities in connection with the principal general hospitals. In these institutions patients afflicted with mild and curable forms of mental trouble receive treatment without being regularly committed to an insane asylum. Such are the insane pavilions in Bellevue and Kings County hospitals in New York.

History and Architecture. There are no data available on the design and arrangement of the earlier monastic hospitals, but with the remarkable development of monastic architec-

ture (see MONASTERY) in the eleventh and twelfth centuries, the hospital was given an important place in the architectural scheme, and its design was further developed in the Gothic period. Several of these mediæval hospitals are still extant, wholly or in part. The most notable is that at Ourscamp, not far from Compiègne, in France. The hospital of this type was a vast and lofty hall, usually vaulted upon one or two rows of columns, and provided with latrines and other accessories. The building was isolated and, being spacious, lofty, and well lighted, served admirably the simple requirements of the time. In closely built cities, however, the tendency was to build in several stories and around inclosed courts, as in the vast Ospedale Maggiore at Milan, which, dating from the sixteenth and seventeenth centuries, has nine courts and accommodates 3500 patients. The result was loss of light and ventilation, overcrowding, and progressively increasing danger from accumulated deposits of noxious germs.

In 1778 the French Academy of Sciences first among scientific bodies promulgated principles and rules for hospital design, and during the nineteenth century, especially after the Crimean War (1854-56), with its frightful mortality among the sick and wounded in the great barrack hospitals at Scutari and Kuleli (Constantinople), medical and surgical science occupied itself increasingly with the problem of hospital design and construction. The vice of inclosed courts, low ceilings, and inadequate sunshine and air was recognized, and the pavilion type was recommended for all permanent hospitals, the wards being housed in wings of not over three stories, exposed to the light and air on three sides, and connected at one end by a continuous structure containing the administrative and other accessories.

The great Hôtel Dieu at Paris, built in 1854, very imperfectly embodied these ideas. They are realized to perfection in such modern hospitals in cities as the Johns Hopkins at Baltimore, the Mount Sinai at New York, the New King's College Hospital at London, and most modern examples.

The same principles have led to the isolation of many wings or buildings in large complex hospitals, especially those for contagious and infectious diseases. Following the American Civil War it became a common practice to provide, where the space permitted, small isolated, inexpensive, and temporary buildings for such cases, to be burned or destroyed after a few years' service and replaced by similar pavilions, and this practice is still followed in some places. But the tremendous scientific advance which came with the discovery of the agency of germs—microbes and bacteria—in the causation and spread of disease, and with the development of aseptic surgery and of the efficient use of antiseptics, brought about a revolution in the details of hospital construction and put an end, so far as new hospitals are concerned, to the old-time scourge of hospital infection, which in the Scutari Hospital raised the mortality to 42 per cent of all patients.

In all strictly modern hospitals not only is artificial ventilation added to natural ventilation and carefully regulated artificial heat provided in addition to abundant sunshine, but floors, walls, and ceilings are made of the most impervious materials available, moldings, cracks, and projections of all sorts avoided, all

the corners and angles of floors, walls, and ceilings rounded to facilitate cleansing and to prevent the lodgment of dust, and every means employed to prevent secondary infection. Hospitals for the tuberculous are preferably built in an open or wooded country where a dry soil and atmosphere prevail and are arranged to provide for sleeping as far as possible in the open air, in tents or in rooms or porches broadly open to the outside atmosphere.

In general, a modern hospital in a large community comprises many distinct services. The administration building contains offices, examination room, visitors' parlors, chapel, pharmacy, refectory, stores, and various other functions serving the whole institution. The wards, housed in wings or pavilions, in one, two, or three stories, are divided between the medical and the surgical services and comprise both public wards, each with many beds in one large room, and private wards and rooms for one patient each. Adjoining the wards are service rooms (diet kitchens, dining rooms, toilets, baths, nurses' room, etc.). The operating room in the surgical section is sometimes isolated, except for connecting passages, sometimes in a surgical wing on the top floor, with skylight and side windows, etherizing, sterilizing, and recovery rooms. Nurses' living quarters, recreation rooms, a laundry, power house, mortuary house, sun parlors, and various other accommodations are housed variously—sometimes in separate buildings, sometimes in portions or wings of the central building. The equipment for heating, lighting, and ventilating, for baths, toilets, and medical and surgical functions of all kinds, is of the most elaborate and costly description in hospitals of the first class, and there is no kind of building or group of buildings upon which more care and pains and expense are, or should be, lavished than upon hospitals, or which is more complex and exigent in the problems it imposes upon the architect.

Military Hospitals. This term is descriptive, but broadly inclusive in its application to institutions for the care of sick and wounded of military forces. The history of military hospitals is the story of the progress of the healing art and the development of the sanitary departments of armies. As in all civil communities there have always been individuals who have ministered to the ills of the body through methods in which spiritual and material agents were confused, so fighting men have always been accompanied by medicine men of some sort, but in the earlier days they were not a part of the organizations of the armies. In all of the progressive armies of the world the personnel of sanitary departments has always kept pace with the progress of civil medical practice.

Until the thirteenth century, in Europe, the practice of surgery was in the hands of the monks, and when this was prohibited by papal decree it fell into the hands of the barber-surgeons, who for centuries after, under the German name of *Feldscherer* (field barbers)—a name still surviving as "*felcher*" in the Russian army medical service—were almost the only medical attendants with fighting units.

The first organized medical service in the German army was established in the sixteenth century, and from that day to this its progress has been steady and consistent, with a scientific attempt to add the experience of each successive war to its system.

The first attempt of the French to organize a medical service was made in the fifteenth century by the Duke of Burgundy, before this time the wounded were left to find their way to monasteries or to fall into the hands of the chailatans who accompanied the army.

Army commanders have always complained that their losses from disease and wounds weakened their military strength, but all the advance in sanitary measures that has ever been accepted has been forced by the demands of the medical service, supported by public opinion. The French military surgeons endured a system of farming out their hospitals under contract until 1747, and their sanitary service was subordinate to their commissary department until 1780. Outbursts of economy in administration at times caused a return to old systems, but the general progress has been such that the French and German armies have developed the principles of medical service organization which all other armies have since followed. Military disaster is always attended by sanitary failure, and the efficiency of medical organizations can only be tested by actual warfare, which is generally followed by sanitary advance, as, e.g., the reorganization of the medical services of the American and British armies after the Spanish-American and Boer wars.

The two widely different classes of military hospitals are those for peace and those for war, as the one is permanent and the other mobile.

Permanent Hospitals—These hospitals receive soldiers who are living in garrison rather than in camp, and the service to the patients does not differ from that of civil hospitals, although the management and administration are technically adapted to general army methods. The executive and professional functions are exercised by a commanding officer who holds military control over his patients, and all records are kept so as to exhibit the relation of the patient to the government and the responsibility of the government to the patient.

The two classes of permanent hospitals are (1) *post or garrison hospitals*, which are under the direct control of the local commander as a part of his command, and (2) *general hospitals*, which, regardless of their geographical location, are not under the command of territorial commanders but are under the direct control of the War Office through the surgeon-general of the army.

Post hospitals vary in size with the military population, which is called the garrison. In the United States army the bed capacity is estimated at 4 to 5 per cent of the garrison, depending upon the climatic conditions of the locality, but this ratio does not obtain in European armies, as their civil hospitals are used to some extent for military purposes, while in the United States there is no relation between the civil and military institutions. A post hospital may be larger and more important clinically than a general hospital. In the smaller post hospitals no female nurses are employed, as only soldiers of the Hospital Corps care for patients. Nurses of the Army Nurse Corps, who are always attached to general hospitals, may be detailed by the surgeon-general for duty in any post hospital where their services may be required. A woman may be employed in any post or general hospital, as a hospital matron, for the purpose of washing and

mending hospital linen, this arrangement is found expedient only in the smaller and especially the more isolated posts.

In the United States there are two ordinary general hospitals which care for patients from the army who need extended treatment or who are up for final review as to disposition on account of physical disability: one is the Walter Reed General Hospital, Washington, and the other the Letterman General Hospital, San Francisco. There are also two special general hospitals for the treatment of special diseases, one is the Fort Bayard General Hospital at Fort Bayard, N. Mex., and the other the Army and Navy General Hospital at Hot Springs, Ark.

The Fort Bayard General Hospital has been established on the site of an old army post, where climatic conditions have been found favorable for the treatment of officers and enlisted men of the army suffering from pulmonary and laryngeal tuberculosis. Other surgical conditions requiring operation may be admitted by the Secretary of War.

The Army and Navy General Hospital is devoted to the treatment of such diseases as the waters of Hot Springs have an established reputation in benefiting. It is administered by the surgeon-general of the army with a medical officer of the army in command, but naval medical officers may be detailed as assistants. Army regulations formerly denied admission to venereal cases, but this proscription was removed in 1910. It is supplied with extensive hydrotherapeutic equipment designed to give that sort of treatment known as a "cure" at Carlsbad or Aix-la-Chapelle. Admission to this hospital is restricted to officers and enlisted men of the regular and volunteer army and navy on active, retired, or discharged status; officers of the revenue cutter service, the public health service, and cadets from the military and naval academies.

In the armies of other countries there are the same two classes of permanent hospitals, but owing to the economical indications of large standing armies and the location of their barracks in or near large cities, their garrison hospitals are frequently a part of the civil hospitals, which are usually institutions of the state. The larger general military hospitals in Europe are usually associated with the education and training of army medical officers, e.g., Netley Hospital in England, Val-de-Grace in France, and the Charité Hospital in Berlin.

Mobile Hospitals—The hospitals of real and vital importance to an army's sanitary service are the mobile hospitals, which are a part of the field organization of the army. Permanent hospitals are only associated with the preparation for war, and their management is simple and formal compared with that of mobile hospitals, which must meet widely varying conditions always in an informal clinical way and are never able to provide the formal service of a peace hospital. "Field hospital" is a term used in the United States army, and similar terms are used in almost all other armies, to designate a particular mobile sanitary unit, as, e.g., the *hopital de campagne* of the French, the *feld-lazaret* of the Germans, and the *feldspital* of the Austrians.

Ambrose Paré, who in the seventeenth century taught the new doctrine that gunshot wounds were neither poisons nor burns, and who laid down what may be considered in this day ra-

tional rules for the treatment of wounds, made the first effort to establish a mobile field hospital, which first achieved fame in the battle of Dettigen in 1743, when the wounded of the French army were systematically evacuated by the Main and the Rhine into Alsace. Larrey, in Napoleon's Italian campaign in 1797, organized the first of flying hospitals, consisting of 1 staff surgeon, 2 assistant and 12 undersurgeons, 2 administration officers, 3 noncommissioned officers, 1 carrier of dressing materials, and 12 sick attendants, all mounted, 6 noncommissioned officers, 1 mechanic, and 25 sick attendants on foot. The transportation consisted of 4 heavy wagons, 4 light four-horse ambulance wagons for four recumbent patients, 8 drawn by two horses for two recumbent patients, and pack animals for mountain service.

This was the parent of the organized mobile units of all armies, and except for a few numerical differences and a somewhat scant equipment it might be taken as a combined field hospital and ambulance of the United States army to-day.

Frederick the Great in 1744 imported from France barber-surgeons to act as operators and instructors in his own army, but he thought they were so expensive that he sent them back after 28 years. Goercke (1750-1822) was to the German medical service what Larrey and Percy were to the French, and he organized the first German field hospitals, although they failed in mobility. Sometime later, and after the battle of Jena (1806), there were 18,000 Germans wounded with no field hospital to care for them, but in 1809 an efficient mobile hospital service was organized which ever since has been consistently improved. With the 20,000 Prussian troops forming part of Napoleon's Grand Army in 1812, there were three flying hospitals of 200 beds each and an evacuation hospital of 1800 beds, which is a proportion of sanitary troops comparing favorably with those accompanying a division of the United States army of a strength of about 20,000. As an example of sanitary progress, it may be noted that in the German army the carrying of first-aid packets was made universal throughout the army in 1869.

In the United States army the attempts at organization of field mobile units have been fitful and with varying success. With all the experience of the past centuries in the organization of field sanitary units the Federal army at the beginning of the Civil War had no field medical service, except the regimental aid. Surgeon Jonathan Letterman of the regular army, who became medical director of the Army of the Potomac in 1862, first organized field hospitals and ambulance companies, after the surgeon-general had protested against the neglect of wounded due to the utter lack of field sanitary units, and General Halleck had disapproved the plan of organization. An effective and efficient organization was then established, but the United States army was again as wholly lacking in 1898. Mobile field sanitary units were next provided as a part of the organization of the army by an Act of Congress in 1903, and since that time efficient units have been provided.

The mobile medical units of the United States army may be taken as an illustration, as they are adopted from the medical services of the Germans and French.

1. *Regimental infirmary*, one to each regi-

ment, made up of the regimental sanitary detachment of 4 medical officers and 24 Hospital Corps men, with special equipment carried by 1 wagon and 1 pack mule, furnishes the first aid in battle.

2. *Field hospital*, three to each division (about 20,000 men), provides 200 beds and receives the casualties at the regimental aid stations. The *personnel* is 5 medical officers (1 major commanding), 9 noncommissioned officers, and 48 privates. The equipment, including tentage and 3 days' rations and forage, weighs 20,000 pounds and is hauled in 8 four-horse wagons.

3. *Ambulance company*, three to each division, provides the litter bearers, works in conjunction with a field hospital, and transports the casualties from the regimental aid when possible and from the dressing stations to the field hospital. There are 12 four-horse ambulances, 3 four-horse wagons, and 4 pack mules. The *personnel* is 5 medical officers (captain commanding), 9 noncommissioned officers, and 70 privates.

4. *Transport column*, two to each division, evacuates wounded from field hospitals to evacuation hospitals. It consists of 4 medical officers, 20 noncommissioned officers, and 64 privates. The ambulances and equipment are the same as for an ambulance company, except the pack mules. Supply wagons returning to the rear are also used when necessary.

5. *Evacuation hospitals*, two to each division, are movable but not mobile, and are located indefinitely along lines of communication and receive the wounded from field hospitals, which latter must be free to move with the division. The capacity is 300-400 beds, with 14 medical officers (lieutenant colonel commanding), 24 noncommissioned officers, and 130 privates.

6. *Base hospitals*, one to each division, provide 500 beds, with an organization somewhat larger than that of the evacuation hospital. No transportation is provided, and, while sufficient tentage is furnished, it is expected that permanent buildings will be occupied whenever they are available.

The combined service of these units provides for the patient's care and transport from where he falls in battle to the base of operations, whence he is conveyed to home territory—to a general military or a civil institution.

Hospital ships are not provided for in the United States army, except that their *personnel*, uses, and method of operation are mentioned in the Medical Department regulations. No arrangements are made for the purchase or conversion of a merchant vessel to a hospital ship, and the matter of supply and equipment must be left until the emergency arises which requires a hospital ship. In other countries hospital ships are specially constructed, and, if not actually in service as such, they are operated as merchant vessels under subsidy, with their equipment and supplies in some port to which the ship at any time can be ordered, to be placed in commission as a hospital ship. See HOSPITAL SHIP.

Hospital trains have not been organized in the United States army, although sets of apparatus are in storage by which empty cars can be equipped to suspend 500 field litters, which will be used as beds. Foreign armies have developed this unit in great detail, and the French army may be taken as an example of the most efficient organization. These are of three classes: (1) *permanent hospital trains*;

(2) *improvised hospital trains* (3) *improvised hospital trains for carrying patients in ordinary passenger cars* For the permanent hospital trains two great railroad systems of France have cars of special construction, in regular service, for which is provided special equipment to be put in place when the cars are taken into hospital service. The material is held in mobilization stores and is sent to the railroad company within five days of the date of the requisition order, and the railroad authorities are responsible for completing the preparation of the train 15 days after receipt of requisition. Each train consists of 16 cars for 8 patients each, 1 car for officers, 1 car for ward orderlies, 1 for kitchen, 1 for pantry, 1 for operating room, dispensary, and linen, 1 for provisions, and 1 for soiled linen and fuel, total, 23 cars. Four spare cars must be kept in reserve in the Paris depot for replacement. The personnel of this train is 2 medical officers, 1 pharmacist, 1 quartermaster, 1 military clerk, and 27 non-commissioned officers and men.

Improvised hospital trains, to carry 306 recumbent patients, are made up of freight cars fitted with special apparatus for suspending litters, and the preparation of one of these trains is carried out according to a carefully timed plan in seven hours.

In general, it may be said that the efficiency of all units organized for the succor of wounded and sick in time of war is based on the same principles that are involved in the efficiency of all combat units, viz., the assembling of proper equipment, the distribution of necessary supplies, and the training of sufficient personnel in times of peace. See *HYGIENE, Military Hygiene*.

HOSPITAL CORPS, UNITED STATES In the United States recruits are enlisted for the Hospital Corps and permanently attached to the Medical Department, and in time of war perform the necessary field hospital and ambulance service under such officers of the Medical Department and assistants as may be detailed for that duty. They are not required to perform any military duties other than those pertaining to their corps, receiving instruction in such drills, both foot and mounted, as are necessary for their efficiency. Their field equipment is like that of other enlisted men (except that they have no arms or ammunition), with the addition of a large Hospital Corps knife, and an emergency medical pouch or case. Arms are issued only by the authority of the commanding officer when it is probable that rights under the Geneva Convention will not be recognized. At every permanent military post there is at least one noncommissioned officer of the Hospital Corps and an additional one for every additional four privates of the corps. Special in-

structions in the duties of litter bearer and the methods of rendering first aid to the sick and wounded are given to all enlisted men of the signal corps and of the line of the army by their company officers, for at least 12 hours in each calendar year, post surgeons under the direction of post commanders being responsible for the professional instruction of the company officers.

In field service troops are accompanied by detachments of the Hospital Corps, each medical officer on the march being attended by a mounted private of the Hospital Corps. For the regulations of the *sanitary service* in the field, including the use of the first-aid packet, regimental aid station, dressing stations, ambulance companies, field hospital companies, evacuation points, station for the slightly wounded, the sanitary train, etc., consult *Field Service Regulations, United States Army* (Washington, 1914).

HOSPITALERS (OF *hospitalier*, from ML. *hospitalarius*, from *hospitale*, hospital, inn from Lat. *hospitālis*, relating to a guest, from *hospes*, guest). Charitable brotherhoods, founded at various times and in different countries, for the care of the sick in hospitals. The vow to devote one's self to this work of mercy is usually superadded to the ordinary vows of poverty, chastity, and obedience, commanded by St. Augustine. One of the earliest recorded instances of such a brotherhood is the Order of the Madonna della Scala in Italy in the ninth century. The Knights of St. John of Jerusalem (qv), as also the Teutonic Knights (qv), were originally Hospitalers. There are many other local institutes or congregations having various names and living under various rules. The sisterhoods are now much commoner than the brotherhoods, over 100 are known to be in existence.

HOSPITAL SHIP A ship designed to take care of the sick and wounded either as a floating hospital or as a transport hospital. The second Geneva Convention in 1868 provided that hospital ships, merchantmen (i.e., unarmed ships not used for any military or naval purpose), having wounded on board, and boats picking up wounded or wrecked men, shall be neutral. They are required to fly the Red Cross flag, and their men must wear the Red Cross armband. Government hospital ships are required to be painted white with a broad longitudinal green stripe on each side extending from bow to stern, hospital ships belonging to aid societies to be similarly painted, but the stripe is to be red. Both varieties of ships must fly the Red Cross flag as well as their national ensign, and no arms of any sort are to be allowed on board. Any evidence amounting to presumption that the enemy is violating the rules of the convention and using the ships for improper purposes constitutes sufficient ground for refusing the further granting of immunity until the contrary is proved. The hospital ship *Solace* of the United States navy accompanies the fleet even in times of peace to take care of the serious cases of illness or injury. See *HOSPITAL, Hospital Ships*.

HOSPITAL SUNDAY In the United States, the last Sunday of December, in England, the Sunday nearest June 15, on which days the collections in the churches are devoted to the support of hospitals. The custom has been generally adopted since 1873.

HOSPITAL TRAINS See **HOSPITAL****HOSPODAR** (Upper Sorbian, master, lord)

A title formerly given to the governors of Moldavia and Wallachia. Hospodar (*gospodar, gospod, gospodin*, in the various Slav languages) means simply 'master'. The hospodar held his power at the pleasure of the Sultan, who made a practice of farming out the office to the highest bidder. The incumbent held his office for a short period or else secured reappointment by repeated gifts. The Lithuanian princes were likewise called hospodars, and the Polish kings, down to the time of Sobieski, assumed that title in their diplomatic negotiations with Russia. *Gosudar* (ruler, monarch) is even now one of the titles of the Emperor of Russia. In Little Russia hospodar is the title for the head of a family.

HOSS, ELIJAH EMBREE (1849-) An American Methodist Episcopal bishop and educator, born in Washington Co., Tenn. He graduated from Emory and Henry College (Virginia) in 1869 and entered the ministry of the Methodist Episcopal Church South in 1870. He was president and professor in Martha Washington College from 1876 to 1881, vice president and president of his alma mater (1881-85), for five years professor of ecclesiastical history in Vanderbilt University, and from 1890 to 1902 editor of the *Christian Advocate*, published at Nashville, Tenn. In 1902 he was elected Bishop of his church.

HOST A term used in pathology, especially plant pathology, to designate the living plant or animal upon which a parasite is living. For example, in the case of wheat rust the wheat is the host and the rust is the parasite. In the case of disease following the attack of a parasite it is the host that is diseased, while the parasite induces the disease.

HOST See **LORD'S SUPPER**

HOSTAGE (OF *hostage, ostage, Fr. otage*, It. *ostaggio*, from Lat. *obsidatus*, state of being a hostage, from *obes*, OLat. *opes*, hostage, from *obsidere*, to remain, from *ob*, at + *sidere*, to sit, influenced in popular etymology by Lat. *hostis*). A person or thing given in pledge for the performance of conditions. When a town capitulates, victors and vanquished usually give into the custody, one of the other, several officers, as pledges that each party will duly carry out the terms stipulated. When the terms are fulfilled, the hostages are exchanged, but if the terms be evaded, the opposite side holds the right to put to death or otherwise punish the hostages in its possession.

HOSTEL See **HALL**

HOSTILITY, ACTS OF See **ACTS OF HOSTILITY**

HOSTILITUS, TULLUS A semilegendary king of Rome, grandson of Hostus Hostilius, the champion of Rome in the first war with the Sabines, he succeeded Numa Pompilius on the throne of Rome (670 B.C., according to the common chronology). Consult Livy, I, 22-31.

HOSTIUS, A Roman epic poet of the second century B.C., author of metrical annals after the manner of Ennius (q.v.), and *Bellum Histricum*, in 7 books, a poem on the Istrian War of 129 B.C., in which the consul Gaius Sempronius Tuditanus was victorious. Fragments of the latter work, quoted by Macrobius (*Saturnalia*, vi, 3 5, vi, 5 8) and Servius (*Ad Æn.*, xii, 121), are printed in Baehrens, *Fragmenta Poetarum Romanorum* (1886). Some authorities think he

is the *doctus aius* alluded to by Propertius (iii 20 8), some ancient authorities declare that the real name of Cynthia, the mistress of Propertius (q.v.), was Hostia.

HOSTRUP, hös'trup, JENS CHRISTIAN (1818-92) A Danish poet and dramatist, born at Copenhagen. His first comedy, *Gyenboerne* (The Neighbors, 1843, published in 1847), was acted by his fellow students before he left the university. It was played afterward at the Royal Theatre and remains a favorite piece. Among his other plays, composed under the pseudonym of Kristrup, are *Intingerne* (1848), *En Spurv i Tranedands* (1846), *Eientyr paa Fodreisen* (1850), *Soldaterlojer* (1849), *En Nat mellem Fjeldene* (1852, music by Emil Hartmann), *Mester og Løvling* (1852). From 1855, when he took orders, to 1881, he had charge of a parish. His *Folkelige Foredrag* (Popular Lectures) appeared in 1882. A volume of his poems, *Sange og Digte*, appeared in 1884, and his drama, *Eva*, in 1881. After this he wrote little but what was demanded by his parochial work. The last years of his life were spent at Copenhagen. His popularity is largely due to the national character of his many plays, his humor without vulgarity, and the vivacity of his dialogue. His poems were published in six volumes (1852-56) and a fifth edition of his comedies in 1888-89. Consult his *Erindringer fra min Barndom og Ungdom* (Copenhagen, 1891) and *Senere Livs-erindringer* (ib., 1893), and Klint, *Jens Christian Hostrup* (ib., 1893).

HOT-AIR ENGINE An engine in which the pressure acting on the piston is produced by increasing the temperature of air through the application to it of heat by transfer through a separating metal wall. This definition distinguishes the hot-air engine from the compressed-air engine (see **COMPRESSED-AIR ENGINE**) on one hand and the internal-combustion engine (see **GAS ENGINE** and **INTERNAL-COMBUSTION ENGINE**) on the other hand. The action of hot-air engines, like that of all other heat engines, consists in admitting the air at a high temperature and pressure and by allowing it to perform work on the piston reducing its pressure and temperature, after which it is either exhausted into the atmosphere and a fresh supply is introduced or else it is cooled and again heated for a repetition of the former process. In their principal working parts hot-air engines are very similar to ordinary steam engines. The heated air is introduced into a cylinder in which works a tightly fitted piston, which is thus compelled to move up and down and transfer its motion to a revolving shaft by means of piston and connecting rods and the other usual mechanisms of steam engines. (See **STEAM ENGINE**.) Hot-air engines are of several types, which may be described and explained as follows. Closed-cycle engines are those which operate continuously with the same mass or weight of air, only taking in a fresh charge to replace leakage or to increase the mass in use. Open-cycle engines are those in which at each stroke a new charge is drawn in from the atmosphere and after being heated and expanded is exhausted again into the atmosphere. Regenerative and nonregenerative engines are those which respectively use or do not use a regenerator to absorb the heat of the exhaust air and to restore it to the incoming cooler air. Finally, closed-cycle engines may be divided into two subclasses, which differ by having the temperature change take place in

the air at constant pressure or at constant volume. Each of these types is identified with the name of some designer or engineer. Hot-air engines have been designed in great numbers, but the limited extent to which they have been

FIG. 1. STIRLING HOT-AIR ENGINE.

used makes most of them but little more than names.

The hot-air engine, as defined at the beginning of this article, seems to have been invented by the Rev. Robert Stirling, an Englishman, in 1816. His first successful engine was built in 1827, and one afterward was used in a foundry in Dundee, Scotland, developing 20-brake horse power on the consumption of 50 pounds of coal per hour. In this engine, shown diagrammatically in Fig. 1, the same volume of air was alternately heated and cooled, producing a variation of pressure which actuated a working piston. The heating and cooling were effected by changing the air by means of a plunger, *D*, from end to end of a cylinder, *A*, one end of which was kept hot by a fire and the other cool by a coil of water pipe, *C*. On its way from end to end the air passed through a passage partly filled with thin plates of metal, *E*, which alternately absorbed the heat from the air and gave it back on the return. This was the first application of the economizer or regenerator, and its invention is said to be due to James Stirling, a civil engineer. This engine failed through the giving out of the heaters, which required to be kept red-hot. In 1844 Franchot, a Frenchman, patented an arrangement of the Stirling engine with large and efficient heating and cooling surfaces. Further attempts at improvement were made by Rankine and Napier, and by Professor Jenkin in England, and also by Lauberau in France. The Stirling engine belongs to the type of hot-air engines with temperature changes at constant volumes. Another hot-air engine which has much the same classic and historical interest as the Stirling engine is that invented by John Ericsson (q.v.). The engines of Ericsson differed from the Stirling engine in that they drew their supply of air

from the atmosphere at each stroke, heated it, allowed it to expand while doing work, then exhausted it again into the external air; they belonged to the type of hot-air engine with temperature changes at constant pressure. The first engine was installed in the ship *Ericsson* in 1852; but the idea dates from 1833, and it enjoys the distinction of having been built on the largest scale and of having made the most noted failure of all hot-air engines. To Ericsson is to be credited also the term "caloric engine," which he applied as a sort of trade name to his invention. Briefly described, Ericsson's first engine was designed for a 2200-ton seagoing ship; it was intended for 600 horse power, but actually ran at about 300 horse power. There were four cylinders, each 14 feet in diameter and having 6-foot stroke, and the engine ran at nine revolutions per minute. As stated above, the engine proved a failure after several attempts had been made to remedy its faults. First the 14-foot cylinders were removed and replaced by others, which also failed; and finally the engine was replaced entirely by a steam engine. Afterward Ericsson made another attempt to drive a ship by an air engine. The *Primera* was built and fitted with horizontal engines drawing their supply from and exhausting into an artificial atmosphere of high pressure. As in the former attempt, however, the heating surface proved inadequate, and the available pressure was too small to give much power, so that again steam was substituted after a short trial. Economizers were employed with both of his large engines, but in the small engines, to the design of which Ericsson turned his attention after the failure of his large motors, the economizer was abandoned. Ericsson's first design for a small motor was brought

FIG. 2. ERICSSON CALORIC ENGINE.

out in 1860, and in 1880 the latest form for pumping purposes was produced. Fig. 2 shows this type of engine. The fire of coal or gas is below the cylinder *d*, which is water-jacketed at the upper end, *x x*. In tank pumping en-

gines the pumped water circulates through the water jacket. At *A* is the hollow displacing piston, and *B* is the working piston proper. The displacer is coupled to the bell crank *h*, and so to the crank *e* to which the beam *a* is linked directly by *g*. These engines do not use less fuel than steam engines of similar size, but as they require no water or licensed engineer, they have come into considerable use.

The Stirling engine and the Ericsson engine between themselves embodied all the characteristic features of the several types of hot-air engines defined above. The Ericsson engine is an open-cycle, nonregenerating engine, with temperature changes at constant pressure, the Stirling engine was a closed-cycle, regenerating engine, with temperature changes at constant volume. The hot-air engines produced by other inventors of this kind of prime motor have resembled sometimes the Ericsson engine and sometimes the Stirling engine, but have had the details of operation worked out in different ways. Two of these only need be mentioned for the purpose of illustration. The Wilcox engine, of which large numbers were made about 1860 to 1865, was, like the Ericsson ship engine, an open-cycle, regenerative engine, with temperature changes at constant pressure. Its distinctive characteristic was a peculiar supply cylinder fitted with a piston operated from the main shaft. This supply cylinder took in the atmospheric air and passed it through the regenerator to the operating cylinder, where it was heated and expanded to perform its work, after which it was exhausted through the regenerator into the external air. The Merrill engine, one of which of 10 horse power was used for some years previous to 1885 to run a factory at Winchendon, Mass., worked on the same principle as the Stirling engine, i. e., it used the same volume of air over and over. It had two working cylinders, each of which was double-acting (see STEAM ENGINE), and two reverser plungers, which effected the transfer of the air between the heating and cooling devices.

Mention was made at the beginning of this article of hot-air engines employing previously compressed air. These are commonly known as compression engines. In them a constant quantity of air is constantly changed in volume, being compressed while cold and expanded while hot. There are usually two cylinders—one cold and kept cold by a water jacket or other means, and the other hot and kept heated by external means. The piston in the hot cylinder is generally timed from one-sixth to one-quarter revolution in advance of that in the cold cylinder, whereby the air is first changed into the cold cylinder, sometimes through a regenerator, then compressed therein, then changed to the hot cylinder back through the regenerator, taking up again the stored heat, and finally expanded in the hot cylinder. The first engine of this kind seems to have been invented by Charles Louis Felix Franchot, a Frenchman, in 1853, and it is deserving of brief mention for the clear manner in which it illustrates the working principle. Hot and cold cylinders of different areas were placed side by side, as shown by Fig. 3, with their pistons connected to cranks 135° apart. The bottom of the cold cylinder, *A*, was connected to the top of the hot cylinder, *B*, and vice versa through heating and cooling chambers, *C* and *D*, containing Stirling regenerators. The arrangement of the pistons was such that the

air was compressed in the cool cylinder, passed through the regenerator into the hot cylinder, where it was expanded, then transferred to the cold cylinder through the cooling chamber, and

FIG 3

the cycle repeated. From four to six cylinders, each double-acting, were proposed to be combined in a series. A model of one of these engines was exhibited at the Paris Exposition of 1855. This same principle was embodied in an engine patented by the famous engineer Sir William Siemens in 1860, but he neglected to

FIG 4 RIDER CALORIC ENGINE

put it into practical use. The Siemens engine employed four cylinders, each hot at one end and cold at the other, all connected to one shaft, and so arranged that the hot end of one communicated through a regenerator with the cold

end of the next. The heat was supplied by hot products of combustion from producer gas in a chamber connected with the hot ends of the cylinders, while the opposite ends were fitted with refrigerating devices. One of the latest forms of compression engines is the Rider, shown by Fig 4. In this sectional view *C* is the cold cylinder or compression cylinder, surrounded by the water jacket, *E*, and *D* is the hot cylinder. The compressed air from the cold cylinder is changed through the regenerator, *H*, to the hot cylinder, where it is expanded by the heat from the grate underneath the cylinder.

Hot-air internal-combustion engines, or, more properly, hot-air products of combustion engines, operate by forcing atmospheric air through a closed fire, which may be and generally is a solid fuel fire, and carrying the air and gases of combustion to the engine cylinder. An historic form of such an engine is shown by Fig 5. The furnace was placed in a chamber

FIG 5 HOT-AIR PRODUCTS OF COMBUSTION ENGINE

strong enough to withstand the pressure. The compressing pump *B* forced air below the ash pit up through the fire, where it was expanded by heat and by combustion with carbon. Being admitted to the working cylinder against the piston, it was exhausted into the chimney. The furnace had to be charged with fresh fuel through a combination of double doors, *D*, working on the principle of an air lock. A hot-air product of combustion engine was described by Sir George Cayley, an Englishman, in 1807 and 1825, and again in 1837 this inventor patented a modification of the same design and built several engines, none of which gave any marked success. In 1821 Dr. Neil Arnott (qv), the celebrated scientist, took up the same idea and patented a form of engine in which, to avoid the abrading action of the ashes on metal pistons and cylinders, he used oil pistons. Following Cayley and Arnott, a number of inventors worked on the idea, among them being the Americans Stephen Wilcox, S. H. Roper, and Philander Shaw, each of whom built and sold a number of engines. Broadly speaking, the difficulties of operating these engines were so great that they recorded a general failure. These difficulties were caused by flue dust and the grit in the cylinders, the rapid destruction of the working surfaces and valves by the intense heat, and the practical impossibility of lubrication. They were also more bulky than other types of hot-air engines in proportion to the power developed.

The possibilities of the hot air engine as a competitor of the steam engine have been often urged, but so far it has never reached any practical success which warranted much hope that the competition would prove serious. With the improvements and progress in the internal-combustion motor using cheap fuels, hot air engines now are mainly of historic interest. The two sides of the question may be fairly and concisely summarized as follows:

The hot-air engine in small sizes is more economical than the steam engine of the same capacity. In larger sizes it has about the same economy as the less economical steam engine, measured in coal consumed per horse power. It has the advantage of avoiding the steam boiler as a magazine or reservoir of energy which may be liberated by accident so suddenly as to be explosive. It can be run by less skilled and expensive labor, and no steam runner's license is demanded. It is safe and odorless. The objections to the hot-air engine are the greater bulk and greater weight for the same power as compared with the steam engine, the low mean pressure with high initial pressure, which latter compels great strength of structure, the deterioration of heating surfaces exposed to high heats and consequent oxidation, the difficulties of packing and lubricating at high temperatures, the difficulty of regulation closely to varying resistances. If there is any danger to the present supremacy of the steam engine, it will be in relatively small plants that a hot-air engine can be a substitute, the gas or internal-combustion engine is more to be feared than the hot-air engine proper.

HOT-AIR TREATMENT. A method of treatment of sprains, flatfoot, arthritis, synovitis, gout, rheumatism, neuralgia, myalgia, sciatica, and chronic ulcers by means of air at a temperature of from 250° to 300° F. It was introduced in 1893, largely through Mr. Willet of St. Bartholomew's Hospital, London. Adjustable ovens are adapted to the joint or limb affected and are at first brought to a temperature of 150°. A sense of comfort follows, with copious sweating, enormous increase of circulation, and an anodyne effect. The heart rate increases from 10 to 25 beats, the respiration from 2 to 6 breaths a minute, the mouth temperature rises 2° to 5°. See BIER'S HYPERÆMIA.

HOTBED. Fermenting compost or manure covered with earth, and generally surmounted by a frame, for cultivating plants which require more than the natural heat of the climate, but not so much as to render the hothouse necessary. The heat is the result of fermentation. Hotbeds are in very general use for growing plants from seed in spring, to be planted in the open ground as summer advances, and for forcing vegetables.

and flowers. The material mostly used is horse manure, either alone or mixed with litter, but tan bark, leaves, the waste of flax, cotton, or woolen factories, etc., are sometimes substituted for it. It is necessary that the heat of very rapid fermentation be expended before the hotbed is planted, and it is usual, on this account, to prepare the materials some days in advance of planting. A hotbed is made highest at the back, sloping towards the south. The bed extends on all sides 12 inches or more beyond the frame, according to the temperature of the outside air. The frame has a movable glass sash or sashes, according to its size, or is covered with cloth. The thickness of the hotbed and of the earth upon it is accommodated to the purpose intended and the degree of heat required. When the heat decreases, it is for some purposes necessary to keep it up by "linings" of the same material as the hotbed, added to the sides of it. The sashes of hotbeds must be partially removed during the day to permit ventilation and the escape of vapor.

HOTCH/KISS, BENJAMIN BERKELY (1826-85). An American inventor, born in Watertown, Conn. of humble parentage. He was at an early age employed in a gun factory, where he came into contact with Samuel Colt (qv) in the manufacture of revolvers. During the Civil War he was engaged in the manufacture of ordnance in New York and later invented the Hotchkiss magazine gun, used by the United States troops in the West and the United States Marine Corps. This was followed in 1882 by the Hotchkiss machine gun, for use in the fighting tops of war vessels. He was also the inventor of several important improvements in projectiles and heavy ordnance. His guns were in general use throughout the armies and navies of the world until displaced in the more advanced nations by later inventions. His death occurred in Paris, where in 1870 he established a gun factory, a branch of which he was organizing in England at the time of his death. See MACHINE GUN, RAPID-FIRE GUN.

HOTCHKISS GUN. See MACHINE GUN, RAPID-FIRE GUN, ORDNANCE.

HOTCH/POT (OF *hochepot*, from O Dutch *hutsot*, chopped beef or mutton boiled in a pot, from *hutsen*, *hotsen*, to shake + *pot*, AS *pott*, from Ir *pota*, *puite*, Welsh *pot*, Bret *pōd*, pot, connected with Lat *potare*, Skt *pā*, to drink, Gk *porós*, *potos*, drunk). In law, the mixing and blending together of advancements made to children during a parent's life and of property left at his death, in order that the whole may be equally divided among all the children. According to Blackstone the doctrine came into English jurisprudence from the law of the Lombards, but the term is explained by him in the language of Littleton, as follows: "Hotchpot is in English a pudding, for in a pudding is not commonly put one thing alone, but one thing with other things together." By this housewifely metaphor, adds Blackstone, our ancestors meant to inform us that the lands which had been given to one or more daughters in frank marriage, as well as the lands descending to them in fee simple, should be mixed and blended together and then divided among all the daughters. After estates in frank marriage fell into disuse, the principle of the law of hotchpot was revived and applied by the Statute of Distributions (22 and 23 Car. II, c. 10). The provisions of this statute have been reenacted by the legislatures

of the United States with some shades of difference and on the basis of the rules as to hotchpot throughout the country. The great object of these rules is to produce equality among the children of a deceased person. Property which has been turned over to a child as an advancement, instead of a pure gift, is to be brought into hotchpot as a condition of his taking a child's share in the parent's estate. It is not necessary that he actually bring and surrender the very chattel or other form of property advanced to him. It is enough that its fair value be allowed for. In arriving at this value its worth is to be estimated at the death of the parent. Accordingly, where a slave boy, 12 years old, was given to a child as an advancement, the child was charged with the fair value of the slave at the father's death, not at the date of the gift, nor yet at the time of the distribution of the estate, which did not occur till a much later date. On the other hand, the profits of an advancement between the date of the gift and the death of the donor, or the enhanced value due to improvements, need not be accounted for. Consult the *Commentaries* of Blackstone and Kent. See ADVANCEMENT.

HOT CROSS-BUN. See CROSS-BUN.

HOTEL (Fr *hôtel*, OF *hostel*, from ML *hospitale*, large house, palace, inn). The origin of the modern hotel, especially in the United States, dates from the introduction of the railroad. Its advent transformed the small road house, which was planned for occasional guests, into the more pretentious hotel. Again, about 1888, came another revolution in hotel building, and the modern fireproof structures began to replace their poorly planned prototypes. Still later, the idea of specialization, i. e., of providing particularly for a certain class in the community, began to gain ground. The concentration of wealth, commerce, and industry in large cities attracted to them numerous persons for whose permanent or transient accommodation there were required comfort and luxury independent of a permanent domicile. In the United States there are four general kinds of hotels: (1) those which are run on the American plan, (2) those using the European plan, (3) those combining both systems, (4) the so-called apartment hotel, where suites of rooms, furnished or unfurnished, are rented for more or less extended occupancy, while a restaurant is maintained in the house primarily for the benefit of the guests. The European plan, on which practically all the great hotels of Europe are run, consists in paying a certain daily rate for a room and then paying separately for whatever food is ordered. By the American plan the guest pays a certain amount a day for both room and meals. With changes in life and habits the American plan is encountered less frequently, especially in the hotels of large cities, where a charge is made for rooms and meals are usually *à la carte*, the guest paying for what he orders. The difference between an American hotel which is run on the European plan and the continental hotel is that in the former the various minor items, such as light and service, are included in the price of the room, while on the Continent these items are often charged for separately, though this custom is not as prevalent as formerly. One of the most characteristic establishments of Europe is the village road house, or inn, which is found throughout the Continent, but especially in France, Germany,

and Austria. It is, as a rule, marked by simplicity and comfort and is preferred by many to the more elaborate hotel. Indeed, the small hotel in Europe is a model of its kind, and its cuisine is generally superior to that of second-class hotels in the United States, though great improvement is to be noted in recent years, and extensive touring in motor cars has brought about better conditions of accommodations. The large first-class hotels of the United States are to-day unexcelled for comfort, luxury, convenience, and service. Both in Europe and America changes have been wrought in recent years through the operation of hotels by large corporations or syndicates, which control large hostelrys in different cities. Sometimes these may be operated as a chain of hotels under a single management, as by a large railway system, with purchasing and commissary departments available or there may be but two or three hotels where the same customs, traditions, and conditions are maintained. Such high organization of the business has led to large investments in enormous buildings, where every convenience and luxury is provided for the guests and where facilities are employed to attract to its restaurants, banquet rooms, tea rooms, music room, etc., other patrons, so that the greatest return will be secured on a very large investment. The following description applies to the modern hotel.

By far the greater part of the space in a modern hotel usually is occupied with private rooms for guests, but the central feature of the design of a modern hotel is the great office and lobby, or chain of connected halls and corridors, which form the common place for arrival and departure and for meeting people from both without and within the building. A large and generally imposing entrance and vestibule lead to the office or lobby, which frequently occupies an inclosed central court, two or three stories in height, while sometimes there are several such entrances. The lobby generally contains not only the public office of the hotel, often with separate desks for its room clerks, cashier, mail clerks, and information clerks, but also news and cigar stands, a telegraph office, and telephone booths, or, if these are not in, they are adjacent to and connect with the lobby. Theatre and other amusement tickets may be secured, baggage checked, cabs ordered, flowers and small articles purchased, and high-grade shops are usually near by. Reading, writing, and smoking rooms also adjoin the lobby, and there may be parlors or reception rooms near at hand, with tea and palm rooms arranged for music. The hotel parlors are more generally on an upper floor, commonly on the second. Both public and private parlors are usually provided. Another marked feature of a hotel is its dining room. Here the object is to get a large, unobstructed floor space, with plenty of natural light, where possible, and at the same time to have the room only second in general accessibility to the lobby or office. Smaller public dining rooms, frequently called breakfast rooms, are generally provided, and also a gentlemen's cafe and grill room, while roof or other outdoor dining or tea rooms are provided for the summer months, besides which there are private dining rooms in proportion to the size and general character of the hotel. A conspicuous feature of American hotels is the bar, which is likely to be near, if not connected with, the cafe, and in the larger hotels several of these may be provided. The bar is often on

the office floor, but where this floor is well above the street level the bar and cafe, together with barber shop, lavatories, and perhaps the public baths, are on the ground floor or in the basement. The hotel kitchen must be either near or in speedy communication with the dining room. It may be on a different floor if dumb-waiters are provided. Where there are numerous dining rooms, public and private, several kitchens are a practical necessity.

Spacious stairways almost invariably lead from the office or lobby to the parlor or dining room, although the universal use of elevators has lessened their importance, and they are apt to be more for decorative effect than for extensive use save in an emergency. An impressive feature of some of the finest hotels is a gallery above and around the lobby giving access to whatever public rooms may be located on the second floor. The elevators should be conveniently arranged so as to give quick access to private dining rooms, ballrooms, and parlors and there should be separate elevators for servants and freight. The guests' rooms if any, on the lower floors of large hotels are generally in suites (bedroom, parlor, and bathroom), but similar suites may, of course, be distributed on the other floors, and in the newer hotels the upper floors are often the most luxurious in their arrangement and appointments. Above the second floor the building commonly assumes, at least in city hotels, the form of a hollow square, or rectangle, though many large hotels are built L-shaped or with a series of wings to secure a maximum number of outside rooms. The guests' rooms are arranged along corridors—the outer ones fronting on the street, the inner ones on the court. Even third or fourth rate hotels of the present day rarely offer guests a room which does not have an ample window opening into the outer air. Fire escapes must be provided on each floor, and red lights are placed near them and at the heads of staircases to mark their location. Besides the various rooms, public and private, already mentioned, baggage and storage rooms, ballrooms, halls for concerts, conventions, and other assemblies, music rooms, and often roof gardens, are, some or all, found in the best hotels. Indeed, there is practically no end of the comforts and conveniences available in a large hotel. Not only are maids and valets at the command of the guests, but physicians, trained nurses, and even an operating and hospital room are found in at least one hotel, which has in addition a nursery for the children. Specialization has been carried to such an extent that, in at least one large metropolitan hotel, a floor has been set aside for guests whose working hours are such that they are obliged to sleep during the day, and another floor for women. The great revival of interest in dancing in 1913 and 1914 attracted many persons to hotels for dinner and supper as well as the superior music and floors that were provided, such being beyond the reach of a private dwelling.

Mountain and seaside resorts call for various modifications in design, including many spacious verandas and balconies, sun parlors for winter use, and other features suited to the changed conditions of a hotel life where recreation and social amusements, or perhaps the search for health, are the main objects. The constructional features of hotels are not sufficiently different in the material employed and the way in which it is put together to require separate treatment.

In modern city hotels, which are for the most part buildings of extreme size and height, the same conditions as regards fireproof construction obtain as are found in the best office buildings. The fire hazard of hotels at summer and health resorts is attracting increased attention, and with added comfort greater safety is being demanded by guests and enforced by insurance and State authorities.

The governing principle in the design of a hotel should be to make it as safe, convenient, comfortable, and generally attractive as possible. Unfortunately the order of these requirements sometimes is reversed, or, at least, inadequate attention is given to the safety of the guests. Safety is used broadly here, to include all that goes to make the building structurally sound, to reduce dangers from fire, and to conduce to good sanitation. Fireproof construction (qv) is now universally demanded for all hotels of any size, and there should be adequate fire escapes, plainly marked both by night and day, and fire-protection facilities. The latter, at least in all large hotels, include apparatus in the way of fire pumps, stand pipes, hose, chemical extinguishers, and the like, and regular drills of employees and tests of alarms and other apparatus and appliances. A plentiful supply of water is, of course, essential. This necessity frequently entails an independent pumping plant, and often in addition filtration, and always requires an extensive system of piping for both hot and cold water. To meet the demands for purity in drinking water, it is frequently advisable to install a filter plant in the basement of the hotel, or, where possible, to sink deep artesian wells. Spring waters are often supplied at table, and travelers demand that drinking water not only shall be safe but shall be clear and palatable.

Both public and private baths are required. The latter should be in separate rooms with independent air and light. Private water-closets generally accompany private baths. The public lavatories and water-closets, both as regards spaciousness and good sanitation, may be taken as a fair index of the rank of most hotels. In general, all plumbing should be of the simplest possible design and should be readily accessible for inspection and repairs. In the choice of floors and floor coverings, wall finish and decorations, window and other hangings, it should never be forgotten that frequent and thorough cleansing is imperative, and that everything that creates or serves as a lodging place for dust or that cannot be thoroughly disinfected is a menace to health. With the more general provision of vacuum-cleaning apparatus there is little excuse for dust, and it is rarely to be found in the best hotels so equipped. The furniture demanded and installed in modern hotels is of high grade, and the same as regards design as would be found in well-fitted private residences. Expert decorators are employed not only for the adornment but for the furnishings, and with luxury and elegance there has been a distinct gain in taste and homelikeness. Ventilation is most important and, together with heating, its arrangement should be intrusted to a heating and ventilation engineer. In the best hotels in the colder sections of America the buildings are heated with steam or hot water throughout, supplemented in some instances by open fireplaces. Automatic heat control is frequently found, but this must be supplemented by devices that will enable a

guest to adjust the temperature of his rooms to his own requirements. Well-equipped laundries, with drying closets, are becoming more and more common even in smaller hotels, and special arrangements are made for supplying prompt service to transient guests. Electric lights are provided in most hotels, and the illumination of both public and private rooms is carefully studied and planned so as to secure the maximum effect and convenience.

Whatever the rank of a hotel, some means is provided for making known wants without leaving one's room. The most common method is a simple push button electrically connected with an annunciator in the hotel office. In some hotels elaborate signal systems are provided so that by moving a pointer over a dial in one's room any want may be made known in the office. Such cumbersome devices, however, largely have been superseded by the house telephone system, with a telephone in every room, which often through the central switchboard can be connected with ordinary local and long-distance lines. In large hotels there may be a floor operator or manager on each floor who receives visitors' cards through pneumatic tubes from the reception-room floor, supervises the chambermaids and bell boys of that floor, and performs similar duties.

The management of modern hotels presents a difficult executive problem. The number of employees (which varies according to the hotel, but which is always over 50 per cent of the guests), the constantly shifting crowd of guests, the numberless mechanical details, and the large amount of provisions and supplies which is necessary, all complicate the problem. Under the manager, and directly responsible to him, are a steward and a chef. The former has charge of the supplies and general supervision over the housekeeper, storekeeper, head laundress (and their subordinates), and over the clerks of the accounting department and the plumbers, carpenters, and upholsterers. The chief engineer also is no unimportant individual, as he is charged with the oversight of the electric-lighting plant, heating and ventilation, refrigeration, and elevator system, all of which consume large quantities of fuel. Everywhere in the modern hotel mechanical appliances are employed. For transmitting messages, as the order of a dinner, the telautograph may be employed, the occupancy of a room may be denoted in a special indicator, the whereabouts of a chambermaid may be revealed automatically. In the kitchen manual labor is supplanted wherever possible by automatic machinery, and temperature regulators are used in ovens and ranges, not to mention automatic measuring devices, knife cleaners, dishwashers, soup passers, and similar appliances. The steward generally buys the necessary provisions and supplies. Most of the provisions are ordered fresh every day though usually the larder is stocked with a supply sufficient for two days, while the supply of dry stuff on hand is sufficient for a week. The chef has absolute charge of the kitchen and its staff, which includes special cooks in various departments. The steward makes his purchases according to lists furnished him by the chef, who oversees all details in connection with the cuisine. A head waiter with numerous assistants superintends the dining rooms and arranges for private dinners and suppers. For the history of the early hotel, see INN.

HÔTEL DE RAMBOUILLET, de ran'-bû'ya' See RAMBOUILLET, HÔTEL DE

HÔTEL DES INVALIDES, dà zân'va'lêd'. See INVALIDES

HÔTEL DE VILLE, de vêl The French name for a town hall, applied especially by preeminence to the city hall of Paris. This was originally on the left bank of the Seine, whence it was transferred to a position near the Châtelet on the right bank in the thirteenth century, and in 1357 to the Place de la Grève, now the Place de l'Hôtel de Ville. Under Francis I a new edifice was begun (1539) by the architect Domenico da Cortona or Boccadori (or, as is contended by some authorities, by Pierre Chambiges), it was completed under Henry IV, but altered and extended under later reigns. It was totally destroyed by the Communists in 1871, with the loss of 600 of their companions who were unable to escape from the building, and was rebuilt between 1873 and 1883. The new building, by Ballu and Déperthes, is a fine Renaissance structure, with an imposing façade enriched with allegorical groups and single statues typifying the principal French cities. The interior is richly ornamented with sculpture and paintings by great French artists and contains a fine grand staircase and a sumptuously decorated festival hall. See TOWN HALL.

HÔTEL DIEU, dyê. One of the oldest hospitals in Europe and the most important in Paris, said to have been founded in 660. It formerly stood on the south side of the Ile de la Cité and was connected with an annex on the right bank of the Seine. In 1772 the hospital was destroyed and subsequently rebuilt on the same spot. The institution was transferred in 1868 to its present position on the north side of the island, near Notre Dame. It contains 559 beds, and three medical professorships are attached to it.

HOTHAM, hûth'am, WILLIAM, first BARON (1736-1813). A British naval officer, educated at Westminster School and at the Royal Naval Academy. He was appointed to the North American station in 1751, in 1759 captured a French frigate, and having joined Lord Howe (1776) at the American station, participated in the engagement in the cul-de-sac of St Lucia in the West Indies in 1778. On his return to England in 1781 many of the ships of his convoy were taken from him by a superior French force. In 1782, with the rank of commodore, he joined the Mediterranean fleet, to the chief command of which he was eventually appointed, succeeding Admiral (Viscount) Hood. He had been promoted rear admiral in 1787 and vice admiral in 1790 and on his return to England in 1795 was made admiral. The French fleet, which he twice met in situations of advantage to himself escaped with minor losses. In 1797 he was made Baron Hotham of South Dalton.

HOTHOUSE. A building intended for the cultivation of exotic plants which require a higher temperature than that of the open air. The term is more generally applied to those buildings in which artificial heat is used. It includes such terms as "stove," "bark stove," etc.,

in the former of which the heat was derived from fires, and in the latter by fermenting tan bark, which not only produced heat, but kept the air moist. See GREENHOUSE.

HOTMAN, ô'tman', or **HOTMAN'NUS**, FRANÇOIS (1524-90). A French jurist and author, born in Paris. He received the degree of doctor at Orleans, and afterward, though but 22 years old, gave lectures on Roman law at the University of Paris. At this time he became a convert to the Reformed religion and was forced to take refuge in Geneva. On the recommendation of Calvin he was made professor of belles-lettres and history at Lausanne in 1549. Afterward he went to Strassburg as professor of civil law (1555), then to Valence (1562) and Bourges (1567). For a short time he returned to Paris, where he actively interested himself in the fortunes of the Huguenots, but the Massacre of St Bartholomew sent him back to Geneva. His last years were spent at Basel. Hotman's books had a great influence on the time and wrought a reformation in the study and teaching of law. His two most important works are *L'anti-tribonian, ou discours sur l'étude des lois* (1567) and *Franco-Gallia* (1573), often reprinted with changes of matter and titles.

HOT SPRINGS. See GEOLOGY, SPRING, THERMAL SPRING.

HOT SPRINGS. An Alaskan town, the centre of the Hot Springs mining district on Baker Creek, near the mouth of the Tanana River (Map Alaska, J 3). It is also a health resort and truck-farming district, which received its name from its numerous hot springs, which are the best known of all in Alaska. Its population was 101 in 1910.

HOT SPRINGS. A city and the county seat of Garland Co., Ark., 54 miles west by south of Little Rock, on the St. Louis, Iron Mountain, and Southern, the Memphis, Dallas, and Gulf, and the Chicago, Rock Island, and Pacific railroads (Map Arkansas, B 3). It is one of the most beautiful towns in the United States and is widely noted for the hot waters that flow from 72 springs, included in a space of 10 acres on the west side of Hot Springs Mountain. The waters of these springs range in temperature from 76° F to 157° F and are beneficial in a multitude of diseases. In 1832 four sections of land, the thermal springs being in the centre of the district, were set off by Congress as a government reservation. Since then the government has established on the mountain the Army and Navy General Hospital and expended large sums in improving and developing the reservation. The government bathhouses, extending along Central Avenue are tasteful in design and have attractive surroundings. There are many hotels here, the Eastman, the Arlington, the Majestic, and the Park ranking among the largest in the country, and the city is one of the most popular resorts in America, having annually 150,000 visitors. The city has a fine courthouse, city hall, and opera house. One of the features of the place is the tower on the summit of the mountain, from which four States can be seen. Settled about 1804, Hot Springs was incorporated as a town in 1876 and was chartered as a city of the first class in 1879. The government is administered by a mayor and a municipal council. Pop., 1900, 9973, 1910, 14,434, 1914 (U S est.), 16,334.

HOT SPRINGS. A town in Madison Co.,

N C, on the French Broad River, 38 miles northwest of Asheville, on the Southern Railway (Map North Carolina, B 4) It has an elevation of more than 1300 feet and is a noted health resort because of the medicinal value of its hot mineral waters These springs are visited by many persons yearly Dorland Institute, a mission boarding school for mountaineers, was established here in 1894 The principal industries are lumbering and mining Pop, 1900, 445, 1910, 443

HOT SPRINGS A city and the county seat of Fall River Co, S Dak. 104 miles south of Deadwood, on the Chicago, Burlington, and Quincy and the Chicago and Northwestern railroads (Map South Dakota, A 4) It is situated at an altitude of 3400 feet, in the beautiful Minnekahta (hot water) vale, at the source of Fall River and is noted for its thermal and medicinal springs, which have more than a local reputation Hot Springs is the seat of the State Soldiers' Home and contains a Carnegie library and several hospitals, sanitariums, and hotels, notably the Battle Mountain Sanitarium, built by the United States government at a cost of \$2,000,000 The city is the commercial centre for important mining, live stock, and lumber interests, and has good water power, manufactures of stucco, and pink sandstone quarries Pop, 1900, 1319, 1910, 2140

HOT SPRINGS. A health resort in Bath Co, Va, about 75 miles north of Roanoke, on the Chesapeake and Ohio Railroad (Map Virginia, E 3) It contains mineral springs having medicinal properties, a public library, and the old Homestead Hotel The region was settled about 1740 and attracted people to its springs as early as 1754. Pop (permanent), about 500.

HOTSPUR. A name given to Henry Percy (qv)

HOTTENTOT BREAD (*Testudinaria elephantipes*) A species of the family Dioscoreaceae, indigenous to South Africa Its slender, many-branched, vine-like stems, which die down during the dry season, grow to a height of 30 to 40 feet and bear bright heart-shaped leaves. The hemispherical or nearly globular rootstock, sometimes 3 feet in diameter, protrudes conspicuously aboveground and is covered with a brown corklike substance with many-sided protuberances separated by deep cracks and fissures Both the scientific name and one of the common names, elephant's foot, have been derived from fancied resemblances to the foot of an elephant It is sometimes called tortoise plant. The fleshy interior affords food to baboons and other animals The plant is cultivated as a greenhouse curiosity The rootstocks are exported apparently dead, but when placed in the ground they soon throw out rootlets, and stems grow rapidly from the upper surface The genus *Testudinaria* is combined with *Dioscorea* by some botanists See DIOSCOREACEAE

HOTTENTOT FIGS See ICE PLANT.

HOTTENTOTS (*Khor-Khoin*, men of men) A race in South Africa (census of 1904, 85,892 Hottentots proper, 1138 Korana, 7955 Griqua in the Cape Colony, Natal, and the Orange River Colony; census of 1909, 14,359 Hottentots in German Southwest Africa). Their domain is said to extend from Orange River to Wal-fish Bay and far into the Damara upland. A study of their somatology shows them to have the following characteristics, cranial capacity,

1290, cephalic index, 74.3, stature, 160.4 centimeters They are accordingly short, but not dwarfish Their skin is yellow, brown, or gray, not black, the hair is long and woolly, the cheek bones are prominent, eyes are dark chestnut or black, wide apart, the nose is very broad and flat, nostrils thick, the mouth is large, with heavy, upturning lips and enormous prognathism, chin pointed, and receding jaw They have little beard, and no hair on the body The ears are large, without lobules (See Colored Plate of AFRICA, DARK RACES of) Steatopygia is common There are three divisions of them—the Hottentots proper, the mongrel Griquas of Griqualand West, and the Koranas on the Orange, Vaal, and Modder rivers Between the persecutions of the spreading Bantu tribes and later the occupation of the lowlands by Dutch and English settlers, most of them have been driven into the mountains and waste places, and they are slowly dying out They live in low, oval, dome-shaped huts, made by setting rough poles in the ground, bending them down, and tying them together Over all is a thatch or layer of mats woven by the women In the centre of each hut is the fire pit where meat is roasted, and around the sides are holes in which they sleep They wear little costume beyond a cloak of skin, but smear their bodies lavishly with fat and soot At the time of the advent of the Europeans their wealth consisted largely in cattle Their chief weapons were bows and poisoned arrows In their villages the huts were arranged in a circle, forming what is known as a kraal A portion of the Hottentots shared the fortunes and stood the oppressions of the settlers, and their descendants form a mixed race, many of whom are prosperous in flocks and herds

Hottentot men do little work besides helping to tend cattle and occasionally hunting and fishing Some pursue the trades of smith or armorer, tailor or tanner The women make cords, mats, and pottery, cook, tend cattle, and perform most of the labor

Trade is carried on by barter in cattle, and oxen are used for bearing burdens Little beef is eaten, and meat is procured by hunting, milk being the chief food, from their environment The Hottentots secure many roots and fruits, which supply the vegetable element in their diet Cooking of meat is by roasting or seething in a skin bag by means of hot stones. They make an intoxicating mead and chew a narcotic root

Puberty, marriage, and funeral feasts are held Their amusements are mock fights, games accompanied with music, drinking, and smoking Family affection seems strong, and they are friendly, liberal, and hospitable among themselves.

Their yellow skin has been an enigma to anthropologists, and the discovery of similarities in grammar, together with the existence of words representing abstractions of a high order, strengthened the theory that the Hottentots had separated from the Caucasian kindred in the north in prehistoric times, settling the southern portion of the continent, where they were pressed upon later by the black Bantu tribes More probably they are an isolated race, like the Australians The theory that they are lost Hamites has recently been readvanced by Meinhof, largely because of the existence of grammatical gender, and Von Luschan has attempted

to support this linguistic argument on somatological and cultural grounds. The linguistic basis of the theory seems, however, very far from convincing, for the Hottentot gender system differs widely from that of the Hamites.

A peculiar phonetic element shared with the Bushmen consists of clicks, resembling the smacking of the mouth in clucking, etc., made by pressing the tongue against the teeth, the palate, the sides of the upper jaw, or doubling it backward and then producing an explosive noise. These clicks usually occur at the beginning of words, and while each one is not difficult to imitate, the European is quite unable to follow them up with the vocal sounds that make up the word. The name Hottentot is an effort of the Dutch to imitate the dental clicks pronounced like the expression of surprise, *tut! tut!* with an inhalation. See AFRICAN LANGUAGES.

The unit of government among the Hottentots was the *kraal*, with its subchief, who with the leading men had jurisdiction even to the extent of the death penalty. The tribes were ruled by hereditary chiefs, who were greatly revered and received their pay in kind, being entitled to a share of whatever was killed or produced. Descent was in the female line for sons, and initiation into the tribe was with ceremonial scarification of the body. Their instruments of music were the *gorah*, or musical bow, a rude fiddle, *l'gutha*, an imitation of European violin, a *tomo*, a bow rubbed with another bow, and a single-head drum.

The religious belief of the Hottentots was in keeping with their social scale and organization. They held to the existence of the soul after death. The ruler of all things is a deified patriarch, *Heitsi-Eibeb*, or a Great Captain *Tsu-goab*, who was formerly one of their mighty chiefs and came from the East. Hence all Hottentots' graves are oriented, and when they pass a cemetery they leave stones on the spot to express good will and ask a blessing. The existence of this practice in former times enables the student to follow the trail of the Hottentot in his wanderings. The cult of these people is obscure. It has been stated that they had no temples or places of united worship, no altars on which offerings or sacrifices were laid, and no class with priestly function; yet medicine men, witch doctors, or sorcerers, were common among them, called in to heal the sick by magic. An immense folklore is based on the primitive conceptions of ghosts, charms, signs, offerings, luck, and causation by spirit influences that cram the air. The folk tales reveal many resemblances with those of the neighboring Bantu, indicating a common origin.

Bibliography. Accounts of the Hottentots are to be found in the narrative of Francisco de Almeida (1509), also in the records of the Dutch East India Company from 1652 and of the British occupation after 1795. Consult also P. Kolben, *Present State of the Cape of Good Hope* (London, 1731-38), A. Sparman, *Voyage to the Cape of Good Hope* (Perth, 1786); Sir John Barrow, *Travels into the Interior of South Africa* (London, 1801), Bleek, *Reynard the Fox in South Africa, or Hottentot Fables and Tales* (ib., 1864), Emil Holub, *Seven Years in South Africa* (Eng. trans., Boston, 1881), G. HOTTINGER, hŏt'ting-ēr, JOHANN HEINRICH (1620-67). A Swiss Orientalist and biblical scholar. He was born at Zurich. After studying at Geneva, Groningen, and Leyden, he became professor of Church history in Zurich, where he remained until 1655, holding successively the chairs of theology and Oriental languages and rhetoric and logic. In 1655 he became professor of Oriental languages at Heidelberg. In 1661 he returned to Zurich to take charge of a German translation of the Bible, and in 1662 he was elected rector of the University in Zurich, which title he kept for life. In 1667 he was called to Leyden, but was drowned at Zurich by the capsizing of his boat while on a pleasure excursion before leaving for his new work. Hottinger was a prolific writer on Oriental subjects. The most important of his works are the following: *Thesaurus Philologicus seu Claris Scripturæ* (1649), *Historia Ecclesiastica* (1651-67), and the *Etymologicon Orientale, sive Lexicon Harmonicum Heptaglotton* (1661).

HOTTINGER, JOHANN JAKOB (1783-1860). A Swiss historian and educator. He was born at Zurich, studied there and at Leipzig, and, returning to his birthplace, taught history in the girls' academy, in the art school, and in the university (1833). As a member of the council on education, Hottinger was prominent in the introduction of reform measures. He edited the *Archiv für schweizerische Landeskunde* (1827-29), *Archiv für schweizerische Geschichte* (1843-53), and the *Schweizerisches Museum für historische Wissenschaften* (1837-39), and wrote *Geschichte der Eidgenossen während der Zeiten der Kirchentrennung* (1825-27), *Huldreich Zwingli* (1841), *Geschichte des Untergangs der Eidgenossenschaft der 13 Orte* (1844), and *Hans Konrad Escher von der Linth* (1852).

HOT-WATER HEATING. See HEATING AND VENTILATION.

HOT-WIRE ANEMOMETER. See ANEMOMETER.

HOUARIOS, hŏ-a'ri-ŏz. Small coasting vessels and pleasure boats used in parts of the Mediterranean. They bear lateen sails and have each two masts and a bowsprit.

HOUBARA, hŏu-ba'ra. See BUSTARD.

HOUBRAKEN, hŏu'bra'ken. A Dutch family of artists.—ARNOLD (1660-1719) was born at Dordrecht and studied under Samuel van Hoogstraeten and others. In 1713 he visited England. He practiced his art chiefly at Amsterdam and painted a number of historical pictures and figure subjects, none of great value. His chief claim to fame is a biography of Dutch painters, *Groote schoubouogh der nederlandsche konstschilders en schilderessen* (1718), an invaluable contribution in view of the absence of a similar account, but which, by reason of its uncritical and anecdotic character, must be cautiously used. Consult Hofstede de Groot, *Arnold Houbraken und seine Groote Schoubouogh* (The Hague, 1893).

His son and pupil, JACOBUS HOUBRAKEN (1698-1780), a well-known engraver, was also born at Dordrecht and practiced chiefly at Amsterdam. His first work was a series of portraits for his father's book. He did 100 plates for *The Heads of Illustrious Persons of Great*

Butain (1743-52), by T. Buehs, but his best work is a series of scenes after C. Troost. His individual portraits are said to number more than 600. (Consult *Alexander Ver Huell, J. Houbraken et son Œuvre*, Paris, 1875-77.) After Houbraken's death engraving in the Netherlands became almost a lost art.

HOUDAN, hū'dan. A breed of domestic fowls, in the French class with the *Creve-cœur* and *La Fleche*. They are widely bred in the United States and are hardy and profitable. These fowls are of medium size, mottled black and white in color, with black wing bars and primaries, and a heavy crest divided in the middle of the crown in the cock, but falling backward in the hen. They have five toes, like Dorkings. A hen should weigh six pounds, a cock seven. The other breeds mentioned are highly esteemed in France, but little known in America.

HOUDARD, ō'dar', GEORGES LOUIS (1860-). A French composer and musical savant, born at Neuilly-sur-Seine. While still studying composition under Hillemeier and Massenet, he manifested a strong leaning towards musical archaeology and research. His reputation was securely established by his very first book, *L'Art dit Grégorien d'après la notation neumatique* (1897). This was followed the next year by the not less important *Le rythme du chant dit Grégorien d'après la notation neumatique*. Other works, all embodying the results of original research, are *La richesse rythmique musicale de l'antiquité* (1903), *La cantilène Romaine* (1905), *La rythmique intuitive* (1906), *L'ade-mecum de rythmique grégorienne* (1912). His compositions, the most important of which is a *Requiem*, belong exclusively to the field of sacred music.

HOUEDETOT, ō'd-tō', ELISABETH FRANÇOISE SOPHIE DE LA LIVE DE BELLEGRADE, COUNTESS D' (1730-1813). The mistress of Saint-Lambert and probably also of Rousseau. She was the wife of a French general and the sister-in-law of Madame d'Épinay. Rousseau mentions her in his *Confessions* and attributes to her influence much of his poetical inspiration. Their love is partly represented in *La nouvelle Héloïse*. Her face was plain and slightly scarred with small-pox, but she possessed a brilliant wit and a sunny disposition.

HOUDIN, ō'dān', ROBERT (1805-71). A French conjurer and mechanician. His apprenticeship to the watchmaking trade schooled his fingers in the manipulation of intricate machinery, and his hatred of shams led him to apply his mechanical knowledge to the unveiling of the conjuring tricks of his time, especially those which appealed to the religious side of human nature. By producing more wonderful illusions, with the credit given to natural causes, than those which his predecessors had attributed to supernatural, he completely revolutionized the art of magic and was honored by medals in 1844 and 1855 for his mechanical toys and the practical value of some of his inventions. In 1852 he was sent by the government to Algiers to convince the Arabs by his magic that the French were a far superior race. He was the author of an autobiography, *Robert Houdin* (1857), *Confidences* (1859), *Les tricheries des Grecs dévoilées* (1861), *Secrets de la prestidigitation et de la magie* (1868), reprinted as *Comment on devient sorcier et Magie et physique amusante* (1877), translated into English by Hoffmann

Consult H. Houdin, *The Unmasking of Robert Houdin* (New York, 1908).

HOUDON, ō'dōn', JEAN ANTOINE (1741-1828). One of the foremost French sculptors of the eighteenth century. He was born at Versailles, France, March 20, 1741, the son of a domestic attached to the house of De la Motte, a courtier. His first impulse towards art came from the splendid decorative sculpture of the park at Versailles, and as a boy of 10 or 12 he haunted the ateliers of the Royal School of Sculpture. In the catalogue of the Salon of 1795 he calls himself a pupil of Slodtz, but he was really much more influenced by Pigalle and the younger Lemoyne. In 1761 Houdon won the *Prix de Rome*, but was not influenced greatly by the treasures of art in Rome. His personality was too healthy and powerful to follow the lead of any other master and could only be satisfied by its own direct and intelligent interpretation of nature. His stay in Rome is marked by two characteristic and important productions—the superb "Ecoche," an anatomical model, which has served as a guide to all artists since his day, and the statue of St. Bruno in the church of Santa Maria degli Angeli in Rome, a work of very powerful characterization.

After 10 years' stay in Rome Houdon returned to Paris and soon became one of the foremost French sculptors, he was admitted to the Academy April 23, 1769. In 1785 he visited America in company with Benjamin Franklin in order to make the statue of Washington which had been ordered by the Legislature of Virginia. He visited Washington at Mount Vernon, and the marble statue which followed now adorns the capitol at Richmond. During the French Revolution Houdon was in danger before the Tribunal for executing a statue of St. Scholastica, but succeeded in convincing the judges that his saint was in reality a statue of Philosophy. Houdon died July 16, 1828, in Paris.

Houdon was a perfectly trained and competent technician, producing easily and abundantly, with equal success both in marble and bronze. His knowledge of anatomy was marvelous, and he was a thorough naturalist who succeeded best in portraiture. His name is principally connected with a fine series of more than 200 portrait busts, which form one of the chief monuments of French sculpture. Among these were those of Diderot (about 1769), Benjamin Franklin (1778), and of Gluck (1777), on the death of Rousseau in 1778 he made two busts in bronze and terra cotta from a cast of his face. One of the most characteristic of his busts is that of Molière, in the Théâtre Français, Paris. Among his statues are those of "Morpheus," in the Ecole des Beaux-Arts, "Diana the Huntress," the best of his nude female figures, "The Bather," combined with which there was originally a negress pouring water over her mistress's shoulders, in the Altman collection, Metropolitan Museum, New York, and especially the portrait statue of Voltaire (1781), in the Théâtre Français, one of the finest in modern art. Consult Hermann Dierks, *Houdons' Leben und Werke* (Gotha, 1887), Albert Terrade, *Autour de la statue de Jean Houdon* (Versailles, 1892), Hart and Biddle, *Jean Antoine Houdon* (Philadelphia, 1911).

HOUGH, hūf, GEORGE WASHINGTON (1836-1909). An American astronomer, born at Tribes Hill, Montgomery Co., N. Y. He graduated at Union College in 1856 and three years afterward

was appointed assistant astronomer at the Cincinnati Observatory. The next year he became astronomer and director of the Dudley Observatory in Albany and in 1879 went West to become director of the Dearborn Observatory and professor of astronomy in Chicago University, but in 1887 he gave up the latter position to accept a similar one in Northwestern University. He discovered more than 600 double stars and invented a number of astronomical instruments. His chief publication is *Annals of the Dudley Observatory* (1866-71).

HOUGH, LYNN HAROLD (1877-) An American Methodist Episcopal clergyman and theologian, born at Cadiz, Ohio. He graduated from Scio College in 1898 and from Drew Theological Seminary in 1905 and studied also at Columbia University. He entered the ministry in 1906. After serving large churches in Brooklyn and Baltimore he was elected professor of historical theology in Garrett Biblical Institute in 1914. He lectured much before institutes and conferences, contributed to the religious press, and is author of *Athanasius the Hero* (1906); *The Love of Books* (1911); *The Theology of a Preacher* (1912); *The Men of the Gospels* (1914).

HOUGH, THEODORE (1865-) An American physiologist, born at Front Royal, Va., and educated at Johns Hopkins University (A.B., 1886, Ph.D., 1893). From 1893 to 1903 he was instructor and assistant professor of biology at Massachusetts Institute of Technology, from 1893 to 1907 was also instructor in physiology and personal hygiene at the Boston Normal School of Gymnastics, and from 1903 to 1907 was associate professor and professor of biology at Simmons College, Boston. In 1907 he became professor of physiology at the University of Virginia. He is coauthor of *The Human Mechanism* (1906). His researches deal mainly with cardiac inhibition, alcohol and fatigue, the physiology of muscular fatigue and soiness, and the effect of temperature on cutaneous circulation.

HOUGH, WALTER (1859-). An American ethnologist, born at Morgantown, W. Va. He was educated at Monongalia Academy, West Virginia Agricultural College, and the University of West Virginia (A.B., 1883; Ph.D., 1894). He was assistant in 1886-94, assistant curator of ethnology from 1896 to 1910, and curator after 1910 in the United States National Museum. In 1892 he went with the United States Commission to Madrid and was made Knight of the Order of Isabella. He was a member of Dr. J. Walter Fewkes's expedition to Arizona (1896-97), went to Mexico with Dr. J. W. Rose (1899), and made important explorations in the Southwest in 1901, 1904, and 1905. He published some 35 papers on ethnology.

HOUGHTON, hō'ton. A village, port of entry, and the county seat of Houghton Co., Mich., on Portage Lake, near Lake Superior, with which it is connected by a canal, 94 miles northwest of Marquette, on the Duluth, South Shore, and Atlantic, the Copper Range, and the Mineral Range railroads (Map Michigan, A 1). It is the centre of a rich mineral district, copper being mined and exported in great quantities. The Michigan College of Mines, established here in 1885, occupies many fine buildings, which, with the high school and county courthouse and jail, are the finest structures of the village. Other features are the United States

customhouse, county sanitarium, Good Will Farm, Carnegie library, and agricultural school. Among the industrial establishments are a large foundry and machine shop, lumber mills, dry docks, coal docks, breweries, and manufactories of cigars, candy, handles, jewelry, etc. The water works are owned by the municipality. Pop., 1900, 3359; 1910, 5113.

HOUGHTON, GEORGE HENDRICK (1820-97) An American Protestant Episcopal clergyman. He was born in Deerfield, Mass., and graduated at New York University in 1842 and at the General Theological Seminary in 1845. In 1848 he organized, and until his death was rector of, the church of the Transfiguration, better known as the "Little Church around the Corner" in New York City. The story which explains the origin of this name is that, a certain actor having died, his friends requested one of the city pastors to conduct the funeral services. The latter refused, but advised them to try the "little church around the corner." Dr. Houghton was distinguished for his activity in benevolent work. At his death he was succeeded by his nephew, George Clarke Houghton.

HOUGHTON, HENRY OSCAR (1823-95) An American publisher, born at Sutton, Vt. He graduated in 1846 at the University of Vermont and worked in Boston as compositor and newspaper reporter. In 1849 he entered the Cambridge firm of Messrs. Bolles and Houghton printers and in 1852, upon Mr. Bolles's retirement, transferred the office to its present site and established the well-known Riverside Press. In 1864 he became a member of the publishing firm of Hurd and Houghton, which in 1878 became Houghton, Osgood, and Company and in 1880 Houghton, Mifflin, and Company. In 1872 he was elected mayor of Cambridge. In 1878, by acquiring control of the large list of the old firm of Messrs. Ticknor and Fields, the Houghton house secured exclusive publication rights for the works of many leading American authors, such as Emerson, Longfellow, and Holmes. For many years *Webster's International Dictionary*—now *Webster's New International Dictionary*, published by G. and C. Merriam Company of Springfield, Mass.—has been printed by the Riverside Press.

HOUGHTON, hā'ton or hōu'ton, RICHARD MONCKTON MILNES, LORD. See MILNES, RICHARD MONCKTON.

HOUGHTON, hō'ton (WILLIAM) STANLEY (1881-1913) An English dramatist. He was born in Manchester, was educated at the Manchester Grammar School, and was employed for a time in the cotton trade. From 1906 to 1912 he was assistant dramatic critic and reviewer for the *Manchester Guardian*. He was connected with the movement that resulted in the establishment by Miss Horniman (see HORNIMAN, ANNIE E. F.) of her repertory theatre at Manchester in 1908, and it was there that his first plays were produced—*The Dear Departed* (1908), *Independent Means* (1909), *The Master of the House*, and *The Younger Generation* (1910). The first and last of these were produced in London in 1912-13 by the Repertory Players, who gave there in 1912 his best play, *Handle with Care*, a gloomy piece of Lancashire mill-town realism. This play was produced in New York the next year, as was *The Younger Generation*. His other plays, all produced in London in the last few months of his life, were, in 1912, *Fancy Free*, *Puppets*, and

Pearls, and, in 1913, *Trust the People* and *The Perfect Cure*. His *Five One-Act Plays* were collected in 1913.

HOUGUE, LA See **HOGUE, LA**

HOULTON, hōl'ton A town and the county seat of Aroostook Co, Me., 140 miles northeast of Bangor, on the Bangor and Aroostook and the Canadian Pacific railroads (Map Maine, E 2). It is surrounded by a farming and lumbering district and has considerable commercial importance. There are foundry and machine shops, saw, planing, and molding mills, woolen mills, starch factories, a flour mill, a butter factory, and a large slaughterhouse. The town has a public library, two hospitals, parks, and the Ricker Classical Institute. The water works and electric-light plant are owned by the municipality. Pop. 1900, 4686, 1910, 5845.

HOUMA, hō'ma (Indian, mound) A city and the parish seat of Terrebonne Parish, La., 54 miles southwest of New Orleans on the Barataria Canal, the Bayou Terrebonne, and on the Southern Pacific Railroad (Map Louisiana, H 7). It has several oyster-packing establishments, a large moss factory, canneries, saw and planing mill, brickkilns, manufactures of sugar, molasses, and lumber, and considerable trade in rice and grain. The water works and electric-light plant are owned by the city. Pop. 1890, 1280, 1900, 3212, 1910, 5024. The place was first inhabited by the Houmas Indians.

HOUND (AS *hund*, OHG *hunt*, Ger *Hund*, Goth *hunds*, connected with Lat *canis*, Gk *κύων*, *kyōn*, OIr *cú*, Lith *szū*, Skt *śān*, dog). Broadly the term "hound" distinguishes hunting dogs, who follow their animal quarry by scent, from the greyhound group, who hunt by sight, and also from the field dogs (q v).

Hounds, then, comprise the bloodhound—or sleuthhound, as he is still called in Scotland—the buck or stag hound, the foxhound, the otter hound, the harrier, the beagle, the basset, and the Great Dane. The origin of all the breeds of hounds is the Talbot, or old Southern hound (*Canis sagax* of Linnaeus), of which probably no true example exists to-day, although a few were preserved well up into the nineteenth century. These dogs were remarkable for their great size and strength, the depth of the chest, length of ears, and the breadth of the head in the region covering the olfactory nerves, hence their capacity for tracing the "sleuth," "slot," or track. Before the Christian era the bloodhound, or sleuthhound, of Great Britain had become so celebrated for these qualities that, as we know on the authority of Gratius, they were imported into Gaul. Strabo, who flourished somewhat later, confirms this, and Oppian praises their powers of scent and their courage.

The Bloodhound. This hound is the nearest to the original Talbot and for centuries was the hound of the huntsman whose quarry had to be followed by scent. During many centuries he was the principal agent in Europe in bringing the bear, the boar, and the stag to bay, but swifter breeds were gradually evolved, and the bloodhound's occupation dwindled to that of employing his extraordinary capacity to maintain a trail, however crossed and faint, in tracking human poachers to their hiding places. Had it not been for this need, the breed would in all probability have entirely disappeared, as, in fact, it nearly had when in the middle of the nineteenth century a few enthusiasts took up the breeding and restored the dog to his rightful

position. The stories of carnage following the dog's overtaking man do not apply to the true bloodhound. When he has tired or fixed his man, he gives tongue and takes care that the pursued does not escape, but he will never lay hold viciously and maliciously. The bloodhound's practical use to-day is in tracking fugitives, refugees, and missing persons, and for this purpose packs of them are maintained by many public authorities. Their capacity to do this borders on the incredible, for, however the footsteps of the one sought for may be crossed by others, in country or street, the nose of this hound, once it has taken up the trail, will follow it. Running water is apparently the only medium that will baffle him. This sense is, of course, natural, but to develop it and bring the dogs use of it into subjection and make it intelligently useful, the puppy has to be trained and his powers gradually extended and kept in practice.

The characteristics adopted as the standard by the American Bloodhound Club depict the modern dog. He should be from 25 to 27 inches high at the shoulder for dogs and a little less for the other sex, in color, black and tan—the black, extending to the back, top of neck, and top of head, is, however, always more or less mixed with tan. The tan is a deep rich red, the coat should be short and hard on the body, but silky on the ears and top of head. The ears should be long enough to overlap each other when drawn down together in front of the dog's nose. The eyes should be hazel, deeply sunk, and with triangular lids, showing the third eyelid, or "haw." The head should be large in all dimensions except width, the muzzle deep and square, the brows fairly prominent. The skin covering the forehead and cheeks is wrinkled, and the general expression of the whole head is majestic. The neck is long, to enable him to drop the head to the trail without altering his pace. The chest and ribs are wide and deep, and the legs straight and muscular, the ankles of full size, and the feet round and catlike.

The Foxhound. As a breed distinctly characteristic and solely used for the hunting of the fox, the foxhound is a comparatively modern development, not reaching farther back than 200 years, but it has been developed from the bloodhound and the Talbot or old Southern hound, traceable for 2000 years. When England gradually became more or less deforested, and animals of the chase had more open spaces for their speed, it naturally followed that this dog had to have increased pace, and for all kinds of game except the very heaviest the bloodhound and Talbot gradually gave place to lighter hounds grafted on the old model. The stag, or buck, hound was the first variety of what we now class under the general term "foxhound." He was the first to come and practically the first to go, for not one pack of the larger buckhound exists to every hundred packs of the true foxhound. The establishment of regular packs of hounds for hunting the fox, the first of which was the Pythley in 1750, stamped the breed on the lines from which the English hound has never varied—indeed, into some packs not a single drop of extraneous blood has ever been introduced. Most of the packs established in the latter part of that century are still, so far as other blood is concerned, in unbroken existence, such as the Belvoir (founded, 1756), the Quorn, and the Cottesmores.

Where the game chased is as swift and crafty as the fox, and the country is open, yet studded with hedges and walls, which act as an ever-recurring screen from sight, it follows that the pursuing hound must have unfailing powers of scent, endurance, and swiftness. These are the three characteristics of the bony, muscular, compact, big-bodied, typical foxhound. His height is not so material as are other points. 23 to 24 inches at the shoulder is a safe medium. Nor is color imperative, though necessarily, from the jealousy with which the breed has been guarded, there are no variations outside the yellow or tan, black and white, in ever-varying and clearly marked blotches over the whole body. The head should have a girth in front of the ears of fully 16 inches, the nose should be $4\frac{1}{2}$ inches long, and wide, with open nostrils, and ears set low and lying close to the cheeks. The neck should taper from the shoulders to the head. The chest of a dog 24 inches high should be more than 30 inches in girth, to give the necessary lung capacity, and the ribs must be deep and grade into the loins without an observable break. The hind quarters must be very strong, and the front legs straight and strong. So important are these two features that in judging they call for 20 points out of the total 100. The modern dog, being better trained, is lighter than his ancestor, 70 to 80 pounds is the limit of a dog's weight, and the female may be 10 pounds lighter.

In America the local conditions differ so widely and are so various that it is almost impossible to define the American foxhound. In some districts, like Maryland and in the Genesee valley, the fox is followed very much after the English fashion, on horseback, over rolling grasslands, elsewhere the dog does the hunting and the man waits behind a wall on the supposed runaway with a gun, in a third the men follow the dogs afoot, in still others they hunt the fox at night. It follows, therefore, that the dogs locally needed must be as various as the methods, and they are so, but, speaking broadly, and of the hound favored by the American Foxhound Club, it need only be said that it is bred on lighter and finer lines than its English ancestor. It is shorter at the shoulder—21 to $23\frac{1}{2}$ inches—and weighs not more than 57 pounds. The chest is narrower in proportion to depth than the English standard, 20 inches in a $23\frac{1}{2}$ -inch hound is considered good. In most other respects, naturally, the requirements are very similar. One minor point of some importance may be noticed: the English dog always has his ears artificially rounded, while the American dog retains them untrimmed.

The Harrier. From the earliest times the hare has been hunted by dogs. There is a cameo among the Greek gems which depicts him chased by his special enemy, the long dog, or greyhound, but he had an equally persistent foe in the old Southern hound, the immediate ancestor of the modern harrier. The original harriers must not be confused with the dwarf foxhound, which does duty as a harrier to-day. It was only after the draining and clearing of England and Ireland at the beginning of the nineteenth century, when for the first time the chase could be followed on horseback, that the old Sussex blue-mottled harrier, the first step in refining the old stock, came into fashion. The persistence with which a scent-hunted hare can be worried by dogs with good noses, and the sport it

afforded to watch the tricks and subtleties of hare and hounds, made hare hunting very popular. In order further to insure the needed qualities, the smaller foxhound strain was called into requisition, and "Trian," a sire from the Duke of Grafton's kennel, became the foundation of the pack of Sir John Dashwood King, of West Wycombe, whence the strain spread throughout Great Britain. There are still packs of the older and slower kind, however, and there is a "standard of points," but it is scarcely worth repeating here.

The Beagle. The harrier looks like a diminutive foxhound, and the beagle looks like a diminutive harrier, but he is not that. He has a most ancient lineage, and for beauty of form, gentleness of manner, sweetness of voice, and hunting qualities he has no equal. The length of the separate existence of the beagle has allowed opportunity for many varieties besides the "rough" and the "smooth." A very pygmy breed called "lap-dog beagle" was once popular. So small were one pack of these that the whole 10 or 12 couples were carried to the field in a pair of panniers slung across a horse. Even the common-sized beagle is slow enough to allow any ordinarily active man to follow the chase afoot. There is a Beagle Club in America which sets the standard, and field trials are annually held under its auspices. Though diminutive some classes not exceeding 15 inches, the beagle is every inch a dog with a wiry frame and a determined though placid look. His standard of form closely follows that of the foxhound.

The Basset. This dog is the French equivalent of the English beagle, inasmuch as he is the diminutive of an ancient breed, and his quarry is the rabbit. In other respects, as the beagle follows the characteristics of the old Southern hound, the basset resembles them other ancient common ancestor, the bloodhound. His body is longer, and his legs even shorter than the beagle's. His head is long and narrow, with heavy flews, and his forehead wrinkled to the eyes, which, like the bloodhound's, show the hawk; his expression is dignified, the neck is very powerful, with heavy dewlaps, and the ears so long he is likely to tread on them, for his legs are not more than 4 inches long. The stifles are bent, and the quarters full of muscle. He is very barrel-like and has a character easily recognized.

The Dachshund. Except that this dog hunts rabbits and, like the beagle and the basset, is short on the leg and long in the body, he has nothing in common with the others. He is a curious mixture. He has the smooth coat and body of a pointer, the tail and nose of a black and tan terrier, the ear of a foxhound, with more than the foxhound's sensitiveness, the hinder legs taller than the front ones, and the latter comically bowed. He is a very ancient breed. One of his kind is painted on an Egyptian monument of the period 2000 B.C. He has many modern admirers, and a club devoted to his interests, whose standard calls for a general appearance long, low, and graceful, not cloddy, a wedge-shaped head, long and lean, broadest at its base, skull moderately arched, bridge of nose somewhat curved or nearly straight, no stop, muzzle strong, not snipy, but fairly pointed, with open nostrils, ears medium, long, broad, and soft, round at end, set on high and well back, eyes showing no white and with keen expression, jaws strong, with strong and regular

teeth, neck tapering from the shoulders to the head, shoulders well muscled and plastic, chest well developed, especially the breastbone, body long, back ribs very short, foreribs well sprung, forelegs short and strong in bone, forearms crooked, feet large, round, and strong, hind legs smaller in bone and higher than forelegs, lower thigh very short and forming nearly a right angle with the upper thigh, feet of hind legs smaller than those of forelegs, coat short (except on the wire-haired), dense, strong, and glossy, but short and fine on the underside of the body, skin loose and supple, color red in all tints, black and tan, liver and tan, gray and tan, and spotted. White is objectionable, except in a small stripe from the breastbone (which is prominent) downward.

Turnspit A dog closely akin in build to the dachshund, and called the bath hound, or turnspit, was used in England in some localities well into the nineteenth century to drive a wheel by which the roasting spits were turned before the fire. He was put in a box in such a position that he could apply his forefeet one after another to a paddle wheel, and by that means the spit went round. A similar dog, used for rabbiting, was early known to English hunters as the wry-legged terrier.

The Otter Hound This is the gamiest and pluckiest of dogs. His prime requisite is such hardihood as will enable him to follow the otter to its water den and fight him there, withstanding without complaint the severest bites from this most vicious of animals. If fish are to be "preserved" in certain streams, otters must be limited, and to this end otter hounds are a necessity. This dog must have powerful jaws and good teeth, also a rough grizzly coat, which defies alike the chill of the water and the teeth of the otter. Beneath the wry outer coat an undercoat of oily wool is essential. This hound is a large dog, standing about 25 inches high, and weighing 50 to 75 pounds.

The Great Dane, or German Boar Hound This is the last visible remnant of one of the two great classes into which dogs were divided by Xenophon and the early Greek writers—the "fighting dogs," famed for their huge frame, their pugnacity and ferocity under training. Most of the ancient nations cultivated this dog as an ally in their armies. Arrian enumerates those of "the Mede, Celt, Ser or Indian, Albanian, Iberian, Lycaonian, Libyan, Egyptian, Magneſian, Molossian, Briton, Arcanian, and a few others nearly allied." Cyrus had his war dogs, and at Marathon dogs shared the honors of the day. That their use was continued by the Romans is evidenced by the fact that from the ruins of Herculaneum have been exhumed the calcined corpses of dogs wearing mail armor. The use of this huge dog for aggressive pugnacity has long since passed, but as a companion and safeguard he has always been valued by German game wardens.

The standard adopted by the Great Dane Club of America maintains all the great and marked qualities of this giant of the canine world, decreeing for dogs a minimum height of 30 inches and a weight of 100 pounds, with an approximate height of 32 inches and a weight of 140 pounds. It requires a powerful and elegant brute. The body must be long, round, and compact; the coat short and fine; the ears small and carried high; the eyes small, deeply set, and with a sharp expression. The recognized colors

are the various shades of gray or blue, mouse color, black, white, red or fawn, also brindle or tiger-striped or white ground, with patches of dark colors.

The Mastiff This dog (the *Canis anglicus* of Linnaeus) is a true hound and undoubtedly is of British origin, for he was exported from there before the Roman conquest of the islands. He was used by the Britons as a guard dog for their persons and their flocks, more than in the hunt, and he remains preeminently the watchdog of the present day. Watching has become almost instinctive with him. He is the largest and most muscular dog known, exceeding even the Great Dane, and has the courage of the bulldog, yet withal is so gentle that he is the especial favorite of children. In color he is apricot, or silver fawn, or dark fawn brindle, with the muzzle, ears, and nose black in all cases, his coat is short and close-lying, his head is a very ideal of strength and massiveness, and it is set on a neck and chest in proportion. No height is set in the standard, but a dog which must weigh from 155 to 175 pounds should be very little under three feet tall.

Bibliography Consult authorities mentioned under Dog.

HOUND A small shak. A name more common in Great Britain than in America for the dogfish of the genus *Mustelus*, especially the blue or "smooth" hound (*Mustelus canis*), common to both sides of the Atlantic. See DOGFISH.

HOUND/FISH 1 A needlefish, especially *Tylosorus raphidoma*, also called guardfish. See NEEDLEFISH, and Plate of NEEDLEFISH, PIKES, ETC. 2 A dogfish.

HOUND, HOUNDING A hound is a dog employed in the chase, specifically, in England, one adapted to fox hunting. Hounding is the pursuit of game by hounds. The keeping of hounds and the sport of hounding are, to a greater or less extent, regulated by law. Those who follow hounds in fox hunting, in England, are exempt to some extent from the common-law liability of other trespassers, such sport ranking as a privileged pursuit. The employment of hounds in deer hunting is prohibited by statute in some of the United States. Consult Peer, *Cross Country with Horses and Hounds* (New York, 1902), and the authorities referred to under GAME LAWS.

HOUND'S-TONGUE (so called from the shape and texture of the leaves), *Cynoglossum*. A genus of coarse-appearing, small-flowered plants of the family Boraginaceæ, of which there are many species. The common hound's-tongue (*Cynoglossum officinale*) is a native of Europe, Asia, and Africa, introduced in North America. It has soft downy leaves, of a dull-green color, purplish-red flowers, and a stem about 2 feet high. Its odor is very disagreeable. The root was formerly administered in scrofula, dysentery, etc., and is said to be anodyne. It is also one of the pretended specifics for serpent bites and hydrophobia. The hound's-tongue is considered a pernicious weed on account of its burs, which adhere to the wool of sheep and to other animals. *Cynoglossum virginianum*, known as wild comfrey, is a common plant from New York to Florida, and *Cynoglossum boreale* occurs in Canada and northern United States as far west as Minnesota. The species of *Echinosperrum*, formerly united with *Cynoglossum*, are weeds, *Echinosperrum* being the beggar-lice

or sticktight. The quality of sheep's wool is often considerably lowered from the abundance of their burrs in it.

HOUNSLOW HEATH A region west of the township of Hounslow, London, covering in 1546 an extent of 4293 acres. It was formerly notorious as the resort of highwaymen, and it was customary to leave the bodies of those who had been executed hanging on gibbets along the road. In 1686 James II established a camp on the Heath for the purpose of overawing the Londoners. Extensive barracks were erected in 1793, and part of the land is now occupied by powdermills. The region is in great part under cultivation and inclosed.

HOUR (AF *ure*, OF *ure*, *hure*, *ore*, *hoir*, Fr *heure*, from Lat *hora*, from Gk *ώρα*, hour, season) A measure of time equal to one twenty-fourth part of a day (qv). As there are two kinds of days, the solar and sidereal, so there are two kinds of hours, the solar and sidereal. The latter is shorter than the former by 9 856 solar seconds.

HOUR/GLASS. An instrument for measuring intervals of time. It is made of glass and consists of two bulbs united by a narrow neck. One of the bulbs is nearly filled with dry sand, fine enough to run freely through the orifice in the neck, and the quantity of sand is just as much as can run through the orifice in an hour if the instrument is to be an hourglass, in a minute if a minute glass, etc. The obvious defects of this instrument are the expansion or contraction of the orifice produced by heat or cold, and the variations in the dryness of the sand, all of which produce deviations from the true measurement of time. Instruments constructed on this principle are occasionally used by navigators in "heaving the log," for the purpose of measuring the time during which the log line is allowed to run out. Similar instruments are also employed by cooks in fixing the proper time for boiling eggs.

HOURI, *hou'ri* (Ar *hawrâ*, woman with bright black eyes, from *hawra*, to have brilliant black eyes). The beautiful celestial maidens, described in the Koran (Sura lvi, 24, lv, 55 et al.) and Mohammedan tradition as dwelling in Paradise, whose companionship is one of the rewards held out to the pious Moslem. Numerous descriptions amplifying the notices in the Koran are found in Mohammedan writers. They repose on gorgeous couches in pavilions of pearl. Their countenances are so bright that one can see his face reflected from a houri's cheek. They are made by "a peculiar creation," not of clay, like ordinary women, but of musk, saffron, incense, and amber. While retaining all the qualities of virgins, they have none of the failings of women, remain ever young and free from physical defect, and have the power to conceive and bear children at will, who within an hour grow to maturity. The later Mohammedan theologians, like Ghazali (qv), whose more refined instincts were offended by this rather sensual picture of Paradise, endeavored to place an allegorical interpretation upon the houri, but there can be little doubt that to Mohammed and to his immediate followers, as to the bulk of present-day Mohammedans, they represent an intense reality. This follows from the details of the houri given by Mohammed and amplified by subsequent writers, on the basis of tradition, which accord with the general view of Paradise as a place where life will be full of secret delights, where

there will be plenty of water, delicious fruits, with attendants waiting on the pleasure of the inhabitants, and the like. Mohammed's conception of Paradise, while based in part on the current Jewish and more particularly Christian views embodied as its original factors the adaptation of these views to his own mental horizon and to that of his surroundings, and one is inclined to conjecture that the houri represent the reverse of the popular conception of demonic beings, frequently pictured as female spirits, who plague and torture man in this world.

HOURS. See **HORA**.

HOURS, Book or. The name given to books of private devotion designed for the laity, which were very popular and in general use throughout the Catholic church from the fourteenth to the sixteenth centuries. These books were wont to open with an almanac giving the movable feasts, etc., followed by a calendar, which in turn was followed by passages from the Gospels, by portions of the canonical hours, penitential Psalms and litanies, and, finally, by diverse miscellaneous prayers. These devotional works were also called *Primers*, or *Primers*, and frequently they were referred to simply as *Hours*. Both before and after the discovery of printing they were often beautifully illuminated, and fine examples of them are to-day much coveted by collectors. Great personages were fond of having these books made specially for themselves, with decorations and illustrations of an individual appeal. A book responding to this taste is the famous *Tres riches heures* of the Duc de Berry, where pictures by Chantilly, appropriate to the different months, represent the Prince's châteaux set off against landscape backgrounds exquisitely executed in color. In the embellishment of these works of devotion distinguished artists—miniaturists, engravers, and others—labored. Consult E. H. Longlois, *Essai sur la calligraphie des manuscrits du moyen-âge et sur les ornements des premiers livres d'heures imprimés* (Rouen, 1841), Felix Soleil, *Les heures gothiques* (ib., 1882), Wordsworth and Littlehales, *Old Service Books* (London, c 1890), Armand d'Herbonnez, "Les heures de Chantilly et l'exposition des primitifs français," in *Revue des Questions Historiques*, vol. lxxviii (Paris, 1905).

HOURS, CANONICAL. See **CANONICAL HOURS**.

HOURS OF LABOR. See **LABOR LEGISLATION, EIGHT-HOUR DAY**.

HOEWICH, *hou'wich*, ISAAC A. (ARONVICH) (1860—) An American statistician, born at Vilna, Russia. He graduated from the Classical Gymnasium at Minsk in 1877, studied at the St. Petersburg Academy of Medicine and Surgery, and at the University of St. Petersburg, and graduated from the Demidov Juridical Lyceum at Yaroslavl (LL.M., 1887) and from Columbia University (Ph.D., 1893). He was admitted to the bar in Russia in 1887, in Chicago in 1893, and in New York in 1896, and he practiced law until 1900. He served as docent in statistics at the University of Chicago in 1893-95, as translator to the Mint, Washington, in 1900-02, as expert special agent of the Census Bureau in 1902-06 and 1909-13, and as statistician of the Public Service Commission of New York in 1908-09. He is author of *Peasant Migration to Siberia*, in Russian (1887), *The Economics of the Russian Village* (1892), *Immigration and Labor* (1912).

HOUSATONIC, *hou'sa-tôn'ik* A river of

Massachusetts and Connecticut (Map Connecticut, C 5), which rises in the Berkshire Hills about 2 miles south of Hinsdale, Mass., flows northward past that town, then northwestward to Dalton, then southwestward to Pittsfield, where it turns southward through Connecticut, entering Long Island Sound, four miles east of Bridgeport, after a course of 150 miles. It supplies water power to numerous manufactories.

HOUSE (AS *hūs*, ME *hous*, OHG *hūs*, Ger *Haus*, perhaps akin to Eng *hide*, to conceal). A human habitation of fixed and permanent character, as distinguished on the one hand from huts, cabins, tents, wigwams, etc., and on the other from palaces (qv). The word is also used in other senses, e.g., of a dynasty, a commercial company, a superstructure on a vessel (deck house), a shelter for vehicles (carriage house), etc. In this article it is discussed only in its primal meaning.

The history of human habitation is important, both socially and architecturally, since it is intimately concerned with the social and family life both of the individual and of the community. Probably 99 per cent of all buildings in the world are houses, and in the plan, arrangement, construction, and decoration of the house one may trace the progress of human society and civilization. The house, as distinguished from the tepee, wigwam, or kraal, embodies and is the product of the family life as against that of tribe or clan, and since the earliest temples were undoubtedly conceived of as the dwellings of the gods, they were planned after the type of the human house, so that all religious architecture has sprung from that of the primitive house.

Little is known about the houses of the ancient Egyptians and Assyrians, as the only extant ruins of dwellings are of palaces, not common houses, and the pictures and reliefs on the monuments throw little light on the form and construction of the latter class. We know much more about the primitive Greek house, from the ruins of Mycenæ and Tiryns, more, indeed, than about those of the historic period, of which the remains are very scanty. The Mycenaean house consisted of a hall (*megaron*), with four columns about the central hearth, an anteroom, or *prodomos*, and a porch, or *aihoussa*. The rooms, few or many, were grouped around the *megaron*. The type of the Greek house of historic times has probably been preserved for us in the Roman or Pompeian house, whose *atrium* (qv) recalls the primitive Greek *megaron*, surrounded by the various living rooms, while the *faux* takes the place of the *prodomos* and *aihoussa*.

Throughout the entire Mediterranean basin and as far East at least as the Euphrates it has been the immemorial practice to build all houses of any pretension whatsoever around a court (qv), of greater or less size. Even in Paris to this day the larger houses are built around courts. The Spaniards carried their *patio*, or court, with them, so to speak, to Mexico, Central and South America, and the West Indies, where it is still the custom, as about the Mediterranean, to build each house around a *patio*. Security and privacy are afforded by the court, from which the living rooms receive both access and light, without exposure to the dust, noise, and publicity of the street.

The excavation of Pompeii (qv) has given us almost complete details of the Roman pro-

vincial town house of the last century B.C. and first century A.D. in southern Italy. This was usually of one story, although portions might have a second story. It comprised an entrance passage (*faux*) leading from the street to the first atrium, or court, with its two lateral extensions, or *alæ*, its roof open in the centre (*compluvium*) and discharging its rain water into a central basin below, the *impluvium*, its *tablinum* where the family records and tablets were kept, three or four small rooms opening from it, and beyond these the *fauces*, or passages connecting it with the second court. This was larger than the atrium, was surrounded with columns, adorned with basin, fountains, marble table, flowers, and statues, and flanked by living rooms, while on one side or at the end was the *triclinium*, or dining room, open to the court. Beyond this, again, was the garden. The *cubicula*, or sleeping rooms, were hardly more than cells, and the kitchen was small and primitive. In crowded cities, at least in Rome, there were also tenement houses of many stories, but of their form and arrangement we know nothing.

The *villa* (qv) was an establishment with many wings and numerous rooms, approaching the elaborate elegance of a palace. In central Syria there are many ruins of houses of the late Imperial and early Christian centuries, showing courts only in part inclosed by buildings, the other sides protected by high stone walls, and a similar arrangement is found in many mediæval French buildings, e.g., the Hôtel Cluny in Paris, the Hôtel Jacques Cœur at Bourges, Hôtel d'Assézat at Toulouse, and others. In the ancient Roman houses one notes the scanty provision for indoor life and for individual privacy. The nearest approach to our "living rooms," parlors, and drawing-rooms was the peristyle, where in sheltered corners, under the roof or awnings, a couch, chairs, tripod, and table might be grouped for rest and familiar converse. In the villas, on the other hand, there was an abundance of special accommodations, but these were only for the rich.

In northern Europe the Teutonic and Slavic races developed a quite different type of house, taking its light and air from the outside, not from an interior court, and having its rooms therefore more compactly put together, in two, three, or even four stories. The climate, with its rain and snow, forbade the flat roof, and the high gabled roof was universal. The mediæval houses of north European cities, closely built in blocks, taking light from front and rear only, were sometimes of stone, more often of half-timber (qv) construction. In the country the house was evolved out of the barn, for the primitive type sheltered under one roof horses, cattle, and the family. A fireplace at one end of a central hall, stalls along one side for the beasts, along the other for the family, and lofts above—such was the type, surviving still in some Swiss chalets. As civilization developed, and the demand for privacy and comfort increased, rooms were partitioned off, and finally the live stock was removed to separate quarters, connected with the house only by a common courtyard inclosed by a wall. The central space became the spacious, lofty hall or gallery (see GALLERY, HALL) of the manor house, in which, as in the peristyle of the Romans, the social life of the family was passed. About the huge fireplace at one end of the hall, with its projecting hood or mantle, was the gathering place of

the family, the servants and feudal dependents gathered at the other end. The hall was the common dining room.

In the fifteenth and sixteenth centuries the spread of the Renaissance and the growing security of public institutions and private life gave a great impulse to the development of domestic comfort and convenience, of privacy and elegance. In England a carved screen in the hall now separated the family from the servants, everywhere rooms were multiplied, many of them provided with fireplaces. In England the number of chimney stacks and then elaborate decoration are especially notable. City houses, still in southern Europe built around or partly around courts, became architecturally sumptuous. The stairs were everywhere made more and more spacious and important—at first of spiral form in turrets, one for each group of rooms, they were now built in straight flights with landings, starting not from a court but from the hall. Corridors were introduced into the planning, securing private access to every room. This was one of the greatest of all improvements in house planning and marked the attainment of complete privacy for the individual. It came earlier in the North than in the South. In Italy and Spain the court arcade provided independent though less private access than the corridor to the rooms of two or three stories. See MANOR HOUSE, MUSEE CLUNY.

Modern individualism has tended to greater variety of house type than was ever known before. Even in the houses of one country or city the greatest variety is seen, especially in rural and suburban houses, where limitations of space are less exacting than in closely built towns. Local building materials play a great part in these variations, which are too numerous to be even catalogued here. The English manor house retains many of its mediæval features—its great hall and stairs irregular plan, kitchen wing, high gables, multiplied chimneys, garden front with terrace, and inclosed kitchen or servants' court. The modern German country house is more compactly built, but more irregular and picturesque, than the average modern French château, which since the time of Henry IV (1589-1610) has displayed a somewhat formal regularity, with a compact plan instead of an open or inclosed court. The American country house varies both with the region and the individual, the country houses of the very wealthy reproduce French, English, and Colonial types. Thus, Biltmore, in North Carolina, is a French château of the sixteenth century. The Colonial types are derived from the pre-Revolution and post-Revolution houses respectively, of the North in wood and of the South in brick, and these from the English Queen Anne and Georgian styles. In city dwellings we recognize four main types with many subtypes: (1) the French, built between the garden in the rear and the service court in the front, (2) the Italian and Spanish, built wholly around a court, or patio, (3) the mansion, isolated in its garden or set upon the street with the grounds on the other three sides, (4) the house in a block, as in Venice and in all north European and many American cities. This type is much subdivided according to the planning, arrangement of hall and stairs, position of kitchen and dining room, etc. Until about 1880 all American city houses in closely built towns were of almost

identical plan, with a basement, high stoop, narrow hall and straight stairs, and rooms at front, back and one side of hall. Great variety has replaced this dull uniformity.

Very interesting are the smaller rural and suburban houses of modern times especially in England, Germany, and the United States. Those of England are peculiarly interesting in exterior design, picturesque use of material and harmony with the landscape. In the United States wood has been the dominant material, and the piazza or veranda an essential feature of the design, the plans are irregular, the masses picturesque, convenience and personal comfort are sought everywhere. But with much that is admirable in these houses they have not yet attained that pervading charm that is noticeable in England. The Colonial type—rectangular, spacious, and dignified—is much seen in the smaller towns. Brick, concrete, and hollow tile are gradually replacing clapboards and shingles for the exteriors of American rural houses, the extreme inflammability of the wooden houses and the increasing price of lumber have stimulated this change. Half timber (qv) and brick are the chief materials in England, except in some districts where stone abounds and clay is scarce. On the continent of Europe city houses are of brick or stone, country houses almost universally of brick or rubble, stuccoed, except in Switzerland, parts of Russia, Sweden, and Norway, and Turkey, where wood abounds. The wooden mansions of the Bosphorus are extremely picturesque, and their planning is not unlike that of the Colonial mansions of the United States.

Bibliography. C. D. Daly, *Architecture prise au XIXe siècle*, series 1-3 (Paris, 1870-77). E. E. Viollet-le-Duc, *Story of a House*, translated by G. M. Towle (Boston, 1874), id., *Dictionnaire Raisonné de l'Architecture* (10 vols., Paris, 1876), id., *Habitations of Men in all Ages*, translated by Benjamin Bucknall (London, 1876), Charles Garnier, *L'Habitation humaine* (Paris, 1891), Russell Sturgis, *Dictionary of Architecture* (3 vols., New York, 1901), *Handbuch der Architektur* (Leipzig, 1911). See APARTMENT HOUSE, CASTLE, MANOR HOUSE, PALACE, also BUILDING and CARPENTRY, for American frame construction.

HOUSE ANT. The little red ant of households (*Monomorium pharaonis*), a species which has accommodated itself perfectly to the conditions of civilization. It nests in the walls of houses or in rubbish in cellars or old closets and feeds on all sorts of household stores. It becomes a great nuisance, not so much from the amount it eats as from its inordinate propensity for getting into things, especially sugar, sirup, and sweet substances generally. Careful watching will sometimes reveal the crack from which most of them come, and the nest may thus be found and destroyed. They may be trapped by thousands by a sponge moistened with sweetened water, which is daily relieved of its burden of ants by plunging it into scalding water. The cracks by which the ants enter storerooms and pantries may be plugged with cotton soaked

RED HOUSE ANT
a, female, b, worker,
in relative proportions

with kerosene, or the entire house may be fumigated with bisulphide of carbon or hydrocyanic acid gas. Directions for such fumigation are printed in circular form by the Department of Agriculture at Washington and are sent to all applicants free of charge. Two little black ants (*Monomorium minutum* and *Tetramorium cespitum*) are also found in houses, but nest outside. Consult Howard and Marlatt, *Principal Household Insects of the United States* (Department of Agriculture, Washington, 1906), and other publications of the department.

HOUSE-BOATING. The passing of the summer time, as a recreation, on what really is a flat-bottomed raft supporting a more or less extensive and luxurious suite of rooms, occupying the centre of the raft. Generally at each end of the house there is an open deck, and there is an open gallery along the sides, the top, which is railed round and covered by an awning, often forms an open court or garden. This manner of passing the summer holidays began about 1870 on the Thames, England. Today a hundred house boats are to be found on it, and a weekly paper is published, which gives the whereabouts of every such boat from day to day. Some of these boats are models of beauty in decorations and fittings, and veritable floating palaces of luxury and fashion. They are either poled from point to point or towed from the path by a horse or else by an auxiliary launch. The proximity of riverside villages and inns precludes the necessity of giving up much of the internal space to stores.

American conditions are so different as to need a much greater variety of treatment, and in every section of the country house-boating is popular. House boats are abundant on the Pacific coast, and the Mississippi system is dotted with them wherever a great city forms the necessary social nucleus. On the St. Lawrence and Lakes George and Champlain they are a summer feature, and the neighborhood of New York is especially favorable to them. In the Florida waters are some of the largest ever built, as well as many of the humbler and truer kind.

House boats may be divided into three classes—those which simply float and are moved from place to place by towing, those which move from place to place under sail, and those which move under their own power. Consult A. B. Hunt, *House Boats and House Boating* (New York, 1905), F. W. and C. Hutchins, *Houseboating on a Colonial Waterway* (Boston, 1910), also various magazine articles, such as Lord, "How to Build a Houseboat for \$300," *Scientific American*, May 14, 1910, Wainstall, "A Commuter's House Boat," *Country Life in America*, May 1, 1911, White, "A Year-Round Houseboat," *Country Life in America*, Dec. 1, 1911.

HOUSEBOTE. In English law, the right of a tenant for life or years to take from the land sufficient timber to keep the buildings on the place in repair. Housebote belongs to the class of ancient tenant rights, dating back, it would seem, to the Anglo-Saxon period, now generally known as estovers. They constituted a class of exemptions from the law of waste which severely restricted the right of a tenant for life or years in his enjoyment of the lands held by him. These rights still exist in the United States as well as in England. See ESTOVER; LANDLORD AND TENANT, WASTE.

HOUSEBREAKING. See BURGLARY.

HOUSE CENTIPEDE. A myriapod with very long legs and long antennae, which is numerous in the Southern States and brightly colored. It haunts houses and is feared by ignorant persons as poisonous, but is harmless and really beneficial, as it feeds on small insect vermin. It is the only representative in the United States of the chilopodous family Cermatidae, and is named *Scutigera forcipes*. Consult Howard and Marlatt, *Principal Household Insects of the United States* (Washington, 1906). See MYRIAPODA.

HOUSE CRICKET. See CRICKET.

HOUSE FINCH, or LINNET. A small finch (*Carpodacus mexicanus frontalis*) very common throughout California, Arizona, and northern Mexico, and familiar in all valley towns and rural gardens, where it is welcome for its beautiful plumage and exceedingly sweet, canary-like song, heard throughout the year. It is related to and resembles the purple finch of the Eastern States,

but is smaller and tinner. The head and breast of the male are a rich red-wine color, varying from carmine to crimson, and the remainder of its plumage a mixture of reds, soft grays, and browns, the females and young have no red, and in winter the colors are less bright than in early summer. This finch makes its nest normally in trees, but now also occupies holes and crannies about houses and buildings, where it is never disturbed by the people, although much harassed by swallows in competition for desirable quarters. The eggs are pale blue, sparingly marked with dark lines and dots about the large end. Other names for this bird are adobe finch, red-headed linnet, and burnion. Consult Bergtold, "A Study of the House Finch," in *The Auk*, xxx (Cambridge, Mass., 1913).

HOUSE FLY (*Musca domestica* L.) An insect belonging zoologically to the order Diptera, or two-winged flies. It belongs to a very large group containing a number of families and species which closely resemble it in appearance. House flies breed and are found largely outside of houses, and conversely other flies of allied families are found within domiciles which are not the true *Musca domestica*. A true house fly is distinguished from the Sarcophagidae by having four black lines instead of three on the back of its thorax. The Tachinidae also possess four black lines, but they have the bristles of the antennae smooth, whereas the house fly has

HOUSE CENTIPEDE

them feathered. From the Anthomyiæ it is distinguished by a bent vein near the tip of the wing. In addition to this characteristic *Musca domestica* possesses no bristles on the abdomen except at the tip. The house fly breeds in fermenting organic matter, preference being given to horse manure, although the eggs will be deposited on the excreta of almost any animal. The larvæ have been found in decomposing garbage, vegetable waste, kitchen slops, decayed meat, animal hair, and chicken feathers, and even in snuff, but, most important of all, they are found in abundance upon human excreta, upon which the fly feeds as well as deposits its eggs. It is often referred to as the typhoid fly, its habits in the above respect favoring the dissemination of this disease. House flies have been accused by various observers with the dissemination of a long list of diseases, including cholera, dysentery, diphtheria, erysipelas, contagious ophthalmia, cerebrospinal meningitis, anthrax, and possibly smallpox. The evidence in regard to typhoid is conclusive. It is believed to be most active in spreading diarrheal affections, such as cholera morbus, dysentery, summer diarrhoea, paratyphoid and typhoid fever. Torrey in 1912 found, by observing the flies in New York City during the warm months, that they were only mildly infected with disease germs in the spring, but as the summer advanced the bacterial count steadily increased.

Life Cycle. Depending largely upon conditions of heat and moisture, the duration of the life cycle of the domestic fly varies from 10 to 15 days. According to Hewitt, the minimum rate of growth in the various stages is as follows: eggs, eight hours, the first larval stage, 20 hours, second larval stage, 24 hours, third larval stage, three days, pupa, three days, a total of eight days and four hours. The rate of generation based on the climatic conditions in Washington, D. C., assuming that all eggs survive, is astonishing. A single female laying 120 eggs on April 15 would have descendants by September 10 to the number of 5,598,720,000,000. This calculation is based only upon one batch of eggs, whereas there is a possibility of four such layings from a single fly. The house fly has a keen sense of smell, and its first impulse on issuing from the pupal inclosure is to seek warmth and food, it flies from its filth heap unerringly towards the nearest kitchen. It feeds on a variety of food and is apparently equally fond of the milk jug, the slop bucket, garbage can, or filth heap, passing freely from one to the other and distributing on its way many varieties of bacteria which cling to its feet. Its intestinal canal is comparatively simple, and pathogenic bacteria and other microorganisms pass unchanged through it and thus find another method for distribution. The digestive fluids are very weak, and the insect absorbs merely those substances which are readily soluble in them. Although the fly is capable of traveling at great speed and for long distances, Hewitt is of the opinion that normally they do not migrate very far from their place of origin. The facts in regard to the life history of the fly make it a comparatively simple matter to deal with the problem. Measures urged by boards of health throughout the country are to destroy all possible breeding places of the insect and to keep garbage cans and other refuse receptacles screened and to destroy by traps or otherwise all flies that can be

caught, particularly in the early part of the summer. The fly has many enemies. It is readily attacked by fungous and parasitic diseases, by certain microscopic protozoa, one species known as *Heptemonas musca domestica* being most active, nematode or thread, worms are active enemies. The mite called *Atomus parasiticum* attacks it. Besides these spiders of many varieties, the house centipede, the false scorpion, and ants may be mentioned among the natural enemies of the house fly. The common toad feeds upon flies and will catch enormous numbers. domestic poultry feed with avidity upon the larvæ, many lizards and a certain species of rat feed largely upon flies. Birds, on the other hand, play very little part in the destruction of this pest. Consult Hewitt, *The House-Fly. A Study of its Structure, Development, Bionomics, and Economy* (Manchester, England, 1910), id. *House Flies and How they Spread Disease* (New York 1912), L. O. Howard, *The House-Fly—Disease Carrier* (ib., 1911), and references there given, id., *House Flies* (Washington, 1911), C. V. Chapin, *The Source and Modes of Infection* (New York, 1912), W. E. Britton, *House Fly as a Disease Carrier and How Controlled* (Hartford, Conn., 1912), E. H. Ross, *Reduction of Domestic Flies* (Philadelphia, 1913). See also FLY, INSECTS, PROPAGATION OF DISEASE BY.

HOUSEHOLD, ROYAL (of Great Britain)

The personal attendants upon the reigning sovereign. Among all primitive Germanic peoples we find such attendants. The chief officers of the household are usually four in number: the steward, who is the head of the household, the marshal, or head of the royal stables, the cup-bearer, and the chamberlain, who has charge of the King's chambers. These four officers are found among the Anglo-Saxons and at the court of the Norman dukes. As the royal power developed, the household attendants became officers of state, and the King's household is his ministry. Under the Norman kings of England the royal household consisted of two sets of officers, whose functions greatly resembled each other. Foremost among them was the justiciar, the King's chief adviser and his representative in England when the King was abroad. The steward, whose most important functions of state passed over to the justiciar, remained head of the royal household. Other members were the treasurer, who had charge of the King's treasury, and the chamberlain, who audited the accounts, the constable, a sort of quartermaster-general of the court and the army, who had a seat in the exchequer, and the marshal, whose functions were similar. Some of these officers, viz., the steward, the constable, butler, and marshal, were hereditary in the great Norman families and either lost their importance or became merely household officers. Others which were appointed, like the justiciar, chancellor, and treasurer, became the important officers of state.

In the present organization of the royal household the lord steward is the chief officer. His authority extends over the treasurer, the controller, and the master of the household, and over all the other household officers and servants except those of the chapel, the chamber, and the stable. The dean and the subdean are the principal officers of the chapel, which is composed of a number of clerks and chaplains. The lord chamberlain controls the officers and servants of the royal chambers and appoints the trades-

men who are purveyors to the sovereign. The master of the horse is in charge of the royal stables and has under his charge the master of the hounds, the grand falconer, the crown equerry, and other servants. In the court of a female sovereign the ladies of the household play an important part. The mistress of the robes is the head of this department, and under her are the ladies of the bedchamber, maids of honor, and other attendants. The ladies of the bedchamber are the personal attendants of the Queen. Besides these there are a large number of physicians, surgeons, apothecaries, druggists, and dentists in attendance. The other members of the royal family have similar households, but on a much smaller scale.

The expenses connected with the royal household have varied greatly in the different periods of English history. In the Middle Ages the King was always attended by a large following of lords, both spiritual and temporal, besides knights, esquires, and other inferior attendants. He obtained provisions for his court by exercising the right of purveyance (*qv*), which has been abolished. Notwithstanding this, the expenses of the royal household often proved a burden to Parliament, which sometimes regulated them. This was most carefully done in the *Household Book* of Edward IV, which rigorously defined the officers of the household and the duties of its members. The expenses of the household of Edward IV were £13,000 a year, which may be taken as a fair average sum for the household expenses of a king during that period. Since the accession of William III Parliament has fixed the amount of the appropriation at the beginning of each reign. Queen Victoria received an allowance of £385,000 a year, distributed as follows: privy purse, £60,000, household salaries and retired allowances, £181,260, household expenses, £172,500, royal bounty, arms and special services, £18,200, leaving an unappropriated balance of £8040, to be used at discretion. The Prince of Wales received an annuity of £40,000 over and above his other revenues, the Duke of Connaught £25,000, and the other members of the royal family in proportion to their rank. By a grant of May 9, 1901, Parliament increased the Civil List to £415,000, the King's privy purse being increased to £110,000. See CIVIL LIST.

Consult *The Ordinances and Regulations for the Government of the Royal Household*, published by the Society of Antiquaries (London, 1790); Larson, *The King's Household in England before the Norman Conquest* (Madison, 1904); Round, *The King's Sergeants and Officers of State* (London, 1911).

HOUSEHOLD ECONOMICS. See HOME ECONOMICS.

HOUSEHOLD GODS (Lat. *di familiares*, or *di domestici*). Among the ancient Romans, the divinities supposed to watch over the house and the family. Thus, Vesta (*qv*) was the goddess of the hearth and guardian of domestic unity. But the name was applied especially to the *lares* (*qv*) and the *penates* (*qv*).

HOUSEHOLD SUFFRAGE. The form of the parliamentary franchise at present in force in Great Britain. It was established in the boroughs by the Reform Bill of 1867-68, which conferred the right of voting for members of Parliament on all adult male household owners or lodgers who were the occupants of a dwelling capable of bringing in a yearly rental of £10

and over. By the Franchise Bill of 1884 the right was extended to the inhabitants of the counties who possessed the same qualifications.

HOUSEHOLD TROOPS. Specifically, the term applies to those regiments of the British army which form the permanent garrison of the city of London, and whose especial duty it is to attend the sovereign. Details from these troops mount guard over the royal residences and important public buildings and institutions. The term includes the following troops: two regiments of the Life Guards (First and Second), the Royal Horse Guards, the first, second, and third battalions of Grenadier Guards, the first and second battalions of Coldstream Guards, the first and second battalions of Scots Guards, and the Irish Guards. The term "household troops" is frequently used by English and American writers to describe the élite regiments of Germany and other monarchical countries.

HOUSEHOLD WORDS. A weekly periodical, founded March 30, 1849, by Charles Dickens, who became its chief editor. The opening numbers contained a serial story by Mrs Gaskell *Hard Times*, and many of Dickens's minor stories, first appeared in it. It was discontinued in 1858 and was succeeded by *All the Year Round* (April 30, 1859).

HOUSE INDUSTRY. A form of industrial organization in which the workman labors at home for a manufacturer or contractor. It is to be contrasted, on the one hand, with the artisan organization of industry in which the master craftsman was his own business manager and produced for the needs of a local market and, on the other, with the factory organization with its groups of workmen cooperating under a common direction and division of labor. Historically it forms a transition from the former to the latter. It was the outgrowth of a widening market for goods and marked a change in the mercantile organization of industry which kept pace with and in many cases outstripped its technical progress. As a dominant form of organization, it marked especially the closing years of the eighteenth and early years of the nineteenth centuries, and while it still lingers in backward regions and even grows up anew under peculiarly favorable circumstances, it is in the main a thing of the past.

The characteristics of the system are the isolation of the worker's production by the crude processes of hand labor and the marketing of the product by third persons. The workman may in the first instance supply his materials, but the need of uniformity in the product soon brings it about that the latter are supplied to him, and he is paid at piece rates for the work he does upon them.

Such an organization can compete with factories only when the technical processes of production remain comparatively primitive. When complicated machinery and minute subdivision of labor are introduced into factory work, house industry is doomed. It has under such circumstances kept up for a time an unequal struggle in which long hours of labor and the assistance of the entire family marked the labor in the homes. Bad as were the conditions in the factories of England in the early part of the last century, their misery was exceeded by that of the poor hand workers with whom the factories competed.

The modern counterpart of house industry in

Great Britain and America is found in the sweating system. This system is most extensively employed in the garment trade, in which the mercantile transformation was later than in other lines of industry, and in which the relative scope of hand labor as compared with use of machines is very large. The textile industries and the manufacture of boots and shoes both passed through this stage. While spinning machines and power looms were yet primitive, the hand workers were able to maintain themselves for a while by working for others. In New England the factory system had its beginnings in the domestic occupations of the people. Throughout northeastern Massachusetts may still be seen about the farms ruins of small workshops where during the winter the farmers made shoes for the merchants of Lynn and Boston. Elsewhere in the State straw for the manufacture of hats was plaited by the women on the farms, and by men in the winter time. In Sweden and Russia such industrial occupation among the rural population is quite frequent. In central Europe house industry is far more extensive. The hilly region of central Germany, from the Thuringian to the Silesian mountains, is its peculiar home. See SWEATING SYSTEM.

HOUSE/LEEK', or LIVE-FOREVER (*Sempevivum*). A genus of plants of the family Crassulaceæ, the members of which have succulent leaves which generally form close rosettes. The common houseleek, or cyphel (*Sempevivum tectorum*), grows wild on the rocks of the Alps, but has long been common in almost every part of Europe, planted on walls, roofs of cottages, etc. It sends up leafy flowering stems of 6 to 12 inches in height, which bear branches of pale-red statelike flowers, equally curious and beautiful. The leaves, cut or bruised and applied to burns, insect stings, ulcers, and inflamed sores, afford immediate relief. They were formerly in high esteem as a remedy for fevers and other diseases, and an edict of Charlemagne contributed greatly to the extensive distribution of the plant. Other species possess similar properties. *Sempevivum globiferum*, with yellowish-green flowers, is very frequently planted on walls in Germany. Some of the species, natives of the south of Europe, the Canary Isles, etc., are shrubby, others are common greenhouse plants.

HOUSE/MAID'S KNEE. A term commonly applied to an acute inflammation of the bursa, or sac that intervenes between the patella, or kneecap, and the skin. Housemaids are especially liable to it from their kneeling on hard surfaces. It causes considerable pain, swelling, and febrile disturbance. The only disease for which it can be mistaken is acute inflammation of the synovial membrane lining the cavity of the joint, but in this disease the patella is thrown forward, and the swelling is at the sides, while in housemaid's knee the swelling is very superficial and is in front of the patella. The treatment consists essentially in the employment of rest, cold applications, and bandaging. Where the condition has become chronic, radical relief can be secured by the excision of the bursa or the injection of iodine. If suppuration occurs, the sac must be opened and the pus evacuated.

HOUSE MARTIN. See HOUSE SWALLOW.

HOUSE OF COMMONS. See GREAT BRITAIN, Government, PARLIAMENT.

HOUSE OF CORRECTION. See REFORMATORIES.

HOUSE OF FAME, THE. A poem by Chaucer, in three books, probably written in 1384. The influence of Dante is evident in the construction of the poem.

HOUSE OF KEYS. See MAN, ISLE OF.

HOUSE OF LIFE, THE. A century of sonnets by Dante Gabriel Rossetti, published among the *Ballads and Sonnets* in 1881. Some of the poems were reprints from the *Poems* of 1870.

HOUSE OF LORDS. See GREAT BRITAIN, Government, LORDS, HOUSE OF.

HOUSE OF THE FAUN (It *Casa del Fauno*). One of the largest and finest houses of Pompeii, famous for its sumptuous decorations. In it was discovered the statue of the "Dancing Faun," from which the house received its name. Its mosaics are the most beautiful that have been preserved to the present day. Among them, occupying the floor of the exedra, was discovered the celebrated mosaic of the Battle of Issus, showing Darius fleeing from Alexander, now in the Naples Museum, where the other mosaics belonging to the House of the Faun are also preserved. These include a representation of the creatures of the Nile, which formed the threshold to the Battle of Issus, the Genius of Autumn riding on a panther, doves pulling a necklace out of a jewel box, and other compositions.

HOUSE OF THE SEVEN GABLES, THE. A novel by Nathaniel Hawthorne, published in 1851. It is the story of a decayed New England family and deals with the heritage of evil which has been passed down to an inoffensive generation.

HOUSE SNAKE. See MILK SNAKE, MOCASIN SNAKE.

HOUSE, or "ENGLISH," SPARROW. This typical sparrow (*Passer domesticus*) is the most familiar fringilline bird of Europe and latterly of the whole civilized world. It is indigenous to Europe and in closely related subspecies to Asia, where it is only partly migratory and a constant attendant upon mankind. It was not known south of the Sahara, nor in Australasia, until the European colonization of those regions caused its introduction there, and since 1850 it has become a resident of both North and South America. Everywhere it flourishes, increases with amazing rapidity, and impresses itself upon the locality by its adaptability and pugnacity towards native birds. From the earliest times it has associated fearlessly with mankind and has been a denizen of towns more than of the country. This characteristic is most prominent in the new countries, where it clings at first to cities and later spreads along railroads and other highways to the interior towns. It remains everywhere a town bird, rarely visiting and never nesting in the wilderness. To this urban habit are due in large measure its extraordinary hardihood and prolificacy, for in town it can always find an abundance of food in the streets or about warehouses, railroads, etc. Consequently it is nearly independent of season in breeding and may rear several broods a year, moreover, its nests and fledglings are safe against nearly all the enemies and dangers which beset the lives of wild birds. The result is a longevity and a rapidity of multiplication which may speedily render the species a serious local nuisance. This is felt in the more populous parts of the Old World as

well as in the countries to which it has been transplanted and where it flourishes with aggressive vigor

While the sparrow seems able to eat all sorts of food, it is naturally graminivorous, and only when young or in feeding its young does this species consume insects in any considerable quantity. Its services to agriculture in this way are so limited in time and amount that they are insignificant, and more than overbalanced by its incessant attacks upon the smaller insect-eating birds, which otherwise would come freely about villages, orchards, and farmhouses. In the United States it has greatly lessened the number of such birds in some localities or at any rate has driven them away from villages and farmsteads—particularly bluebirds, wrens, and all sorts of swallows, whose nests it destroys or appropriates, but there is reason to believe that the native birds are learning more and more how to cope with this bandit. Moreover, in some districts, besides great destruction wrought to the buds of fruit trees, the sparrows annually migrate in summer in large companies to the grainfields and devour or shake down quantities of ripening grain. A third evil attributed to this bird is the spread of disease due to its propensity for using feathers and rags in the construction of the nest and for placing this nest upon or as near as possible to the house, since it may and frequently does gather these materials from infected clothing or bedding thrown out of sick rooms.

Introduction into America. The house sparrow was first brought to the United States from England in 1850 by Nicholas Pike and other directors of the Brooklyn Institute, when eight pairs were liberated in Brooklyn, N. Y., but a second importation in 1853 was needed to establish the race. Sparrows were brought in and colonized elsewhere during the next 20 years, in various parts of the country, including California, the city government of Philadelphia importing and letting loose in that city over 1000 pairs in 1869. The motive in most cases was to free the shade trees of devastating caterpillars, which about that time were especially numerous and annoying throughout the Eastern States. A few far-seeing persons protested, but were not listened to. Only a few years elapsed, however, before a mass of evidence was presented that the sparrows were of no practical service as insect destroyers and were an increasing nuisance and menace. The outcome of much discussion and writing was an exhaustive inquiry, conducted by the United States Department of Agriculture, the results of which, unfavorable to the bird, were published in 1889 in *Bulletin No. 1* of the Department, a document of 400 pages. Whether, as many believe, a balance will after a time be obtained, and these imported sparrows cease to be relatively more numerous and troublesome than native birds of the same nature, remains to be seen. The fact that the people of Great Britain make the same complaint as those of the United States against their prolificacy and destructiveness discourages this expectation.

Bibliography. T. G. Gentry, *House Sparrow at Home and Abroad* (Philadelphia, 1878), Elliott Coues, *Present Status of Passer Domesticus in America* (Washington, 1879), W. B. Barrows, *English Sparrow in North America, especially in its Relation to Agriculture* (ib., 1889), Newton and Gadow, *Dictionary of Birds*

(London, 1893-96) S. D. Judd, *Relation of Sparrows to Agriculture* (Washington, 1901).

HOUSE SWALLOW, or **HOUSE MARTIN.** The English name of the familiar European swallow (*Hirundo*, or *Chelidon, rustica*), which makes its mud nest about houses and barns, more often than otherwise in the interstices of farmhouse chimneys, so that it is also called chimney swallow (qv). It is widely distributed throughout the Old World and everywhere a familiar of civilization. See SWALLOW, and Plate of SWALLOWS.

HOUSE TAX. The duty laid on inhabited houses in Great Britain. This tax was first imposed by Act of Parliament in 1778 (18 Geo. III, c. 26) and was suggested by Adam Smith, in his *Wealth of Nations*, as a substitute for the unequal and obnoxious window tax which had been imposed on householders since 1696. The house tax has been continuously collected since, except for a brief period (1834-51) when it was suspended. It differs from the real-property tax, which is the universal basis of direct taxation in the United States, in two respects, viz, it is levied on the legal occupier and not on the owner of the premises, and it is based, not on the value of the real estate, but on the rental value of the house. Houses used exclusively for trade or other business purposes, houses that have a rental value of less than £20 per annum, unoccupied houses, and charity hospitals, charity schools, etc., are exempt from the tax. The question as to what is and what is not a house for the purposes of the act has given rise to much litigation. The results that have been reached betray some singular inconsistencies. Thus, it has been held that where a dwelling house is let in different stories, tenements, or lodgings to different people, it is to be charged as one house but, on the other hand, each set of chambers in the Inns of Court and each set of rooms in the colleges or halls of any university is treated as a separate house. See TAX, TAXATION.

HOUSE THAT JACK BUILT, THE. A nursery rhyme in *Mother Goose*. It relies for its interest on the accumulative manner in which it is told. Hallowell conjectures that its original was a Chaldean hymn or fable, in *Sepher Haggadah*, which is strikingly like the rhyme of *The Old Woman and the Crooked Shapence*.

HOUSING PROBLEM. The concentration of population in cities, resulting from the progress of modern industrialism, has given rise to serious evils connected with the housing of the poor. Scarcity of accommodations, coupled with high rents, has resulted in a degree of overcrowding and an exploitation of cheap and obsolete dwellings that threaten the physical and moral health of the working class.

The housing problem presents various aspects according to local conditions. In American cities, especially in New York, its chief feature consists in undue aggregation of population upon a limited area of ground, with the resultant tendency to occupy as much of the building space as possible with lofty structures, thus depriving the tenants of adequate light and air. In European cities, on the other hand, where building operations have been less active, the evil is manifested in the form of occupancy by several persons of apartments designed for one, with consequent menace to health and morals.

Previous to the nineteenth century little at-

tention was paid to the homes of the common people. The poor of the rural districts were generally housed in wretched hovels, but this, like the state of poverty, was assumed to be natural. Sporadic attempts to provide housing for certain limited classes have, indeed, been recorded. In the early seventeenth century Christian IV of Denmark erected what would then have been considered model dwellings for sailors of the royal navy, and a Portuguese noble founded at Lisbon, after the earthquake of 1759, a "workingmen's city," some vestiges of which still remain.

With the appearance of large industrial establishments in the nineteenth century, the housing problem became acute. Villages adjacent to the new factories were unable to provide satisfactorily for the influx of workers. The owners of factories were forced to erect buildings to house their workers. An early example of this kind of enterprise was the workmen's village erected by Legrand, a coal-mine owner, at Mons, Belgium, in 1818. The plan was widely adopted by employers and quickly degenerated into an auxiliary means of profit, the cheapest and most unsanitary cottages being provided at the highest possible charges. In 1833 another Belgian employer established at Verviers what may be considered one of the earliest model factory villages. Forty-three cottages, each with its garden, were erected at a cost of 100,000 francs. After 1850 the model factory village began to make its sporadic appearance in other countries as well. Much more frequent, however, was the appearance of the factory village designed to extract from the worker in rent as much as possible of his wages in return for accommodations unfit for habitation. Of the model village type are the Krupp villages (see KRUPP FOUNDRIES, SOCIAL WORK AT), erected to house the workers in the Krupp works at Essen, the buildings of Lever Brothers, Birkenhead, England, and the Pullman cottages at Pullman, Ill. (see PULLMAN). Other instances of the same type are numerous in all industrial states. They appear, as a rule, where a single powerful company occupies a dominating position in a small community. Necessity drives the employer to erect workmen's dwellings, and interest in a healthy and contented working force, as well as philanthropy, leads to an endeavor to supply the best practicable accommodations. Where stress of competition or the presence of a great body of low-standard labor intervenes, the same condition may produce some of the most frightful cases of overcrowding and sanitary neglect. The unsanitary factory village affords a problem still far from solution.

The housing problem at present most prominent in the public mind concerns overcrowding in the great cities. The problem is coextensive with modern industry. Investigations carried on in New York, Chicago, Berlin, London, Paris, and Stockholm tell the same story of a working population overcrowded in houses and tenements, with resultant weakening of health, prevalence of infectious diseases, and moral decay. In the United States the problem first assumed acute form in New York City. Agitation for public control of housing in New York began with a report by Dr. James H. Griscom, inspector of the board of health, submitted in 1842. No action was taken until 1864, when a council of hygiene and public health was organized. In

1867 the first law on the subject of tenements was enacted. Its provisions were hopelessly inadequate, and builders were practically free to follow their own devices until the Law of 1901 was enacted, after a prolonged agitation in which the most prominent part was taken by Jacob Riis (qv). This law, improved by successive amendments and efficiently enforced, has done much towards improving housing conditions in New York. It has not been possible to overcome all the worst consequences of the earlier period of license. As late as 1910 there were in New York City 1000 'dumb-bell' tenements, 20,000 houses in which most of the rooms were dark, 100,000 rooms without windows, and 1,000,000 persons with no facilities for baths in their homes. None the less the condition of the tenements has been notably improved. To this improvement must, at least in part, be credited the decline in the death rate from 20 per thousand in 1900 to less than 14 per thousand in 1914.

The regulation of housing in other cities received a great impetus from the New York Law of 1901. In 1904 a similar law was enacted in New Jersey, and by 1912 such laws had been enacted in six other States, applying for the most part only to large cities. In 1913, 82 cities in the United States and five in Canada had housing regulations in force.

American housing regulations include, as a rule, restrictions upon the percentage of lot area that may be covered by a building, requirements as to cubic content of each room intended for occupation and as to light and air, regulations as to plumbing, provision of safeguards against fire, such as the specification of fireproof or slow-burning materials for buildings above a given height, noncombustible stairways, fire escapes, etc. Such regulations may be enforced through the regular police, through a board of health, or through a special administrative organ like the Tenement House Commission of New York. The last method is essential to effectiveness.

In the case of buildings in existence at the time of the enactment of housing laws it is possible to make only limited improvements. On grounds of public safety and health an energetic administrative board can impose certain improvements, such as the provision of fire escapes, the cutting of windows in dark rooms, and the installation of proper plumbing. The serious evils of overbuilding in respect to area of lot and of improper construction cannot thus be reached.

The public regulation of housing in Great Britain began with the Act of 1875. Additional measures were enacted at almost every session of Parliament. At present the subject is regulated by the Public Health Acts of 1875 and 1891, the Housing of the Working Classes Act of 1890, amended in 1894, 1900, and 1903, and the Housing and Town Planning Act of 1909. The Public Health Act requires the local authorities to provide appropriate inspection of houses. The Housing Acts authorize the local governing bodies to demolish unsanitary buildings and to construct habitations for the working classes, or to encourage private enterprise in this work. Under this provision several cities have carried through extensive projects for the reclamation of slum areas. Unfit habitations have been demolished, and their places taken in some cases by open spaces and thor-

oughfares, in others by model tenements erected by the city and leased to working-class families. As compared with the American plan of exclusive reliance upon restrictions on private builders and owners, the British plan presents certain obvious advantages. A thorough reconstruction of an unsanitary quarter is possible under the latter plan, but not under the former. The results of the British plan have not, however, been wholly favorable. It has placed heavy burdens upon the city treasury, at the same time, since the city-built tenements occupy less ground area than the old tenements demolished and consequently house fewer persons, the process has resulted in an aggravation of overcrowding in adjacent tenement districts.

Serious attention has long been given to the housing problem in Germany. Restrictive measures of great minuteness, severely enforced, characterize most of the larger cities. The cities, like those of England, have authority to acquire real property, to demolish old buildings and erect new, or to encourage private enterprise in the provision of housing. In general, the policy of German cities has been not so much to reconstruct areas already developed as to develop new centres. While the municipalities frequently erect apartment houses and cottages at public expense, either to let or for sale, the prevailing method is to encourage cooperative societies or private individuals to erect buildings under appropriate restrictions. This encouragement takes the form of building loans from public or semipublic funds, such as municipal savings and public insurance funds. Rates on such loans are low, and provision is made for the gradual amortization of the loan through small additions to the interest payments.

Methods similar to the German are employed in Scandinavia, Austria-Hungary, and Italy. In this connection should be noted the Belgian plan of providing workingmen's trains, enabling the workers from the city to remove their residences to distant suburbs, where land is cheap. Coupled with provision for loans at low interest of semipublic funds, the workingmen's trains have given Belgium a far larger proportion of wholesome semirural dwellings than was to have been expected from its position as one of the most highly industrialized of modern nations.

Much attention has been given to private efforts to contribute to the solution of the housing problem. Two methods have been in vogue—one purely philanthropic, the other a combination of sound business and philanthropy. An early instance of the philanthropic method was the project of Octavia Hill, undertaken in 1864, with the financial support of John Ruskin. The plan was to secure unsanitary property by purchase, employ the sums received in rent to improve it, and eventually to use the funds thus accumulated to erect new and better buildings. The plan involved both improvement in the property and in the standard of housing of the tenant population. Similar methods have been employed sporadically in many cities of America and Europe. While they provide improved housing for a few, their effectiveness is limited to the original funds, which, since they are managed without a view to profit, are apt to become dissipated in time through some miscalculation.

The plan involving both philanthropy and business principles has had far greater success.

It is a well-known fact that much of the very worst tenement property, though ill adapted to its use, pays very high profits on the capital invested. Accordingly there would appear to be good reason for the belief that an enterprise operating on a considerable scale, erecting buildings with the utmost economy consistent with the requirements of comfort and sanitation, and limiting itself to a moderate scale of profits, could furnish good habitations as cheaply as, or even at a lower rate than, the owners of unsanitary shacks can furnish such habitations as they have. It is upon this principle that the most successful model housing projects have been based. Among these may be mentioned in England, the Metropolitan Association for Improving the Dwellings of the Industrious Classes (1841), which owns 14 estates in London and pays $4\frac{1}{2}$ per cent, the Peabody Donation Fund, which owns enormous blocks of tenements, the Improved Industrial Dwellings Company of London, founded by Sir Sidney Waterlow as the result of a successful experiment (1862), which endeavors to combine beauty and utility in large blocks, the Guinness Trust. In 1899 the Garden City Association, later organized as the Garden City Pioneer Company, Limited, was formed to provide suburban homes, with spaces reserved for gardening, for the city population. On the continent of Europe are the Berlin Mutual Building Company (1849) and other commercial and semiphilanthropic companies in different cities. In the United States A. T. White founded the Improved Dwelling Company of Brooklyn (1876), which has erected the Home Tower and Riverside buildings, the older buildings paying 10 per cent, the new buildings 5 or 6 per cent. Other New York enterprises are the Astral Apartments (Brooklyn) of Pratt Institute, Improved Dwellings Association, with model tenements at Seventy-first Street, paying 5 per cent, Tenement House Building Company, with property on Cherry Street. In Boston are the Harrison Avenue Estate, the Rufus Ellis Memorial Building, Cooperative Building Company (1871), and the Improved Dwelling Association (1885). In Philadelphia is the Theodore Starr Property. The City and Suburban Company of New York City was organized in 1896 as the outcome of the Improved Housing Conference. It aims to offer a safe investment returning 5 per cent and to provide the best accommodations for working people.

Under this head the most striking development is the Garden City movement, which seeks to solve the housing problem by removing city workers to suburban areas. By acquiring large tracts of land remote from the path of city development and providing adequate transportation facilities, all the benefits that would ordinarily accrue to the speculative landowner from improvements may be reserved to the occupier of the land. Model dwellings may be erected in adequate spaces and leased or sold to city workers at prices which, while affording a fair profit, are none the less much lower than those prevailing in the city. The Garden City movement is the outgrowth of Ebenezer Howard's book, *Garden Cities of Tomorrow*, published in 1898. In 1902 the Garden City Pioneer Company was organized. In 1904 the company purchased 3500 acres of land at Letchworth, 34 miles northwest of London. The land was laid out in small parcels by experts; two-thirds of

e land was retained in small farms. The number of houses that could be erected on one acre was limited to 12. Returns from the enterprise were limited to 5 per cent on the investment. The population resident in the Garden City exceeded 7500 in 1912. Enterprises of a similar character, but with the philanthropic element predominant, are Bournville and Portlough. The Garden City movement has aroused great interest in Germany. In 1909 the garden city of Hellerau, just outside of Dresden, was founded. One hundred and fifty cottages were erected in the first year of its existence, and as many the second year. The cottages are erected by cooperative building societies and are rented to members of the societies at from \$62 \$150 annually. Similar suburban garden cities have been founded at Karlsruhe, Nuremberg, and Munich. An American example of the movement is the community established at Forest Hills, L. I., by the Russell Sage Foundation.

Important as philanthropic efforts at housing reform really are, it is easy to exaggerate their influence upon the general housing situation according to estimates of Veiller, in the years 1902-1908, 25 groups of tenements, accommodating 3588 families, were erected in New York under philanthropic auspices. 27,100 tenement houses, accommodating 253,510 families, were erected by speculative builders. In the years 1902-08 the philanthropic enterprises provided accommodations for 1871 families, while speculative enterprise provided for 253,235 families. It is obvious that even a slight improvement, imposed by public authority upon the mass of speculative builders, may contribute more to the solution of the general housing problem than the aggregate of philanthropic endeavor. American students of the housing problem accordingly concentrate their efforts upon improving the housing regulations and securing their efficient administration.

HOUSMAN, ALFRED EDWARD (1859-) An English Latin scholar, an elder brother of Laurence Housman. He was educated at St John's College, Oxford, was a division clerk in the Patent Office in 1882-92, and, after being professor of Latin at University College, London, from 1892 to 1911, was made professor of Latin at Cambridge and fellow of Trinity College. He wrote *A Shropshire Lad* (1896, music by C. F. Manney 1914) and edited two books of Manilius (1903 and 1912) and selections from Juvenal (1905), besides publishing articles in classical periodicals.

HOUSMAN, LAURENCE (1867-) An English illustrator and author, brother of Alfred Edward Housman (qv). He began his career, after studying art at South Kensington, as a book illustrator, working somewhat in the Pre-Raphaelite tradition, in which capacity he is seen to advantage in his designs for Meredith's *Jump to Glory Jane* (1892), Christina Rossetti's *Goblin Market* (1893), *Werewolf* by his sister, Clemence Housman—who engraved his designs on wood—and Shelley's *Sensitive Plant* (1898). As a poet, one thinks of him in connection with Rossetti, whose influence is felt in his mysticism and in the technique of his verse, as will be seen in such representative poems as those collected in *Spikenard* (1898), *Mendicant Rhymes* (1906), and in *Selected Poems* (1909). As a writer of tales of a symbolical and allegorical cast, he is perhaps at his best in *All Fellows* (1896), *The Blue Moon* (1904), and *The Cloak of Friendship* (1905), as a biting if cheerful satirist, in story form, of the England of his day, in *John of Ingallow* (1912), and as a novelist, in the finely written *An Englishwoman's Love Letters* (1900), in *A Modern Antæus* (1901), and in *Sabrina Warham* (1904), probably his strongest novel. His *The Royal Runaway* appeared in 1913. In 1902 his *Bethlehem*, an attempt to recapture the homely, naïve piety of the old miracle play, was performed in London. Other dramatic pieces of his are the modern paraphrase of *Lysistrata* (1910) and the quaint and engaging *Prunella, or Love in a Dutch Garden* (1911, 1914), written in collaboration with Granville Barker, and played in London in 1904 and in New York in 1913. Housman identified himself actively with the militant suffrage movement.

HOUSSA. See HAUSA STATES.

HOUSSAYE, JOSÉ, ARSÈNE (1815-96). A French author, born at Bruyères. His real name was Housset. He went to Paris at an early age and at 21 became widely known as the author of two romances, *La couronne de bluets* and *La pécheresse*. He attracted attention particularly as an art critic, publishing his *Histoire de la peinture flamande et hollandaise* in 1846. In 1849 Houssaye was appointed director of the Comédie Française, at the suggestion of Rachel, and held the place until 1859. He was long editor of *L'Artiste* and for some years was editor and proprietor of *La Presse*. Among his works are, in addition to those already named *Mlle de la Vallière et Mme. de Montespan* (1860) and *Galerie de portraits du XVIIIe siècle* (1844), historical studies, *Le roi Voltaire* (1858) and the well-known and

entertaining *Histoire du quarante et unieme fauteur de l'academie française* (1855), both volumes of literary criticism, his play, *Comédiennes* (1857); *Symphonie des vingt ans* (1867) and *Cent et un sonnets* (1873), poems, *Les filles d'Ève* (1852) and other novels. Consult his *Confessions* (4 vols, Paris, 1885-91), and Ernest Lemaitre, *Jérôme Houssaye Notes et souvenirs* (Rheims, 1897), which latter contains a good bibliography.

HOUSSAYE, HENRY (1848-1911) A French historian and critic, born in Paris. He distinguished himself in the Franco-Prussian War and was subsequently an editor of the *Journal des Débats* and the *Revue des Deux Mondes*. His *Histoire d'Alcibiade et de la république athénienne depuis la mort de Périclès jusqu'à l'avènement des trente tyrans* (1873) received from the French Academy the prize established by Thiers. In 1894 he was elected to the Academy. His further works include *Histoire d'Appelles* (1867), *L'Armée dans la Grèce antique* (1867), *Athènes, Rome, Paris* (1879), *L'Art français depuis dix ans* (1882), *Aspasie, Cléopâtre, Théodora* (4th ed, 1890). He made a careful study from the original documents of the fall of Napoleon and of the First French Empire. The results are embodied in two works of the first importance. 1814, *Histoire de la campagne de France et de la chute de l'empire* (1888), which went through some 46 editions, and 1815, comprising three parts, of which *La première restauration, le retour de l'île d'Elbe, les cent jours* appeared in 1893, *Waterloo* in 1899, and *La seconde restauration, la ténacité blanche* in 1905. In 1903 he published *Napoléon homme de guerre*. He was an Officer of the Legion of Honor and an honorary president of the Society of Men of Letters. Consult Louis Sanolet, *Henri Houssaye Biographie critique avec notes et bibliographie* (Paris, 1905).

HOUSTON, hū'stən A city and the county seat of Harris Co., Tex., on Houston Ship Channel, an arm of Galveston Bay, at the head of navigation, 48 miles northwest of Galveston, on the International and Great Northern, the Gulf, Colorado, and Santa Fe, the Texas and New Orleans, the Missouri, Kansas, and Texas, the Houston and Texas Central, and several other railroads (Map Texas, E 5). It is a railroad centre of great importance, and improvements on the channel by the Federal government at a cost of \$2,500,000 have added to its transportation facilities by giving direct water communication with the Gulf of Mexico and the Atlantic Ocean, while local transit is facilitated by several bridges across the channel. The area of the city, which was about 16 square miles, was increased by annexation in 1914 to over twice that amount. It has the Houston Lyceum and Carnegie libraries and a large city hospital. Other prominent structures include the municipal auditorium (costing \$400,000), the new South End Junior High School (\$1,000,000), Union Station (\$5,000,000), the United States government building, the city hall, the courthouse, the cotton exchange and market, and the Masonic Temple. The William M. Rice Polytechnical Institute (coeducational), endowed with the estate of the founder, amounting to \$10,000,000, is situated in Houston. The city controls extensive commercial and financial interests; it is one of the most important cotton markets in the United States, and in its lumber trade ranks with the leading cities of the South-

west. Cottonseed oil, rice, and sugar are also exported, and a large general trade contributes to the city's prosperity. There are extensive railroad car and machine shops, cotton compresses and oil mills, planing mills, foundries and machine shops, rolling mills, potteries, brick and tile works, flour mills, carriage and wagon shops, etc. Iron and lignite are found in the vicinity. The government, under a charter of 1905, is vested in a municipal commission, consisting of a mayor and four commissioners, chosen from the city at large every two years. The water works are owned by the municipality. Houston spends annually in maintenance and operation \$2,717,000, the principal items of expenditure being \$430,000 for schools, \$172,000 for the street department, \$171,000 for the fire department, \$193,000 for the police department (including amounts for courts, jails, reformatories, etc.), \$135,000 for maintenance of water works, and \$63,000 for the health department (including amounts for charitable institutions). Houston was laid out and settled in 1836, was named in honor of Gen. Sam Houston, and in 1837-39 and 1842 was capital of the Republic of Texas. Pop., 1890, 27,557, 1900, 44,633, 1910, 78,800, 1914 (U. S. est.), 93,122.

HOUSTON, DAVID FRANKLIN (1866-). An American public official, born at Monroe, Union Co., N. C. He graduated from South Carolina College in 1887 and from Harvard University (A. M.) in 1892, and received the honorary degree of LL. D. from Tulane (1903), the University of Wisconsin (1906), Yale (1913), and Harvard (1914). He taught ancient languages at South Carolina College in 1887-88, was superintendent of Schools at Spartanburg, S. C., in 1888-91, and served as adjunct professor (1894-97), associate professor (1897-1900), and professor of political science (1900-02) at the University of Texas, where he was also dean of the faculty (1899-1902) and president in 1905-08. In 1902-05 he was president of the Agricultural and Mechanical College of Texas, and he served as chancellor of Washington University, St. Louis, from 1908 until his appointment in 1913 as Secretary of Agriculture in President Wilson's cabinet. He became vice president of the American Economic Association in 1914. He published *A Critical Study of Nullification in South Carolina* (1896).

HOUSTON, EDWIN JAMES (1847-1914). An American electrical engineer, born at Alexandria, Va. He graduated from the Central High School, Philadelphia, where he afterward taught physical geography and natural philosophy. In Philadelphia, also, he was professor of physics at Franklin Institute and at the Medico-Chirurgical College. He was one of the inventors of the Thomson-Houston system of arc lighting, was a member of the United States Electrical Commission, and was chief electrician of the International Electrical Exposition at Philadelphia in 1884. In 1893-95 he served as president of the American Institute of Electrical Engineers. His publications include *Elements of Physical Geography* (1878, 9th ed., 1909), *Dictionary of Electrical Word Terms and Phrases* (1889; 4th ed., 1898), *Arc Lighting* (1897; 1906); *Electricity in Every Day Life* (3 vols, 1904), *Wonder Book of Magnetism* (1908), *The Land of Drought* (1910), *Born an Electrician* (1912).

HOUSTON, SAM (1793-1863). An American

soldier and political leader—a leader, with Stephen F. Austin, in the movement which gained Texas independence from Mexico and a conspicuous figure in the early history of Texas as a State. He was born near Lexington, in Rockbridge Co., Va., March 2, 1793, of Scotch-Irish parentage. After his father's death, in 1806, the family emigrated to Tennessee, where he entered an academy, but left to try a clerkship in a store and, wearying of this, went to live among the Cherokees of east Tennessee. He remained with them three years, when he returned to civilization and taught school. His own opportunities for obtaining an education were scant. In 1813 he enlisted as a private in the United States army, served bravely in General Jackson's campaign against the Creeks, being wounded at Tohopeka, and soon rose to be lieutenant. In 1817 he was appointed agent to aid in negotiations with the Cherokees, incurred the criticism of the War Department, of which John C. Calhoun was Secretary, for attempting to prevent the smuggling of negroes from Florida into the United States, resigned his commission, 1818, and began the study of law at Nashville. He soon opened an office at Lebanon, was made adjutant general of the State in 1819 and major of the State militia. He was elected to Congress in 1822, was re-elected in 1824, and in 1827 was elected Governor by the Jackson Democrats. In January, 1829, he married Miss Allen, a Tennessee lady, but three months afterward left her and, resigning his office without giving either public or private reasons for his course, went to live among his old friends the Cherokees, who had emigrated to Arkansas, and was formally adopted a member of their nation. He championed their cause before Congress, incurring by this much enmity, especially from the "Indian ring," and becoming involved in an encounter with William R. Stanberry, Representative from Ohio, who had accused him of fraudulent attempts to obtain a contract for Indian rations. For beating Stanberry he was reprimanded in the House of Representatives and was tried and fined, but President Jackson remitted the fine. Between Jackson and Houston there existed an unbroken friendship. The incident served to give Houston once more a national notoriety.

Visiting Texas in December, 1832, he was invited to settle there and become the leader of the American colonists in their struggle for their rights. He complied and was elected a delegate to the convention held April 1, 1833, to form a State constitution and seek membership in the Mexican Republic, separate from the State of Coahuila, with which Texas had hitherto been joined and in which the anti-American party was predominant. The rejection of the constitution and the attempt to disarm the Americans led to open warfare, and Houston was then chosen general of the military district east of Trinity River and soon afterward commander in chief of the Texan army. At the head of a small force of undrilled volunteers he led in the military movements which resulted in the defeat of Santa Anna on the San Jacinto, April 21–22, 1836, and in the independence of Texas. His force numbered less than 800, the great majority of whom were old settlers, while the Mexicans had about 1600. In September he was elected President of Texas, succeeding David G. Burnett, the first president

of the Republic, and from 1841 to 1844 he served again, succeeding M. B. Lamar. Texas having been admitted as a State of the American Union in 1845, Houston was chosen one of its representatives in the Senate from 1846 to 1859. In 1859 he was again elected Governor of Texas but opposed secession in 1861 and refused to take an oath of allegiance to the Confederate States, for which, on March 18, 1861, he was declared deposed. Both as Governor and as Senator he upheld the rights of the Indians. He retired to Huntsville, Tex., where, on July 23, 1863, he died. Consult W. C. Crane, *Life and Select Literary Remains of Sam Houston* (Philadelphia, 1884); Henry Bruce, *Life of General Houston* (New York, 1891), in the "Makers of America Series"; A. M. Williams, *Sam Houston and the War of Independence in Texas* (Boston, 1893); R. M. McElroy, *The Winning of the Far West* (New York, 1914). See TEXAS.

HOUSTON, hous'ton WILLIAM (1844–) A Canadian educator and journalist, born at Lanark, Ontario, and educated at Toronto University. He was early a reporter and an editorial writer for the Toronto *Globe* and later an editorial writer on the St. John (New Brunswick) *Daily Telegraph* and the Toronto *Liberal*. In 1883–92 he was librarian of the Ontario Legislature, in 1887 member of a commission to investigate foreign municipal systems, in 1892–99 director of teachers' institutes for Ontario, and later up to 1904, public-school inspector for Algoma and Manitoulin districts. In 1906 he was lecturer on Canadian constitutional history in Toronto University. He afterward became an editorial writer on the *Globe*. He contributed largely to educational and other journals, lectured on historical subjects before university extension classes, and edited *Documents Illustrative of the Canadian Constitution* (1891).

HOUTMAN, hout'man, CORNELIS (?–1599) A famous Dutch traveler and founder of trade with the East Indies, born at Gouda in the middle of the sixteenth century. He went on a trading voyage with his brother, Frederik, to Lisbon in 1593, where he was thrown into prison. Released by a friend, he studied the Portuguese routes to the Far East and, returning with charts to Amsterdam, organized an expedition which sailed in four ships out of the Texel (1595). He rounded the Cape of Good Hope, passed through the Strait of Sunda to the south coast of Java, and returned safely to Holland in 1597, having demonstrated an easy route to the Spice Islands. This voyage was followed by many others and led to the formation of the Dutch East India Company. In a second expedition of two ships in a conflict with the natives of Achin, assisted by the Portuguese, he was killed—His brother, FREDERIK (1570–1627), navigator of his fleet, also played an important part in the opening of the East to trade and commerce. In 1598 he was taken prisoner by the King of Achin, but, having been freed by Paulus van Caerden, he reached Holland in 1601; in December, 1603, he went again to the East Indies and in 1605 was made Governor of Amboyna, in 1618 of the Moluccas and in 1625 was honored with a gold medal for having opened the treasures of the East to Dutch enterprise. Almost as great as his exploits in war and commerce and explorations were his linguistic attainments. Having learned

the Malay language during his captivity in Achin, he opened the Malay languages to European study. In 1603 he published a dictionary with grammatical notes of Malay and Madagascar, with comparison of many Arabic and Turkish words, which work was republished in 1680 as a grammar and dictionary of Dutch and Malay. In 1880 bronze statues of the brothers Houtman were erected at Gouda, from models by Stiackee of Amsterdam. See EAST INDIA COMPANY (*Dutch*), with bibliography.

HOUYHNHNMS, hōw-in'mz or hōw-in'mz. An imaginary nation of horses, of highly advanced civilization, gifted with reason and without passions, which Gulliver visits, in the fourth part of Swift's *Gulliver's Travels*. Their nature is supposed in the story to be as far superior to that of humanity as it is inferior in actual life.

HOVE. See MADAGASCAR, *Ethnology*.

HOVE, hōv. A municipal borough in Sussex, England, on the English Channel, west of and adjacent to Brighton. The sea wall of Brighton continues into Hove and forms part of the famous promenade. Hove has all the characteristics of its larger neighbor—handsome streets, avenues, squares, public buildings, parks and recreation grounds, maine walk, and baths. It is lighted with electricity. It maintains a free library, with news room, lending and reference departments. It was incorporated in 1898 with a mayor, 10 aldermen, and 30 councilors. Pop., 1901, 36,535, 1911, 42,173.

HOVEDEN, hūv'den or hōv'den, or **HOWDEN**, ROGER OF (?-c 1201). An English chronicler, born probably at Howden in Yorkshire. He was clerk in the household of Henry II and was employed by him on various missions. He was appointed an itinerant justice for the forests of Cumberland, Northumberland, and Yorkshire in 1189 and is supposed to have retired to Howden to write his *Cronica*. This begins with the year 732. Most of the work is copied, but from 1192 to 1201 is in his own writing and has a certain value. The *Cronica* was edited by Bishop Stubbs (4 vols., 1863-71). An English translation by Riley was published in London in 1853 in the *Bohn Library* and is still in print.

HOVELACQUE, ōv'-lak', ALEXANDRE ABEL (1843-96). A French linguist and anthropologist, born in Paris. He was a pupil of Chavée in languages and of Broca in comparative anatomy. In 1876 he was one of the founders of the *Ecole d'Anthropologie*, in which he was made professor of linguistic ethnography, and of which, after the death of Gavarret, he became director (1890). In spite of his scientific interests he took an active part in politics as an extreme Republican. From 1888 to 1890 he was mayor of Paris. His works include *Mélanges des linguistique et d'anthropologie* (1889), with Emile Picot and Julien Vinson, *Les races humaines* (1882), *Précis d'anthropologie* (1887), with G. Hervé. In 1886 Hovelacque and Chavée founded the *Revue de Linguistique*.

HOVEN. See BLOAT.

HOVENDEN, THOMAS (1840-95). An American genre painter, born in Dunmanway, Ireland. He studied first in Cork, in New York at the National Academy of Design, having come to America in 1863; and in Paris for six years with Cabanel. He became a member of the National Academy in 1882. His French paintings picture life in Brittany, among them

are "A Brittany Woman Spinning," "News from the Conscript," "Loyalist Peasant Soldier of La Vendée," "A Breton Interior, 1793." Two of his American subjects are in the Metropolitan Museum, New York—"Jerusalem the Golden" and the "Last Moments of John Brown," his only historical picture. His studies of negro life, begun soon after his return from France, are excellent. Typical of his latest and best work is "Breaking Home Ties," a country boy leaving home to make his fortune. The story is told clearly and beautifully, and the sentimentings true.

HOVEY, hūv'i, ALVAN (1820-1903). An American Baptist theologian. He was born at Greene, N. Y., and graduated at Dartmouth in 1844 and at Newton Theological Institution in 1848. After a year spent in the ministry he returned to Newton Centre as a teacher, became professor of Church history (1853), of theology and Christian ethics (1855), and was president from 1868 until 1899, and afterward was professor of apologetics. Among his works are *The State of the Impenitent Dead* (1858), *The Scriptural Law of Divorce* (1866), *Manual of Christian Theology* (6th ed., 1900), *Systematic Theology and Christian Ethics* (1877), *Biblical Eschatology* (1888), *Studies in Ethics and Religion* (1892), *Christian Teaching and Life* (1895).

HOVEY, ALVIN PETERSON (1821-91). An American soldier and public official. He was born at Mount Vernon, Ind., attended the common schools, studied law, was admitted to the bar in 1843, and served successively as a circuit judge, judge of the Supreme Court, and United States district attorney. At the outbreak of the Civil War he was appointed major of Indiana Volunteers and later became major general. The battle of Champion's Hill in 1863, which Grant considered the turning point of his Vicksburg campaign, was won largely through General Hovey's efforts. When the war terminated, he returned to his native State and took an active part in politics. He became Minister to Peru in 1866, a member of Congress in 1886, and from 1888 until his death was Governor of Indiana. In 1888 Governor Hovey was elected president of the Service Pension Association of the United States.

HOVEY, CHARLES MASON (1810-87). An American horticultural editor and nurseryman, born at Cambridge, Mass. He edited the *Magazine of Horticulture*, which prospered under his management longer than any other American horticultural journal. He was the first to introduce a pistillate strawberry, the Hovey—the variety that marks the beginning of profitable strawberry culture in the United States. His *Fruits of America*, of which two volumes only were completed, is one of the best examples of art fruit work attempted in this country.

HOVEY, EDMUND ORIS (1862-) . An American geologist, born at New Haven, Conn. In 1884 he graduated from Yale University (Ph.D., 1889), and he also studied at the University of Heidelberg (1890-91). He taught in Minnesota and Connecticut schools, assisted on the United States Geological Survey in 1890 and in 1901-06, had charge of the Missouri mineral exhibit at the Chicago Exposition in 1892-93, and was assistant curator (1894-1900), associate curator (1901-10), and curator after 1910 of the geological department of the American Museum of Natural History. He

published *Martinique and St Vincent* (1902) and papers dealing with vulcanology, seismology, and meteorology

HOVEY, RICHARD (1864-1900) An American poet, born at Normal, Ill. He was graduated at Dartmouth in 1885, studied for one year in the General Theological Seminary, New York, was for a time assistant in the church of St Mary the Virgin, New York, and afterward journalist, actor, dramatist, poet, and lecturer on English literature in Barnard College, New York. He passed some years in Europe and was much influenced by French and Belgian poets, especially Maeterlinck, some of whose work he translated. His original verse was always marked by high aims and grew in grace and power. His untimely death closed a career of exceptional promise. His *Launcelot and Guenevere*—a series of dramas comprising *The Quest of Merlin*, *The Marriage of Guenevere*, and *The Birth of Galahad* (1880-98)—and *Talesin A Masque* (1900), though they scarcely show dramatic mastery, exhibit lyrical power and remarkable imagination. *Seaward* (1893) is an elegy upon T. W. Parsons (qv). Hovey also collaborated with Bliss Carman (qv) in *Songs from Tagabondia* (1893, two later series, 1896, 1900) and published a collection of his miscellaneous poems in *Along the Trail* (1898). In 1908 appeared *To the End of the Trail*, a volume of poems edited by his widow. In these works he showed that he could touch the more immediate and ordinary human interests, but these are, on the whole, not emphasized in his work, which is romantic and idealistic. Consult J. B. Rittenhouse, *Younger American Poets* (Boston, 1904).

HOW, WILLIAM WALSHAM (1823-97) An English prelate, born at Shrewsbury. From Oxford he received the degree of B.A. in 1845 and M.A. in 1847, and after holding several curateships became rector of Whittington, Shropshire (1851), which position he held until he went to the parish of St Andrew Under-shaft in London (1879). In that year he was appointed Suffragan Bishop of Bedford and a year afterward Bishop of Wakefield. He was well known as a devotional writer. His numerous works in prose include *Private Life and Ministration of a Parish Priest* (1873), *Commentary upon St John* (1879), *The Papal Claims in the Light of Scriptural History* (1881), and some *Pastoral Lectures* (1883). He also wrote some *Poems* (1886) and *Hymns* (1886).

HOWADJI, hou-ä-j'i A nom de plume of George William Curtis.

HOWARD A city and the county seat of Elk Co., Kans., on the Elk River, 76 miles south of Emporia, on the Atchison, Topeka, and Santa Fe Railroad (Map: Kansas, F 7). Farming and stock raising are the leading industries. The gas and electric-light plants are owned by the city. Pop., 1900, 1207, 1910, 1163.

HOWARD. A noble English family, which for many centuries has stood at the head of the English peerage and has held the Dukedom of Norfolk since the middle of the fifteenth century. The earliest of the house to gain distinction was Sir William Howard, a learned Chief Justice of the Common Pleas under Edward I and Edward II. His grandson, Sir John Howard, was admiral and captain of the King's navy in the north of England and also sheriff of Norfolk, in which county he held extensive

estates, subsequently increased by the marriage of his grandson, Sir Robert, with the coheirress of the house of Mowbray, Dukes of Norfolk. The only son of this union was Sir John Howard, one of the leading supporters of the house of York, who, having gained early distinction in the French wars of Henry VI, was appointed by Edward IV constable of the important castle of Norwich and sheriff of Norfolk and Suffolk. Afterward he became treasurer of the royal household, obtained a grant of the whole benefit that should accrue to the King by coinage of money in the city and Tower of London and elsewhere in England, and was raised to the peerage as Lord Howard and Duke of Norfolk. We find him in 1470 made captain general of the King's forces at sea and most strenuous in that capacity in his resistance to the house of Lancaster. Finally he was created Earl Marshal of England, an honorary distinction still borne by his descendants, and in 1484 was appointed Lord Admiral of England, Ireland, and Aquitaine. He fell next year, however, on Bosworth Field, and after his death his honors were attainted, as also were those of his son Thomas, who had been created Earl of Surrey. The latter, however, after suffering three years of imprisonment in the Tower of London, obtained a reversal of his own and his father's attainders and became distinguished as a general, winning fame by his defeat of the Scots at Flodden in 1513. His son Thomas, third Duke of Norfolk, by his marriage with a daughter of King Edward IV, became the father of the accomplished but ill-fated Earl of Surrey, who was put to death by Henry VIII. Norfolk, too, was sentenced, but the death of Henry saved him from the block. The Earl's son Thomas, fourth Duke of Norfolk, suffered attainder and was executed on Tower Hill for high treason, for his communication with Mary, Queen of Scots. The family honors, however, were restored, partly by James I to his grandson, and partly by Charles II to his great-great-grandson, Thomas, who became eighth Duke, and whose cousin and successor, Charles, ninth Duke, was the direct ancestor of the present Duke of Norfolk.

In one or other of their widespread branches the Howards either have enjoyed within the last three centuries, or still enjoy, the earldoms of Carlisle, Suffolk, Berkshire, Northampton, Arundel, Wicklow, Norwich, and Effingham, and the baronies of Bindon, Howard de Walden, Howard of Castle Rising, and Howard of Effingham.

Among the other distinguished members of the family, Sir Edward Howard, brother of the first Earl of Surrey, was made by Henry VIII King's standard bearer and admiral of the fleet, in which capacity he lost his life in boarding a French vessel off Brest in 1513, his brother, Sir Edmund, acted as Marshal of the Horse at Flodden, and his half brother, Sir Thomas Howard, was attainted and died a prisoner in the Tower, for aspiring to the hand of Lady Margaret Douglas, daughter of Margaret, Queen of Scotland, and niece of Henry VIII, one of whose ill-fated consorts was Lady Catharine Howard. Consult Dugdale, *Baronage of England* (London, 1675-76); Collins, *Peerage of England* (5th ed., 1b, 1779); Howard, *Memorials of the Howard Family* (privately printed, 1834); Lodge, *Portraits of Illustrious Personages* (London, 1835); *The*

Howard Papers, with a Biographical Pedigree and Criticism by Canston (ib, 1862), Yeatman, *The Early Genealogical History of the House of Arundel* (ib, 1882), Doyle, *Official Baronage of England* (ib, 1886). Brennan and Statham, *The House of Howard* (ib, 1907)

HOWARD, BENJAMIN CHEW (1791-1872). An American statesman, born at Belvedere, Md., son of John Eager Howard, Revolutionary officer, and grandson of Chief Justice Benjamin Chew. He was educated at Princeton (1809), studied law, and practiced in Baltimore. In 1814 he was active in the defense of the city, and he fought at North Point. He was a United States Representative (1829-33, 1835-39), became head of the Committee on Foreign Relations, and wrote its report on the boundary question. For 20 years he was reporter of the United States Supreme Court. He was nominated for Governor of his State in 1861, but withdrew his name. In the same year he was delegate to the Peace Congress. His *Reports of Cases in the Supreme Court of the United States from 1843 till 1855* was published in the latter year.

HOWARD, BLANCHE WILLIS (1847-98). An American novelist, born in Bangor, Me. She was educated in New York City, but dwelt after 1878 in Stuttgart, where she taught and wrote. In 1890 she married Baron von Teuffel, a physician. The more noteworthy of her novels are: *One Summer* (1875), *Just Serena* (1880), *Guenn* (1882), *Julnay Tower* (1886); *The Open Door* (1889), *No Heroes* (1893), a story for boys, *A Fellow and his Wife* (1892), in collaboration with William Sharp, *Seven on the Highway* (1897), a volume of short stories, the posthumously published *Dionysius the Weaver's Heart's Dearest* (1899); *Garden of Eden* (1900). She wrote also a book of travel, *One Year Abroad* (1877).

HOWARD, BRONSON (1842-1908). A well-known American dramatist, born at Detroit. He prepared for college at New Haven, but instead of entering Yale turned to journalism in New York. From 1867 to 1872 he worked on several newspapers, among them the *Evening Mail* and the *Tribune*. So early as 1864 he had written a dramatic piece called *Fantine*, which was played in Detroit, but his first important play was *Saratoga*, produced by Augustin Daly in 1870. It was very successful and became the first of the long series of pieces which gave Mr. Howard a foremost position among American playwrights. Among his other best-known plays are: *The Banker's Daughter* (1878), *Old Love Letters* (1878), *Young Mrs. Winthrop* (1882), *One of our Girls* (1885), *The Henrietta* (1887, revived in 1913 as *The New Henrietta*), *Shenandoah* (1889), *Aristocracy* (1892). In 1899 he collaborated with Brander Matthews in *Peter Stuyvesant Aristocracy*, which is a satire upon some features of Anglomaniac in American society, has been called its author's best play, though the war drama *Shenandoah* is more ambitious, and *Old Love Letters*, in quite a different line, is an inimitable bit of sentimental comedy. Howard married a sister of Sir Charles Wyndham, the English actor, and he had homes both in New York and in London, where some of his plays have been no less popular than in America. He was a member of the American Academy of Arts and Letters. Consult M. J. Moses, *The American Dramatist* (Boston, 1911).

HOWARD, CATHARINE (1520-42). Fifth

wife of Henry VIII. She was a daughter of Edmund Howard, third son of the Duke of Norfolk. The King married her soon after the divorce of Anne of Cleves, in 1540. She was accused of immoral conduct before her marriage and of suspicious conduct after it. Her guilt before marriage was established, and, with Lady Rochford, who had connived at her wrongdoing, she was beheaded, Feb. 13, 1542. Consult Brennan and Statham, *The House of Howard* (London, 1907).

HOWARD, CLINTON NORMAN (1868-). An American lecturer and temperance advocate. He was born at Pottsville, Pa., and was educated privately. In 1890 he founded and became president of the Prohibition Union of Christian Men, and in 1900 he began his work as a Chautauqua and lyceum lecturer, on such subjects as "God's Measure of a Man," "Why God Made a Woman," and "The Greatest Event in the World." He became vice president of the National Temperance Society.

HOWARD, GEORGE ELLIOTT (1849-). An American educator and author, born at Saratoga, N. Y. He graduated at the University of Nebraska in 1876, studied at the universities of Munich and Paris in 1876-78, and was professor of history in the University of Nebraska from 1879 to 1891. From 1891 to 1901 he was head of the history department and professor of American and institutional history at Leland Stanford Junior University, in 1902 he gave special courses in history at Cornell University, and he lectured on history at the University of Chicago in 1903-04. He returned to the University of Nebraska in 1904 as professor of institutional history and in 1906 was transferred to the chair of political science and sociology. In 1885-91 he was secretary of the Nebraska State Historical Society. He wrote: *Local Constitutional History of the United States* (1889), *The Evolution of the University* (1890), *The King's Peace and the Local Peace Magistracy* (1891), *History of Matrimonial Institutions* (3 vols., 1904), *Preliminaries of the Revolution* (1905), *Social Control and Function of the Family* (1906), *General Sociology* (1907), *The Family and Marriage* (1914). He was a contributor to the NEW INTERNATIONAL ENCYCLOPEDIA.

HOWARD, GEORGE WILLIAM FREDERICK. See CARLISLE, seventh EARL OF.

HOWARD, HENRY. See SURREY, EARL OF.

HOWARD, JACOB MERRITT (1805-71). An American legislator, born at Shaftsbury, Vt. He graduated at Williams College in 1830, studied law, and began to practice in Detroit, Mich. He was a member of the State Legislature in 1838 and in 1840 was elected to Congress as a Whig, in which party he was an active campaign worker in 1844, 1848, and 1852. He took a prominent part in bringing about a coalition of the Whigs and Free-Soil Democrats in 1854, was the author of the platform drawn up at a State convention of the two parties held at Jackson, Mich., on June 6, 1854, and is said to have suggested the name "Republican" for the new political organization thus brought into existence. He was nominated for Attorney-General of the State by the new party in that year and was elected and reelected twice thereafter, serving until 1859. In 1862 he was elected to the United States Senate, to fill a vacancy caused by the death of Senator Bingham, and was reelected for a full term in 1864. He

translated from the French the *Secret Memoirs of the Empress Josephine* (1847)

HOWARD, JAMES E (1851-) An American engineer physicist and commerce expert He was born at Palmer, Mass., and was educated at Nichols Academy (Dudley, Mass.) and at the Highland Military Academy (Worcester, Mass.) From 1880 to 1910 he served as engineer of tests at the Watertown (Mass.) Arsenal, from 1910 to 1914 was engineer physicist of the Bureau of Standards, Washington, D C., and in 1914 he was appointed by President Wilson to the Interstate Commerce Commission

HOWARD, JOHN (1726-90) An English philanthropist, best known for his work in behalf of prison reform He inherited a considerable fortune from his father and spent his early life in travel Settling at Cardington, Bedfordshire, in 1756, he erected model cottages for his tenants and furnished schools for children of all sects In 1773 he was appointed high sheriff of Bedfordshire, and soon the defective arrangements of prisons and the intolerable distress of prisoners were brought under his notice Finding that all the abuses he had seen at home existed in neighboring counties, he traveled all over the United Kingdom and finally became a self-appointed prison inspector, not only of Great Britain and Ireland, but of all Europe He gave evidence before the House of Commons, and in 1774 laws were passed for the improvement of the sanitation of prisons and the abolition of jailers' fees In 1777 he published his *State of the Prisons in England and Wales, with an Account of Some Foreign Prisons* After each of his many tours new editions, with additional facts, were published One important result of this book was the adoption of the hard-labor system in English prisons In 1785 Howard investigated the infection hospitals of Europe, with a view to discovering the best means of preventing the plague, and published *An Account of the Principal Lazarettos in Europe* (1789) He died of camp fever while studying the Russian military hospitals He was a man of deep religious feelings He traveled more than 50,000 miles in making his investigations, on which he spent at least £30,000 of his own fortune, refusing all government aid Of the numerous works on Howard, consult, especially, his *Correspondence*, edited by J Field (London, 1855), lives by Hepworth Dixon (ib, 1849), by J Field (ib, 1850), by John Stoughton (new ed, ib, 1884), and by G F Russell Barker, in *Dictionary of National Biography*, vol xxviii (ib, 1891)

HOWARD, JOHN EAGER (1752-1827) An American soldier and public official, born in Baltimore Co, Md He served throughout the Revolutionary War, participating in many important battles, becoming lieutenant colonel in 1780, and receiving a silver medal from Congress for his conduct at the battle of Cowpens He was wounded at Eutaw Springs At the close of the war he represented Maryland in Congress from 1787 to 1788 He was the Governor of his State from 1789 to 1792 In 1795 he was a member of the Maryland Senate, was a United States Senator from 1796 to 1803, declining in 1796 the portfolio of Secretary of War, and in 1798 was made a brigadier general by Washington, when a war with France seemed certain He organized a defense of Baltimore

in 1814 when the English forces threatened the city, and two years later was a Federal candidate for Vice President

HOWARD, JOHN GALEN (1864-) An American architect Born at Chelmsford, Mass., he graduated from the Boston Latin School, and after three years of study at Massachusetts Institute of Technology, five years under private architects, and three years at the Ecole des Beaux-Arts, Paris, he established himself as a practicing architect in New York City Notable buildings planned by him include the Montelan (N J) Public Library, the Hearst Memorial Mining Building at the University of California (Berkeley), and the Electric Tower at the Pan-American Exposition, Buffalo, 1901 In the latter year, also, he was appointed supervising architect of the University of California, and of the Alaska-Yukon-Pacific Exposition (Seattle, 1909) he was one of the two architects in chief He became a member of the National Institute of Arts and Letters and in 1910 was elected an Associate National Academician

HOWARD, LELAND OSSIAN (1857-) An American entomologist, born at Rockford, Ill He graduated at Cornell in 1877 and was assistant in entomology at the United States Department of Agriculture until 1894, when he was made chief of the Bureau of Entomology He edited the journal *Insect Life* lectured on entomology at several colleges and universities, and wrote on that subject for the *Century* and *Standard* dictionaries and the *NEW INTERNATIONAL ENCYCLOPEDIA* He was made permanent secretary of the American Association for the Advancement of Science, honorary curator in the United States National Museum, and consulting entomologist of the Public Health Service in 1904 He wrote *Mosquitoes* (1901), *The Insect Book* (1901), *The House Fly—Disease Carrier* (1911), *Mosquitoes of North America* (1912), and bulletins and reports of the United States Department of Agriculture

HOWARD, LUKE (1772-1864) An English meteorologist, born in London From 1796 to 1803 he was a wholesale and retail chemist in partnership with William Allen, but later he conducted the business independently His essay *On the Modification of Clouds* (1802, 3d ed, 1865) established his reputation as one of the founders of the science of meteorology The names—cirrus, cumulus, stratus, and nimbus—which he gave to the different kinds of clouds were generally adopted by other meteorologists His other published works include *The Climate of London* (2 vols, 1818-20; 2d ed, rev, 3 vols, 1833), *Seven Lectures on Meteorology* (1837, 2d ed, 1843), *A Cycle of Eighteen Years in the Seasons of Great Britain* (1842), *Papers on Meteorology* (1854)

HOWARD, OLIVER OTIS (1830-1909) An American soldier He was born in Leeds, Me, graduated at Bowdoin in 1850 and at West Point in 1854, served as chief of ordnance during the Seminole troubles of 1857, and was assistant professor of mathematics at West Point from 1857 to 1861 Leaving the regular army in June, 1861, he became colonel of the Third Maine Volunteers and commanded a brigade in the first battle of Bull Run He was promoted to be brigadier general of United States volunteers in September, participated in the Peninsular campaign, and in the battle of Fair Oaks (June 1, 1862) received a wound

which necessitated the amputation of his right arm. After a short leave of absence he rejoined the Army of the Potomac, took a prominent part in the battle of Antietam, was promoted to be major general of volunteers in November, and was engaged in the battle of Fredericksburg (December 13). In April, 1863, he was placed in command of the Eleventh Army Corps and as such took a conspicuous part in the battles of Chancellorsville and Gettysburg. He then served in the Chattanooga campaign, taking part in the battle of Chattanooga and accompanying Sherman on his march for the relief of Knoxville. From April to July, 1864, he commanded the Fourth Army Corps of the Army of the Cumberland and during the march to the sea and the campaign in the Carolinas commanded the Army of the Tennessee, which constituted the right wing of General Sherman's army. In December, 1864, he was appointed brigadier general in the regular army and in March, 1865, was brevetted major general for services at Ezra Church and during the Atlanta campaign. From May, 1865, to July, 1874, he was commissioner of the Bureau of Refugees, Freedmen, and Abandoned Lands. Within less than three years 1400 schools (not including 700 Sabbath schools) had been established, and many of the freedmen had been enabled to buy and maintain homesteads of their own (See FREEDMEN'S BUREAU). In 1872 Howard was special commissioner to the hostile Apaches of New Mexico and Arizona, and, having been placed in command of the Department of the Columbia (1874), he conducted the operations against the Nez Percés Indians in 1877 and against the Bannocks in 1878. He subsequently was superintendent of the United States Military Academy at West Point (1881-82) and commanded successively the departments of the Platte, of California, and of the East. In 1886 he was appointed major general in the regular army, and in November, 1894, retired from the service. In 1895 he founded the Lincoln Memorial University at Cumberland Gap, Tenn., for the education of the "mountain whites." He was also instrumental in the establishment by the government in 1867 of Howard University, at Washington, D. C., over this institution he presided from 1869 to 1873. Besides numerous magazine articles, his publications include: *Donald's School Days* (1879), *Chief Joseph, or the Nez Percés in Peace and War* (1881), *General Zachary Taylor* (1892), in the "Great Commanders Series"; *Isabella of Castile* (1894), *Fighting for Humanity* (1898), *Henry in the War* (1898), *My Life and Experience among our Hostile Indians* (1907), *Autobiography of O. O. Howard* (2d ed., 2 vols., New York, 1907). Consult H. B. Stowe, *Men of our Times* (ib., 1868).

HOWARD, SIR ROBERT (1626-98). An English dramatist, son of Thomas Howard, first Earl of Berkshire, by Elizabeth, daughter of William Cecil, Lord Burghley. During the Civil War he took the Royalist side; and he was knighted (1644). He was imprisoned under the Commonwealth in Windsor Castle, but after the Restoration lucrative posts were given him, and he sat in Parliament. He is the Crites of Dryden's *Essay on Dramatic Poesy*. Dryden married his sister Elizabeth. Of Howard's five extant plays, *The Committee* (1692), caricaturing the manners of the Commonwealth, is most interesting.

HOWARD, ROY WILSON (1883-) An American newspaper man, born at Gano, Hamilton Co., Ohio. After graduating from the Manual Training High School of Indianapolis, Ind., he became a reporter for the Indianapolis *News* in 1902 thereafter was sporting editor of the Indianapolis *Star*, assistant telegraph editor of the St. Louis *Post-Dispatch*, and news editor of the Cincinnati *Post*, and in 1906 he was New York correspondent of the Scripps-McRae League and then New York manager of the Publishers' Press Association. He became New York manager in 1907, and president and general manager in 1912, of the United Press Association.

HOWARD, THOMAS, EARL OF ARUNDEL. See ARUNDEL.

HOWARD, THOMAS BENTON (1854-). An American naval officer. Born at Galena, Ill., he graduated from the United States Naval Academy in 1873. At the battle of Manila Bay he was navigator of the *Concord* and was subsequently promoted, having command of the *Chesapeake* (1901), the *Nevada* (1903-05), the *Olympia* (1907), the *Tennessee* (1907), and the *Ohio* (1908-09). Becoming rear admiral in 1910, he commanded the fourth division of the Atlantic fleet in 1910-12 and the third division in 1912 and in 1912-13 was president of the Naval Examining and Retiring Board. In 1914 he became commander in chief of the Pacific fleet.

HOWARD, WILLIAM. See STAFFORD, VISCOUNT.

HOWARD, WILLIAM TRAVIS (1867-). An American pathologist. He was born at Statesburg, S. C., studied at the University of Virginia (1885-87), graduated from the University of Maryland (M.D., 1889), and took graduate work at Johns Hopkins (1889-93) and at Munich (1906-07). In 1894 he was appointed professor of pathology at Western Reserve University, and he became also pathologist to various Cleveland hospitals and bacteriologist to that city's board of health. In 1902 he was president of the American Association of Pathologists and Bacteriologists. His papers deal with heart hypertrophy, ulcerative endocarditis, origin of gas and gas cysts in the central nervous system, tumors, etiology of smallpox, vaccinia, and other subjects.

HOWARD UNIVERSITY. An institution for higher education, situated in Washington, D. C. It was incorporated by Congress in 1867 and was named for Gen. O. O. Howard, one of its founders and early presidents. It is controlled by a self-perpetuating board of trustees. The university is nonsectarian and is open to students of both sexes without regard to race. It is chiefly known, however, for its work in the higher education of the colored people. It has the following departments, each with the requirements and courses of the standard institutions: College of Arts and Sciences, Teachers College, School of Theology, School of Medicine, including medical, pharmaceutical, and dental colleges, School of Law, School of Manual Arts and Applied Sciences, Conservatory of Music, Library School, Commercial College and Academy. In 1914 it had 115 professors and instructors and 1463 students from 36 States and 10 foreign countries. The theological department is supported from income, from endowment, and from private benefaction, the medical department chiefly from tuition.

The other departments are largely supported by an annual congressional appropriation administered by the Secretary of the Interior. The university has a beautiful campus of over 25 acres in the midst of the city of Washington, D C, and 10 large buildings. Its productive endowment is \$304,000, and its other property is valued at \$1,385,000. The annual budget is \$190,000. The president in 1914 was Stephen M. Newman, A M.

HOWARTH, HOWARTH, ELLEN CLEMENTINE (DORAN) (1827-99). An American poet, born at Cooperstown, N Y. She wrote a number of songs, such as "Tis but a Little Faded Flower," and published a volume, *The Wind-Harp and Other Poems* (1864). Her later work, under the title *Poems* (Newark, N J, 1868), was edited, with an introduction, by Richard Watson Gilder.

HOWE, ALBION PARIS (1818-97). An American artillery officer in the Civil War, born at Standish, Me., and educated at West Point. He entered the Fourth Artillery, from 1843 to 1846 was a mathematical instructor at West Point, served creditably in the Mexican War, was made a captain in 1855, and after the outbreak of the Civil War became General McClellan's chief of artillery in western Virginia in 1861. During the campaign on the Peninsula, in 1862, he commanded a light-artillery brigade in the Army of the Potomac. Having been appointed a brigadier general of volunteers in 1862, he was assigned to a brigade in Couch's division, Fourth Army Corps, was in command of the artillery depot at Washington in 1864-66, and was brevetted major general in the regular army in 1865 for meritorious service during the war. General Howe took part in the battles of Manassas, South Mountain, Antietam, Fredericksburg, and Gettysburg. He was retired from the army in 1882.

HOWE, ELIAS (1819-67). An American inventor, born in Spencer, Mass. His father was a miller, and after working in his mills the boy went, in 1835, to Lowell, where he entered a manufactory of cotton machinery. Two years later he lost his position on account of the financial panic, but finally secured work in a machine shop, first in Cambridge and later in Boston. About 1843 he commenced the practical working out of his idea for a sewing machine, and by 1845 the invention was finished, but, despite its obvious advantages, met with bitter opposition. For the next nine years Howe was wretchedly poor. A trip to England in 1847 in hope of being able to interest capitalists there was unsuccessful, and he sold the English rights to his machine for £250. Upon his return to this country he found that his invention had been pirated, and that many sewing machines were already in use. He obtained influential backing and immediately began action to establish his patent. After long suits he won his case and thereafter was one of the leading manufacturers in the United States. Although improvements on Howe's machines were subsequently made by Singer and others, there is no doubt that the Howe was the original prototype of the present machine. When the Civil War broke out, Howe volunteered as a private in the Seventeenth Connecticut Volunteers. In 1867 he received the gold medal and the cross of the Legion of Honor at the Paris Exhibition.

HOWE, FREDERIC CLEMONS (1867-) An

American authority on municipal problems. Born at Meadville, Pa., he graduated from Allegheny College (1889) and from Johns Hopkins University (Ph D, 1892), and he studied also at Halle, Germany, at the University of Maryland Law School, and at the New York Law School. He practiced law from 1894 to 1909 in Cleveland, Ohio, in 1905, for the United States government, investigated municipal ownership in Great Britain, and in 1906-09 served in the Ohio Senate. He became professor in the Cleveland College of Law and lecturer on taxation at Western Reserve University and in 1906-09 lectured on municipal administration and politics at the University of Wisconsin. He is author of *The City, the Hope of Democracy* (1905), *The British City—The Beginnings of Democracy* (1907), *The Confessions of a Monopolist* (1907), *Privilege and Democracy in America* (1910), *Wisconsin An Experiment in Democracy* (1912), *European Cities at Work* (1913), *The American City* (1914).

HOWE, HENRY (1816-93). An American historian and publisher, born at New Haven, Conn., son of Gen. Hezekiah Howe, the publisher. He entered the publishing business in 1839 and in 1840 began his historical research in New York and New Jersey, together with John W. Barber. He made like studies in Ohio, sketching old landmarks and interviewing old settlers. Soon after the publication of his work in Ohio he removed to Cincinnati, where he published subscription books for nearly 30 years. In 1878 he returned to New Haven, but in 1885 went back to Ohio, prepared a second edition of his history of that State, and entered the publishing business again. He wrote *Eminent Mechanics* (1839), *Historical Collections of New York* (1841), *of New Jersey* (1843), and *of Ohio* (1847 and 1891), *The Great West* (1851), *Travels and Adventures of Celebrated Travelers* (1853), *Life and Death of the Ocean* (1855), *Adventures and Achievements of Americans* (1858), *Our Whole Country* (1861), *Times of the Rebellion in the West* (1867), *Over the World* (1883), and *Outline History of New Haven* (1884) and *New Haven Elms and Greens* (1885), the two last named being pamphlets.

HOWE, HENRY MARION (1848-) An American metallurgist, son of Julia Ward Howe and brother of Laura E. Richards (qqv). Born in Boston, he graduated from Harvard University in 1869 and from Massachusetts Institute of Technology in 1871. In 1897 he accepted the professorship of metallurgy at Columbia University and there remained until he became professor emeritus. In 1895 he received the Elliot Cresson gold medal of the Franklin Institute of Philadelphia, the Bessemer gold medal of the British Iron and Steel Institute, and the gold medal of the Verein zur Beförderung des Gewerbfleisses, and he was honored by the presidency of the American Institute of Mining Engineers (1893) and of the International Association for Testing Materials (1912). He is author of *Copper Smelting* (1885), *Metallurgy of Steel* (1890, 4th ed, 1904), *Metallurgical Laboratory Notes* (1902), *Iron, Steel, and Other Alloys* (1903, 2d ed, rev, 1906).

HOWE, JOHN (1630-1705). A Puritan clergyman, called the *Platonic Puritan*. He was born May 17, 1630, at Loughborough in Leicestershire. He studied both at Cambridge and Oxford, and after preaching for some time

at Winwick in Lancashire and Great Torrington in Devonshire, he was appointed domestic chaplain to Cromwell in 1657. He held the same position under Richard Cromwell, but in 1659 returned to Torrington, where the position he had held during the Commonwealth made him an object of close suspicion to the government. The Act of Uniformity ejected him from his parish (1662), and he wandered about preaching in secret till 1671, when he was invited by Lord Massereene, of Antrim Castle in Ireland, to become his domestic chaplain. There he began his greatest work, *The Good Man the Living Temple of God* (1676-1702), which occupies one of the highest places in Puritan theology. In 1676 he became pastor of the dissenting congregation in Silver Street, London. In 1677 he published, at the request of Robert Boyle, *The Reconcilableness of God's Presence of the Sins of Men with the Wisdom of His Counsels and Exhortations*, in 1681, *Thoughtfulness for the Mourner*, in 1682, *Self-Dedication*, in 1683, *Union among Protestants*, and in 1684, *The Redeemer's Tears Wept over Lost Souls*. In 1685 he was invited by Lord Wharton to travel with him on the Continent; and, after visiting the principal cities, in 1686 he settled, owing to the state of England, at Utrecht. In 1687 King James's "Declaration for Liberty of Conscience" induced him to return to England, and at the revolution the next year he headed the deputation of dissenting clergymen when they brought their address to the throne. Besides smaller works, he published, in 1693, *Carnality of Religious Contention*, in 1694-95, several treatises on the Trinity, in 1699, *The Redeemer's Dominion over the Invisible World*, and he continued writing till 1705, when he published *Patience in Expectation of Future Blessedness*. He died in London, April 2, 1705. His works have been several times reprinted. For his life, consult E. Calamy, memoirs in *Howe's Works* (London, 1724), Henry Rogers (ib., 1879), and R. F. Horton (ib., 1896).

HOWE, JOSEPH (1804-73). A Canadian journalist, orator, and statesman. He was born near Halifax, Nova Scotia, and within a few years after 1817, when he began to learn printing in the office of the *Halifax Gazette*, he was on the editorial staff of that paper. In 1827 he was part owner of the *Weekly Chronicle*, under the name of the *Acadian*, and after 1828 for many years he owned and edited the *Nova Scotian*. Besides his editorial writing, he contributed notable sketches of Nova Scotian life and scenery and the "Legislative Reviews," a series of papers on public men and various needed reforms. In 1835 he was brought into wide public notice by his indictment and trial for alleged libel of the municipality of Halifax, and his speech in his own defense, which gained an acquittal, established his reputation as an orator. Elected a Liberal member of the Nova Scotia Legislature in 1836, he held his seat, except for short intervals, until 1863. Throughout his political career his one main object was the defense of responsible government in his native province, and to its establishment there he had contributed more than any other public man. In 1840 he became a member of the Provincial cabinet, in 1841 was elected Speaker of the Provincial Legislature, and in 1848 was made Provincial Secretary. He was active in promoting railways, in 1854 resigning the Pro-

vincial secretaryship to take charge of the construction of the first Nova Scotia railway. In 1863 he became Provincial Premier. In the issues which precipitated confederation (see CANADA, *History*) he took the keenest interest, but he strongly opposed the plan outlined at the Charlottetown and Quebec conferences, and not until after 1867, when confederation was accomplished, was he willing to give it a qualified support. He was elected a member of the first Dominion Parliament, and, after procuring the passage of resolutions giving better terms to Nova Scotia, he entered the Conservative cabinet of Sir John A. Macdonald in 1869 as President of the Council and in 1870 became Secretary of State. To Nova Scotia Liberals this step was political apostasy. Howe was severely blamed, but his course was due to a wise submission to the inevitable, not to any consideration of personal advancement. Long before 1867 he had matured a plan of Imperial consolidation on broader lines than those of the British North America Act, and the failure to realize this embittered him. On May 1, 1873, he was appointed Lieutenant Governor of Nova Scotia, and he died at Halifax a month later. He was the greatest of Canadian political orators in English and was a writer of verse besides. His oratorical masterpiece was the speech delivered at the International Commercial Convention in Detroit in 1865. He published a large number of speeches, letters, and political pamphlets. Consult: William Annand, *Speeches and Public Letters of the Honorable Joseph Howe* (2 vols., Boston, 1858; new ed., 1909), G. M. Grant, *Joseph Howe* (Halifax, 1904), J. W. Longley, *Letters and Speeches of Joseph Howe* (Toronto, 1904). See also CANADIAN LITERATURE.

HOWE, JULIA WARD (1819-1910). An American poet, philanthropist, and sociological writer, active in the agitation for the legal and political rights of women. She was born in New York, of wealthy parents, and married, in 1843, Dr. S. G. Howe, a philanthropist, best known for his labors for the education of the blind. With him she edited the *Boston Commonwealth*, an antislavery journal, lecturing also on social subjects and preaching occasionally in Unitarian pulpits. After the war she became a noted advocate of woman suffrage and of prison and other reforms. She was the only woman ever elected a member of the American Academy of Arts and Letters. Her early publications, *Passion Flowers* (1854), *Words for the Hour* (1856), and *Later Lyrics* (1866), were in verse, the best known of her pieces being the stirring "Battle Hymn of the Republic," which was written in 1861. She wrote also two dramas, *The World's Own* (acted in 1855) and *Hyppolytus* (1858). The more significant of her later works are *Sex and Education* (1874), *Modern Society* (1880), *A Life of Margaret Fuller* (1883), a valuable autobiographical *Reminiscences, 1819-99* (1899); and *Sketches of Representative Women of New England* (1905). Florence Howe Hall, Mrs. Howe's daughter, edited a selection from her mother's speeches and essays, *Julia Ward Howe and the Woman Suffrage Movement* (1913). Her verse is collected in *From Sunset Ridge, Poems New and Old* (1898). Consult L. E. Richards, *Two Noble Lives* (Boston, 1911).

HOWE, MARK ANTONY DE WOLFE (1864-) An American editor and author, born

at Bristol, R I In 1886 he graduated from Lehigh University and in 1887 from Harvard University (A.M., 1888). He served as associate editor of the *Youth's Companion* from 1888 to 1893 and again from 1899 to 1913, as assistant editor of the *Atlantic Monthly* in 1893-95, and as editor of the *Harvard Illuminist Bulletin* after 1913 Besides editing *The Memory of Lincoln* (1889), *Home Letters of General Sherman* (1909), *The Beacon Biographies* (31 vols., 1899-1910), and *Lines of Battle and Other Poems by Henry Howard Brunnell* (1912), he published *Shadows* (1897), *American Bookmen* (1898), *Phillips Brooks* (1899), *Boston The Place and People* (1903), *Life and Letters of George Bancroft* (1908), *Harmonies A Book of Verse* (1909), *Boston Common Scenes from Four Centuries* (1910), *Life and Labors of Bishop Hare, Apostle to the Sioux* (1911), *Letters of Charles Eliot Norton* (1913), with Sara Norton, *The Boston Symphony Orchestra* (1914)

HOWE, MARSHALL AVERY (1867-) An American botanist, born at Newfane, Vt. He graduated from the University of Vermont in 1890 and from Columbia University (Ph.D.) in 1898. He was instructor in cryptogamic botany at the University of California in 1891-96, served as curator of the Columbia University herbarium from 1899 to 1901, and thereafter was assistant curator (1901-06) and curator of the New York Botanical Garden. He also served as editor of *Torreya* (1901-07) and as associate editor (1898-1907, 1911-) and editor (1908-10) of the *Bulletin of the Torrey Botanical Club*. Between 1901 and 1910 he participated in scientific expeditions to Newfoundland, the West Indies, and Panama. Besides papers on marine algae, he is author of monographs on *The Hepaticae and Anthocerotae of California* (1899) and of *Phycological Studies* (1905-11).

HOWE, RICHARD, EARL (1726-99) A British admiral, born in London, March 8, 1726, the second son of Emanuel Scrope, second Viscount Howe of the Irish peerage. He left school at Eton when only 14 and went with Anson on the *Severn* to attempt a voyage around the world. He commanded the *Baltimore*, which, with the *Greyhound* and *Terror*, fought two large French frigates off the west coast of Scotland in 1746. The English squadron was beaten, and Howe was severely wounded. In 1755 his ship, the *Dunkirk*, captured the *Alcide* off Newfoundland. His next service was under Sir E. Hawke in the expedition against Rochefort. Ordered to attack the fort on the Isle of Aix with his ship, the *Magnanime*, he compelled it to surrender and achieved the only material success which attended the expedition. He was commodore of the squadron which sailed in 1758 for Saint-Malo. The troops were landed and reembarked without loss, after destroying all the magazines and shipping in the port. In the same year he took Cherbourg and destroyed the magazines and cannon. A second attack upon Saint-Malo was repulsed with great loss of life. In 1758, after his brother, a brigadier general, was killed at Ticonderoga, Howe succeeded to the Irish title of Viscount and to the family estate. He continued his distinguished naval service to the end of the Seven Years' War.

In 1760 he was made colonel of the Chatham division of marines and afterward First Lord

of the Admiralty and Treasurer of the Navy. He was made a rear admiral in 1770 and a vice admiral in 1775. In 1776 he was placed in command of the fleet on the American coast. In 1778 he held his own against a superior naval force under D. Estaing. He was made a viscount of Great Britain in 1782. In that year he set out with a fleet to relieve Gibraltar. He succeeded in disembarking troops, ammunition, and supplies, and then offered battle to the combined fleets of France and Spain which declined an engagement. This achievement gave Howe a brilliant reputation. He was made First Lord of the Admiralty in 1783 and received an English earldom in 1788. When the war with France broke out in 1793, he took the command of the Channel fleet and next year gained the victory known as that of "the glorious first of June." The French fleet consisted of 26 ships of the line, and the English of 25. Howe, in his flagship, the *Queen Charlotte*, engaged, off Ushant, the French admiral, who in less than an hour crowded all the sail he could carry, followed by as many of his ships as could get away. The English captured two ships of 80 guns and four 74s; another 74 sank immediately after she was taken possession of. London was illuminated three nights in honor of the victory, the thanks of Parliament were voted to Howe, and George III gave him a sword and made him Knight of the Garter. His last service was in bringing back the mutinous seamen at Portsmouth to their duty in 1797. He died Aug. 5, 1799. Consult *British Magazine and Review*, June, 1783 (London, 1783), Sir John Barrow, *Life of Richard, Earl Howe* (ib., 1838); *Memoir of the Life of Admiral Sir Edward Codrington*, edited by Lady Bouchier (ib., 1873), J. K. Laughton, *From Howard to Nelson* (ib., 1899), E. Chevalier, *Histoire de la marine française* (Paris, 1900).

HOWE, ROBERT (1732-85) An American patriot and soldier, born in Brunswick Co., N. C. After serving against the Indians he was elected to the Assembly in 1765, and the same year Governor Tryon nominated him commander of Fort Johnson on the Cape Fear River. He served in the Assembly until 1775, was a member of the Provincial congresses of 1774 and 1775, and took a prominent part in the preparations for revolt. On Sept. 1, 1775, he was made colonel of the Second North Carolina Regiment, afterward a part of the Continental troops, and aided General Woodford in driving Lord Dunmore, the British Governor, from Virginia. He was made brigadier general of the Continental troops March 1, 1776, and was especially excepted from the general offer of amnesty issued by Sir Henry Clinton. He was made major general Oct. 20, 1777, and placed in command of the Department of the South. An unsuccessful expedition to Florida resulted in the abandonment of Savannah in December, 1778, and Howe was succeeded in his command by Gen. Benjamin Lincoln. He commanded the North Carolina troops at the defense of Charleston (1780) and was in command of West Point the same year. In 1781 he was tried by court-martial for the loss of Savannah on the complaint of the Georgia Assembly, but was honorably acquitted. During this year and again in 1783 he was sent by Washington to reduce mutinous regiments and was entirely successful. He was sent to pacify the Indians of the West in 1785, and the same year was elected to the

North Carolina Legislature, but died before taking his seat.

HOWE, SAMUEL GRIDLEY (1801-76) An American reformer and philanthropist, born in Boston. He graduated at Brown in 1821 and took the degree of M.D. at Harvard Medical School in 1824. Stirred by the poems of Byron, he offered his services to the Greeks in their struggle for independence. In Greece his services were not confined to the duties of a surgeon, in which capacity he had volunteered, but were of a more military nature, and his bravery, enthusiasm, and ability as a commander, as well as his humanity and nobility of character, won for him the title of "the Lafayette of the Greek Revolution." He continued in the service until 1827, when he returned to America to raise funds and supplies to alleviate the famine and suffering in Greece. Through his efforts more than \$60,000 was raised, besides large donations of food and clothing, with which, after writing his *Historical Sketch of the Greek Revolution* (1828), he went again to Greece, where he remained until 1830 and became surgeon in chief of the Greek fleet. Before leaving Greece he settled a successful colony of exiles at Corinth. He then spent some time in medical studies at Paris, where his enthusiasm for a republican form of government led him to take part in the July revolution. In the following year he returned to the United States and became interested in the work with which his name will be longest connected—the education of the blind. He returned to Europe to study the existing systems in England and France, but his investigations were interrupted in the winter of 1831-32, when he became chairman of the American-Polish Committee at Paris, organized by himself, J. Fenimore Cooper, S. F. B. Morse, and several other Americans living in the city, for the purpose of giving relief to the Polish political refugees who had crossed over the Prussian border into Prussia. Dr. Howe undertook to distribute the supplies and funds personally and while in Berlin was secretly seized by the Prussian authorities and imprisoned for five weeks. In the latter part of the same year (1832) he returned to Boston, where he met with great success in his educational work, and the Perkins Institution for the Blind, as it was named in honor of its principal benefactor, became the greatest school of its kind in the world. Dr. Howe himself was the originator of many improvements in method as well as in the processes of printing books in raised types. Besides acting as superintendent of the Perkins Institution to the end of his life, he was instrumental in establishing a large number of institutions of a similar character throughout the country. At the Perkins Institution his most remarkable achievement was in the education of Laura Bridgman. The care and education of idiots and feeble-minded, the reform of prisons, abolition of imprisonment for debt, and finally the abolition of negro slavery in the United States, all engaged Howe's attention. He entered publicly into the antislavery struggle for the first time in 1846, when, as a "Conscience Whig," he was an unsuccessful candidate for Congress against Robert C. Winthrop. In 1851 he was one of the founders and editor of an antislavery paper, the *Boston Daily Commonwealth*, upon which his wife, Julia Ward Howe (qv), whom he had married in 1843, assisted him. He was one of the most prominent mem-

bers of the Kansas Committee in Massachusetts, and with Sanborn, Stearns, Theodore Parker, and Gerrit Smith, was interested in the plans of John Brown, although he disapproved of the latter's attack upon Harper's Ferry. During the Civil War Howe was one of the directors of the Sanitary Commission and at its close entered into the work of the Freedmen's Bureau. He was the originator of the State Board of Charities of Massachusetts, in 1863, the first board of the sort in America, and was its chairman from that time until 1874. In 1866 he made a last trip to Greece to carry relief to the Cretan refugees and in 1870 was a member of the commission sent by President Grant to inquire into the practicability of the annexation of Santo Domingo. It is probably not too much to say that no man ever lived in America who so truly deserved the name "philanthropist" in its highest and best sense—a lover of his fellowmen, and no American certainly was ever connected with more great reforms that were brought to a successful conclusion. Consult F. B. Sanborn, *Dr. S. G. Howe, the Philanthropist* (New York, 1891), L. E. Richards (ed.), *Letters and Journals* (2 vols., Boston, 1906-09), id., *Two Noble Lives* (ib., 1911).

HOWE, TIMOTHY OTIS (1816-83) An American lawyer and politician, born in Livermore, Me. After graduating from Redfield Seminary he was admitted to the bar in 1839 and in the following year became a Whig member in the Maine Legislature. In 1840 he was obliged by ill health to give up his career in Maine and removed to Green Bay, Wis., which was his home during the rest of his life. In 1850 he was elected judge of the Circuit and Supreme courts of Wisconsin. From 1861 to 1879 he was a member of the United States Senate as a Republican and served on the committees of Finance, Commerce, Pensions, and Claims. He declined an appointment to the vacancy in the United States Supreme Court occasioned by the death of Judge Chase. In 1881 he became Postmaster-General in President Arthur's cabinet and in the latter part of that year went to Paris as a United States delegate to the International Monetary Conference.

HOWE, WILLIAM, fifth Viscount (1729-1814) A British soldier in the American Revolution, younger brother of Richard, Earl Howe. Until 1799 he was known as Sir William Howe. He was born Aug. 10, 1729, was educated at Eton, was appointed a cornet in 1746, and saw service in Flanders. In 1750 he became captain, and in 1757, having attained the rank of lieutenant colonel, he was placed in command of the Fifty-eighth Foot and sent with it in the following year to America, where he took part in the siege and capture of Louisburg and accompanied Wolfe on his expedition to Quebec. After the capture of Montreal, in 1760, he returned to Europe, and in 1762 was adjutant general of the expedition against Havana. After the close of the Seven Years' War he was made colonel of the Forty-sixth Foot (1764), was elected to Parliament as a Whig from Nottingham, and in 1768 was appointed Lieutenant Governor of the Isle of Wight. He attained the rank of major general in 1772. Although opposed to the government's course, he commanded the reinforcements sent to General Gage at Boston in March, 1775. He commanded the British in the battle of Bunker Hill, on June 17

following Later he was made a lieutenant general and in October succeeded Gage in command of all the troops in America outside of Canada, with the local rank of general He was besieged in Boston by Washington during the winter of 1775-76 and, being compelled to abandon the city, withdrew his troops to Halifax and afterward transferred his command to Staten Island, whence he moved on New York, winning the battle of Long Island on Aug 27, 1776, and occupying the city on September 15 On October 28 he defeated Washington at White Plains and afterward captured Forts Washington and Lee, after which he settled down in New York for the winter It was not until June, 1777, that he again took the field Wishing to reach Philadelphia, and finding that he had not a sufficiently large force to advance across New Jersey in the face of Washington's army, he embarked his troops and sailed down the coast and up the Chesapeake Bay as far as Elkton, where he landed his forces on August 28 Marching northward, he encountered and defeated Washington at the Brandywine on September 11 and on September 27 occupied Philadelphia On October 4 the Americans were repulsed at Germantown After hearing the news of Burgoyne's surrender at Saratoga on October 17, Howe made arrangements to stay in Philadelphia during the winter, while Washington went into winter quarters at Valley Forge Howe had sent in his resignation shortly after taking Philadelphia, but it was not accepted until May, 1778, when Sir Henry Clinton was appointed to succeed him He was severely criticized for his inactivity at Philadelphia, and in 1779, after his return to England, his conduct was the subject of a parliamentary inquiry, but the examining committee reached no definite decision in the matter In 1782 he became lieutenant general of ordnance and attained the rank of full general in the following year He died at Plymouth, July 12, 1814 Consult S G Fisher, *The Struggle for American Independence* (Philadelphia, 1908)

HOWE, WILLIAM HENRY (1846-). An American animal painter He was born at Ravenna, Ohio, was educated in the public schools, and, having studied art in Paris under Otto de Thoen and Vuillefroy, became known especially for his paintings of cattle He won a gold medal at the Paris Salon in 1888, and gold medals or other honors with pictures exhibited at various expositions (New Orleans, 1885, Paris, 1889, Chicago, 1893) His work was also represented in the art exhibitions of London, Boston, New York, and San Francisco He became an officer of the French Academy in 1896, received the cross of the Legion of Honor in 1898, was elected an Associate National Academician in 1894 and a National Academician in 1897, and was a member of the jury of awards at the St Louis Exposition in 1904

HOWE, WILLIAM WIRT (1833-1909) An American jurist, born at Canandaigua, N Y After graduating from Hamilton College he practiced law in New York and St Louis, Mo He served in the Union army during the Civil War, rising to the rank of major, settled in New Orleans, La., and from 1868 to 1873 was associate justice of the Louisiana Supreme Court In 1897 Judge Howe was elected president of the American Bar Association. He was widely known as a lecturer and wrote several

papers on the history of New Orleans and on civil law

HOWELKE, JOHANNES See HEVILIUS

HOWELL A city and the county seat of Livingston Co., Mich., 33 miles east by south of Lansing, on the Pere Marquette and the Ann Arbor railroads (Map. Michigan F 6) It has the State sanatorium for the treatment of tuberculosis and a Carnegie library It is in the centre of a Holland Holstein-Friesian cattle-breeding region and has manufactures of flour, condensed milk, wheel plows centrifugal pumps, etc The water works and electric-light plant are owned by the city Pop., 1900, 2518 1910, 2338

HOWELL, CLARK (1863-) An American editor He was born in Bainwell Co. S C, and graduated at the University of Georgia in 1883 After an apprenticeship in newspaper work he succeeded Henry Grady as managing editor of the *Atlanta Constitution* in 1889 and became editor upon the retirement of his father in 1897 He was a member of the Georgia House of Representatives in 1886-91 serving as Speaker in 1890-91, and became a member of the Democratic National Committee in 1892 From 1900 to 1906 he was a member and president of the Georgia Senate

HOWELL, HECTOR MANSFIELD (1842-) A Canadian jurist He was born in Hastings Co., Ontario, and was educated at Albert College, Belleville For several years he was a public-school teacher, but afterward studied law and was called to the Ontario bar in 1871 and in 1879 to the bar of Manitoba, where he rose rapidly to be one of the leaders in his profession In 1904 he was elected president of the Manitoba Law Society He entered politics, but was unsuccessful as a Conservative candidate for the Manitoba Legislature Later he joined the Liberal party, owing to the Manitoba school question (See MANITOBA, *History*) In 1906 he was appointed Chief Justice of the Court of Appeal.

HOWELL, JAMES (c 1604-1666). An English author, born in Wales He graduated B A from Jesus College Oxford (1613), traveled extensively on the Continent as a representative of the government He was imprisoned for a time during the Civil War, but after the Restoration he was appointed historiographer royal of England Howell wrote with ease and grace many books, of which the best is *Epistolæ Hædianæ, Familiar Letters, Domestic and Foreign, Divided into Sundry Sections, Partly Historical, Political, and Philosophical* (vol i, 1645, vol ii, 1647, together with a third vol., 1653) These were mostly written in the Fleet Prison and to imaginary correspondents for the most part Consult reprint of the tenth edition by J Jacobs (London, 1890) and, for a popular edition, the "Temple Classics Series"

HOWELL, JOHN ADAMS (1840-) An American naval officer, born at Bath, N Y. He graduated from the United States Naval Academy in 1858, participated in the battle of Mobile Bay in 1864, was stationed at the Naval Academy in 1867-71 and in 1875-79, and was promoted through the various grades to captain in 1884 and rear admiral in 1898 He was commandant of the navy yard at Washington in 1893-96 and of that at League Island in 1896-98, in 1898 commanded the European squadron and the Northern Patrol squadron, and from 1898 to 1902, when he retired, was president of

the Naval Examining and Retiring Board. He wrote the first truly scientific American work on the deviations of the compass, patented a disappearing gun carriage, and originated the gyroscopic steering torpedo. See TORPEDO.

HOWELL, JOHN CUMMING (1819-91). An American naval officer, born in Philadelphia, Pa., and educated at Washington College, Pennsylvania. He was appointed a midshipman in the United States navy in 1836, saw some service in the naval operations of the Mexican War, became commander in 1862, and participated in many engagements during the Civil War. He served as fleet captain of the European station in 1869-70, was commandant of the League Island Navy Yard at Philadelphia in 1871-72 and of the Portsmouth Navy Yard from 1872 to 1874. From 1874 to 1879 he was chief of the Bureau of Yards and Docks, at times acting as Secretary of the Navy, became a rear admiral in 1877, was in command of the European squadron from 1879 to 1881 and was retired on Nov. 24, 1881.

HOWELL, WILLIAM HENRY (1860-). An American physiologist. He was born in Baltimore and graduated in 1881 at Johns Hopkins, where he became associate professor of physiology (1888) and in 1893, after teaching in the University of Michigan and for one year at Harvard, was made professor. He was dean of the Medical School from 1899 to 1911. In 1905 he became a member of the National Academy of Sciences. Dr. Howell contributed to the *London Journal of Physiology*, the *Transactions of the Royal Society*, the *Johns Hopkins Biological Studies*, the *Journal of Morphology*, and the *Journal of Experimental Medicine*. In 1896 he edited *An American Text-Book of Physiology* and wrote a *Text-Book of Physiology* (1905, 5th ed., 1913). He contributed articles on physiology to the NEW INTERNATIONAL ENCYCLOPEDIA. He was associate editor of the *American Journal of Physiology* after 1898.

HOWELLS, WILLIAM DEAN (1837-) An American novelist, editor, poet, and critic, born at Martin's Ferry, Ohio, March 1, 1837, of well-to-do Welsh-Quaker ancestry. Howells spent his youth among books. He began making verses almost as soon as he could read, serving a literary apprenticeship in his father's printing office, afterward as compositor on the *Ohio State Journal* and other newspapers, and still later as correspondent and editor. He first attracted marked attention by poems published in the *Atlantic Monthly*. In 1860 he published *Poems of Two Friends* with John J. Piatt (qv.) and in the same year wrote a campaign *Life of Lincoln*, in recognition of which he received the Venetian consulate (1861-65). As a fruit of his first Italian sojourn we have *Venetian Life* (1866, latest ed., 1907), a work of vivid realism, flexible style, and genuine charm, which was followed by *Italian Journeys* (1867). On his return to America, Howells was connected editorially with the *Tribune*, the *Times*, and the *Nation* of New York and from 1866 to 1881 with the *Atlantic Monthly* of Boston, of which he was the editor from 1872. *Their Wedding Journey* (1871), his first attempt at fiction, was followed, during his Boston residence, by *A Chance Acquaintance* (1872); *A Foregone Conclusion* (1875), *Out of the Question* (1877), *A Counterfeit Presentment* (1877), *The Lady of the Aroostook* (1879), and *The Undiscovered Country* (1880). *A Fearful Responsibility* (1881),

Dr. Breen's Practice (1881), *A Modern Instance* (1882), *A Woman's Reason* (1883), *Three Villages* (1884), and *The Rise of Silas Lapham* (1885) were written during a residence in England and Italy. On his return in 1886 Howells assumed an editorial function for *Harper's Magazine*, developing strong critical powers and steadily opposing the romantic or pseudo-historic in modern fiction, while constituting himself the champion of an uncompromising realism, which he exemplified in his own work. He was also for a short time editor of the *Cosmopolitan Magazine*. The more noteworthy volumes of fiction in this period are *The Minister's Charge* (1886), *Indian Summer* (1886), *April Loves* (1888), *Annie Kilburn* (1889), *A Hazard of New Fortunes* (1890), *The World of Chance* (1893), *The Coast of Bohemia* (1893), *The Story of a Play* (1898), *Ragged Lady* (1899), *Their Silver Wedding Journey* (1899), *Heromes of Fiction* (1908), critical studies of a group of heroines of English novels, *The Flight of Pony Baker* (1902), *The Kentons* (1902). Howells has written also many farces, of which *The Sleeping-Car*, *The Mouse-Trap*, *The Elevator*, and *Out of the Question* are characteristic. Noteworthy also are *Tuscan Cities* (1885), *Modern Italian Poets* (1887), *Criticism and Fiction* (1891), essays, *A Boy's Town* (1890), *A Traveler from Altruria* (1894), in which his quondam leanings towards socialism find expression in the form of fiction, *Impressions and Experiences* (1896), *Literary Friends and Acquaintance* (1900), valuable records, especially as regards New England authors of a generation earlier than Howells, *Son of Royal Langbrith* (1904), *London Films* (1905), one of a number of his charming books of similar nature, in which graphic and subtle description and mellow reflection and comment blend delightfully, *Miss Bellard's Inspiration* (1905), *Certain Delightful English Towns* (1906), *Between the Dark and the Daylight* (1907), *My Mark Twain Reminiscences* (1910), *New Leaf Mills* (1913), *Familiar Spanish Travels* (1913); *Seen and Unseen at Stratford-on-Avon: A Fantasy* (1914). A collected edition of his works, the Library Edition, was published (New York and London) in 1913.

His poems were collected in 1873 and 1886, and a volume under the title *Stops of Various Quills* appeared in 1895. Perhaps, of all the books named above, *The Rise of Silas Lapham* and *A Hazard of New Fortunes* represent their author at his best. He is the founder of the school of American realists who derive through the Russians from Balzac and has little sympathy with any other form of fiction, although full of encouragement for new writers in whom he discovers a fresh note. His style, while simple and natural, is at the same time finished, richly varied, and resourceful, and his knowledge of the details of life is accurate and minute. It can hardly be doubted that his was the most influential work done in American fiction during the last quarter of the nineteenth century.

Like Henry James, Howells has done his country a great service in interpreting America to Europe and hardly a lesser service in interpreting America to itself. Irving turned to legend and history for his material, Cooper to the Indian and border adventure, Hawthorne to a world apart from the light of common day, Poe to the terrible and the grotesque. It remained for Howells, and, with a difference, for

Henry James, to present with unswerving truth and minuteness everyday aspects of the life and character of their country and their countrymen which the earlier novelists who were their compatriots had either idealized out of ready recognition or well-nigh ignored. With a sure sense for the finer elements of the national character, his genius found a way to seize upon and present them in high relief, and with a certain detachment bred of cosmopolitan culture Howells has been with propriety referred to as the dean of American letters. Man of letters essentially he must certainly be counted, not only as a novelist, but as a writer of short plays and witty farces, as poet and literary critic, and as a writer of familiar essays full of ripe wisdom and marked by the subtlety and finish of an accomplished and resourceful literary artist. He was one of the seven chosen by the National Institute of Arts and Letters as first members of the American Academy, and of the latter body he became president.

HOWELL'S STATE TRIALS See **STATE TRIALS**

HOWE TRUSS See **BRIDGE**

HOWISON, GEORGE HOLMES (1834-1916)

An American philosopher, born in Montgomery Co., Md. He graduated at Marietta College in 1852 and at the Lane Theological Seminary in 1855. After holding positions at Washington and Harvard universities, at Massachusetts Institute of Technology, and at the University of Michigan, he was Mills professor of philosophy at the University of California from 1884 until his retirement, in 1909. In philosophy he came to be known as a Kantian, but he developed Kantianism along original lines, arriving at a personal idealism according to which reality is a community of spirits bound together not by causal relations but by sharing a common ideal eternally realized in God, the highest Spirit. He was one of the most successful teachers of philosophy in America, his pupils being found in many colleges and universities in the United States; he also exercised a profound influence on the intellectual life of the Pacific coast, having among other things organized a most successful philosophical club, the Philosophical Union of the University of California, before which have been delivered as addresses what subsequently appeared as important published works, such as Royce's *The Conception of God* and Watson's *Christianity and Idealism*. William James first proclaimed his pragmatism before this Union in an address entitled "Philosophical Conceptions and Practical Results." Howison's publications include *Treatise on Analytic Geometry* (1869) and *Limits of Evolution* (1901, 2d ed, 1905). He edited and contributed to Royce's *The Conception of God* (1897).

HOWITT, WILLIAM (1792-1879) and **MARY** (1799-1888). Two English authors, who may well be treated together. William Howitt was born at Heanor, Derbyshire. His parents were Quakers. Though he attended several schools, he educated himself mostly by reading. From his youth he was fond of outdoor sports, and he celebrated in verse the scenery with which he was familiar. In 1821 he married Mary Botham, daughter of a prosperous Quaker of Uttoxeter, Staffordshire. After living for a year in Staffordshire they settled in Nottingham, where William set up as a druggist. Here they remained for 12 years. They subsequently

lived at Esher in Surrey, London, Heidelberg, and Rome. William spent two years in Australia (1852-54). Somewhat after middle life they became spiritualists. Both died in Rome and were buried there. Soon after their marriage they began to write in collaboration and then independently. Among their joint works are contributions in verse and prose to annuals and periodicals, *The Forest Minstrel* (1823), *The Desolation of Eyam and Other Poems* (1827), *Literature and Romances of Northern Europe* (1852), *Ruined Abbeys and Castles of Great Britain* (1862). Among William's independent works are *Book of Seasons, or Calendar of Nature* (1831), *Popular History of Priestcraft* (1833), *Pantika, or Traditions of the Most Ancient Times* (1835), *Rural Life of England* (1838), *Visits to Remarkable Places* (1st series, 1840, 2d series, 1842), *Boys' Country Book* (1839), *Rural and Domestic Life of Germany* (1842), *Popular History of England* (1856-62), *The Mad War Planet and Other Poems* (1871). Among Mary's independent publications, numbering 110 distinct works, are translations from Fredrika Bremer and Hans Andersen *Sketches of Natural History* (1834), *Popular History of the United States* (1859), a novel called *The Cost of Caerguyn* (1864), *Tales in Prose for Young People* (1864), *Tales in Verse for Young People* (1865), *Tales for All Seasons* (1881). From these lists it may be seen that the Howitts did much for their generation by diffusing knowledge. On the other hand, they wrote little or nothing of permanent value. Consult *Mary Howitt in Autobiography*, edited by her daughter, Margaret Howitt (London, 1889).

HOWITZER (from *howitz*, from Ger *Hau- litze*, formerly *Haubnitz*, from Boh *haufnice*, *haufence*, *howitzer*, sling for casting stones). A type of cannon intermediate between guns and mortars, which may be used as a gun or as a mortar. For example, the 6-inch siege howitzer of the United States army has a variation in elevation from -5° to $+40^{\circ}$. Combining this range of elevation with the three different charges of powder used, the howitzer possesses a flexibility in range and angle of fall not possible with guns and mortars. Field howitzers are designed for a curved fire greater than that of guns and less than mortars. Such fire reaches the *personnel* protected behind shielded guns and steep cover. The ammunition includes both shrapnel for the attack of men and animals, and high-explosive shell for the attack of material objects and overhead cover. A howitzer concealed behind steep cover, over which its curved trajectory makes it possible to fire, can attack the field gun which cannot effectively reply, on account of the flatness of its trajectory.

In recent years European artillerymen have given much attention to the development of light and heavy howitzers designed to accompany an army in the field. The howitzers in service in the United States army are the 3-inch mountain gun or howitzer carried on pack mules, using a 15-pound projectile, the 3.8-inch and 4.7-inch howitzers using 30-pound and 60-pound projectiles respectively. One battalion (3 batteries, equipped with 12 howitzers) of the 3.8-inch pieces is assigned to the artillery brigade forming the divisional artillery. In addition to the above calibres the 6-inch howitzer (120-pound projectile) forms a part of the

heavy field artillery accompanying the mobile army. This piece, using the maximum charge giving a muzzle velocity of 900 feet per second, when fired at an angle of elevation of 40°, gives a horizontal range of 6704 yards, after rising a maximum vertical distance of 4478 feet. The angle of fall is 45°, or a slope of 1 on 1.

In the European War of 1914 the effective employment of large-calibre, powerful howitzers and mortars in the attack of permanent fortifications was one of the notable developments of artillery. For several years before the outbreak of this war Germany, in particular, had successfully experimented with novel types of heavy ordnance. This development was closely watched and copied by other European nations, especially by France, who was in the same position as Germany with respect to defending and attacking fortified places on the land frontiers. Germany, with her usual military foresight, prepared for the inevitable conflict by rushing the construction of a large number of 11-inch howitzers and mortars at the great works of Krupp and Ehrhardt. The characteristics of these are shown in the accompanying table, with the 11-inch French mortar designed

founded and published *Outing* (1882-85), was editor and proprietor of the *Cambridge (Mass.) Tribune* (1885-90), served as publisher and treasurer of the *Outlook* (1900-13), and in 1914 became president of the Independent Weekly Publishing Company (publishers of the *Independent*).

HOWLAND, SIR WILLIAM PEARCE (1811-1907). A Canadian statesman. He was born at Pawling, N. Y., but in 1830 went to Upper Canada, settled in York County, and later became a wholesale merchant in Toronto. Entering politics, in 1857-67 he was a Liberal member of the Canada Legislative Assembly. In 1862-63 he was Minister of Finance in the Macdonald-Sicotte administration, and in 1863-64 Receiver-General in the Macdonald-Dorion administration. In the coalition government of 1864-66 he was Postmaster-General and afterward Minister of Finance. In 1865 he and Sir A. T. Galt (q.v.) were commissioners to Washington in behalf of reciprocity of trade between Canada and the United States. He took a prominent part in the movement for Canadian confederation and in 1866-67 was a delegate at the conference in London, England, at which

COMPARATIVE TABLE SHOWING THE CHARACTERISTICS OF THREE TYPES OF SIEGE HOWITZERS AND MORTARS USED BY THE GERMANS AND FRENCH IN THE EUROPEAN WAR, 1914

	French Schneider mortar	German Krupp howitzer	German Ehrhardt mortar
Calibre, inches	11.023	11.023	11.023
Extreme range, yards		11,045	10,327
Common shell, pounds	758*	750*	760 6*
Weight of powder charge, pounds		10 to 30	16.53 to 23.14
Muzzle velocity	853 f s †	1115 f s †	885 f s †
Limit of elevation	10° to 60°	0° to 65°	20° to 60°
Limit of traverse	20°	10°	10°
Weight of mortar, pounds	8,892	13,514	8,818.5
Weight of mortar and carriage complete, pounds	33,082	30,644	22,928
Number of loads after dismounting for transportation	4	2	2
Weight of loads, pounds			
	Gun load	Gun load	Gun load
	10,837	19,687	13,117.5
	Chassis load	Carriage load	Carriage load
	10,660	17,990	14,109.5
	Carriage load		
	8,750		
	Platform load		
	11,220		

* High explosive shells of less weight are also used.

† Variable, according to weight of ammunition used.

by the celebrated ordnance firm of the Schneiders of France. It will be noted that the German *matériel* is transported in two loads, the French in four. The latter therefore has a greater mobility, but takes longer to assemble for firing. The Germans were the first to transport on the gun-carriage wheels and fire therefrom a calibre as large as 11 inches. The results obtained in the reduction of the Antwerp forts in October, 1914, fully justified the existence of these great guns. It is true that the Japanese used 11-inch mortars in the reduction of Port Arthur in 1904-05, but these were coast-defense mortars dismantled in Japan and remounted in front of Port Arthur on specially prepared concrete foundations, whereas the German pieces are transported on and fired from their own carriages. See ARTILLERY, FIELD ARTILLERY, HEAVY FIELD ARTILLERY, SIEGE ARTILLERY, MORTARS, ORDNANCE; HORSE ARTILLERY, MOUNTAIN ARTILLERY.

HOWLAND, WILLIAM BAILEY (1849-). An American publisher, born at Ashland, N. Y., and educated at Williston Seminary. He

were finally settled the terms of union to be embodied in the British North America Act. In 1867 he was elected to the first Dominion Parliament, and until 1868 was Minister of Inland Revenue in the administration of Sir John A. Macdonald. In 1868-73 he was Lieutenant Governor of Ontario. In 1879 he was knighted.

HOWLER, or **STENTOR**. An American monkey of the genus *Myrcetes*, or *Alouatta*, remarkable for the dilatation of the hyoid bone into a hollow drum, which communicates with the larynx, makes a conspicuous external swelling of the throat, and gives prodigious power to the voice, enabling these animals to emit hideous sounds, which are heard miles away, and to which all their names refer. There are two, and sometimes four, other resonators connected with the larynx, besides the one in the hyoid. The howlers live chiefly among the branches of trees and make extraordinary leaps from one to another, taking hold by the tail as readily as by the hands and often swinging by it alone. They are the largest monkeys in the New World.

About seven species are known, occurring from Central America southward to the Rio Grand do Sul. They are sometimes kept in captivity, but are always sullen and untamed. Their habits and brain structure both show that their position is properly among the lowest monkeys. The best-known forms are those of southern Brazil, such as the very black shaggy howler or guereba (*Alouatta caraya*), of which the females and young are dingy white, and the brown araguata, or ursine howler (*Alouatta usina*). The red howler (*Alouatta seniculus*) belongs to the Orinoco region and is distinguished by its bright chestnut color and the ridge of upright red hair across the top of its head. This one is said to furnish the principal animal food used by the natives of the eastern slopes of the Andes, but they are obtained only in the lowlands. Still another species abundant along the lower Amazon, is the yellowish arabata (*Alouatta beelzebub*). See CERBIDÆ, MONKEY, and Plate of AMERICAN MONKEYS with the latter article.

HOWLEY, JAMES PATRICK (1847-) A British-American surveyor and geologist. He was born in St John's, Newfoundland, and was educated at St Bonaventure's College. In 1867 he was appointed assistant geological surveyor and in 1887 became director of the geological survey of Newfoundland. In 1879 he was elected a member of the Mineralogical Society of Great Britain, in 1883 a fellow of the Geological Society (London), and in 1896 a member of the North of England Institute of Mining and Mechanical Engineers. He prepared a large number of reports and articles relating to the resources and geology of Newfoundland and published *The Geology of Newfoundland* (1877).

HO-WO, hō'wō' See FUNG-HUANG

HOWORTH, hō'wəth, SIR HENRY HOYLE (1842-) An English scientific writer and politician, member of the Royal Society. He was born at Lisbon, was educated at Rossall School, and was admitted to the bar, though he practiced law very little, but devoted himself to Lancashire politics and to literature. He served in the House of Commons as a Conservative from 1886 to 1900. He became a member of many geographical and anthropological societies, in 1899 he was made a trustee of the British Museum, and he also served as president of the Archaeological Institute. Howorth's writings, besides letters to the *Times* and contributions to the *Quarterly* and the *Edinburgh*, are on geological, archaeological, ethnological, and historical subjects. Among these are *History of the Mongols* (2 vols, 1876-78), *The Vicars of Rochdale* (1883), *The Mammoth and the Flood* (1887), *Ice or Water* (3 vols, vols 1, ii, 1903), *St Gregory the Great* (1912), *St Augustine of Canterbury* (1913).

HOWRAH, hō'ra. A town of the Presidency of Bengal, India, on the right bank of the Hugh, opposite Calcutta (qv), of which it is the most important suburb (Map India, F 4). Howrah has large jute works, manufactures cottonseed oil, iron, rope, and machinery. It is an important railway terminus and the seat of the Sibpur Civil Engineering College. Pop, 1901, 157,594, 1911, 179,006.

HOWSON, JOHN SATL (1816-85). An English clergyman and author, born at Giggleswick-in-Craven, Yorkshire. He graduated at Trinity, Cambridge, in 1837, was classical master and

later principal of the Liverpool Collegiate Institute (1845-65), and from 1867 until his death was dean of Chester. During the latter period he practically restored the cathedral, raising nearly £100,000 for the purpose. He is best known for his *Life and Epistles of St Paul* (1852), written in conjunction with Rev W J Conybeare. He also published *The Character of St Paul* (1862), *The Metaphors of St Paul* (1868), and other religious works, including commentaries.

HOWTH, hōth or houth. A picturesque peninsula, forming the north shore of Dublin Bay, Ireland (Map Ireland, E 5). It is about 2½ miles long by 2 miles broad and terminates in a cliff 563 feet high, at the foot of which is Howth village, an important fishing station and watering place.

HOXIE, VINNIE REAM (1847-1914). An American sculptor born at Madison, Wis. She studied under Bonnat in Paris and under Majoli in Rome. Shortly after Lincoln's death, and while she was still in her teens, she won a \$30,000 prize in a competition for a statue of the martyred president. The first woman sculptor ever to receive a commission from the government, she executed a life-size figure, which is now in the rotunda of the Capitol at Washington. Congress later commissioned her to make the heroic statue of Farragut in Farragut Square, Washington. Among other works were statues of "The West," "Sappho," and busts of Mayor Powell of Brooklyn and of Ezra Cornell. In 1911 she was chosen to be the sculptor of the statue of Sequoyah to represent Oklahoma in the statuary hall in the Capitol at Washington. She married Gen Richard L. Hoxie in 1878.

HOY. One of the Orkney Islands (qv), Scotland, situated in 58° 50' N, long 3° 20' W, 2 miles southwest of Pomona (Map Scotland, F 2). It is 14 miles long and 6 miles broad and rises abruptly from the sea, with precipitous cliffs 1000 feet in height fronting the west. Area, 53 square miles. Waid Hill, 1564 feet high, commands a fine panoramic view of the islands. Pop, 1891, 1320 1901, 1216, 1911, 1082.

HOY (Flem *hui*, Dutch *heu*, *heude*, of uncertain etymology). A small vessel, usually sloop-rigged, formerly used in large harbors and rivers and to some extent as a coaster. The term is now applied to *pouder hoys*, *anchor hoys*, and similar heavy-built barges (sailing or steam) for carrying ammunition, anchors, or other heavy weights.

HOYEN, hē'yēn, NIELS LAURITS ANDREAS (1798-1870). A Danish art critic, born at Copenhagen, where he entered the university in 1816. In 1822-25 he traveled through Germany, Austria, and Italy to Rome, where he met many artists gathered around Thorvaldsen. After his return he lectured at the academy, where in 1829 he became professor, and at the university after 1856. For years he was, with C J Thomsen, director for *Den kongelige Malerisamling*, and he put into order the art collections in all the royal castles of the kingdom. As lecturer, he exerted a great influence, being an eloquent speaker and enthusiastic in his advocacy of a distinctly national art. The trend of Danish art in the middle of the last century towards the picturing of homely scenes of common life is largely due to Hoyen's influence. His literary works, *Skrifter*, with

Hoyen's Leined, were edited by J L Ussing (3 vols, Copenhagen, 1871-76). Consult J Lange, "Hoyen som Docent og Forfatter," in *Skifter*, vol III.

HOYLAND NETHER A manufacturing town in the West Riding of Yorkshire, England, 5 miles south-southeast of Barnsley. It has large collieries and brickworks. Pop., 1901, 12,464, 1911, 14,638.

HOYLE, EDMOND (1672-1769) An English writer on games. Of his early life nothing is definitely known, although it is asserted that he was educated for the law. For many years he lived in London, writing upon and giving instruction in games, and in 1742 he published *A Short Treatise on the Game of Whist*, which went through many editions and became the world's authority. He also published works on backgammon (1743), piquet (1744), quadrille (1745), brag (1751), and chess (1761). See **WHIST**.

HOYT, ALBERT HARRISON (1826-) An American editor and author, born in Sandwich, N H. He graduated from Wesleyan University in 1850, studied and practiced law in Portsmouth, N H., was a paymaster in the army during the Civil War and rose to be lieutenant colonel, and after the peace was editor of the *New England Historical and Genealogical Register* (1868-76) and of *Memorial Biographies*, vol IV (1885). His other works include *Necrology of the New England Colleges* (1869-70), *Captain Francis Golet's Visit to Boston, etc., in 1745-50* (1870), *Letters of Sir William Pepperell, Bart.* (1874), *The Name Columbia* (1886).

HOYT, CHARLES HALE (1860-1900) An American dramatist, born in Concord, N H. He graduated at the Boston Latin School and, after being engaged in the cattle business in Colorado for a time, took up newspaper work, first with the *St Albans (Vt.) Advertiser*, and later becoming musical and dramatic critic of the *Boston Post*. Finally he turned playwright and wrote a series of farcical comedies, of which *A Trip to Chinatown* (1890) and *A Milk-White Flag* (1893) were the most successful. He was twice a member of the New Hampshire Legislature and was Democratic candidate for Speaker.

HOYT, HENRY MARTYN (1856-1910) An American lawyer and public official, born at Wilkes-Barre, Pa. He graduated from Yale University in 1878 and from the law department of the University of Pennsylvania in 1881. Entering the banking business, he became treasurer and later president of the Investment Company of Philadelphia, but after 1893 he devoted himself to the practice of law in that city. He served as United States Assistant Attorney-General from 1897 to 1903 and as United States Solicitor-General from 1903 to 1909. When the office of Counselor of the State Department was created in 1909, he was appointed to that position by President Taft. He participated in the negotiations for a reciprocity treaty between the United States and Canada in 1910.

HOYT, JOHN WESLEY (1831-1912) An American educator and administrator, born near Worthington, Ohio. He graduated at Ohio Wesleyan University (1849), studied law and medicine, and for a time edited and published the *Wisconsin Farmer*. He was State or national commissioner to expositions in London (1862), Paris (1867), and Vienna (1873), and was spe-

cial representative for foreign affairs at the World's Fair, Chicago (1893). In 1873-74, as chairman of the Wisconsin State Board of Railway Commissioners, he helped to settle the Granger war. He reorganized the University of Wisconsin, suggested and framed a bill for the establishment of a national university, was Governor of the Territory of Wyoming (1878-83) and president of Wyoming University (1887-91). His publications include *University Progress* (1869), *Studies in Civil Service* (1878), *Of Appointment and Removal* (1885), *History of University Education* (1903).

HOYT, WAYLAND (1838-1910) An American Baptist clergyman, born at Cleveland, Ohio. After graduating from Brown University in 1860 and from Rochester Theological Seminary in 1863, he held various pastoriates until 1874, when he was called to the Shawmut Avenue Church, Boston. Subsequently he occupied the pulpits of the Tabernacle Church, New York (1876-82), the Memorial Church, Philadelphia (1882-89), the First Church, Minneapolis, Minn (1889-95), and Epiphany Church, Philadelphia, after 1895. He was also a professor in the theological department of Temple University, Philadelphia. He is author of *Hints and Helps in the Christian Life* (1880); *Along the Pilgrimage* (1884), *At His Feet* (1893), *Home Ideals* (1904), *The Teaching of Jesus concerning His Own Person* (1907).

HOZIER, o'zyá', CHARLES RENE d' (1640-1732) A French genealogist, son of Pierre, Seigneur de la Garde, whose work he continued. He succeeded his brother, Louis Roger, as *juge d'armes* in 1666. In 1696 he collected the declarations of those having armorial bearings, who had been ordered to register. This was the beginning of the *Armoiral Général de France*, a collection now in the Bibliothèque Nationale. It comprises 35 volumes containing some 60,000 entries. He published *Recherches de la noblesse de Champagne* (1673), *Remarques sur l'histoire de Charles IX de Valois* (1686), *Recherches des armoiries de Bourgogne*, in manuscript form.

HOZIER, PIERRE d', SEIGNEUR DE LA GARDE (1592-1660) A French genealogist. He belonged to the household of the Marshal de Créquy and gave him aid in his genealogical investigations. In 1616, because of his great heraldic knowledge, he began extensive researches into the genealogy of the princely families of the kingdom. The King, in order to facilitate his work, created him one of the "hundred noblemen" of his household. In 1628 he received the order of Saint-Michel and in 1629 a pension. From this time on his reputation as a genealogist was established. In 1634 he was appointed historiographer and genealogist of France and in 1641 *juge d'armes*. In 1643 he verified the claims of the pages of the household of the King and in 1654 became Councilor of State. He had six sons, two of whom survived him and continued his work. The oldest son, Louis Roger (1634-78), succeeded him as *juge d'armes*. He became blind in 1675 and was succeeded by his younger brother, Charles René (qv). Pierre published a *Recueil armorial des anciennes maisons de Bretagne* (1638), *Les noms, surnoms, qualitez, armes, et blasons des chevaliers et officiers de l'ordre du Saint-Esprit* (1634). At his death his genealogical notes, *Généalogie des principales familles de France*, which comprise some 150 volumes, in manuscript form, were deposited in the Bibliothèque Nationale. He is said to have

helped Renaudot (qv) establish his *Gazette de France* (1631)

HŌZUMI, hō'zō'mē', NOBUSHIGE (1855-) A Japanese jurist and educator. He studied in Tokyo, became an English barrister of the Middle Temple, and attended Berlin University. As professor in the University of Tokyo, he did much for the reorganization of that institution. He was a member of the House of Peers in 1890-92, was one of the commission of three that drafted the Japanese civil code, and was chairman of the committee to revise the criminal code. Besides works in Japanese on codification and other subjects, he wrote, in English, *Incestor Worship and Japanese Law* (1901) and *The New Japanese Civil Codes as Material for the Study of Comparative Jurisprudence* (1904).

HRABANUS MAURUS, ra-ba'nō's mou'roos. See **RABANUS MAURUS**.

HRABR, hra'b'r. An early South Slav (Old Bulgarian) writer. Of his life nothing is known beyond the fact that he was a monk and lived at the end of the ninth and the beginning of the tenth century A.D. In his treatise *O Pismeneh* (On Writing), which bears witness to the literary activity of the early Slav translators of the Greek church books, Hrabr endeavored to justify the right of the Slavs to employ an alphabet of their own in preference to the Greek. It is, however, impossible to ascertain whether he refers to the Cyrillic alphabet (qv) or the Glagolitsa (qv). Consult Abicht, "Das Alphabet Chrabres," in *Archiv für slavische Philologie*, vol. xxxi (Berlin, 1910).

HRDLICKA, dlich'ka, ALŠ (1869-) An American anthropologist, born at Humpoletz in Bohemia. He went to New York City, where he studied at the Eclectic College and the Homoeopathic College. Hrdlicka made special studies of the insane, accompanied anthropological expeditions to Mexico and the Southwestern States (1898-1900, 1902, 1905, and 1910), to Florida (1906), to the Northwest (1908), to Egypt (1908-09), to South America (1910), to Siberia and Mongolia (1912), and to Peru (1913), and from 1899 to 1903 was director of the anthropological section of the Hyde expedition sent by the American Museum of Natural History to the southwestern United States and Mexico. His anthropological studies brought him to the conclusion that the bulk of the American aborigines were of Asiatic origin. He was assistant curator of physical anthropology in the United States National Museum from 1903 to 1910 and thereafter curator, and from 1901 to 1908 he was also associate editor of the *American Naturalist*. He wrote *Report on Anthropological Work in the State Institution for Feeble-Minded Children, Synacuse, N. Y.* (1898), *Anthropological Investigations on One Thousand White and Colored Children* (1899), *The Eskimo Brain* (1901), *Ancient Man in North America* (1907), *Tuberculosis among Indians* (1909), *Observations on Eskimo* (1910), *Ancient Man in South America* (1912), *Anthropological Work in Peru in 1913* (1914).

HRODBERT, rōd'bērt, SAINT. See **RUPEET**, SAINT.

HROLF, or **ROLF**, rōlf, THE GANGER. The conqueror of Normandy. See **ROLLO**.

HROSWITHA, hrōs'vē-ta, or **HROTSUITA**. See **ROSWITHA**.

HSI-AN-FO, shē'an'fō'. See **SI-NGAN-FU**.

HSIEN FENG, shyēn fūng. See **HIEN FUNG**.

HSIN-MIN-TUN, shīn-mīn-tūn'. A village of Manchuria. See **RUSSO-JAPANESE WAR**.

HSUAN T'UNG, shwān tūng' (1905-) The reign title of Pu-yi, tenth and last Manchu Emperor of China. The nephew of the preceding Emperor, Kwang-su, and the son of Tsai-feng (qv), commonly known as Prince Chun. Hsuan Tung was no doubt selected by the Empress Dowager Tzu-hsi as successor because of his youth which would insure her own continuance in power. But she died Nov. 15, 1908, the day following the death of Kwang-su. On the accession of Hsuan Tung in 1908, his father was appointed Prince Regent. A liberal policy of reform was inaugurated, but the forces operating to destroy the Manchu monarchy had proceeded too far to be checked, and the outbreak at Wuchang, October, 1911, was the signal for the revolution which ended Feb. 12, 1912, by the abdication of Hsuan Tung and the establishment of the Republic. Concerning the Emperor, it was stipulated in the terms of abdication that he was to retain his title of Emperor of Ta Ch'ing, to receive an allowance of 4,000,000 taels annually, and to have the Summer Palace, a few miles from Peking, as his permanent residence.

HUACA, wa'ka, hwa'ka, or **GUACA**, gwa'ka, colloq. wī'ka. See **PERUVIAN ARCHEOLOGY**.

HUAINA CCAPAC, wa'-na ka'pak. A Peruvian Inca. See **HUAYNA CCAPAC**.

HUALAPAI, wa'la-pī. An Indian tribe in Arizona. See **WALAPI**.

HUALLAGA, wa-lyā'ga. See **AMAZON**.

HUAMBISA, wam-bē'sa. A savage tribe of the Jivaroan linguistic stock dwelling about the junction of the Santiago and Marañon-Amazon rivers, at the head of Amazon navigation, on the Peru-Ecuador boundary. They joined the Jivaró (qv) group in their revolt against the Spanish authority in 1599 and took part in the sack of Sevilla del Oro, when 7000 Spanish women were carried off by the victors. Evidence of this admixture remains to day, the Huambisa as well as the Jivaró and several other tribes of the region being fair-skinned and bearded. They are implacably hostile, both to the whites and to the neighboring Indians.

HUANACO, wa-na'kō. See **GUANACO**.

HUANCACHELCA, wan'ka-čā-lē'ka. A department of Peru, bounded by the departments of Lima and Junín on the north, Ayacucho on the east, Ica on the south, and Lima on the west (Map. Bolivia, B 6). Its area is 9250 square miles. It belongs entirely to the region of the Cordilleras and contains only a very small portion of land fit for agriculture. The mineral wealth of the mountains consists of quicksilver, gold, silver, copper, and lead. The quicksilver mines of Huancavelica, first worked in 1566 and famous during the colonial period, are now among the most important on the globe. However, little mining is carried on because of the poor transportation facilities and the lack of capital to introduce the necessary modern methods. The vine is cultivated, and sugar cane, cotton, and cereals are produced. There is also some stock raising. Pop, 1876 (census), 103,069, 1896 (official estimate), 223,796. The capital, Huancavelica, is situated in the northern part of the department at an altitude of over 12,000 feet and has a population of about 3000.

HUANCAYO, wan-ka'yō. A town in the Peruvian Department of Junín, situated on the river Mantaro, at an altitude of over 10,000 feet.

The constitution promulgated here in 1839 remained in force till 1860. Pop., about 5000.

HUANG-HSING, or **HWANG-HSING**, hwang'-shing' (1875-1916). A Chinese general and organizer of the revolution of 1911. He was born near Changsha, capital of Hunan Province, and was educated at the college of the Liang-lu (which means the provinces of Hunan and Hupeh). Later he graduated from Tokyo University in Japan. From his youth he was active against the Manchu monarchy and incurred the hostility of the court. He fled to Japan and there continued his republican activities. A good orator and skilled organizer, he did much to enlist the prominent people of Hupeh and Hunan provinces in the revolutionary cause. During the period of preparation which preceded the outbreak he was the representative of Dr. Sun Yat-sen in China and received the money for the cause which Dr. Sun collected in Europe and America. He commanded forces at Hankow, Hanyang, and Wuchang during the revolution. At Hankow he was second in command and at Hanyang conducted a brave defense against the superior number of well-trained northern troops opposed to him. The convention at Nanking, December, 1911, which named Dr. Sun provisional President, made Huang-hsing Premier and Minister of Navy and Marine. In March, 1912, when Yuan Shih-kai became President, Huang-hsing was appointed commander in chief of the southern army. As a member and the founder of the Kuomintang, or southern party, he got into difficulties with President Yuan and was expelled from the Peking Assembly. He took the leading part in the unsuccessful revolt which followed. In 1914 he visited the United States.

HUÁNUCO, wa'-nu-kō. A department of Peru, bounded by the Department of Loreto on the north and east, Junín on the south, and Ancachs on the west (Map Bolivia, B 5). Its area is 14,027 square miles. It is exceedingly mountainous in the western part, with a general easterly slope towards the Ucayali River. It is watered by several streams, including the headwaters of the Amazon, and is covered to a large extent with thick forests. The climate is hot and moist in the east and cold in the mountainous regions of the west. The mountains contain deposits of gold, silver, and quicksilver, but the lack of good roads prevents their exploitation. Sugar cane, coffee, tobacco, and cereals are grown, and there are some manufactures of blankets and alcohol. Pop., 1876 (census), 78,991; 1896 (official estimate), 145,309. Capital, Huánuco (q v).

HUÁNUCO. The capital of the Peruvian department of the same name, situated at an altitude of nearly 6000 feet, near the river Hualaga, 170 miles northeast of Lima (Map Bolivia, B 5). It has a healthful climate, is the seat of a bishopric, and was, until 1855, the capital of the Department of Junín. Its chief industry is the manufacture of cocaine. It was founded about 1543. About 35 miles west lies Huánuco Viejo, an Inca town settled by the Spaniards in 1535 and now almost abandoned. Pop. of Huánuco, about 7500. Consult C. R. Enock, "The Ruins of 'Huánuco Viejo,'" in *Geographical Journal*, vol. xxvi (London, 1905).

HUARAZ, or **HUARAS**, wa'-ras. Capital of the Peruvian Department of Ancachs, situated on the Huaraz River, and connected by rail with the coast (Map Bolivia, B 5). It has a cool and generally equable climate, its streets are

narrow and its houses plain, and the only noteworthy buildings are the government building, a hospital, a school and two churches. It is the seat of a bishop. Set in the wall of its cemetery is a very interesting collection of stones sculptured by the ancient Peruvians and collected from the surrounding country. Pop., about 17,000.

HUARTE DE SAN JUAN, war'tā dā san hwan', or **HUARTE Y NAVARRO**, é na-vai'rō, JUAN DE DIOS (c 1530-c 1600). A Spanish physician and psychologist, who was born in Lower Navarre. He wrote a curious book on phrenology, *Examen de ingenios para las ciencias* (1575), which was extremely popular and was translated into several European languages—into English as *A Trial of Wits*. Some of his theories on education are very enlightened for the time, while others are fantastic in the extreme. Consult J. M. Guardia, *Ensayo sobre la obra de J. Huarte* (Paris, 1855), and *Biblioteca de autores españoles*, vol. lxxv (Madrid, 1873).

HUASCÁN, was-kan'. See HUASCAREN.

HUASCAR, was'kar (c 1495-1533). A Peruvian Inca, born in Cuzco. He was the legitimate heir of Huayna Ccapac, but his father allowed him to inherit only half the kingdom, leaving the other half to a younger brother, Atahualpa, of a more fierce and warlike character, who coveted the whole. A battle between the rival claimants took place near Mount Chimboazo (1532), and Huascar was defeated, falling afterward into the hands of his half brother, who compelled him to look on while the women of the royal household were tortured to death. The landing of the Spaniards was the beginning of the end for Atahualpa, whose dread that they might reinstate his brother caused him to have Huascar secretly drowned in the river Andamarca. Consult Pedro Sarmiento de Gamboa, *History of the Incas*, published by the Hakluyt Society (Cambridge, 1907), and C. R. Markham, *The Incas of Peru* (New York, 1910).

HUASCARAN, was-ka-ian', or **HUASCÁN**. See ANDES, Peru.

HUASCO, was'kō. A port of Chile, in the Province of Atacama (Map Chile, E 3). The bay is sheltered, but it has poor facilities for shipping. It has several regular lines of steamers and is connected by railway with the interior. A very fertile valley lies back of Huasco, which is rapidly being placed under cultivation. The chief exports are copper, silver, gold, pressed hay, agricultural produce, and cattle. In 1911 its exports amounted to \$174,255, and its imports to \$1,697,579. It also carries on a large coast trade. Pop., 2500.

HUASTECS, was'tēks. A detached tribe of Mayan stock (q v), on the shores of the Gulf of Mexico along the Pánuco in the states of Vera Cruz and San Luis Potosí. The language contains more archaic forms than any other of the stock, bearing out the traditional and other evidences that the Huastecs were left behind in the southward migration of the Maya people.

HUAULT DE MONTMAGNY, CHARLES J. See MONTMAGNY.

HUAYNA CCAPAC, wa'e-na ka'pak (?-1525). A Peruvian Inca, born in Cuzco. His reign began in 1483, and, being by that time an experienced soldier, he waged war against his neighbors till he had conquered the country as far north as Quito, including Puná Island, Ecuador, and as far south as Atacama, Chile. A

ferocious warrior he cultivated also the peaceful art of road making (notably the highway between Tumbez, Pachacamac, and Cuzco), while it was the magnificence of the palaces he had built which so impressed the first Spanish invaders. Huayna Capac had a harem of more than 600 members, and he decreed that his legitimate heir should share the huge kingdom with a younger brother, which led to the internal dissensions that made it fall an easy prey to Francisco Pizarro. Consult C. R. Markham, *The Incas of Peru* (New York, 1910).

HUAYULE. See GUAYULE.

HUB See HUB OF THE UNIVERSE.

HUBAL, hoo'bal. A god worshiped at Mecca, whose image, probably in human form, stood in the Kaaba (qv). He is said to have been brought from Moab by Amr ibn Luhai, of the tribe of Khuza'a, who occupied the Haram before it passed into the hands of the Koraish, and a northern origin is suggested by the occurrence of his name in a Nabataean inscription found at Hejr. When the Meccans had gained a victory over Mohammed near Medina, they shouted, "Hail Hubal!" This may indicate that the personal name of the god of Mecca was especially affected by the Koraish after Mohammed had given a new conception to the appellation *al ilahu*, or Allah (qv). The identification of Hubal with Allah, proposed by Wellhausen, is altogether probable. Oracles were secured from Hubal through the casting of arrows kept near his image. Consult Wellhausen, *Reste arabischen Heidentums*, p. 221 (2d ed., Berlin, 1907), and Noldeke, article "Arabs," in Hastings, *Encyclopædia of Religion and Ethics* (New York, 1908).

HUBALDUS See HUCBALD.

HUBAY, hoo'bô-i, JENO (1858-). An Hungarian violinist, born at Budapest. He studied the violin with Joachim in Berlin and in 1876 began to give concerts in Hungary and later in Paris. He was chief violin professor at the Brussels Conservatory (1882) and at the Budapest Conservatory (1886), succeeding his father, Charles Hubay, who was also a well-known violinist. As a composer, he ranks high, his operas *Der Geigenmacher von Cremona* (1893), *Ilener* (1892), the Hungarian *A falu rózsája* (1896), *Lavothas Liebe* (1906), and *Anna Karenina* (1915) being especially noteworthy. He also wrote a symphony, a violin concerto, and many solo pieces for violin.

HUBBARD, ELBERT (1859-1915). An American writer, also a printer and binder of books, born in Bloomington, Ill. He made himself widely known as the originator of the Roycroft Shop in East Aurora, N. Y., founded for the purpose of reviving the old handicrafts, particularly that of artistic bookmaking. He also originated and edited *The Philistine*, a periodical characterized by a curious jumble of shrewd but generally kindly philosophy, sometimes marred by vulgarity. His writings have considerable vogue among dilettantes in literature. His work includes a long series of sketches, mainly of a biographical nature, published as *Little Journeys*, many pamphlets, such as *A Message to Garcia* (1899), *Time and Chance* (1899), a graphic account of John Brown's career, *Contemplations* (1902), short essays and miscellaneous selections from Hubbard's writings, *Hollyhocks and Golden Glow* (1912); *The Book of Business* (1913). Died on the *Lusitania*.

HUBBARD, GARDINER GREENE (1822-97).

An American lawyer, born in Boston. He graduated at Dartmouth in 1841, studied law at Harvard, and was admitted to the bar in 1843. He practiced his profession in Boston until 1873, when he removed to Washington, D. C. There he was intimately connected with the organization and development of the American Bell Telephone Company. He was the founder, and for many years the president, of the National Geographic Society and was a trustee of several important educational institutions. Hubbard devoted much attention to the advancement of oral instruction among deaf-mutes. He made a large collection of etchings and engravings, which were given by his widow to the Library of Congress with a fund for additions.

HUBBARD, JOSEPH STILES (1823-63). An American astronomer, born at New Haven, Conn. He graduated from Yale College in 1843 and the next year went to Philadelphia, where he acted as assistant to Sears Cook Walker, who had built the observatory of the Philadelphia High School. Soon afterward he accepted a position offered him by General Fremont, then a lieutenant, as computer of the observations for latitude and longitude made during the explorer's journey across the continent. In 1845 he was appointed to a vacancy in the corps of professors of mathematics in the navy and was assigned to the Washington Observatory, where he remained during the rest of his life. He contributed frequently to the *Astronomical Journal* and twice, for long periods, was its editor. During his connection with the Washington Observatory he made a number of cometary investigations and important computations. He was a member of the National Academy of Sciences and of various other scientific societies.

HUBBARD, LUCIUS FREDERICK (1836-1913). An American soldier. He was born in Troy, N. Y., went to school in Granville, N. Y., learned the trade of a tinsmith, and followed it for three years in Chicago. In 1859 he started a newspaper in Red Wing, Minn., and afterward served in the Civil War, conducting himself gallantly and becoming brigadier general. Later he engaged in railroad building and milling. He was a State Senator (1872-76), Republican Governor of Minnesota (1882-87), and in the Spanish-American War commanded a volunteer brigade.

HUBBARD, RICHARD WILLIAM (1816-88). An American landscape painter, born at Middletown, Conn., and in later life a resident of Brooklyn, N. Y. He studied under Daniel Huntington and in France and England and became a member of the National Academy in 1858. His work pictures scenes in New York and Connecticut and is often graceful and pleasing but never vigorous.

HUBBARD, WILLIAM (1621-1704). An American clergyman and historian, born in England. As a child, he was brought by his parents to New England, graduated at Harvard (1642), was ordained and became assistant minister and afterward pastor of the Congregational church at Ipswich, Mass., a post which he resigned but a year before his death. He wrote, at the order of the Colonial government, which paid him 50 pounds for it, a *History of New England*, mainly compilation, which barely escaped destruction by fire when Gov. Thomas Hutchinson's house was mobbed in 1765. The Massachusetts Historical Society printed it in 1815. He wrote also *A Narrative of Troubles with the Indians* (Boston, 1677), which was for years popular in New Eng-

land and was even reprinted at the beginning of the nineteenth century at Worcester, Mass., 1801, and Roxbury, Mass., 1805. It is full of errors, but illustrates what was regarded by the writer's contemporaries as an elegant prose style. Minor works are a volume of sermons (1684) and *Testimony of the Order of the Gospel in Churches* (1701).

HUBBARDTON. A town in Rutland Co., Vt., 13 miles northwest of Rutland (Map Vermont, B 5). It was the scene of a sharp conflict, on July 7, 1777, between the rear guard of General Saint Clair's army, retreating from Ticonderoga, and a British and Hessian force under Generals Fraser and Riedesel. The Americans, under Colonels Warner and Francis, were defeated, with a total loss in killed, wounded, and prisoners of 324 men, nearly one-third their number, while the British loss was only 183. A monument commemorates the battle. Pop., 1900, 488, 1910, 455.

HUBE, hū'be, ROMUALD (1803-90). A Polish jurist, born at Warsaw and educated there, at Cracow, and in Berlin. From 1826 to 1832 he was professor of criminal law at Warsaw, then became head of a committee on revision of the laws of Poland, and was for a time professor at St. Petersburg. In 1846 and again in 1867 he went with Count Bludov on diplomatic missions to Rome. He died at Warsaw after 13 years' service in the Russian Council of State. His works include treatises on penal law (1828), on Polish criminalists (1830), *Antiquissima Constitutiones Synodales Provinciae Gnesnensis* (1836), *Loi Salique* (1867), *Histoire de la formation de la loi Bourguignonne* (1867), *Droit romain et gréco-byzantin chez les peuples slaves* (1880), and on Polish law in the thirteenth (1874) and fourteenth (1881) centuries.

HUBER, hū'bēr, EUGEN (1849-) A Swiss jurist, born at Stammheim, Canton of Zurich. He became a lecturer at the University of Bern in 1873 and professor of civil law at Basel in 1880, at Halle in 1898, and at Bern in 1902. He also served as a member of the Swiss National Council, as member of the Permanent Court of Arbitration at The Hague, and as editor of the *Schweizerisches Zivilgesetzbuch* after 1907. In Switzerland he did an especially important service in codifying the civil law and in bringing about a uniform law usage in the courts. His best-known work is the *System und Geschichte des schweizerischen Privatrechts* (4 vols., 1886-93).

HUBER, u'bār', FRANÇOIS (1750-1831). A Swiss naturalist. He was born in Geneva, inherited a love of nature as well as keen powers of observation from his father, studied physics under Saussure and chemistry with a relative. At 15 he began to lose his sight. Before he became totally blind he married a Mademoiselle Lullin. Her devotion, his father's wealth, and the keen eyes of his manservant, Burnens, made it possible for him to carry out his pioneer researches of the life and habits of honeybees. In 1792 he published at Geneva, under the title *Nouvelles observations sur les abeilles*, letters to Bonnet. These were translated into English in 1806. In later works, especially on the origin of wax and the construction of cells, Huber was assisted by his son. Among his more important discoveries were the aerial impregnation of the queen bee (see BEE), the killing of the males by the workers, the rivalry of the queens, the use of the antennæ, the origin of the propolis, and

the ventilation of the hives which supplies fresh oxygen.

HUBER, hū'bēr, HANS (1852-) A Swiss dramatic composer, born at Schönenwerd, near Olten. He studied at the Leipzig Conservatory and became well known as a music teacher, being appointed in 1896 director of the music school at Basel. His operas *Weltführung* (1894) and *Gudrun* (1896) were successfully produced at Basel, and his instrumental pieces are universally popular. He cultivated almost every branch of instrumental and vocal composition.

HUBER, JOHANNES (1830-79). A German theologian and philosopher, leader of the Old Catholics. He was born in Munich, was educated there, and became assistant professor of philosophy in the university in 1859 and a fearless opponent of the Ultramontanes. His work *Die Philosophie der Kirchenväter* (1859) was put on the Index Expurgatorius, and Catholic students were of course forbidden to attend his lectures. He actively opposed the dogma of infallibility and played a conspicuous part at the first general congress of the Old Catholics at Munich, in September, 1871. With Dollinger he wrote the famous *Der Papst und das Konzil von Janus* (1869). Among his other works are *Johannes Scotus Eugena* (1861), *Die Freiheiten der französischen Kirche* (1870), *Das Papsttum und der Staat* (1870), *Die Lehre Darwins kritisch betrachtet* (1871), *Der Jesuitenorden* (1873), *Der Pessimismus* (1876), *Die Forschung nach der Materie* (1877). Consult Eberhard Zinngebl, *Johannes Huber* (Gotha, 1881).

HUBER, LUDWIG FERDINAND (1764-1804). A German author, born in Paris. Taken to Leipzig when only two years old, he was educated in the German, English, and French languages and literatures and joined the intimate circle of Körner and Schiller. In 1798 he became editor of the *Allgemeine Zeitung* and shortly before his death, counselor of education for Swabia. He became well known for his political writings in the periodicals *Friedenspalmarien* (10 vols., 1794-96) and *Klio* (1795-98), he published two volumes of criticism under the title *Fermischte Schriften von dem Verfasser des heimlichen Gerichts* (1793), and he wrote also many dramas, of which *Das heimliche Gericht* (1790, new ed., 1795) was the best. Consult his *Sämtliche Werke seit dem Jahre 1802*, with a biography by his wife, Therese Huber (4 vols., Tübingen, 1807-19).

HUBER, VICTOR AIMÉ (1800-69). A German literary critic and social reformer, born at Stuttgart. He studied medicine and modern languages at Würzburg and Göttingen. Between 1821 and 1823 he traveled extensively, he gave up medicine and taught at Bremen, was appointed professor of the history of literature and of modern history at Rostock in 1833, of the languages of western Europe at Marburg in 1836 and in 1843 at Berlin. He was one of the best scholars of the Spanish language and literature in Germany. From 1851 to 1869 he lived in retirement in the Harz Mountains. His writings on Spanish, French, and English literature include *Die Geschichte des Cid* (1829), *Crónica del Cid* (1844), *De Primitiva Cantilenarum Popularum Epicarum (vulgo Romances) apud Hispanos Forma* (1844); *Skizzen aus Spanien* (4 vols., 1828-35), one of the best estimates of modern times, *Die neuromantische Poesie in Frankreich* (1833), *Die englischen Unversitäten* (1839-40). He was for a time a Conserva-

tive in politics and founded the journal *Janus*, but later became a Socialist. Consult Rudolf Elvers, *Victor Aimé Huber* (Bremen, 1872-74), and Eugen Jäger, *Victor Aimé Huber, ein Vorkämpfer der sozialen Reform* (Berlin, 1879).

HUBERDEAU, u'bër'dô', GUSTAVE (c1878-). A French dramatic basso, born in Paris. At the age of 17 he entered the Paris Conservatory, where he studied violin, singing, and theory, carrying off many prizes. After the completion of his studies he made his debut in Rossini's *Barbiere di Siviglia* in 1898 at the Opera Comique, of which institution he remained a member for 10 years, until his engagement for the Manhattan Opera House in New York in 1908. After the dissolution of that company, in 1910, he joined the Chicago-Philadelphia Opera. At the American premiere of R. Strauss's *Elektra* he created the rôle of Orestes. He possesses a splendidly trained voice of great volume and flexibility and is at the same time an excellent actor.

HUBERMANN, hû'ber-man, BRONISLAV (1882-). A Polish violinist, born at Czen-tochowa, near Warsaw. After some instruction from Michalowiez and Lotto, with whom his progress was nothing less than amazing, his father in 1892 took him to Joachim in Berlin. In less than a year the famous master declared the boy a finished artist. He made his debut in 1893 in Amsterdam and the same year played in Brussels and Paris. The following year Patti (qv) heard him in London and was so impressed that she engaged him to appear with her at her farewell concert in Vienna (January, 1895). There he attracted the attention of no less a personage than Brahms. In 1896 he toured the United States. While concertizing in Italy in 1903, he was signally honored when the municipality of Genoa engaged him to play in the city hall upon the famous Guarnerius formerly owned by Paganini (qv). He visited every country of Europe.

HUBERT, hû'bërt. The custodian of Arthur, in Shakespeare's *King John*. The character is taken from that of Sir Hubert de Burgh, who died in 1243.

HUBERT, u'bär', SAINT (c656-727). The first Bishop of Liège, honored as its patron and founder. There are numerous legends concerning him, but there seems no doubt that he was of noble birth and was married to a lady of rank. It is related that the apparition of a crucifix upon the head of a stag which he was chasing on Good Friday turned him to the religious life. He became Bishop of Maestricht and made so many converts in the district that he was called the Apostle of the Ardennes. He is the patron saint of the hunter and the healer of hydrophobia. His anniversary (November 3) is made the occasion of curious ceremonies in French rural districts. Several military orders are named after him.

HUBERT DE BURGH (?-1243). An English statesman. He held office under Richard the Lion-Hearted and about 1202 was made, by King John, castellan of Falaise and guardian of Arthur of Brittany, the young son of John's elder brother, Geoffrey. The story of his refusal to obey the King's orders to blind the young prince, incorporated by Shakespeare in his *King John*, is unauthentic. In the struggle between John and the barons he sided with the King, but is mentioned as one of those by whose advice Magna Charta was granted. In the same year he

was made justiciar of England. He held Dover Castle against the Dauphin Louis in 1216 and on August 24 of the following year gained a notable naval victory over a French fleet which was bringing in reinforcements to Louis. After 1219 Hubert, at first with the papal legate Pandulf, carried on the government for the young Henry III. He was a bitter opponent of the foreign party headed by Peter des Roches, Bishop of Winchester, and attempted to put an end to the system by which the wealth of the English clergy was being taxed for the benefit of the papal court. His policy in general was dictated by a twofold desire to strengthen the power of the crown and to further his own fortunes. During his terms of office he amassed vast riches through prudent marriages, as well as by arrogating to himself lucrative offices and the guardianship of wealthy heirs. Members of his family were advanced to high positions in the Church. His ill success against the Welsh about the year 1228 afforded his enemies an opportunity for undermining his influence with the King. He was dismissed from office in 1232 and charged with malfeasance, murder, and treason. Though restored to the King's favor for a short period, he never again exercised any influence in the government. He died in London, May 12, 1243. Consult William Stubbs, *Constitutional History of England*, vol. II (4th ed., Oxford, 1896), H. W. Davis, *England under the Angevins and Normans* (New York, 1905), T. F. Tout, *History of England, 1216-1377* (London, 1905).

HUBERTI, u'bär'të', LÉON GUSTAVE (1843-). A Belgian composer, born at Brussels. He won the Prix de Rome (1865) at the Brussels Conservatory and from 1874 to 1878 was director of the Mons Conservatory. He was inspector of singing in the Antwerp schools (1880-89), becoming later a professor at the Brussels Conservatory and director of the music school of St. Josse-ten-Noode-Schaerbeek. His compositions, which are of sterling merit, comprise the oratorios *Een laatste Zonnestraal*, *Bloemaiddine*, and *Willem van Oranjes dood*, the dramatic poem *Verlichting*, for organ, orchestra, soli, and chorus, a *Symphonie funèbre*, a romantic suite, many songs, piano pieces, and instrumental numbers.

HUBERTUSBURG, hû'bër'tus-burk, or **HUBERTSBURG**, hû'bër'ts-burk (Ger., Hubert's castle). A royal hunting seat, not far from Leipzig, built in 1721-24 by Augustus the Strong (Frederick Augustus I) of Saxony. Here, on Feb. 15, 1763, was signed the treaty of peace between Austria, Prussia, and Saxony, marking the conclusion of the Seven Years' War (qv). It is now a lunatic asylum.

HUBLI, or **HOOLY**, hû'bli. A town and railway junction in the Dharwar district, Bombay, British India, 90 miles northeast of Karwar on the Malabar coast (Map India, C 6). It is one of the principal cotton marts in that section of India and has manufactures of copper ware and silks. It has a fair trade in grain, salt, and agricultural produce. The chief objects of interest in the town and vicinity are the ancient Jain temples and numerous monasteries. Pop., 1901, 60,214, 1911, 61,440.

HUBNER, hup'nër, EMIL (1834-1901). A distinguished German classical scholar, born at Dusseldorf. He studied at Berlin and Bonn and then traveled widely in Italy, Spain, and England. He was professor at the University of Berlin from 1870 until his death. His contribu-

tions to classical learning, above all in the field of Latin epigraphy, were very numerous. To his influence was due an awakening of interest in classical studies in general and especially in epigraphy in Spain, which he made a favorite field of study. Among his publications the most important are: *De Senatus Populique Romani Actis* (1859), *Epigraphische Reiseberichte aus Spanien und Portugal* (1861), *Die antiken Bildwerke in Madrid* (1862), *Inscriptiones Hispaniae Latinae* (1869, supplementary volume, 1892), *Inscriptiones Hispaniae Christianae* (1871, supplementary volume, 1900), *Inscriptiones Britanniae Latinae* (1873), *Inscriptiones Britanniae Christianae* (1876), *Exempla Scripturae Epigraphicae Latinae* (1885), *Monumenta Linguae Ibericae* (1893), *Ueber mechanische Copien von Inschriften* (1881), *Grundriss zu Vorlesungen über die römische Literaturgeschichte* (4th ed., 1878), a very valuable bibliographical work, translated, with large additions, by J. E. B. Mayor, as *Bibliographical Clue to Latin Literature*, *Grundriss zu Vorlesungen über lateinische Grammatik* (2d ed., 1880), *Bibliographie der klassischen Altertumswissenschaft* (2d ed., 1889), *La arqueología de España* (1888), *Römische Herrschaft in Westeuropa* (1890), *Römische Epigraphik* (2d ed., 1892). Hubner was also coeditor of *Hermes* (1866-81) and of the *Archäologische Zeitung* (1868-73).

HUBNER, JOSEPH ALEXANDER, COUNT (1811-92), called originally **HAFENBREDEL**. An Austrian author and diplomat, born and educated in Vienna. He held various minor diplomatic positions in Paris, Lisbon, and Leipzig, and was then sent to Paris as Minister Plenipotentiary (1849). He held this post under the Republic, and under Napoleon III until 1859. After this he was Minister of Police in his own country, but did not keep that portfolio long. From 1865 to 1867 he was Ambassador to Rome and then made a tour of the world, described in *Ein Spaziergang um die Welt* (1875). His best-known work is his history of *Sixtus V* (1870). His posthumous work, *Neun Jahre der Erinnerungen eines österreichischen Botschafters in Paris unter dem zweiten Kaiserreich, 1851-59* (2 vols., 1904), which also appeared contemporaneously in French, is important.

HUBNER, JULIUS (1806-82). A German historical painter of the Düsseldorf school. He was born at Oels in Silesia, studied at the Academy School in Berlin and under Schadow there and at Düsseldorf. He first attracted attention by his picture of "Ruth and Boaz" (1825). He traveled in Italy and resided for the most part at Düsseldorf until 1839. In that year he settled at Dresden, becoming a professor in the Academy of Arts in 1841 and director of the Gallery of Paintings in 1871. He obtained the great gold medal at Brussels in 1851. Among the works of his first period are "The Fisherman" (1828), after Goethe's ballad, "Ruth and Naomi" (1833), in the National Gallery, Berlin, "Christ and the Evangelists" (1835); "Job and his Friends" (1838), in the Gallery of Frankfurt, "Consider the Lilies" (1839), and the portrait of Frederick III, in the Kaiserhalle, Frankfurt. To his second, or Dresden, period belong the "Golden Age" and "Dispute between Luther and Dr. Eck" (1866), in the Dresden Gallery, "Charles V at San Yuste", "Last Days of Frederick the Great", "Cupid in Winter", and others. He was also known as a poet.

HUBNER, KARL (1814-79). A German genre painter. He was born at Königsberg, and was a pupil of the Düsseldorf Academy. His works were especially popular in Holland and in America, where he was received with enthusiasm in 1874. His genre subjects include "The Silesian Weavers" (1844), "The Sleeping Wood Thief" (1845), "The Abandoned" (1846), "The Seizure for Debt" (1848), Königsberg Museum, "The Sinner at the Church Door" (1874), National Gallery, Berlin, "Consolation in Prayer" (1875), Düsseldorf Gallery, "The Recovery," in the Pennsylvania Academy of Fine Arts.

HUB OF THE UNIVERSE. A name jestingly given by Oliver Wendell Holmes in one of his essays to the State House in Boston as the centre of a self-satisfied community. The term is frequently shortened to "Hub" and applied to the city itself, which is popularly supposed to boast of its superior wisdom and culture.

HUBRECHT, HUBERT, AMBROSIVS ARNOLD WILLEM (1853-1915). A Dutch zoologist. He was born in Rotterdam, was educated at the universities of Utrecht, Leyden, Erlangen, and Heidelberg, was Selenka's assistant in zoology at Erlangen in 1874, in 1875-82 was in the Leyden Zoological Museum, and in 1882 became professor at Utrecht. In 1890-91 he traveled in Java, Sumatra, and Borneo, where he made embryological studies, notably of the tarsier. He visited the United States in 1896 and 1907. Honorary degrees were conferred on him by Princeton, St Andrews, Cambridge, Dublin, Glasgow, and Gießen. His most important work was in embryology and placentation of the mammals. In papers in the *Quarterly Journal of Microscopical Science* in 1883 and 1887 he put forth the theory—also held by Sir E. Ray Lankester—that the vertebrates originated in a Nemertine form, basing this on his discovery in the Nemertines of a continuous nerve sheath. *The Descent of the Primates* (1897) is the title under which were published his lectures at the sesquicentennial celebration at Princeton.

HUBSCH, HUPSH, HEINRICH (1795-1863). A German architect. After studies in Heidelberg he traveled extensively in Greece and Italy (1817-24). In 1827 he was appointed Oberbauath (inspector of buildings) at Karlsruhe. He designed the Basilica at Munich, but is chiefly known for his great work on basilican architecture, *Die altchristlichen Kirchen*, published also in French as *Monuments de l'architecture chrétienne* (Karlsruhe, 1865?).

HUBSCHMANN, HUPSH'MAN, JOHANN HEINRICH (1848-1908). A German philologist, born at Erfurt. He studied Oriental philology at Jena, Tübingen, Leipzig, and Munich, in 1876 became professor of Iranian languages at Leipzig, and in 1877 professor of comparative philology at Strassburg. He was the first to put the Armenian language in right relation to the Indo-Germanic languages. He wrote *Armenische Studien* (1883); *Das indogermanische Vokalsystem* (1885), *Etymologie und Lautlehre der ossetischen Sprache* (1887), *Persische Studien* (1895), *Armenische Grammatik* (1895), *Altarmenische Ortsnamen* (1904).

HUC, UK. EVARISTE RÉGIS (1813-60). A French Roman Catholic missionary and traveler. He was born in Toulouse, joined the Lazarist fathers in 1839, and at once went to China. After spending a few years in missionary labor in northern China, in 1844 he set out for Tibet.

With his two companions—one a Tibetan priest and the other Joseph Gabet, a brother Lazarist—he spent several months in a Tatar monastery, learning the Tibetan language, and then made his way over the desert and glaciers to Lhasa, arriving in January, 1846. Although he was favorably received by the Tibetans, he was compelled to return, the Chinese Ambassador having successfully used his influence to that end. Such was the strain on Father Huc's health that he was forced to come back to France in 1852, after visiting India, Egypt, and Palestine. He published *Souvenirs d'un voyage dans la Tartarie, le Thibet et la Chine pendant les années 1844-46* (2 vols, Paris, 1850), *L'Empire chinois* (ib, 1855), and *Le christianisme en Chine, en Tartarie et en Thibet* (4 vols, ib, 1857-58). All of these works have been translated into English. The strangeness of the things described caused them to be received with incredulity, but later travelers have established their truth, and now they are regarded as comprising one of the most authoritative accounts of Tibet. Consult Henri d'Orleans, *Le pere Huc et ses critiques* (Paris, 1893).

HUC'BALD, or HUBALDUS (c 840-c 930)

A Benedictine monk, author, and musician. He was noted for his piety and learning. He lived most of his life in the monastery of Saint-Amand, near Tournai where he was head master of his uncle's convent school. His writings include some lives of the saints, but he is best known by his treatises on music. The authorship of these is disputed, excepting *Harmonica Institutio*, a criticism of a work by Regimon de Prun. The most celebrated of them is *Musica Enchiridias*, which has now been proved to be by an unknown writer of the end of the tenth century. Other works attributed to him are *Alia Musica* and *Commemoratio Brevis de Tonis et Psalmis Modulandis*.

HUCH, hūc', RICARDA (1864-). A German novelist, born in Brunswick. She prepared for university work privately and studied at Zurich, where she took her doctor's degree in 1891. She published the plays *Der Bundes-schuur* (1891) and *Eloe* (1892), a volume of poems (1894), and two collections of tales, *Erzählungen* (1897) and *Fra Celeste* (1899). Her best work is found in her novels, which are marked by insight into the realities of life and fine stylistic passion. They include *Aus der Triumphgasse* (1901), *Vita Somnium Breve* (1902), *Von den Königen und der Krone* (1904), *Seifenblasen* (1905), *Die Geschichte von Garibaldi* (2 vols, 1906-07), *Neue Gedichte* (1907), *Risorgimento* (1908), *Gonfalonieri* (1910), *Der grosse Krieg in Deutschland* (3 vols, 1912-13). In literary criticism she published *Blutzeit der Romantik* (1899) and *Ausbreitung und Verfall der Romantik* (1902). Consult E. A. Regener, *Ricarda Huch, eine Studie* (Leipzig, 1904) and Elfriede Gottlieb, *Ricarda Huch, ein Beitrag zur Geschichte der deutschen Epik* (1914).

HUCHET, ū'shā', CHARLES A. See LABEYRIERE, COUNT.

HUCK'ABACK (probably from LG. *hukkebak*, pickaback, from *huken*, to crouch + *bak*, back). A coarse kind of linen or cotton cloth, figured somewhat like damask, it is usually employed for toweling. A kind of crash.

HUCKLEBERRY (probably a corruption of *hurtleberry*, *whurtleberry*, *whortleberry*, probably from AS. *uȳrtl*, OHG *uursala*, Ger *Wurzel*, root + *berry*). A term now generally restricted

to various small shrubs of the genus *Gaylussacia* (q.v.), family Ericaceae. In some sections, however, the term "huckleberry" is popularly given to several species of blueberries belonging to the closely allied genus *Vaccinium* of the same family. The flowers of these species have a four or

HUCKLEBERRY

five toothed calyx, four or five cleft bell-shaped corolla, with the limb bent back, and eight to ten stamens with two-horned anthers. The fruit is a four to five celled, many-seeded berry. The numerous representatives of the genus *Vaccinium*, mostly confined to the Northern Hemisphere, are common in the north of Great Britain, Europe, and throughout North America. In nature the blueberry is represented by numerous species. The plants range in size from 6 inches in *Vaccinium pennsylvanicum* to 5 to 10 feet high in *Vaccinium corymbosum*, and bear fruits from 1/8 of an inch up to 3/8 of an inch in diameter. In color they show all shades from waxen black, blue, and white, to red in one species, *Vaccinium vitis-idaea*, which is often called cranberry because of the likeness of its acid fruit to that of the cranberry.

While the blueberry has been successfully transplanted to gardens, grown from seeds and grafted, it has nowhere been cultivated in a commercial way. In certain portions of the United States wild plants are protected and cared for in order that the fruit may be secured for the canneries or markets. Recent experiments in blueberry breeding and culture show that the berries can be greatly improved in size, and that their successful culture depends especially on the use of an acid soil and on the presence of a root fungus that appears to supply the plants with nitrogen (Consult F. V. Coville, "Blueberry Culture," in *The Standard Cyclopedia of Horticulture*, New York, 1914). The "blueberry bairrens" of Maine, an area of some 150,000 acres in extent, is a notable example of the preservation of a native product from which is derived a large annual income. The annual pack from this region alone is about 30,000 cases of 24 cans each, valued at \$57,000. Besides forming a valuable commercial product when canned, the blueberry is extensively gathered and marketed for dessert purposes. Although naturally a dry, rather seedy fruit, the larger specimens

are juicy and possess a most agreeable flavor. The blueberry is also used for preserves and jellies as well as for making wine and distilled liquors.

HUCKLEBERRY FINN. Hero of the novel of the same name, by Mark Twain (S. L. Clemens), first published in 1885.

HUCKNALL TORKARD, hūk'nal tōrkārd. A town in Nottinghamshire, England, 5 miles north of Nottingham. It has coal-mining industries and large tobacco and hosiery works. Lord Byron is buried in the old parish church of St. Mary Magdalene. Pop., 1901, 15,250, 1911, 15,870.

HUDDE, hūd'de, ANDREAS (c1600-63). A Dutch commander in New Netherland after 1629. As one of the four councilors of Wouter van Twiller, director general in America for the Dutch West India Company (1633), Hudde obtained a large grant of land upon Long Island, and in 1642 he was surveyor of Manhattan. Four years later, when trouble had arisen between the Dutch and Swedish settlers on the South (or Delaware) River, he was sent to guard the Dutch West India Company's interests there, and at once entered into strife with the governor of the Swedes, who tried to stir up the Indians against him. But Hudde held his own until 1655, when the Dutch authorities sent ships to help him, and he conquered the Swedish rulers. He continued to enjoy the company's confidence and was made commander of Forts Altona and New Gottenburg (1657) as well as Colonial surveyor and parish clerk. That he was a well-educated man is evidenced by the quality of his literary remains in the Albany archives.

HUDDERSFIELD. A municipal, county, and parliamentary borough in the West Riding of Yorkshire, England, on the Colne, 16 miles southwest of Leeds. It has excellent railway and canal connections and is the chief seat of the English cloth and woolen manufacture (Map England, E 3). It also makes silk, iron, and machinery. Its industries are largely run by its own water power. Coal mining and stone quarrying are profitable industries. The town is well built and thoroughly modern, with spacious thoroughfares and fine ecclesiastical, public, and commercial buildings. The town hall, market hall, and cloth hall are noteworthy. It has a proprietary college affiliated to London University, a collegiate school, a technical school, several grammar schools, and a museum. Its municipal government is of a high order, and the corporation has been a pioneer in several economic features. Artisans' dwellings were established in 1853 for married couples and for single women as well as for bachelors. Huddersfield was the first to own and work its tramways; it owns its gas, water, and electric works and several beautiful parks, maintains free public libraries, an art gallery, public baths and washhouses, a slaughterhouse, markets, technical schools, a fire brigade, a hospital, cemeteries, and a modern system of refuse and sewage disposal. It was the first town to adopt an eight-hour labor day. It is the seat of a United States consulate. Although a town mentioned in the Domesday Book as "Odersfelt," its importance dates only from the establishment of the woolen manufacture in the eighteenth century. Pop., 1901, 95,047, 1911, 107,821.

HUDIBRAS. See BUTLER, SAMUEL.

HUDSON. A town in Middlesex Co., Mass., on Assabet River, 28 miles west of Boston, on the

Boston and Maine Railroad (Map Massachusetts, D 3). It has a public library. There are manufactures of leather, leather and rubber shoes, rubber gossamer clothing, rubber going and webbing, woolen goods, broaching machines, and wooden and paper boxes. The government is administered by town meetings. The water works, sewer system, and electric-light plant are owned and operated by the town. Pop., 1900, 5454, 1910, 6743.

HUDSON. A city and the county seat of Columbia Co., N. Y., on the east bank of the Hudson River, 28 miles south of Albany, on the New York Central and Hudson River, the Boston and Albany, and the Albany Southern railroads (Map New York, G 6). It is finely situated on the slope of Prospect Hill and has a number of noteworthy buildings, the State Training School for Girls, State Volunteer Firemen's Home, Hudson Orphan Asylum, State Armory, and the courthouse, government building, city hall, and city hospital. Public Square and Franklin Square parks and Promenade and Reservoir hills are also of interest. There are extensive manufactures of knit goods, car wheels, ale, lumber, tobacco, iron, machinery, tools, ice elevators, underwear, steel springs, mattresses, Portland cement, etc. Under a charter of 1895 the government is administered by a mayor, elected biennially, and a city council. The water works are owned and operated by the municipality. Pop., 1900, 9528, 1910, 11,417, 1914 (U. S. est.), 12,221. Hudson was settled as Claverack Landing by New Englanders in 1783, its present name was adopted in 1784, and a city charter was received in 1785. For some years the city carried on an extensive foreign trade and was an important whaling port, but its shipping was almost completely destroyed in the War of 1812.

HUDSON. A city and the county seat of St. Croix Co., Wis., on Lake St. Croix, an expansion of the St. Croix River, 20 miles by rail east of St. Paul, Minn., on the Chicago, St. Paul, Minneapolis, and Omaha Railroad (Map Wisconsin, A 4). It has saw and planing mills, interior-finish factory, breweries, and railroad-car and machine shops. The city is the centre of a region the inhabitants of which raise vegetables, small fruits, poultry, etc., for shipment. There are a well-equipped sanatorium, a Carnegie library, and a park. The water works and sewerage system are owned by the municipality. Pop., 1900, 3259, 1910, 2810.

HUDSON, CHARLES (1795-1881). An American clergyman, politician, and author, born in Marlboro, Mass. He was educated for the Church, which he entered as a Universalist in 1819, and he presided over a congregation in Westminster, Mass., until 1839. Beginning his political career in the House of Representatives of his own State, he afterward went to Congress (1841-49) and then was stationed for four years at Boston as officer of the port. He edited for many years the Boston *Daily Atlas*—a Whig organ. His books include *Letters to Rev Hosea Ballou* (1827), *History of Westminster* (1832), and a *History of Lexington* (1868, revised and continued to 1912, 1913), with a genealogical register of its families.

HUDSON, ERASMUS DARWIN (1843-87). An American physician, born at Northampton, Mass. He graduated at the College of the City of New York in 1864 and at the College of Physicians and Surgeons, New York City, in 1867. During 1867-68 he was house surgeon at

Bellevue Hospital. In 1869-70 he was health inspector of New York City, in 1870 was attending physician to the class for diseases of the eye in the outdoor department of Bellevue Hospital, was attending physician at Northwestern Dispensary in 1870-72 and attending physician to Trinity Chapel parish and Trinity Home in 1870-75. He was appointed professor of principles and practice of medicine at the Woman's Medical College of the New York Infirmary in 1872 and held that position for 10 years, and from 1882 until his death was professor of general medicine and diseases of the chest in the New York Polyclinic. He was the author of the following professional works: "Report of Pulse and Respiration of Infants," in *Elliot's Obstetric Clinic* (1872), *Doctors, Hygiene and Therapeutics* (1877), *Methods of Examining Weak Chests* (1885), *Limitations of the Diagnosis of Malaria* (1885), *Home Treatment of Consumption* (1886), *Physical Diagnosis of Thoracic Diseases* (2d ed., 1887).

HUDSON, FREDERIC (1810-75). An American journalist, born in Quincy, Mass. After a common-school education he went to New York City in 1836 and became attached to the *New York Herald*, of which he was managing editor for many years, until 1866. His long experience and diligence in collecting gave him abundant material for his *Record of Journalism in the United States from 1690 to 1872*, published in New York in 1873 and still in print, perhaps the most interesting history yet published of the rise and development of the American newspaper.

HUDSON, GEORGE (1800-71). An English speculator, known as the "railway king," born near York, the son of a farmer. He acquired a fortune as a linen draper and at the age of 27 inherited £30,000. Investing in railways, he soon carried out large schemes of annexation and extension, crushing roads and buying up embarrassed lines. In 1835 he was a town councilor, in 1836 an alderman, was three times elected Lord Mayor of York, and in 1845 was sent to Parliament. In 1847 the value of railway property fell rapidly, and it was found on investigation that Hudson was paying dividends out of capital and appropriating large sums to his personal use. He spent his last 20 years in contesting lawsuits.

HUDSON, HENRY (?-1611). An English navigator. He is first mentioned as the commander of the ship *Hopeful*, sent in May, 1607, by the Muscovy Company in quest of a north-east passage to the Spice Islands. After a voyage of four and a half months, during which he touched the coasts of Greenland and Spitzbergen and sailed as far north as 80° 23', he returned to England. In April of the year following he sailed again under the auspices of the Muscovy Company and reached Nova Zembla, attempting in vain to force a passage through the Vaigatch or Kara Strait, in the expectation of finding himself within easy reach of the Pacific. His next undertaking was made in behalf of the Dutch East India Company. In their employ he sailed from Amsterdam on March 25, 1609, with 18 or 20 men in the *Half Moon*, a vessel of about 80 tons. He made Nova Zembla, intending to try again the passage of the Vaigatch, but, his crew becoming quarrelsome on account of the cold, he directed his course towards the fortieth parallel of north latitude on the American coast because of a notion then dominant in the minds of Capt

John Smith and Richard Hakluyt that in that vicinity the Atlantic was separated from the Pacific only by a narrow isthmus. He crossed the Atlantic and sighted land in the latitude of Nova Scotia. He then sailed south as far as latitude 35° and, again turning north, carefully examined the coast up to Sandy Hook, which he reached on September 12. A month spent in exploring the Hudson River, which the *Half Moon* ascended to the present site of Albany, satisfied him that there was no passage from ocean to ocean in this part of the world and he was back in England the 7th of November. In 1610 he set out once more, this time to search for a northwest passage, under the patronage of an association of English gentlemen. He left England in April and by June 10 had reached the strait which now bears his name. Passing into the bay beyond (Hudson Bay), he spent three months exploring its coasts and islands. Early in November his vessel was frozen in. The winter seems to have been one of great suffering. Provisions were scarce, and dissensions arose among the sailors. Late in June 1611, a part of the crew mutinied, seized and bound Hudson, his son, and seven others of the ship's company, and, putting them into the small boat, set them adrift. They were never seen again. A few wretched survivors from among those on board the ship reached England. Consult the introduction to G. M. Asher *Henry Hudson, the Navigator*, edited for the Hakluyt Society (London, 1860)—this volume includes reprints of the earliest accounts of his voyages, both English and Dutch, Edgar M. Bacon, *Henry Hudson His Times, and his Voyages* (New York, 1907), *List of Books and Magazine Articles on Henry Hudson*, published by the Brooklyn Public Library (Brooklyn, 1909). H. C. Murphy, *Henry Hudson in Holland* (The Hague, 1909).

HUDSON, HENRY NORMAN (1814-86). An American Shakespearean scholar and editor, born at Cornwall, Addison Co., Vt. In early life he worked as a baker and a wheelwright. He graduated from Middlebury College, Vermont, in 1840, and then taught school in Kentucky and Alabama. He presently became an authority of considerable note on Shakespeare, lectured widely on his works, and was appointed a professor in Boston University. Among his works in this field are *Lectures on Shakespeare* (2 vols., 1848), a valuable annotated edition (11 vols., 1851-56), and *Shakespeare His Life, Art, and Characters* (2 vols., 1872). Having entered the priesthood of the Protestant Episcopal church, he was for some years editor of the *Churchman*, was rector at Litchfield, Conn., 1859-60, and served as chaplain in the Union army during the Civil War. On his return he published *A Chaplain's Campaign with General Butler* (1865). He was author also of *Sermons* (1874), *Studies in Wordsworth* (1884), *Essays in Education* (1884), and other works.

HUDSON, WILLIAM (c. 1730-93). An English botanist, born at Kendal in Westmoreland. He became an apothecary, but devoted much time to botany, entomology, and other natural sciences. He is chiefly noted for his adaptation of the Linnean system of plant classification to the flora of Britain, which he published under the title *Flora Anglica* (1762). A third and greatly enlarged edition appeared in 1798. The genus *Hudsonia* was named by Linnæus in his honor.

HUDSON, WILLIAM HENRY (1862-) An English author and professor of English literature, born in London and educated by private tutors. He was private secretary to Herbert Spencer, librarian of Sion College, London (1885-86), and later of the London City Liberal Club (1889-90) and of Cornell University (1891-92). From 1892 to 1901 he was professor of English literature at Leland Stanford Junior University, in 1902-03 professorial lecturer at the University of Chicago, and later staff lecturer in literature to the extension board of London University. His work, besides contributions to magazines, includes *The Church and the Stage* (1886); *An Introduction to the Philosophy of Herbert Spencer* (1894, new ed., 1904); *Studies in Interpretation* (1896); *Idle Hours in a Library* (1897); *The Study of English Literature* (1898); *Sir Walter Scott* (1901); *The Sphinx, and Other Poems* (1900); *The Famous Missions of California* (1901); *Rousseau and Naturalism in Life and Thought* (1903); *An Introduction to the Study of Literature* (1910); *Keats and his Poetry* (1911); *Gray and his Poetry* (1911); *Louell and his Poetry* (1911); *Milton and his Poetry* (1912); *The Story of the Renaissance* (1912); *An Outline History of English Literature* (1913); *The Man Napoleon* (1914). He also edited many English classics, notably, Goldsmith's *Vicar of Wakefield* (1898); *The Sir Roger de Coverley Papers* (1899); *Bacon's Essays* (1901); *Dryden's Essay on Dramatic Poesie* (1904); and *The Elizabethan Shakespeare*.

HUDSON BAY. A spacious landlocked gulf in the northeastern section of Canada, which may be regarded as an arm at once of the Arctic and the Atlantic Ocean (Map: North America, K 4). It communicates with the Atlantic by means of Hudson Strait and with the Arctic by Fox Channel and various passages to the north and west, which, notwithstanding the comparative lowness of their latitude, have proved less practicable for navigation than the Arctic Ocean itself. Hudson Bay extends from about lat 51° to about 64° N, a distance of about 900 miles. Its area is about 400,000 square miles. Its depth is about 70 fathoms, on the west coast there is an average rise and fall of 11 to 12 feet at spring tides. The southern prolongation of Hudson Bay bears the name of James Bay. Hudson Bay contains several islands, in addition to the large Southampton Island at its north end, but no rocks or shoals, and the region is singularly free from storm or fogs. Neither the bay nor Hudson Strait is ever entirely frozen over, but both are beset by detached floes and bergs of ice, which render navigation difficult for sailing vessels. Steamships can make the voyage up the bay and reach land from about the middle of June to the end of October. The proximity of the entrance to the Magnetic Pole causes the compass needle to be unreliable and not an aid to navigation. The west shore lies low, but the east shore is bold and rocky. Thirty rivers of considerable magnitude flow into the bay, the Nelson River being the most important. The Churchill and the Severn come next—the former having a deep though comparatively narrow mouth, which can be entered with ease by the largest ships at all tides. Though the land lying south and west of James Bay is suitable for dairy farming, and though ironstone, manganiferous iron ore, galena, and plumbago are found in other portions of the sur-

rounding territory, neither the soil, timber, nor minerals have been to any extent drawn upon. Caribou and musk ox inhabit the shores, and whale, walrus, seal, and salmon abound in the waters of Hudson Bay, and steam whalers visit it during the summer, but the only business developed lucratively is the fur trade by the Hudson's Bay Company, because of the severe long winter on the shores of the bay. The few summer months are genial and bracing. The bay was discovered in 1610 by Henry Hudson (qv).

HUDSON RIVER. The principal river of New York State and one of the most picturesque and important waterways in the eastern United States (Map: New York, G 6). Its principal sources lie in the wildest region of the Adirondack Mountains, in Essex County, and any one of several small streams might be considered its origin, but the highest permanent body of water from which it is fed is Lake Tear-of-the-Clouds, which lies at an altitude of 4322 feet above sea level, in the centre of the triangle formed by Mounts Marcy, Gray Peak, and Skylight. After emerging from the mountains it flows almost due south until it empties into the Atlantic Ocean through New York Bay at New York City, its total length being about 300 miles.

Like the other Atlantic rivers, it flows transversely through the Appalachian ridges instead of following what would now be the natural course, along the great longitudinal valleys (See APPALACHIANS, especially under the sub-head *Drainage Development*). Accordingly its valley is in places very narrow, and its banks lined with high and steep hills and mountains, notable among which are the Highlands, 1500 feet in elevation, through which the river winds for about 16 miles, the gorge being narrowed at one point to about 1600 feet. Farther down, near the mouth, its west shore, for about 18 miles, is formed by a great dike of trap rock, the Palisades (qv). The Catskill Mountains, west of the Hudson, about 100 miles from the sea, approach to within 8 miles of the river.

The fall of the river in its upper reaches is very rapid, amounting to 64 feet per mile from Lake Tear-of-the-Clouds to North Creek, a distance of about 52 miles. From North Creek to the mouth of the Saconaga the fall is almost 14 feet per mile, and in the next 26 miles (to Fort Edward) the descent amounts to 418 feet more, 175 feet of which, however, are accounted for by the abrupt descents at Palmer, Glens, and Baker's falls.

The chief tributaries of the Hudson are the Indian, Schroon, and Saconaga rivers, above Glens Falls, Batten Kill, and Fish Creek, and the Hoosic and Mohawk rivers between there and Troy. Below Troy the tributaries include the Catskill, Esopus, and Rondout creeks and Wallkill River, from the west, and Kinderhook Creek, Jansen Kill, Wappinger Creek, Fishkill Creek, and the Croton River, from the east. The largest of these confluents is the Mohawk River (qv), which supplies more water than the main stream itself. The valley of the Hudson has a larger population in proportion to its area than that of any other large stream in the United States, excepting the Delaware River.

THE HUDSON RIVER
LOOKING NORTH FROM WEST POINT

The Hudson differs from other Atlantic rivers in that, owing to the considerable sinking or depression of the land in this region, its valley has been drowned and tide water affects the river and makes it navigable to Troy, 6 miles above Albany, or for about 150 miles. Below this point the so-called river is really an estuary or fiord, its volume being far out of proportion to its drainage area (about 13 370 square miles), though, owing to the narrowness of its valley, it still retains the aspect of a river, except for a stretch of about 20 miles between the Highlands and the Palisades, where it expands into Haverstraw Bay, about 6 miles long by $3\frac{1}{2}$ miles wide, and Tappan Sea, about 8 miles long by 4 miles wide. Above Albany and Troy the river is a small stream, obstructed by falls and rapids. It is this drowning of the Hudson valley which is one of the principal causes of the commercial supremacy of New York City, as it has made this river the only deep-water passage cutting entirely through the Appalachian system. The connection of the Atlantic with the North Central States is completed by the Erie Canal (see CANAL), which extends from Troy to Buffalo on Lake Erie.

The Hudson proper is a majestic waterway, from $\frac{1}{2}$ to nearly $1\frac{1}{2}$ miles wide, with the exceptions noted above. It is navigated by a large number of vessels of all kinds, and elegant passenger steamers ply upon its waters. The principal places on the river are Glens Falls, Cohoes, Troy, Albany, Hudson, Catskill, Kingston, Poughkeepsie (where is the only bridge between Albany and the sea), Newburgh, West Point (seat of the United States Military Academy), Peekskill, Haverstraw, Ossining (Sing Sing), Nyack, Tarrytown, Yonkers, and at the mouth of the river, New York, Hoboken, and Jersey City. Sailing craft, whose numbers formerly added so much to the picturesqueness of the river, have to a great extent disappeared. The enormous traffic on the river is facilitated by the New York Central and Hudson River and the West Shore railroads, which run along either shore of the Hudson and the Mohawk. The Hudson was discovered by Verazano in 1524, but first explored by Henry Hudson in 1609. It was called North River to distinguish it from the Delaware (or South) River, but the English named it in honor of its explorer. Its Indian name was Shatemuc. The Hudson was an important waterway in the Revolutionary War (see STONY POINT; WEST POINT), and it was on this river that steam navigation was first successfully introduced by Robert Fulton in 1807. Consult: R. S. Tarr, *Physical Geography of New York State* (New York, 1902); Edgar M. Bacon, *The Hudson River* (ib., 1902); J. B. Woodworth, *Ancient Water Levels of Champlain and Hudson Valleys* (New York State Museum, Bulletin No. 84, Albany, 1905); Barrows and Grover, *Surface Water Supply of Hudson, Passaic, Raritan, and Delaware River Drainages* (United States Geological Survey, Water Supply and Irrigation Papers, No. 202, Washington, 1907); C. Johnson, *The Picturesque Hudson* (New York, 1909).

HUDSON RIVER BEDS The term 'Hudson River slate group' was introduced by Mather in 1839 for the slates, shales, and grits, with interstratified limestones, of the Hudson River region. These were considered as lying above the Utica shale of the Mohawk valley and therefore correlated with the Frankfort and

Lorraine beds of central New York. Later the term was extended to comprise all Ordovician formations above the Trenton limestone, and this usage became established in geological textbooks. The study of the fossils, notably the graptolites, has shown that the Hudson River beds, or group, are not a unit but are composed of many zones extending from the base of the Ordovician (Schaghticoke shale) through the Beekmantown (Deep Kill shale), Chazy and Black River (Normanskill shale) into the Trenton (Canajoharie and Snake Hill beds), while the Utica and Lorraine equivalents are entirely lacking in the group. The name 'Hudson River beds' is now only used when the component horizons have not been distinguished. Consult: Mather, *Geology of New York. Report on the First District* (Albany, 1843); Ruedemann, *Hudson River Beds near Albany* (New York State Museum, Bulletin No. 42, Albany 1901); id., *The Lower Silurian Shales of the Mohawk Valley* (New York State Museum, Bulletin No. 162, Albany, 1912).

HUDSON RIVER SCHOOL OF PAINTING The earliest school of landscape painting in the United States. The name was derived from the practice of its members of depicting the scenery of the Hudson River, upon whose banks many of them lived. Although not the earliest landscape painter in the United States (see DOUGHTY, THOMAS), Thomas Cole, who lived at Catskill on the Hudson, may be called the founder of the school. This honor is shared by Asher Durand, originally an engraver, whose influence was wider and who transcribed nature more faithfully. Cole represented the romantic, Durand the realistic, side of the school. Among their followers were John F. Kensett, J. A. Richards, Worthington Whittredge, then J. F. Cropsey, Sanford R. Gifford, George Inness, F. E. Church, Bierstadt, and McEntee. Somewhat younger were Samuel Colman, William T. Richards, Homer D. Martin, Alexander Wyant, Thomas Moran, and R. Swain Gifford. These men by no means confined themselves to Hudson River scenery, F. E. Church, e.g., painted the Andes, Greece, etc., and Bierstadt, whose training was derived at Dusseldorf, the Rockies and other Western scenery. They shared the conviction that a landscape should represent a grand or romantic piece of nature. Their best work compares not unfavorably with that of contemporary English and German painters. Usually it was hard in line, overdetached in execution, thin and dry in color. The art of the school culminated in the landscapes of three great masters of landscape, George Inness, Alexander Wyant, and Homer D. Martin. Consult Samuel Isham, *History of American Painting* (New York, 1905), and the articles on the painters mentioned.

HUDSON'S BAY COMPANY An English chartered company. It was incorporated in 1670 by Charles II, who granted to a number of "adventurers," with Prince Rupert at their head, the sole right to trade with the native tribes on the shores of Hudson Bay. The company had power to establish laws and impose penalties, to erect forts, maintain ships of war, and "make peace and war with any prince or people not Christian." It started with a capital of about £110,000, and for a long time it maintained its monopoly intact. The progress made was not rapid, and by the middle of the eighteenth century the company had no more than 120 people

in its employ, but nevertheless three or four ships were sent out annually with a cargo of coarse English goods, which were sold to natives for furs and skins at rates which brought the proprietors a handsome profit. Conflicts soon arose with the French, who laid claim to the territory on the ground of an expedition made in 1656 by Jean Bourdon, who, according to Charlevoix, *Histoire de la Nouvelle France*, vol 1 (Paris, 1744), traveled from Quebec to Hudson Bay and took formal possession of the country inclosing James Bay. There is no doubt, however that the Hudson basin had been visited by English navigators long before 1656. In 1682 a trading post on the coast was surprised by the French, and in 1686 four more of the company's forts were taken. During the War of 1689-97 the same forts changed hands more than once, and by the terms of the Peace of Ryswick some of them were given to the French. It was not until the Treaty of Utrecht, in 1713, that the latter finally resigned all claims to the Hudson Bay territory. From 1713 to 1763 the company enjoyed a peaceful and prosperous but far from dazzling career. It imported annually into England about 30,000 skins, and its dividends were 8 to 10 per cent. The conquest of New France was the turning point in the company's history. When Canada became English, the vast territory of the Hudson's Bay Company became accessible from the south as well as from the sea. Trade increased tremendously, and in the next French war (1778-83), when its factories were surprised by a French squadron under Lapérouse, the company was strong enough to bear a loss of £500,000.

So profitable a monopoly could not be long enjoyed. Not only private trappers, but rival companies, entered the field, on the principle of free and open trade guaranteed to all British subjects in the Bill of Rights. Such a competitor was the famous Northwest Company, which, after years of strife amounting at times to actual war, was merged (1821) with its opponent under the name 'Adventurers of England Trading into Hudson's Bay,' for a period of 21 years. The territories of the company had been gradually extended until they reached to the Arctic on the north and the Pacific on the west. In 1859 the trade monopoly was abolished, but the claims of vested interests and property rights remained unsettled until 1869, when, in return for an indemnity of £300,000, together with a land grant of 7,000,000 acres made by the Dominion government, the company gave up all its ancient privileges and took its place on a footing with other business corporations, retaining, however, its forts or trading stations.

Bibliography. Cawston and Keane *Early Chartered Companies* (London, 1896), George Bryce, *History of the Hudson's Bay Company* (ib, 1900); H. B. Willson, *The Great Company* (ib, 1900), A. G. Bradley, *Fight with France for North America* (New York, 1901), A. C. Lant, *The Conquest of the Great Northwest* (ib, 1908), C. B. Reed, *The Masters of the Wilderness A Study of the Hudson's Bay Company from its Origin to Modern Times* (Chicago, 1914). An account of the Northwest Company is given in Washington Irving's *Astoria*.

HUDSON STRAIT. See HUDSON BAY

HUÉ, u'á' Capital of the Kingdom of An-nam, situated on the left bank of the Huong-

giang (in French, the Hué) River, about 10 miles above its entrance into the sea, about lat 16° 29' N and long 107° 38' E (Map Asia, M 7). It is a walled city, fortified in the beginning of the nineteenth century by French engineers after the style of Vauban. Hué consists of two parts, the city proper and the suburbs—the former being in the middle of a square island separated from the suburbs on three sides by the river and on one side by a canal. The walls, which have a circumference of about 8000 yards, are of brick and very high. The citadel is a large quadrilateral with eight gates and a bastioned front. The royal palace has yellow tiles on the roof, those of the nobles have red tiles. Inside the palace, which is kept in good order, is a museum of ancient Annamite art, mainly in gold and jade jewelry. The wall inclosing the royal palaces has three gates, the centre one being in the form of a pagoda elaborately carved and gilded, but most of the public buildings and nearly all the houses are comparatively mean and in poor repair. The official buildings of the French government are on the right bank of the river, also the houses of European officials and merchants. The population is estimated at 41,000, of which 300 are Frenchmen and 800 Chinese. Near Hué are the magnificent tombs of the old Annamite kings. The forts at the mouth of the river were taken by the French in 1883.

HUE, u, GEORGES ADOLPHE (1858--) A French dramatic composer. He was born at Versailles and gave early evidence of his musical gift. When 21 years of age, he won the Grand Prix de Rome and two years later the Prix Ciessent. During his period of study at the Paris Conservatory he was the pupil of Reber and Paladilhe. His compositions include the following operas *Les pantins* (1881), *Le roi de Paris* (1901), and *Titania* (1903). Among his orchestral works are, the symphonic legend, in three parts, *Rubezahl*, and a dramatic sacred episode, *Resurrection*. He also wrote much chamber music and numerous pieces for individual instruments. He became known as one of the most successful teachers in Paris.

HUE AND CRY. A phrase, derived from the old process of pursuit with horn and voice, used in English law in the pursuit of felons. Whoever arrested the person pursued was so far protected that he required no warrant to justify the arrest, and even if the party turned out to be no felon, no action could be brought if the arrest was bona fide. But it was not only a ground of action, but an offense subject to fine and imprisonment, maliciously and wantonly to raise the hue and cry against a person. It was the duty of all persons to join in a hue and cry, and if a person who had been robbed or knew of a robbery failed to raise the hue and cry, he was liable to fine or imprisonment or, according to some authors, to indictment. Hue and cry is now regulated in England by the Sheriffs Act, 1887 (50 and 51 Vict, c 55). *Hue and Cry* is the name given to the weekly printed list containing descriptions of persons wanted by Scotland Yard, London, and circulated among detective offices throughout the world. Consult the *Commentaries* of Blackstone and Pollock and Matland, *History of English Law* (2d ed, Cambridge, England, and Boston, 1899).

HUECO, wá'kó See WAGO

HUEFFER, huf'fēr, FRANÇOIS (1843-89) An

English musical writer and librettist, born in Munster, Germany. He studied in England and on the Continent and afterward settled in London, and became musical critic of the *Times* in 1878. He furnished the libretto for the operas *Columbia* and *The Troubadour* of Mackenzie and *The Sleeping Beauty* of Cowen. His works include an edition of the works of the troubadour Guillem de Cabestant (1868), *Richard Wagner and the Music of the Future* (1874), *The Troubadours. A History of Provençal Life and Literature in the Middle Ages* (1878), *Musical Studies* (1880), a collection of articles originally written for the *Times* and other newspapers, translated into Italian by Visetti (1883) and a translation into English of the correspondence of Wagner and Liszt. He was one of the first to advocate the cause of national English opera.

HUELEN, wā'lan (c 1540-1603). A Chilean patriot, native of Angol. In 1599 he was at the head of the forces of Araucania, mustered to repel the Spaniards, and by copying their methods and teaching his followers to ride the horses the invaders had brought to South America, was enabled to wage successful warfare against them, though no longer a young man. He was victorious at Valdivia (1599), near Concepción (1601), near Bio-Bio (1602), against the enemy with firearms and coats of mail, but his siege of Osorno failed and he died of old wounds and new before he had succeeded in capturing the fort.

HUELSEN, hui'zen, CHRISTIAN (1858-). A German classical archaeologist, born in Charlottenburg, where his father was a Gymnasium teacher and where he got his early education. He studied in Berlin under Mommsen and in Rome under Henzen. After two years' teaching in secondary schools, in 1887 he succeeded Helbig (q v) in the Royal German Archaeological Institute at Rome and held this post until 1909. His works on ancient Rome, which won him honorary degrees from Oxford and Columbia, include parts of vol vi of the *Corpus Inscriptionum Latinarum* (1882-1902), *Formæ Urbis Romæ* (1896, 2d ed, 1912), with Kiepert, *Die Thermen des Atracalla* (1898), *Forum Romanum* (1904, 2d ed, 1905, English by Carter, 1905, Italian, 1905), *Topographie der Stadt Rom im Altertum* (1907), part 3 of vol i of Jordan's great work on the topography of Rome, *Die Themen des Agrippa* (1910), *Skizzenbücher Marten van Heemskerks* (1912).

HUELVA, wāl'va. The capital of the Spanish province of the same name, situated on the deep and navigable estuary of the Odiel River, 10 miles from its mouth in the Gulf of Cadiz (Map Spain, B 4). It is a well-developed town, with a good harbor, and is a railroad centre. Among its buildings is a fine hotel built in 1883 by an English company. There are also several notable churches, that of San Pedro having formerly been a Moorish mosque. The Roman aqueduct has been restored and, after centuries of disuse, again supplies the city with water. The industries and commerce of the city have become very important, through the exploitation on a large scale of the copper mines of the province. The mining companies have built two large iron piers at the harbor, one of them costing \$780,000. The city has also large machine shops and shipyards as well as various other industries. The United States is represented by a consular agent. The city is notable

as the starting point of Columbus on his voyage to America on Aug 3, 1492. Pop, 1910, 27,699.

HUENE, hu'ne, KARL, BARON VON HOENINGEN (1837-1900). A German politician, born in Cologne and educated in Berlin. He entered the army and served in the wars of 1864, 1866, and 1870-71. He retired from the army in 1873 and, after engaging in business, became a member of the Prussian House of Deputies (1877). In 1884 he was elected to the Reichstag, where he rose to prominence as a leader of the Centre and author (1885) of the *Lex Huene* (rescinded in 1893), by the terms of which all taxes on cereals and cattle, save 15,000,000 marks, were divided among the various parochial governments of Prussia. In 1893 he lost his leadership of the Clericals by his compromise with the administration on the military budget and failed of reelection in that year and again in 1895. But until his death he remained a member of the Prussian Council of State, to which he had been appointed in 1890. He was a recognized authority on matters of finance and political economy.

HUEPPE, hup'pe, FERDINAND (1852-). A German bacteriologist, born at Hildesdorf and educated in Berlin. In 1890 he was appointed professor of hygiene in the German University at Prague. He established the fact that subterranean water is free from germs and contended that the source of infection from bacteria is the decayed organism on which the bacillus feeds. Hueppe did much to simplify disinfection and to promote inoculation with benign bacteria. He was the first to advance the theory that the power of nitrifying microbes to absorb carbonic oxide, even in the dark, is due to the oxidation accompanying the ammoniacal preparation of saltpetre. After 1906 he was chief sanitary adviser at Prague. He wrote *Die Formen der Bakterien* (1886), *Ueber die Beziehungen der Faulnis zu den Infektionskrankheiten* (1887), *Ueber den Kampf gegen die Infektionskrankheiten* (1889), *Die Methoden der Bakterienforschung* (5th ed, 1891), *Die Choleraepidemie in Hamburg, 1892* (1893), *Ueber die Ursachen der Gärungen und Infektionskrankheiten* (1893), *Naturwissenschaftliche Einführung in die Bakteriologie* (1896), *Zur Rassen- und Socialhygiene der Griechen* (1897), *Handbuch der Hygiene* (1899); *Zur Socialhygiene der Tuberkulose* (1904), *Wohnung und Gesundheit* (1912), *Sport und Reizmittel* (1913).

HUÉRCAL-OVERA, wār'kal ô-vā'ra. A town of southeast Spain, in the Province of Almería, situated in a broad and fertile valley surrounded by mountains, 16 miles from the Mediterranean coast (Map: Spain, E 4). It has straight and wide streets and several plazas, on one of which stands a handsome church. The town is connected by rail with Murcia, and between it and the coast are the silver, lead, and copper mines of the Sierra de Almagrera, upon which the prosperity of the town depends. Pop, 1900, 15,774, 1910, 17,344.

HUERTA, wār'ta, VICENTE ANTONIO GARCÍA DE LA (1734-87). A Spanish poet and critic. He was born at Zafra in Estremadura, was educated at Salamanca, and spent the greater part of his life in Madrid, where he held the office of principal librarian of the Royal Library, and where he died. He early distinguished himself by his poetic talent. His tragedy *Raquel*, founded upon the story of the love of King Alfonso VIII for the Jewess Rachel,

was received with great enthusiasm when first produced in 1778 and is still considered a work of some merit. Huerta was a most zealous but not always a wise or skillful defender of the ancient Spanish national taste against the Gallicism which then prevailed. His shafts were directed especially against the French school of dramatists and lyric poets inaugurated as a result of Luzán's crusade. As a lyric and dramatic poet, he shows great command of language and versification. His poems were published in two volumes, *Obras poéticas* (1778-79), they are accessible in the *Biblioteca de autores españoles*, vol. lxi (Madrid, 1869). Huerta edited the *Teatro español* (17 vols., Madrid, 1784-85), an unsatisfactory collection of the works of the older Spanish dramatists.

HUERTA, VICTORIANO (1854-1916). A Mexican soldier, born in the village of Colotlán, State of Jalisco, a descendant of the native and Spanish races. He secured the rudiments of an education from the village priest and when a boy determined to enter the army. His opportunity came when he was called upon to serve as amanuensis to the commander of a detachment of troops which passed through his town. His intelligence and ability attracted the general's attention, and when Huerta told of his desire to become a general, the officer took him to Mexico, and President Juárez placed him in the Chapultepec Military College. Huerta was a good student and distinguished himself in topography and astronomy. He graduated in time to take part in the battle of Tecuac (1876), which placed Porfirio Díaz in power. The next 30 years were occupied in the routine duties of the military career, in the command of minor posts, and in putting down incipient revolts. During this period he served as a member of the Geographical Survey Commission and became the best-informed man in Mexico on its geography. In 1902 he was the commander of a successful expedition against the Maya Indians of Yucatan, leaving the district pacified. For this service he was promoted to the rank of brigadier general by President Díaz, who recognized Huerta's abilities, but always distrusted him. From 1907 to 1910 he was on leave of absence and engaged in the contracting business in Monterey. He came into prominence in 1911, when he was placed in command of the army operating against the Zapatistas. The same year he was in charge of the escort which conducted ex-President Díaz on his flight from the capital. He was in active service in the army during Madero's administration, but was distrusted by the President. Difficulties arose between Huerta and Madero over the manner of dealing with Zapata; but these were adjusted, and in 1912 Huerta waged a campaign against Pascual Orozco in Chihuahua, winning a number of victories. He was recalled to Mexico, was promoted to the rank of general of division, and was offered a commission to Europe, which he refused. In February, 1913, he was placed in command of the government forces to suppress the insurrection under Felix Díaz. On February 18 he deserted the cause of Madero, forced the latter's resignation, and was made provisional President. Five days later President Madero and Vice-President Pino Suárez were murdered, revolt broke out in Sonora, and the United States refused to recognize the new government. Huerta refused to resign at the suggestion of President Wilson,

and on October 10-11 he arrested 110 members of the Chamber of Deputies, dissolved the Congress, and assumed dictatorial powers. In November he ignored the ultimatum of President Wilson demanding his elimination from the affairs of Mexico. The Tampico incident (April 9, 1914) involved Huerta in more serious difficulties with the United States and was followed by the occupation of Vera Cruz by United States marines. The offer of mediation by the "A B C" powers (Argentina, Brazil, Chile) was accepted by both sides, but meanwhile the Constitutionalists were making rapid progress against Huerta's forces. There were rumors of his resignation but on July 5 an election was held in the Federal territory, and he was chosen President by a small majority. Having reorganized his cabinet, he resigned on July 15, 1914, and Francisco Carbajal, the new Minister of Foreign Relations, became provisional President. Five days later Huerta went into exile, sailing from Puerto Mexico. Consult L. C. Simonds, "Victoriano Huerta," in the *Atlantic Monthly*, vol. cxiii (Boston, 1914), and J. de Kay, *Dictators of Mexico* (London, 1914). See *MEXICO, History*, UNITED STATES, *History*.

HUESCA, wá'ska (Lat *Osca*). The capital of the Spanish province of the same name, situated in a fertile plain on the river Isuela, 45 miles northeast by rail from Saragossa (Map Spain, E 1). It is an old town, retaining its mediæval aspect, surrounded by the ruins of its double line of ancient walls. It has a celebrated Gothic cathedral dating from the fifteenth century, in which is a magnificent alabaster reredos, representing the Passion, and the old Romanesque church of San Pedro dating from the twelfth century. There are also several old monasteries in the neighborhood, that of Monte Aragón containing in its crypt the tomb of Alfonso I. The institute for secondary education occupies the building of the old university, founded in 1354 and removed to Saragossa in 1845. In one of the vaults of this building the famous Bell of Huesca is said to have been constructed from the 16 heads, including one as the clapper, of as many insurgent nobles who were executed by command of King Ramiro II. The town is decaying, but still has some trade in wine and agricultural produce and has a few unimportant industries. Pop., 1900, 11,976, 1910, 10,147. Under the Romans *Osca* was a place of considerable importance, having a number of Greek and Latin schools and a college founded by Setorius, who here met his death at the hands of Perpenna in 72 B.C. The Moors strongly fortified Huesca, after being taken by Pedro I in 1096 it became the capital of Aragón, but was superseded by Saragossa in 1118.

HUÉSCAR, wá'skar. A city in the Province of Granada, Spain, situated 75 miles northeast of the city of that name (Map Spain, D 4). It has manufactures of flour, paper, linen, and woolen goods. Pop., 1900, 7917, 1910, 8096.

HUET, u'a', PAUL (1803-69). A French landscape painter and lithographer, born in Paris. He was a pupil of the Beaux-Arts (1820-24) and of Gros and Guérin, made his début at the Salon in 1827, and in 1831 produced an impression by sending nine oil paintings and four water colors. He received the cross of the Legion of Honor in 1841. He painted in almost every province of France, and in 1910 there was a retrospective exhibition

of his work at the Beaux-Arts. He was altogether a Romanticist, one of the impassioned school of 1830, preparing the way for Rousseau, Dupre, and the painters of Barbizon (qv). His paintings have the dramatic contrasts and 'images of Byronic poetry—now peaceful calms, now boisterous storms and tumultuous waters, with lightning flashing fiercely through grim masses of clouds. Among his paintings at the Louvre are 'Inundation at Saint-Cloud,' 'Equinoctial Tide near Honfleur,' 'Forest at Compiègne,' 'Setting Sun at Seneport.' Consult Hédard, *Paul Huet*, in the series 'Maîtres de la lithographie' (Le Mans, 1891).

HUET, PIERRE-DANIEL (1630-1721). A French Roman Catholic scholar. He was born at Caen, Feb. 8, 1630, and was educated in the Jesuit School there. He was a zealous follower of Descartes and a pupil of a Protestant Orientalist Bochart, and accompanied the latter on his visit to Stockholm in 1652. On his return to Caen he gave himself up entirely to the study of philosophy, the sciences, and the Oriental languages. As a preliminary to the translation of the text of Origen, he published his *De Interpretatione* (1661), but it was only at the end of 15 years' study that he published his edition of Origen's *Commentaria in Sacram Scripturam* (1668). In 1670 he was summoned to Paris to take part with Bossuet in the education of the Dauphin. In 1679 he published his *Demonstratio Evangelica*. He had an active part, moreover, in the Delphin edition of the classics. In 1674 he was elected a member of the French Academy. In 1676 he entered into holy orders and in 1678 was named abbot of the Cistercian abbey of Aulnay, from which place is named his work, *Almetana Quaestiones de Concordia Rationis et Fidei* (1690). In 1691 he published in Latin a work on *The Situation of Paradise* (Eng. trans., 1694), another in 1693 *On the Voyages of Solomon*, which were followed later by his work in classical geography, *History of the Commerce and Navigation of the Ancients*, in French (1716, Eng. trans., 1717). In 1685 he was named Bishop of Soissons, a dignity, however, on which he never entered, being transferred to the see of Avranches in 1692. Huet died in Paris Jan. 26, 1721. He was one of the most brilliant minds of the century, and his writings cover a field of marvelous breadth. His works were published in a collected form in 1712, and a volume of *Huetiana* appeared in 1722.

Bibliography. *Memoirs of the Life of Pierre Daniel Huet, Written by Himself and Translated from the Latin by J. Aikin* (2 vols., London, 1810), C. J. C. Bartholmess, *Huet, Evêque d'Avranches, ou le scepticisme théologique* (Paris, 1849); F. A. de Gournay, *Huet, Evêque d'Avranches, sa vie et ses œuvres* (ib., 1854). Flottes, *Etude sur Daniel Huet, Evêque d'Avranches* (Montpellier, 1857), Trochon, *Huet, Evêque d'Avranches* (Paris, 1877).

HUFELAND, hoo'fe-lant, CHRISTOPH WILHELM (1762-1836). A German physician, born at Langensalza in Thuringia. He studied medicine at Jena and Göttingen, was professor of medicine at Jena from 1793 to 1798, was physician in ordinary at the court of Weimar, and resided at Berlin from 1798, where he was professor of therapeutics and pathology from the foundation of the university in 1810. He had a very high reputation for learning and skill as a physician, and he was equally esteemed for

his intellectual abilities and his noble and benevolent character. His published works are numerous, chiefly on medical and physiological subjects. His *Malobiotik*, or the *Art of Prolonging Life* (1706), was translated into almost all the languages of Europe. Among his most important works are *Ueber die Ursachen, Erkenntnis und Heilart der Skrofelnkrankheit* (1795), *Gute Rath an Mutter, über die wichtigsten Punkte der physischen Erziehung der Kinder* (1799), *Enchiridion Medicum* (1836).

HUFELAND, GOTTLIEB (1760-1817). A German political economist and lawyer, born at Dantzig. He studied at the universities of Leipzig, Göttingen, and Jena, where he graduated and became professor extraordinary of law in 1788 and professor ordinary in 1793. He held the professorship of law at Würzburg in 1803, but soon afterward went to Landshut. From 1808 to 1812 he was burgomaster of Dantzig, but in 1816 he returned to Landshut and in the following year went to Halle. His publications contain excellent exposition of the Kantian theories of lawmaking. These include *Versuch über den Grundsatz Naturrechts* (1785), *Lehrbuch des Naturrechts* (1790), *Lehrbuch der Geschichte und Encyclopädie aller in Deutschland geltenden positiven Rechte* (1790), *Institutionen des gesammten positiven Recht* (1798), and his best-known work on political economy, *Neue Grundlegung der Staatswirtschaftskunst* (2 vols., 1807-13).

HUFFCUT, ERNEST WILLIAM (1860-1907). An American lawyer and educator. He was born in Kent, Conn., and graduated from Cornell College in 1884 and from Cornell Law School in 1888. He practiced law in Minneapolis, Minn., in 1888-90, served as professor of law at Indiana University in 1890-92 and at Northwestern University in 1892-93, and thereafter was dean of Cornell Law School. Governor Hughes, of New York, at the beginning of his first term (1907), appointed Huffcut his legal adviser. Supposedly as the result of a breakdown due to overwork, Huffcut committed suicide. He was considered by his associates a man of very great ability. He published *American Cases on Contract* (1884, 3d ed., rev., 1913), with E. H. Woodruff, *Cases on the Law of Agency* (1896, 2d ed., 1907), *Elements of Business Law* (1905).

HUFFER, huff'fer, HERMANN (1830-1905). A German historian and jurist, born at Munster and educated at Bonn and Berlin. He was appointed professor of jurisprudence at Bonn in 1860 and in 1884 was made Privy Councillor. From 1867 to 1870 he was a member of the North German Reichstag. Besides his main work, *Diplomatische Verhandlungen aus der französischen Revolution* (3 vols., 1868-79), the following may be mentioned: *Der Rastatter Gesandtenmord* (1896), *Quellen zur Geschichte des Zeitalters der französischen Revolution*, part 1, dealing with the years 1799-1800 (1900-01), *Der Krieg des Jahres 1799 und die zweite Koalition* (1904), and the biographical writings *Aus dem Leben Heinrich Heines* (1878), *Zu Goethes Campagne in Frankreich* (1883), *Annette von Droste-Hulshoff und ihre Werke* (1887-90), *A. L. Menchen, der Grossvater des Fürsten von Bismarck* (1890), *Alfred von Reumont* (1904).

HUG, hoo'g, JOHANN LEONHARD (1765-1846). A Roman Catholic scholar. He was born at

Constance, June 1, 1765, studied at Freiburg, and in 1789 entered into priest's orders. In 1791 he was appointed professor of Oriental languages and of the Old Testament at Freiburg and in 1792 of the New Testament also. The most important fruit of his biblical researches was his *Introduction to the New Testament* (1808, 4th ed, 1847, Eng. trans. of 3d ed, London, 1827, New York, 1830). His great eminence as a biblical scholar led to his being called on to take part in the arrangement of the newly organized studies of several German universities, as at Breslau in 1811, at Bonn in 1816 at Tübingen in 1817, and again at Bonn 1818 and 1831. He died March 11, 1846. Among his untranslated works are *Erfindung der Buchstabenchrift* (1801), *De Antiquitate Codicis Vaticanæ Commentatio* (1810), *Das hohe Lied* (1813), *De Pentateuchi Versione Alexandrina Commentatio* (1818), *Gutachten über das Leben Jesu, kritisch bearbeitet von D. Fr. Strauss* (1835), and several on subjects of classical criticism, especially an interesting work on the ancient mythologies (1812). Consult A. Maier, *Gedachtnissrede auf Hug* (Freiburg, 1847), and Karl Werner, *Geschichte der katholischen Theologie in Deutschland*, pp. 527-533 (Munich, 1867).

HUGEL, hu'gel, FRIEDRICH, BARON VON (1852-) An Austrian-English writer on religion, son of Baron Karl von Hugel. He was born in Florence and was privately educated there and in Brussels. Deafness, resulting from typhus in 1871, possibly strengthened his natural inclination for the study of mysticism. In England, where he settled in 1871, he was an intimate friend of W. G. Ward and of other liberal Catholic scholars. His knowledge of the languages employed in theological scholarship was thorough and extensive, and it was acutely applied in his historical criticism of biblical documents and religious experience. He believed in the methods of the higher criticism, and he followed them with great freedom, notably in his examination of the orthodox view of the Gospel of John, but his opinions did not separate him from his church. After the death of Lord Acton (qv) Von Hugel became the foremost representative of Catholic scholarship in Britain. Besides a large number of articles on biblical criticism and the philosophy of religion in English and foreign reviews, he wrote *The Papal Commission and the Pentateuch* (1906), with Briggs, *The Mystical Elements of Religion as studied in St. Catherine of Genoa and her Friends* (1908-09), *Eternal Life* (1912-13), *Catholic Mysticism* (1914).

HUGEL, KARL ALEXANDER ANSELM, BARON VON (1796-1870). An Austrian soldier, traveler, and naturalist, born at Regensburg. He fought with the expedition against Naples in 1821 and remained there until 1824 as an attaché. He visited Greece, Crete, and Cyprus, examined the ruins of Palmyra and Baalbek, made numerous journeys through Syria and Palestine, and arrived at Bombay in 1832. Thereupon he traversed the greater part of the Deccan, ascended the Nil-Gherria Range, undertook thorough geographical researches in Ceylon, and in 1833 sailed from Madras to Australia (then New Holland). He returned to India (Calcutta) by way of the Philippines and penetrated through Bengal to the Tibetan frontier. He finally arrived at Vienna early in 1837. He contributed papers regarding his expedition

to Austrian scientific publications and to the *Journal of the Royal Geographical Society of London*, and wrote also *Kaschmir und das Reich der Siek* (4 vols., 1840-42), *Das Kabul-becken* (2 vols., 1850-52), and *Der Stille Ocean und die spanischen Besitzungen im ostindischen Archipel* (1860). Other scholars—among them Endlicher, Heckel, Fenzl, and Schott—also prepared the results of his scientific collections. He obtained a European reputation as a horticulturist and founded and became president of the Austrian Horticultural Society.

HUGER, ū-jē', BENJAMIN (1806-77). An American soldier, prominent on the Confederate side in the Civil War. He was born in Charleston, S. C., graduated at West Point in 1825, and served in topographical and ordnance duty until the Mexican War, in which he was chief of ordnance in General Scott's army. For his services he was brevetted successively major, lieutenant colonel, and colonel. From 1848 until 1860 he commanded various arsenals. Shortly after the outbreak of the Civil War he entered the Confederate service as a brigadier general and was soon promoted to be a major general, in which capacity he commanded a division in the Seven Days' Battles against McClellan, but was relieved from his command for his failure to intercept the Federal army after the battle of Malvern Hill. He subsequently served in the ordnance department in the Trans-Mississippi District.

HUGER, ISAAC (1742-97). An American soldier in the Revolution, born on Limerick Plantation, S. C., of French-Huguenot ancestry. He was educated in France, and on his return to America served in 1760 as a lieutenant of a volunteer militia company in a campaign against the Cherokees. With his four brothers he entered enthusiastically into the Revolutionary movement. He served first as colonel in the South Carolina militia organization and in January, 1779, was commissioned brigadier general in the Continental army. He took part in all the campaigns in the South, was especially relied upon by General Greene, to whom he was second in command, in his North Carolina campaign against Cornwallis in the early months of 1781, and was wounded at the battle of Guilford Court House.

HUGGINS, SIR WILLIAM (1824-1910). An English astronomer, born in London. He devoted himself to the study of astronomy and in 1856 built an observatory at his residence in Upper Tulse Hill, London, in which he mounted a telescope of 8-inch aperture and made careful drawings of Mars, Jupiter, and Saturn. His attention was first engaged in observations on double stars, but afterward he took up spectrum analysis. His first discovery in this line was presented to the Royal Society in a paper on the "Lines of Some of the Fixed Stars." He found also that some of the nebulae gave a spectrum of a few bright lines only, which showed that the light had emanated from heated matter in the state of gas, and, further, that one of the principal constituents of the gaseous nebulae is hydrogen. He concluded, therefore, that the nebulae are not simply clusters of stars too distant to be separately distinguished, but relics of the mass of glowing gas from which the solar system is supposed to have been formed by condensation. (See NEBULÆ.) He also examined the spectra of comets and found that part of the light of these objects is different

from the solar light. He also proved the existence of carbon in comets. Huggins was the first to apply Doppler's principle (*qv*) to the measurement of stellar velocities towards the solar system or away from it. See **ASTROPHYSICS**.

He also made innovations along other lines. He introduced spectroscopic photography into astronomy, which, however, was of limited use till about 1875, when the invention of the gelatin dry plate enabled the astronomer by long exposure to accumulate sufficient amount of light to obtain good pictures of celestial objects, too faint to be seen even with the most powerful telescope. Huggins also invented a spectroscopic method for studying the red prominences of the sun and proved, through a laboratory experiment, the existence of calcium in the solar prominences and chromosphere. In all his various researches Huggins was ably assisted by his wife (nee Margaret Lindsay), herself a scientist of distinction. In recognition of his services to science a number of honors were bestowed upon Huggins by various scientific bodies. He was president of the Royal Astronomical Society from 1876 to 1878, of the British Association for the Advancement of Science in 1891. He was president of the Royal Society from 1900 to 1905 and at different times received the Royal, the Copley, and the Rumford medals. Besides a number of original papers he published, jointly with Lady Huggins, in *Atlas of Representative Stellar Spectra* (London, 1899), which received the Actonian prize of the Royal Institution.

HUGH, hū (?-947). King of Provence and Italy. He was the son of Lothar, Count of Arles, and after the death of Louis the Blind (923) became ruler of Provence. In 926 he was crowned King of Italy at Pavia by the subjects of Rudolph, who were in revolt. His attempts to make himself Emperor involved him in constant war. Lombardy was invaded by the Hungarians, and an Italian rival, Berengar, finally drove him out of Italy.

HUGH, SAINT (c 1135-1200). Bishop of Lincoln. He was born at Avalon, near Pontcharra, Burgundy, on the border of Savoy, about 1135. His father was Lord of Avalon, but renounced the world when Hugh was eight years old and took his son with him into a monastery near Grenoble. In 1160 Hugh became a Carthusian monk at the Grand Chartreuse and won such high repute that he was called in 1175 by Henry II of England to put in order a monastery of the order at Witham, Somerset. His great success led to his election as Bishop of Lincoln in 1186. His moral courage made him fearless in resisting unjust demands from King or peasant, and his charity, which was boundless, endeared him to the people. So while he lived he was held in universal esteem, and when he died in London, Nov 16, 1200, he was not forgotten, and his tomb in Lincoln Cathedral became a place of pilgrimage. He is revered in the Carthusian Order next to St Bruno. His day is November 17. Consult his life, in Latin edited by Dimock (London, 1864), in English by Perry (ib, 1879), Thurston (ib, 1898), Bramley, in connection with memorial sermons on the seven-hundredth anniversary of his death (Lincoln, 1901), and by Charles Marson (London, 1901).

HUGH CAPET, hū kă'pĕt, F1 **HUGUES CAPET**, ug kă'pă' (c 930-996). King of France

from 987 to 996. He was a son of Hugh the Great, Count of Paris, and Hedwig, a sister of Otho the Great of Germany. Hugh Capet succeeded his father as Count of Paris in 956 and became thereby the real ruler of the country, though the title of King still belonged to the Carolingians. When, in 987, Louis V, the last Carolingian King of France, died without heirs, Charles, Duke of Lorraine, claimed the throne by descent, but at a meeting of the nobles and prelates of the realm at Senlis it was declared that the crown was elective, and thereupon Hugh was chosen, and became the founder of the Capetian dynasty (*qv*). Charles of Lorraine was easily defeated in the contest which ensued. In 988 he had his son Robert elected and crowned as his successor.

HUGHENDEN, hū'm-den (*Hitchendon*). A parish of Buckinghamshire, England, among the Chiltern Hills, 2 miles north of High Wycombe. It is noted for Hughenden Manor, long the residence of Benjamin Disraeli, Earl of Beaconsfield. Earl and Lady Beaconsfield are buried in the parish church, which contains a monument erected by Queen Victoria to the statesman's memory. Pop, 1901, 1728. 1911, 2134.

HUGHES, hūz, BAIL (1806-68). An American sculptor, resident for some years in New York, later in Boston. He was born in London, studied with Edward H. Bailey, and won several prizes at the Royal Academy. In 1820 he came to America and modeled a marble statue of Alexander Hamilton that was destroyed with the Merchants' Exchange in the New York fire of 1835. He modeled also the high relief of Bishop Hobart in Trinity Church, New York, and the bronze statue of Nathaniel Bowditch in Mount Auburn Cemetery, Cambridge, Mass.

HUGHES, CHARLES EVANS (1862-). An American lawyer, public official, and jurist. He was born at Glens Falls, N. Y., April 11, 1862, a son of the Rev David Charles Hughes, entered Madison (now Colgate) University at the age of 14 and remained there two years, graduated from Brown University in 1881, taught school for a year, and, having graduated with high honors from Columbia Law School (1884), was admitted to the New York bar. On Dec 5, 1888, Mr Hughes married Miss Antoinette Carter, and during the same year became a member of the law firm of Carter and Cravath, which he rejoined after two years (1891-93) as professor of law in Cornell University. In 1905 he was attorney for the Armstrong Committee appointed by the New York Legislature to investigate the financial administration of the great life-insurance companies chartered by the State and having their headquarters in New York City. His skill in uncovering the methods of these companies aroused public opinion and resulted in radical reforms. Nominated mayor of the city of New York by the Republican party in 1905, he declined to be a candidate, because of his unfinished task as counsel for the Armstrong Committee. He was nominated for Governor of New York by the Republican party in 1906 and was elected, defeating W. R. Hearst by about 60,000 votes. In 1908 he was the choice of a majority of the New York delegates to the Republican National Convention for the presidential nomination, in the same year he was reelected Governor of New York.

Governor Hughes's administration was an unceasing fight for reform. In his first message to

the Legislature he recommended (1) a public service commission law, (2) extension of the Corrupt Practices Act, (3) the Massachusetts ballot, (4) direct primaries, (5) laws for the protection of women and children in factories, (6) pure election laws. The Public Service Commission Law was passed, and the suggestion for labor laws was carried out, but the remainder of the programme was defeated by a hostile Legislature. The first drawn fight between Governor Hughes and the Legislature came over the Direct Primary Bill. After a long struggle the measure was defeated. The Governor carried the matter before the people of the State in several public addresses and called an extraordinary session for a reconsideration of the bill, but it was again defeated. Public opinion was aroused by the contest, however, and the law was finally passed, together with the Short Ballot Act, under the administration of Governor Glynn in 1913. In his annual message of 1908 Governor Hughes recommended that the statute relating to pool selling and bookmaking on race tracks be amended in accordance with the constitution of the State, so as to place these practices upon an equality with other forms of gambling. After a hard contest this measure became a law, and the race tracks were closed. On the whole the administration of Governor Hughes was impartial and progressive and won the approval of a majority of the people of the State. He resigned, Oct. 6, 1910, to become an associate justice of the United States Supreme Court by appointment of President Taft. At this post he came to be known as an advocate of a less rigid interpretation of the Constitution than had been in favor among the older of his colleagues.

HUGHES, DAVID EDWARD (1831-1900) An English-American inventor. He was born in London, but was early brought by his parents to the United States, where he subsequently received his education at Bardstow College, Kentucky. In 1850 he was made professor of music and later of natural philosophy at that college. In 1855 he took out a patent for his first important invention—the printing telegraph, which bears his name. After his telegraph was adopted in the United States, he went to Europe (1857), where the instrument was successively adopted by France, Italy, England, Russia, Germany, Austria, Turkey, Holland, Belgium, Switzerland, and Spain. Among his other inventions and discoveries may be mentioned the microphone (1878) and the induction balance (1879). His publications comprise a number of papers on electricity and magnetism.

HUGHES, EDWIN HOLT (1866-) An American Methodist Episcopal bishop and educator, born at Moundsville, W. Va. He graduated from Ohio Wesleyan University in 1889 and from the Boston School of Theology in 1892 and was pastor at Newton Centre and Malden, Mass., until 1903. In this year he was chosen president of De Pauw University—a post he held until 1908, when he was elected Bishop. In 1904 he was president of the State Teachers' Association of Indiana. He published *Letters on Evangelism* (New York, 1906), *Thanksgiving Sermons* (ib., 1909), *The Teaching of Citizenship* (ib., 1909).

HUGHES, HUGH PRICE (1847-1902) A British Wesleyan minister. He was born at Carmarthen, South Wales, and was educated

at University College, London, and the theological school in Richmond, Surrey. After occupying pulpits in Dover, Oxford, and London, he became superintendent of the West London Mission and editor of the *Methodist Times* (1885). His publications include *Social Christianity* (1889), *The Atheist Shoemaker* (1889), *The Philanthropy of God* (1890), *Ethical Christianity* (1892). Consult *Hugh Price Hughes as we Knew him* (London, 1902), *The Life of Hugh Price Hughes*, by his daughter (3d ed., New York, 1904), Walters, *Hugh Price Hughes, Pioneer and Reformer* (London, 1907).

HUGHES, JOHN (1797-1864) An American prelate, first Archbishop of New York, born in Annalohan, County Tyrone, Ireland. His parents were poor and could give him little schooling, but he gave his spare time to study. In 1816 his father came to America, and he followed in 1817 and worked as a day laborer in Maryland and Pennsylvania for three years, until he gained admission to the Roman Catholic College of Mount St. Mary, Emmitsburg, Md. There he earned distinction as a debater and also as a collector of funds for the rebuilding of the college after it was burned down. He was ordained a priest in 1826, and the same year the first of his controversial pamphlets was published, *An Answer to Nine Objections Made by an Anonymous Writer against the Catholic Religion*. After being assistant at the church of St. Augustine, Philadelphia, he went to Bedford, Pa., thence returned to Philadelphia (1827), to take charge of St. Joseph's Church, afterward took charge of St. Mary's, and was the founder of St. John's Orphan Asylum (1829). From 1833 to 1835 he published in the *Catholic Herald* his replies to Dr. Breckenridge, a Presbyterian critic of Catholicism. In 1838 he was appointed coadjutor of the Bishop of New York, four years afterward became Bishop himself, and continued his controversies upon educational, political, and religious affairs, in which his oratorical powers exerted a potent influence. One of Bishop Hughes's first undertakings was the establishment of a short-lived theological seminary at Lafargeville, Jefferson County, which was reopened at Fordham under the name of St. John's College in 1841. In 1850 he was made Archbishop, and in 1861 was sent on a special embassy to gain the friendship of France for the North in the Civil War, extending his influence in the same cause both to Ireland and Italy. He was a loyal American and a statesmanlike prelate. Two volumes of his writings, edited by Lawrence Kehoe, were published in 1865 after his death. Consult J. R. G. Hassard, *Life of John Hughes* (New York, 1866), H. A. Brann, *John Hughes* (ib., 1892), in the "Makers of America Series", Smith, *History of the Catholic Church in New York*, vol. 1 (ib., 1905), J. M. Farley, *History of St. Patrick's Cathedral* (ib., 1908).

HUGHES, RUPERT (1872-) An American writer. He was born at Lancaster, Mo., and graduated from Adelbert College (Western Reserve University) in 1892 and from Yale University (A.M.) in 1899, held assistant editorships on *Godey's Magazine*, *Current Literature*, and the *Criterion*, and from 1901 to 1905 served on the staff of the *Encyclopædia Britannica* in London and in New York. He is author of various juveniles, *American Composers* (1900), *Zal* (1905), *Excuse Me* (1911), successfully dramatized, *The Old Nest* (1912), *The Amiable*

Crimes of Dark Memling (1913) *What Will People Say?* (1914), a satire on New York life, and he also wrote a number of plays.

HUGHES, SAMUEL (1853–) A Canadian statesman and soldier. He was born at Darlington, Ontario, and was educated at the Toronto Normal School, at Toronto University, and at the Royal Military School. For several years he was a public-school teacher. In 1875–85 he was lecturer on the English language and literature in the Toronto Collegiate Institute and in the latter year took up newspaper work and until 1897 was editor and owner of the *Lindsay Warde*. He early entered the volunteer militia and in 1897 became lieutenant colonel in command of the Forty-fifth Regiment. In 1897–98 he visited Australia and New Zealand in the interest of colonial assistance in Imperial wars, and upon the outbreak of the South African War (qv) served therein (1899–1900) in the intelligence and transportation departments, his name being several times mentioned in dispatches. In 1900 he was appointed assistant adjutant general of the South African field forces. In 1902 he was promoted colonel. In 1891 he was an unsuccessful Conservative candidate for the House of Commons, but in the following year was successful. On the defeat of the Laurier administration in 1911 he became Minister of Militia in the Borden cabinet. In 1912 he instituted a Military Transport Board. Upon the outbreak of the European War, in 1914, he was foremost in organizing Canadian troops for the assistance of Britain. The first contingent of 33,000 was, in September–October of that year, assembled and sent on transports, convoyed by British warships, to different English ports and another contingent of 20,000 was sent in the early part of 1915. Hughes was also active in the movement which resulted in a further increase of about 50,000 to the Canadian armed force, nearly all of the latter number being retained for home defense. (See *WAR IN EUROPE*.) He visited England in October, 1914, and was made major general.

HUGHES, THOMAS (1822–96) An English author and politician, second son of John Hughes, of Donington Priory, Newbury, Berkshire, born at Uffington, Berks. He was educated at Rugby under the celebrated Dr Arnold, graduated B.A. from Oriel College, Oxford, in 1845, was called to the bar in 1848, and became a member of the chancery bar. In 1857 he gave to the world *Tom Brown's School Days*—a picture of public-school life, evidently written from the author's own personal experience, and recording the vivid and enduring impressions he brought with him from Rugby. It remains the best story of schoolboy life in the language. It was followed, in 1859, by *The Scouring of the White Horse*, in 1861, by *Tom Brown at Oxford*, in which the mental history of his hero is continued, with sketches of college life and incidents, and in 1869, by *Alfred the Great*. Hughes pursued meanwhile the study and practice of the law, and was appointed queen's counsel in 1869. He was active in founding the Workingmen's College, Great Ormond Street, of which he was principal from 1872 to 1883. He gained the confidence and good will of the working classes by endeavoring to promote a better understanding between masters and men and by teaching the latter the value of cooperation as a means of social elevation. At the general election for Lambeth in 1865 he was placed at the

head of the poll, the workingmen being especially enthusiastic in securing his return. In 1868 he was returned for Fiume, which he continued to represent till 1874, and always took a prominent part in debates relating to the combinations of trade-unions and the amendment of the law of master and servant. In 1880 he took a leading part in the socialistic settlement at Rugby, Tenn. Hughes also wrote *Memoir of a Brother* (1873), *Vacation Rambles* (1895), and several other works.

HUGHES, WILLIAM (1872–) An American legislator. He was born in Ireland, but coming early to the United States, was educated in the public schools and engaged in business. In 1898 he served with the Second New Jersey Volunteers in the Spanish-American War. He was admitted to the bar in 1900 and thereafter engaged in practice at Paterson, N. J. He was a Democratic member of the Fifty-eighth (1903–05) and the Sixtieth, Sixty-first, and Sixty-second congresses (1907–13), and was elected to the United States Senate from New Jersey for the term 1913–19.

HUGH OF LINCOLN, *hī'kon*, *SAINT*. A boy who is the hero of a mediæval legend. The story is told variously in the chronicles and ballads. According to one version, 24 boys were playing ball. St. Hugh of Lincoln, who kicked the ball through the window of a Jew, was enticed into the castle by the Jew's daughter, murdered, and thrown into a well, from which he addressed his mother miraculously and thus disclosed the crime. The story, based upon the belief that the Jews murdered Christian children, is found throughout the popular literature of mediæval Europe. It received the highest artistic treatment in Chaucer's *Prioresse's Tale*. Consult Child, *English and Scottish Popular Ballads*, part v (Boston, 1888).

HUGH OF LUSIGNAN, *hū'zə'nyan'*. The name of several counts of La Marche, of whom the best known is Hugh X, born before 1190, Count after the death of Hugh IX, who died at Damietta in 1219. King John of England had robbed his father of his fiancée, Isabella of Angoulême. After John's death Hugh X married Isabella, who was the mother of Henry III and styled herself Countess-Queen. During the minority of Louis IX he was one of the leading nobles who revolted against the Regent, Blanche of Castile, but was compelled to submit. In 1241 he insulted his overlord, the brother of St. Louis. The latter subdued him, but pardoned him. He took the cross in 1245, but it is not known whether he went on the crusade. The date of his death is uncertain, but his will was dated Aug. 1–8, 1248. Consult *Bibliothèque de l'École des Chartes*, vol. xvii (Paris, 1856).

HUGH THE GREAT (?–956). Count of Paris (called also *THE WHITE*). On the death in 923 of his father, Robert I, who had been elected King of France in opposition to Charles the Simple, he could have taken the title of King, but instead permitted it to go to his brother-in-law, Rudolph of Burgundy. He took the same course after the death, in 936, of Rudolph, who was succeeded by Louis d'Outre Mer, a young son of Charles the Simple. Meanwhile Hugh had assumed large estates, and, as Louis proved anything but a docile King, Hugh was forced to seek the assistance of his brother-in-law, Otho the Great of Germany, in the war that ensued. The King was captured and released after giving up to his conqueror the city

of Laon Louis immediately renewed the struggle, and this time was victorious. Peace was proclaimed in 950. Four years afterward Hugh again had the opportunity to make himself King, on Louis's death (954), but he favored the election of Lothair and in reward for his services was invested with the duchy of Aquitaine. It was his son, Hugh Capet, who ascended the throne 30 years later. Consult Lavissee, *Histoire de France*, vol. II, part 1 (Paris, 1903).

HUGH THE GREAT (1057-1101) Count of Vermandois, the second son of Henry I of France. He joined the First Crusade (1096) and continued with the army until after the capture of Antioch, in 1098. He was then sent by the leaders on an embassy to the Emperor at Constantinople. From there he returned to Europe. Later he joined the Crusade of 1101 and died near Tarsus. There seems to have been no reason for his being called 'The Great,' except that the Latin chroniclers so translated the French word *Maines*, meaning 'the younger.' Consult Hagenmeyer, *Inonymi Gesta Francorum* (Heidelberg, 1890).

HUGLI, or **HOOGLY**, hū'g'li The westernmost and principal deltaic channel of the Ganges, British India, formed by the junction of the Bhagirathi, the Jalangi, and the Churni—known as the Nadiya rivers. It is 125 miles long, the estuary, as far as Saugor Roads, measuring 35 miles more. It is the most available for navigation of all the channels by which the Ganges reaches the sea and is commercially the most important. In the dry season the tide is felt as high as Chandernagar, 17 miles above Calcutta. During the southwest monsoon the Hugh is subject to a bore 7 feet high, often ascending at the rate of 22 miles an hour. Ships drawing 26 feet of water can ascend to the port of Calcutta. The entrance of the river is much encumbered with shoals, and dredgers are constantly employed in maintaining a clear channel. The river above Calcutta is not regulated and is no longer navigable because of silting.

HUGLI, or **HOOGLY**. A city and river port of Bengal, British India, capital of a district of the same name, on the right or west bank of the river Hughli, 24 miles north of Calcutta. (Map India, F 4) The city was founded by the Portuguese in 1537. Chinsura (qv), which now forms a part of it, was founded by the Dutch. Its educational institutions include Hughli College, a Mohammedan college, and several high schools. It is also the seat of an extensive military cantonment. Its chief products are jute bagging, bags, and oil, but both population and trade have declined rapidly. Pop., 1901, 29,383.

HUGO, hū'gō A city and the county seat of Choctaw Co., Okla., 125 miles northeast of Dallas, Tex., on the St. Louis and San Francisco Railroad and on the Kiamichi River. (Map Oklahoma, F 4) It has railroad repair shops, cotton gins and compresses, cottonseed-oil, saw, and planing mills, a handle factory, and creosote works. Hugo was founded in October, 1901, and is governed by a mayor and eight aldermen. The water works are owned by the city. Pop., 1900, 2676, 1910, 4582.

HUGO, hū'gō, GUSTAV VON (1764-1844) A German jurist, born at Lorrach, Baden, and educated in law at Göttingen. After acting as tutor to the Prince of Anhalt-Dessau (1786),

he became professor of law at Göttingen (1788). In 1819 he was made Privy Councillor. He made important investigations of the sources of Roman law. He was, together with Savigny and Haubold, one of the founders of the historical method in jurisprudence. He edited *Ulpian's Fragmenta* (1788), translated Gibbon's chapter on Roman law as *Uebersicht des römischen Rechts* (1789), *Pauli Sententiae Receptae* (1796), and *Jus Civile ante-Justinianum* (1815). But his most important labor was his own book, *Lehrbuch eines civilistischen Kurses* (7 vols., 1792-1821), and his *Civilistisches Magazin* (1790-1837), with its supplement, *Beiträge zur civilistischen Bucherkennntnis der letzten vierzig Jahre* (1828-45). Consult Eyssenhardt, *Zur Erinnerung an Gustav Hugo* (Berlin, 1845).

HUGO, hū'gō, Fr. pron u'gō, VICTOR MARIE (1802-85) The greatest French poet of his century, a distinguished dramatist, novelist, essayist, and politician. His first volume appeared in 1822. For nearly two-thirds of the century he was a leader in French literature, for the greater part of that time preeminently the leader. He represents the supreme reach of an individualistic and Romantic movement. Besançon, his birthplace, had once been a Spanish city—a significant fact, for his work often shows Spanish influence. His father was a distinguished officer of the Republic and Empire, his mother the daughter of a sea captain of Nantes, of Royalist and Catholic sympathies. With her the child lived in Paris till 1811, when General Hugo summoned his family to join him in Madrid, whence he was constrained to send them back in 1812, as King Joseph's cause was growing desperate. The impressions of this year left deep marks on many of Victor's works, notably *Bug Jargal*, *Hernani*, *Ruy Blas*, and *Torquemada*. Afterward, until the fall of the Empire, he was once more with his mother in Paris in the abandoned convent of Les Feuillantines, which appears prominently in *Les misérables*. Set at technological studies by his father, he aspired at 14 "to be Chateaubriand or nothing," wrote a Miltonic *Déluge*, and planned dramas, epics, and operas. At 15 he competed for an academic prize, winning honorable mention and some minor literary patronage. Two years later (1819) he won three prizes at the poetic competition (*Jour de gloire*) of Toulouse. In the same year he founded a fortnightly literary journal, *Le Conservateur Littéraire*, the failure of which, with the withdrawal of his allowance from his father, reduced him to a poverty that gave materials for the Marius episodes in *Les misérables*. It was in the *Conservateur* that he wrote the first draft of the novel *Bug Jargal*, a story of Haiti, of great promise and weird power. *Bug Jargal* appeared in its final form in 1826. It was enlarged especially by the introduction of the dwarf Habibrah, whose dramatic death is imitated later in that of Claude Frollo, in *Notre-Dame*. His brother, Abel, generously helped him to print *Odes et poésies diverses* (1822), which paid him 700 francs and caused King Louis XVIII to grant him a pension of 1500 francs, increased later to 3000. On the strength of this he married (October, 1822) and thereafter enjoyed a happy domestic life. These verses, in their brilliant rhetoric and richness of rhythmic melody, had been approached in that generation only by Lamartine's *Méditations*. They show an ardent royalism, a per-

FROM A PHOTOGRAPH

functory, and sonorous religiosity, and an intense political passion, on which Napoleon was already beginning to exercise a fascination that declared itself openly in the superb *Ode on the Vendôme Column* (1827)

The next few years were occupied with an extravagantly Romantic novel, *Han d'Islande* (1823), and with literary journalism. From July, 1823, to June, 1824, appeared *La Muse Française*, the organ of the First Cenacle (qv). In 1826 appeared *Nouvelles odes et ballades*, whose preface was a sort of literary manifesto of romanticism and of the First Cenacle. Versification and rhythm here begin to show an aggressive individuality, and several poems indicate that sympathetic study of the mediæval mind which is associated with French romanticism. Hugo was recognized as the Romantic leader and asserted and confirmed that position by *Cromwell* (1827). As early as 1826 the Odéon Theatre had offered hospitality to an English company, in which were Charles Kemble and Miss Smithson. This company played *Othello*, *Romeo and Juliet*, and *Hamlet*, all of which were enthusiastically greeted by the new French school. Indeed, Kemble and his companions did not leave the Odéon till July, 1828. *Cromwell* begins with an elaborate preface full of dramatic observations, more opportune than new, but they now became the rallying point of a school who thought "the drama the only complete poetry of our time, the only poetry with a national character." This school demanded for the drama an unconventional vocabulary and a mingling of tragic and comic, to show more fully the irony of destiny, thus unconsciously following Diderot (qv), while attempting to follow nature. In all Hugo's dramas the lyric element tends to delay the dramatic effect. *Hernani* and *Ruy Blas* alone are still played in France.

Cromwell was followed by a drama taken from Scott's *Kenilworth*—*Imy Rohsart* (1829), a failure—and *Marion Delorme*, which the censorship forbade the stage till 1831. In January, 1829, appeared a volume in prose, *Le dernier jour d'un condamné*, which recounts the mental agony of a man on the eve of his execution and is a plea for the abolition of capital punishment. In the same year Hugo published *Les orientales*, a collection of poems containing some of the most striking pieces of metrical art in the world. They were followed by the long-contested triumph of *Hernani* and of romanticism on the French stage (1830), after Hugo had vainly tried to bring about the performance of *Marion Delorme*. For nearly 100 days, from February 26 to June 5, the battle raged nightly at the Théâtre Français, but no further organized effort was made to resist the retrograde evolution of the Romantic drama till it collapsed with Hugo's *Les Burgraves* in 1843. The situation in *Hernani* is strained and dramatically unreal, the sentiment is mawkish, the oratory grandiloquent, but a throbbing life and intensely expressed emotion maintain the interest, though this is a lyric rather than a dramatic one. The same qualities and the same defects, with more strained antithesis of grotesque and sublime, tragic and comic, foul and fair, characterize *Marion Delorme* (1831). They characterize also *Le roi s'amuse* (1832), the prose dramas, *Lucrèce Borgia* (1833), *Marie Tudor* (1833), *Angelo, tyran de Padoue* (1835). They reach their height in *Ruy Blas* (1838) and

become most conspicuous in *Les Burgraves* (1843). Hugo's conceptions were too grandiose to be reconcilable with the limitations of the drama. He gave up the effort and turned to politics. But these 16 mainly dramatic years had produced work of great value in other fields—the novel *Notre-Dame de Paris* (1831) with its Gothic intensity of pathos and its marvelous reproduction of the Paris of Louis XI, the quixotic but eloquent *Claude Gueux* (1834), a plea against capital punishment, the *Feuilles d'automne* (1831), *Chants du crépuscule* (1835), *Voix intérieures* (1837), *Les rayons et les ombres* (1840)—four collections of poems that show growing democratic sympathies and satiric power, a deepening communion with nature, and a generous warmth of universal sympathy, a little shallow in its breadth, that was to give the keynote to his political activity of the next decade.

The 10 years from 1843 to 1853 from *Les Burgraves* to *Les châtiments*, count no literary work of import, but they mark a vital change in the mind of Hugo that affects all the work to follow. Till 1843 drama had taken the first place. From 1853 fiction becomes more prominent, poetry intermittent, with occasional political writings. Hugo sees that his power is essentially lyric and gives this a dominant place even in prose fiction. Through all there is a new earnestness, born in part of the death of his daughter, Leopoldine, and her young husband (1843), in part of a vague yet intense enthusiasm for the Socialistic ideas of Fourier and Proudhon which drew him into a political whirlpool and made him a revolutionary member of the Constituent Assembly of 1848. As a practical politician, then and always, Hugo was a failure. He favored the ambition of Louis Napoleon till Louis ceased to favor his own advancement, he was an advocate of several hopelessly unpractical schemes, and an unconscious convert to the caressing flattery of Emile de Girardin. Napoleon's coup d'état of 1851 saved Hugo from himself. It made a martyr and hero out of a visionary who was distrusted as a turncoat. In his eloquent *Histoire d'un crime* (finished in 1852 and published in 1877), he shows unconsciously how his efforts to organize resistance to the usurper were distrusted by his fellow Republicans. He fled to Brussels, whence he was urgently requested to move on to England, and resided first in Jersey, then in Guernsey, as near France as possible consistently scorning every offer of amnesty till the collapse of the Second Empire brought him back to share the darkest days of the Terrible Year (1870-71).

These years of exile steeled his mind, and his genius was fired by what seemed his country's shame. In 1852 appeared the fierce and scurrilous *Napoléon le Petit*, a foretaste of *Les châtiments* (1853) in which the satiric unites with the lyric genius to produce a classic that will survive for generations the Empire that fired Hugo to a white heat. To calmer hours we owe *Les contemplations* (1856), a collection of lyrics closing in a noble strain, and the first of four volumes of *La légende des siècles* (1859, 1877, 1883), the high-water mark of his achievement in lyrical epic. In 1862 the long-heralded *Les misérables* appeared on the same day in 10 languages—an event till then unparalleled in the annals of letters. The 10 volumes of this vast romance reveal Hugo no longer, as in

Notre-Dame, an evoker of the past, but with eyes on the present and heart in the future. It lacks continuity and proportion. It is a chaos of eloquent special pleading, political reminiscences, Socialistic prophecies, bad psychology, grotesque situations, false pathos, and descriptions wonderfully vivid and absorbing. In the hurly-burly of this lyric-epic novel we find most of the virtues and all the intellectual vices of Hugo. Its value lies, not in its thought, but in its emotion, its lyric cry, and its epic power of description. On the development of fiction it had no influence, for it belonged to a type already outworn. The same may be said of *Les travailleurs de la mer* (1866), in which the descriptions are superb and the subject petty. *L'Homme qui rit* (1869), an historical phantasmagoria of the English court of Queen Anne and an unmitigated failure, closes the fiction of the exile. Meanwhile Hugo's poetic muse had had her Indian summer in *Chansons des rues et des bois* (1865). But as the Empire tottered to its fall, his inauspicious interest in politics became once more dominant. He wrote much for *Le Rappel*, a radical journal, founded by his sons and son-in-law, but revealed once more, in 1870, the hopelessly unpractical nature of his political ideas, alike as a prophet of the people and as a member of the National Assembly at Bordeaux in 1871. He resigned his seat in March and went to Brussels, where he barely escaped being mobbed, owing to his defense of the Paris Commune. He was expelled from Belgium and soon after returned to Paris. Here he failed signally in the elections of 1872, though he was elected life senator in 1876. But if he might not be a tribune, he was already the poet laureate of the Third Republic. Of *Les châtiments* 100,000 copies were sold within a year, several plays, notably *Ruy Blas*, were revived with success, and he rose to the new occasion in *L'Année terrible* (1872), a noble volume of patriotic verse that made a French critic exclaim, with just pride, that Germany had no such poet to sing her victory as France to glorify even her disaster.

Hugo was now past 70, but it is too early to speak of his decline. He could pose as old, indeed, in the poems of *L'Art d'être grand-père* (1877), but *Quatre-vingt-treize* (1874) is the most virile of his novels, with more intensity of action and a truer tragic catastrophe than *Notre-Dame* or *Les misérables*, though by no means without their faults and its own. The second part of *La légende des siècles*, if inferior to the first, is still grand, there are passages of primary quality in *Les quatre vents de l'esprit* (1881), *La pitié suprême*, and even in the *Philosophic Poems* (*Le pape, Religions et religion, L'Ane*, 1878-80), the drama *Torquemada* (1882) is vigorous at least by starts, and in the posthumous volumes (*Le théâtre en liberté, La fin de Satan, Toute la lyre*) one comes constantly on verses that bear his unmistakable mint stamp.

He died in Paris, May 22, 1885. His great age, reaching out into a new generation from an epoch that had passed away and was indeed more foreign to that day than to our own, could not but impress popular imagination, the more so as his talent, his manner, and his personal physique had something of the monumental and grandiose. Thus his death stirred an unparalleled wave of popular feeling. His body lay in state beneath the Arc de Triomphe.

His funeral became a pageant that royalty might envy and could not equal. The relics of St. Genevieve, the patron saint of Paris, were removed from the Pantheon that it might receive the popular hero.

Despite his own belief, Victor Hugo had no new or deep theories of life. He was the confident of his century, "the sonorous echo in the middle of things." Personally he was vain and rather ignorant, if we compare his knowledge with his pretensions. But he is Olympian in his defects—Zeus, Apollo, and Hephaestus turned into one. His convictions are not important. He thinks to proclaim an oracle and reiterates a commonplace. But he is perhaps the greatest compeller and gatherer of words, the greatest master of language, that we know, a great writer rather than a great author and therefore the more sure of an enduring democratic fame. He has formed the rhetorical and poetic taste of three generations of French youth. All schools of French verse that have arisen in the last half century have united to call him their father.

HUGO OF FLAVIGNY, fla-vé'nyé' (1064-c.1140). A Franco-German monk and scholar, born in Verdun. He was educated in the monastery of St. Vannes, becoming a Benedictine monk, and afterward went to Dijon, where about 1090 he began his *Chronicle*. In 1095 he went to England and a year later became abbot of Flavigny. He was obliged to leave his abbey in 1099 and, though reinstated in 1100, was again forced to leave it by the hostility of Norgaud, Bishop of Autun, and retired to Verdun. His *Chronicle* is of value for its ac-

count of the last years of the eleventh century and extends from the birth of Christ to 1102. The original manuscript was in the possession of the late Sir Thomas Phillipps, the antiquary, and was one of the great Meerman collection before he bought it. It was published by P. Labbe in *Bibliotheca Manuscriptorum Nova* and in the *Monumenta Germaniae Historica*.

HUGO OF SAINT-VICTOR (1096-1141)

A French monk, mystic, and theologian, born in Saxony or Flanders. He was educated in the monastery of Hamerleve in Saxony and became monk in the abbey of Saint-Victor, near Paris. Until the middle of the thirteenth century his works were very popular. In his treatment of most of the general questions of theology he kept to the beaten path, but his views on psychological questions were original. There has been much discussion as to the authenticity of certain writings attributed to him. In *Les œuvres de Hugues de Saint-Victor* (1886) M. Haureau gives a list of those about which there seems little doubt and disregards many theretofore considered his. Hugo's most famous book is *De Sacramentis Christianae Fidei*. An excellent edition of his works was published at Venice in 1588.

HUGO VAN DER GOES, hū'gō vān dēr gōōs (?-1482). An eminent painter of the early Netherlands school. He was probably of Dutch origin, born at Goes (Zeeland), whence his name. Very little is known of any but the last few years of his life. The assumption that he was a pupil of Jan van Eyck is impossible for chronological reasons, and, although he was influenced by that master's work, his art more nearly resembles that of Dirk Bouts, for he probably received his earliest training in Holland. He practiced chiefly at Ghent, where his name is first inscribed in the painters' guild in 1467. During the following year he took part in the decorations for the festivities which marked the marriage of Charles the Bold to Margaret of York at Bruges. In 1468-69 his name is twice mentioned as a decorator in the services of the city of Ghent, where he was dean of the painters' guild from Christmas, 1473, to 1475. Soon afterward he retired to the priory of Roendael, near Brussels, of which his brother Nicolas was also an inmate, and where he died in 1482. The most celebrated of his works at Ghent was a decoration painted in oil on the wall of a patrician's house, representing the story of Abigail. It survives in several copies, the best being in the Novak Gallery, Prague. According to the legend the fair Abigail of the painting was his fiancée, while David was the painter himself, and it was the loss of this lady which led him to enter the convent. A fellow novice has recorded in the cloister chronicle the story of Brother Hugo's last years. Many illustrious visitors, including the Archduke Maximilian, came to the convent to see his pictures or to be portrayed by him, and Hugo was permitted to frequent the guest chamber and join in their feasts, at which he indulged too freely in wine. He was subject to frequent attacks of melancholy, particularly regarding his painting. While returning from a pilgrimage to Cologne made some time after taking the vow, he was stricken with a mental malady which caused him to imagine himself a son of perdition. He did not recover his reason until shortly before his death, in 1482.

By far the most important of his surviving works is the Portinari altarpiece, painted about 1476 for Tommaso Portinari, agent for the Medici at Bruges. The central panel represents the Madonna adorning the Christ Child, attended by wonderfully realistic shepherds and delightful angels. The left wing, Tommaso and his two sons under the protection of their patron saints, Anthony and Matthew, the right wing, his wife and daughter with Saints Margaret and Mary Magdalen. For 400 years the altarpiece hung in the hospital of Santa Maria Maggiore, Florence, until it was purchased in 1898 for 900,000 francs by the Italian government and placed in the Uffizi Gallery. It exercised a strong influence upon Italian painting of the later fifteenth century, particularly upon Ghirlandajo and Lorenzo de' Credi. Among the few other paintings which can with certainty be ascribed to Van der Goes is a small triptych the panels of which, now separated, are in the Imperial Gallery, Vienna. One of these represents the "Fall of Man," in which the nude is treated with greater freedom than had previously been done, the others are the "Bewailing of Christ" and "St. Genevieve." The "Death of the Virgin," in the Town Hall of Bruges, probably belongs to his later period. Hugo van der Goes was the most important painter of the generation following the Van Eycks. His works are characterized by ambitious design and by an attractive realism, less monumental but more intimate than that of the Van Eycks. His treatment of light and shade, as seen in the Portinari altarpiece, foreshadows that of the great Dutch masters of the sixteenth and seventeenth centuries, and his landscapes are particularly good. Consult Wanters, *Hugues van der Goes* (Brussels, 1872), Voll, *Die alt-niederländische Malerei* (Leipzig, 1906), Fierens-Gevaert, *Les primitifs flamands*, vol. II (Brussels, 1909).

HUGUENOTS, hū'gē-nōts, *Fr. pron.* ug'nō' (derivation unknown, possibly corrupted through *Ignots*, *Iguenots*, from Ger. *Eidgenossen*, confederates, according to others, a diminutive of *Hugo*, *Hugues*, Hugh, a patron saint of Tours). The name borne by the Protestants of France from about the year 1560 till their extinction as a political party in the seventeenth century; in a more general sense, the adherents of the Reformed religion before the French Revolution. Lutheran Protestantism invaded France probably between 1520 and 1523, and its principles were warmly embraced by large numbers of the learned classes and the nobility. The followers of the new religion enjoyed the special protection of Margaret of Angoulême, Queen of Navarre and sister of Francis I. The work of John Calvin (q.v.), himself a Frenchman, gave energy and cohesion to French Protestantism; but its strength always remained in the nobility and the middle classes, and it never appealed to the masses of the people, as in northern Germany.

Towards the end of his reign Francis I opposed the Huguenots with great severity and caused many to be burned. During the reign of Henry II the persecution assumed a still severer character, the *Chambre Ardente* (q.v.) being instituted in 1535 for the trial of heretics. Nevertheless the Protestants increased in numbers and strengthened their organization, although this year marks the beginning of their emigrations. John Calvin was the most famous émigré. The first national synod on May 23,

1559, adopted a Calvinistic code of 80 articles which became the constitution of French Protestantism. Fifteen churches were represented at that synod. Two years later there were over 2000. The influence of the Guise family, who began to come into power in the reign of Francis I, now showed itself in bitter warfare upon the Huguenots, whose cause was supported by the powerful Bourbon family, the great rivals of the Guises. In 1560 the extremists among the Huguenots, headed by La Renaudie, a nobleman of Périgord, conceived the plan of seizing the person of the young King, Francis II, and placing him under the guardianship of the Bourbon princes. The plot, however, known as the Conspiracy of Amboise, was betrayed; the King was made secure in the castle of Amboise, and the Duke of Guise was appointed Governor-General. The Edict of Romorantin, in May, 1560, took the prosecution of heretics out of the hands of the parlements and put it into those of the bishops. By the Assembly of Notables in August it was resolved that the whole matter of religion should rest until the next assembly of the States-General. Francis II died on Dec 5, 1560, and Charles IX, a boy of 10, ascended the throne. The Queen mother, Catharine de' Medici (qv), being determined to take the power into her own hands, was compelled to seek Huguenot support against the Guises. For the complete termination of strife the court caused a religious conference to be held at Poissy in September, 1561, between the representatives of the two religious parties. The chief disputants were the Cardinal of Lorraine on the one side and Theodore Beza (qv) on the other. The effect of the discussion was merely to widen the breach between the Catholics and the adherents of the new confession, but it served to unite and embolden the Huguenots, with whom the machinations of the Guises forced Catharine into closer alliance. On Jan 17, 1562, appeared an edict giving noblemen the right of the free exercise of their religion on their own estates. This was followed by the recourse to arms on the part of the Guise faction.

Violence and reprisals were perpetrated on both sides. On March 1, 1562, a company of Protestants, meeting in a barn at Vassy for religious exercises, was attacked, and many of them were massacred by the followers of the Duke of Guise. Condé raised the Protestant standard at Orléans, protesting allegiance to the crown, but demanding freedom of conscience. The Guises seized the person of the King and proclaimed the Huguenots rebels. This was the beginning of the First Civil War. The Huguenots were at first successful, overran the southwestern part of the country, and were joined by 4000 soldiers from Germany. At Dreux, however, Dec 19, 1562, the Protestants were defeated. The Duke of Guise was assassinated before Orléans, Feb 18, 1563, and on March 19 the Queen mother concluded the Peace of Amboise, which granted a large measure of religious freedom to the nobles, but set aside one town only in every bailiwick as a place of worship for the Huguenots. The terms of the treaty were disadvantageous when compared with the provisions of the Edict of January, 1562, and were accepted by Condé against the vehement remonstrances of Coligny (qv). Catharine hated the new faith, and with the help of the Holy League (see the fifth HOLY

LEAGUE) formed a close alliance with the Spaniards for the extirpation of heresy, retrenched the privileges of the Protestants, and made attempts upon the liberty and life of Condé and of Admiral Coligny. These leaders then determined to take possession of the King's person in September, 1567. The court took refuge in Paris, which Condé invested, on Nov 10, 1567, a battle was fought at Saint-Denis between Condé and a much superior force under the Constable Montmorency (qv), and soon after Condé fell back into Lorraine, where he effected a junction with an auxiliary force of 10,000 men from Germany and again threatened Paris, upon which Catharine determined to conclude peace, and the Second Civil War was terminated by the Treaty of Longjumeau on March 23, 1568, which confirmed the terms of the Treaty of Amboise. Catharine, however, had consented to the treaty only to gain time and had no intention of acting up to its terms. Plots were formed against the lives of Condé and Coligny, who fled to La Rochelle, where they were joined by Jeanne d'Albret, Queen of Navarre, and her young son Henry. With reinforcements from Germany and England the Huguenots began the Third Civil War, but at Jarnac, March 13, 1569, they were defeated by the royal troops under the nominal command of the Duke of Anjou, afterward Henry III, and Condé was slain after he had rendered himself prisoner. Jeanne d'Albret endeavored to recoup these reverses in an assembly at Cognac and set up her son, then but 15 years of age, as the head of the Protestant cause. Coligny became their military leader and, having received a further accession of troops from Germany, laid siege to Poitiers, but was again defeated by the Duke of Anjou at Moncontour, October 3. French reinforcements from England, Switzerland, and Germany enabled Coligny to take Nîmes in 1569 and to relieve La Rochelle, while La Noue obtained a victory over the royal troops at Lugon. Catharine and her son now sought for peace, to which the Protestants, weary of the hard contest, consented. The treaty, concluded at Saint-Germain-en-Laye on Aug 8, 1570, gave to the Protestants the free exercise of their religion everywhere except in Paris, and the possession of a number of strongholds.

Catharine, having failed to overthrow the Protestant cause in the open field, sought to accomplish her object by treachery. She entered into friendly relations with the Huguenots, partly, it is true, out of fear of the Guise family. After September, 1571, Admiral Coligny exercised great influence at court and was received with much show of affection by the young King and the Queen mother. The marriage of Henry of Navarre, who had just succeeded his mother in his little kingdom, to Margaret of Valois, sister of Charles IX, seemed to promise an end to the period of civil strife. Then came the Massacre of St. Bartholomew's Day, Aug 24, 1572 (see BARTHOLOMEW, MASSACRE OF SAINT), when thousands of Huguenots, among them Coligny, perished. So far from effecting its intended purpose, this detestable deed only roused the Huguenots to take up arms again. They were forced to form a political party or else be completely subjugated. The Duke of Anjou lost his army before La Rochelle, and on June 24, 1573, concluded a peace at that place by which the Protestants obtained complete freedom in

the exercise of their religion in the three towns of Montauban, Nîmes, and La Rochelle, which were exempted also from the obligation of receiving a royal garrison. Everywhere else the Huguenots were promised freedom from molestation on condition that they should not hold assemblies of more than three persons at a time. A section of the Roman Catholic nobility, at whose head was the Duke of Alençon, the youngest son of Catharine, from purely political motives, united with the Huguenots, and their cause was strengthened by the support of the Politiques (qv), the party which put "France" before religion. The accession of Henry III, in 1574, was followed by the outbreak of the Fifth Civil War. Henry of Navarre, who since St. Bartholomew's Day had remained a virtual prisoner at the French court, succeeded in making his escape in February, 1576, and, placing himself at the head of the Huguenot forces in the south, achieved a number of successes in Guenne. This led to the conclusion of the Treaty of Beaulieu, called the Peace of Monsieur, May 6, 1576, by which the Huguenots were granted an increased number of places of security and partial representation in the Provincial parlements. This was regarded by the Catholics as a surrender to heretics and traitors who had not hesitated to call in foreign aid against their sovereign. The Duke of Alençon was won back to the support of the court, and under the auspices of Henry, Duke of Guise, the Catholic League was organized for the defense of the Church, the extirpation of heresy, and the maintenance of the honor and authority of the King. Although there were certain ulterior motives which made the League dangerous to the house of Valois, Henry III for the time put himself at the head of the movement and at the close of 1576 assembled the States-General at Blois. The severe measures enacted by this body against the Huguenots kindled the Sixth Civil War (1577), which was marked by no important engagement. Peace was concluded at Bergerac on Sept. 17, 1577, and confirmed by the Edict of Poitiers, which guaranteed the preservation of the *status quo*. The Seventh Civil War (the *Guerre des Amoureux*) broke out in November, 1579, with little cause and was terminated by the Peace of Fleix in November, 1580, with little result.

There was now a comparatively long interval of repose till 1584, when, by the death of the Duke of Anjou (formerly Alençon), Henry of Navarre became heir to the throne of France. Hereupon Henry, Duke of Guise, exerted himself for the revival of the League entered into an alliance with Spain and the Pope for the extirpation of heresy, declared the Cardinal of Bourbon heir to the throne, and began hostilities against the Huguenots. The results of 25 years of warfare were destroyed by the Edict of Nemours (July 7, 1585), which annulled all previous edicts of toleration. This was followed by the outbreak of the Eighth Civil War, known as the War of the Three Henrys (Henry III of France, Henry of Navarre, Henry of Guise). The Catholic League and the King put no less than seven armies into the field, while the Huguenots received large reinforcements from Germany. At Coutras, Oct. 20, 1587, Henry of Navarre defeated the Catholic army, but this was offset by the victory of Guise over the German auxiliaries at Montargis. So contemptible had Henry III become in the eyes of

the people of Paris that the entrance of the victorious Duke of Guise into the city on May 9, 1588, was followed by an insurrection in his favor. While the Duke was negotiating with the Queen mother, Henry III fled from Paris, but at Rouen in July, 1588, acceded to all the demands made by Guise, the extermination of heresy in the kingdom, the convocation of the States-General, and the appointment of Guise to the post of lieutenant general of France. At Blois, on Dec. 23, 1588, Henry III caused the Duke of Guise to be murdered and summoned to his aid Henry of Navarre. In less than a year the King himself was assassinated by Jacques Clément, and Henry of Navarre succeeded to the throne. The League, however, now under the leadership of the Duke of Mayenne, the brother of Henry of Guise set up the Cardinal of Bourbon as a rival King and, with the aid of Spanish troops, held its own in Paris. Outside, however, it suffered two crushing defeats at Arques and Ivry. On July 25, 1593, Henry of Navarre formally embraced Catholicism and in the following year gained possession of the capital. The civil wars in France were brought to an end by the Peace of Vervins between Henry and the Spanish King, May 2, 1598. On April 13 of the same year the King, in the Edict of Nantes (see NANTES, EDICT OF), guaranteed the Huguenots full liberty of conscience and the preservation of their religious and civil condition. See HENRY IV.

Though Henry IV, convinced that the French were a Catholic people and would never accept a Protestant sovereign, abjured his faith on political grounds, his reign was one of broad toleration, and his great Minister, Sully, was a Huguenot. But when, during the minority of Louis XIII, Maria de' Medici, the Queen of Henry IV, assumed the reins of government, the many privileges enjoyed by the Huguenots were found to have created a strong party that stood in the way of absolutism. The King took an oath in 1614 to maintain the Edict of Nantes, but the marriage treaties with the Spanish court excited the apprehensions of the Huguenots to such a degree that, in November, 1615, they made common cause with the Prince of Conde, who had set up the standard of rebellion. This was contrary to the advice of the most sagacious of their own party. Although by the Treaty of Loudun, May 4, 1616, they obtained a new confirmation of their freedom of worship, the court now only waited for an opportunity of breaking at least their political power. In June, 1617, a royal edict commanded the entire suppression at once of the Protestant church and of political privileges in the Province of Bearn, but the Provincial court at Pau refused to register the edict, and the matter lay over until 1620, when, urged by his adviser that the time was opportune to strike decisively, the King carried the edict into full effect by force of arms. The Protestants throughout all France took alarm, and hostilities again broke out in May, 1621. At the head of the Protestants were the two brothers the Duke of Rohan and the Prince of Soubise. Their cause, however, was feebly maintained, almost all the Protestant towns fell into the hands of the King, force, stratagem, and bribery being equally employed. By the Treaty of Montpellier, Oct. 19, 1622, the Huguenots lost a number of their strongholds and the right of assembly without permission of the King. The court, however,

paid little attention to the stipulations of the treaty, and when the government was involved in difficulties in Italy, the Protestants took the opportunity again to rise in arms (1625). Soubise, with a fleet furnished by the town of La Rochelle, more than once defeated the weak royal navy. Cardinal Richelieu, who had assumed control of the affairs of state in 1624, was a believer in absolutism. He sought to overthrow the Huguenots as a political force and pursued this end relentlessly. He took charge himself of the siege of La Rochelle, the Huguenot stronghold, which was taken after an heroic resistance, Oct. 28, 1628. The fall of La Rochelle was speedily followed by that of Nîmes, Montauban, and all the other Protestant strongholds. The Peace of Alais, June 27, 1629, put an end once for all to the civil wars in France and to the Huguenots as a political party. Richelieu was a great statesman and politician, and when the political power of the Huguenots was broken, he endeavored by conciliation to attach to the state these people, of whom some were the best and most useful in France. This policy was not changed under Mazarin, and Colbert during his years of power restrained Louis XIV from persecution. After Colbert's death the King entered upon a rigorous policy of repression under the influence of religious conviction. Political motives, however, may have served to determine the policy of Louis XIV for the presence of a powerful element in the country differing in belief and to some extent in political theory from the generally accepted doctrines must have clashed with the Grand Monarch's ideal of a nation dwelling in peaceful uniformity under the wing of a benevolent autocracy. The Huguenots were deprived of civil rights, and in the southern provinces, where Protestantism was strong, recourse was had to severer measures. To force them into the bosom of the Church, the people were handed over to the mercies of a licentious soldiery. Detachments of troops were quartered on the inhabitants, while bodies of cavalry patrolled the country, demolishing the places of worship and in some cases putting the Huguenot preachers to death. (See DRAGONNADES.) Hundreds of thousands of Protestants fled to Switzerland, the Netherlands, England, Germany, and the West Indies, as well as to South Carolina, New York, Massachusetts, and other North American colonies. The climax of this persecution was the revocation, Oct. 18, 1685, of the Edict of Nantes, which deprived the Huguenots of their last defense and gave a new impulse to the emigration which took the best blood of France to strengthen her rivals. Thousands betook themselves to the mountains of the Cévennes and continued the exercise of their religion in secret. Among these and the mountaineers of the Cévennes a remarkable fanatical enthusiasm displayed itself, and under the name of Camisards (qv) they maintained for a number of years a wonderfully successful opposition to the forces of the great monarchy. The War of the Cévennes, or Camisard War, began in 1702 and was not terminated until 1705, sporadic outbursts continuing until 1709 or 1710. The suppression of the local rebellion was attended with circumstances of great cruelty. France, after the revocation of the edict, lost more than 400,000 of her population, among them many of wealth and position, besides a number of the middle classes engaged

in mechanical pursuits. The total emigration is variously estimated from 400,000 to 1,000,000 while, notwithstanding the many persecutions, about 1,000,000 Protestants remained.

The partial repose which the Protestants enjoyed for more than 10 years was attended by a revival of their worship, especially in Provence and Dauphine. In 1724, therefore, Louis XV, influenced by political motives, issued a severe edict against them. The spirit of the age, however, now began to be opposed to persecution. An edict in 1752 declared marriages and baptisms by Huguenot ministers to be null and required the repetition of them by the Roman Catholic clergy. But when, upon this, many began again to flee from their country, the disgust of the Roman Catholics themselves was so much excited that the court recalled the edict (1787). Montesquieu and Voltaire successfully advocated the cause of toleration.

French Protestantism in the Nineteenth Century. The first movement towards toleration of Protestantism after the revocation of the Edict of Nantes was the edict of Louis XVI, in 1787, legalizing Protestant marriages. By the concordat concluded between Napoleon and Pope Pius VII, in 1801, Protestantism (Calvinist and Lutheran) and Judaism became, with Catholicism, established religions, with equal protection and a proportional measure of state support, but subject at the same time to the strictest governmental control. By the concordat religion became a part of government, and religious liberty was lost. No church was permitted to make converts from any other, though this law soon became a dead letter with regard to the Roman Catholic church. The Protestant General Synod was put down, particular synods could be convened only by government. Undue ecclesiastical power was given to consistories (elected presbyterial committees), tending to the disintegration of the Church and opening the way for later divisions. The parishes were few in number, most of them very extensive, and more than half of them (100 out of 171) without pastors. Under these circumstances religion became a mere form, or simply the expression of a political idea. There were no schools, religious literature, or asylums of any description. The confirmation of the young, irrespective of religious experience, was a measure of self-preservation. Brilliant exponents of Protestantism at this time were Madame de Stael and Benjamin Constant.

A revival of French Protestantism from its depleted condition after the Revolutionary period and the subsequent political turmoil, during which it suffered greatly, took place under the Scottish Haldanes (see HALDANE, JAMES ALEXANDER, and ROBERT) and the English Methodist Cook (see COOK, CHARLES) in the early twenties. To the revival the formation of the Bible Society in 1819 and the Missionary Society in 1822 contributed. During this period Samuel Vincent introduced German Protestant theology into France and created a liberal movement against the narrow orthodoxy of the revival. Aggressive propaganda being forbidden by law, there was much suffering for conscience' sake. In 1826 the Catholic Prince de Salm was exiled for having embraced Protestantism. Debarred thus from normal activity, the awakened Church turned to benevolent work, and the second third of the century saw the rise of a great number of strong

benevolent and religious societies. The Evangelical Society was founded in 1833, the Central Society in 1847, for the building of churches. Orphanages, refuges for the blind, the deaf, for neglected, criminal, and crippled children, sprang up in great profusion. Educational interests took a prominent place. In 1829 the Society for the Encouragement of Primary Instruction among Protestants was founded. In 1833 the Protestant Guizot secured the passage of the common-school law. In 1840 there were 677 Protestant schools, from primary to normal. There are two theological faculties—at Montauban and in Paris.

From this period dates also the foreign-mission work of the Protestant church, a history of almost unparalleled zeal and self-sacrifice. The Society of Evangelical Missions was founded in 1822, the first missionaries went to South Africa in 1829. The mission fields are now seven in number—in Africa, the Society Islands, and Madagascar.

Protestant journalism also dates from the revival. *Le Semeur*, founded in 1831, enjoyed the collaboration of Vinet. *Le Lien* was founded in 1840 by the elder Athanase Coquerel (qv), to counteract the growing tendency to disintegration—a vain effort, as it proved. The narrow if profound evangelicalism of the revival produced a reaction, fostered by the liberal teachings of the theological school at Strassburg, which ended in the schism of 1848 between the orthodox and liberal wings of the Reformed church, still held together by the Concordat of 1802. The question of the relations between church and state became a capital one, Vinet wrote a book advocating separation and would have headed such a movement but for the powerful opposition of Guizot. The learned of that day strongly advocated it, in 1847 Lamartine declared that separation would not be too dearly purchased by a revolution. The next year (1848) the Count de Gasparin (see GASPARI, AGÉNOR ETIENNE) and Frederic Monod headed the Free church movement. In 1840 the Union of Free Evangelical Churches of France was formed, based quite as much upon individual religious experience, in opposition to the formalism of the Reformed church, as upon the separation of church and state. This movement, never numerically important, barely reaching the number of 50 churches in all France, has yet been notable for the ability of its leaders—Pressensé, Bersier, Hollard, the Monods—and for its support to the orthodox as against the liberal wing of the Reformed church.

The year 1852 saw a new impulse in the Church. The Sunday-School Union and the French Protestant Historical Society date from this year. In 1850 the celebration of the tercentenary of the first synod of the Reformed churches showed the deep attachment of the people to the traditions of the past.

During all this time the liberal ferment was working in the Church, a spirit not so much of *unorthodoxy* as of *freedom*. The attempt of the elder Coquerel to draw the two wings together proved sadly abortive when, in 1864, after a conflict of several years, the younger Athanase Coquerel was tried for heresy, under the leadership of Guizot, for having hailed Renan's *Life of Jesus* as a sign of revived interest in religious studies, while combating his views as to the person of Christ. Coquerel defended himself nobly, but was condemned, by 12 voices

to 3, in the Consistory of Paris, and in spite of the protest of 8000 church members of that city he was deposed from the ministry, the state not interfering, as he was suffragan, not titular, pastor. He continued to preach, however, being supported by the Protestant Liberal Union (founded in 1860). Guizot's victory in this case nearly cost him his seat in the consistory. At the next election he was returned only by a majority of 8 in a vote of 2600.

In the Franco-Prussian War many Protestant pastors rendered distinguished service. At its close the Reformed church took up the question of reorganization, the Lutheran that of the inroads caused by the loss of Alsace, which robbed it of 38 consistories and 191 parishes, while the Reformed churches had lost 5 consistories and 26 parishes.

The twenty-ninth General Synod of the Reformed churches had been held in 1659. Six synods held in "the Desert" during the century of persecution had not been of national extent. The thirtieth synod was convoked by President Thiers in 1872, at the instance of Guizot. The synod memorialized President Thiers in favor of disestablishment, but in vain. A strong but vain effort was made to bring together the two wings of the Church. Since that time, no official synod of the whole Church being possible, the orthodox wing has met triennially in "official" synod, the liberal wing in fraternal assembly, both bodies electing representatives to the Permanent Committee, which alone is recognized by government.

Of late years, in view of the anti-Protestant movement of the ultramontane party in the Catholic church and of the rapid spread of atheistic Socialism, both wings of the Church have recognized the importance of union and have earnestly sought a common doctrinal basis. Failing in this effort, in 1890 delegates from both bodies met in Lyons and formed a practical union for work in the League for the Moral and Social Improvement of the Country. This League was immediately joined by the Free and Lutheran churches, and by the Methodist and Baptist missionary churches. At the officious synod at Anduze, in May, 1902, the serious effort to find a basis of doctrinal agreement again failed, but was prophetic of union in the near future. At this synod the unanimous adoption of a resolution asking for disestablishment placed the Reformed church in line with the advocates of Church disestablishment in France. In December, 1905, a law was passed which separated church and state. The Protestants look upon this as a great victory for their energetic movements for reform.

The establishment of the Third Republic had been the signal for a forward evangelistic movement, to which the founding of the Mission Populaire Evangélique in 1871 by the Rev Robert McAll, of England, contributed much (See McALL MISSION.) The Law of 1878, giving full religious liberty, opened the door to an active home-mission work, already initiated in 1872 by the Interior Mission. Social questions have largely occupied the attention of Protestants. E. de Pressensé, pastor, historian, senator, led the movement for the purification of the press, a movement which in 1902 took on new life under the energetic action of Pastor Wilfred Monod, of Rouen. Charles Robert introduced and advocated profit sharing. Jules Siegfried headed the movement for im-

proved workingmen's dwellings; Gide and Boyer that for business coöperation; Léon Say that for Sunday rest; Richard Waddington that for labor unions. Dr. Legrain has been prominent in the temperance movement; Pastor Robin in that for prison reform and "assistance by work"; Pastor Arbourg in that for benefit associations; Pastor Fallot in that for public morality. Protestant pastors have a league for the study of social questions. A large proportion of the younger pastors, led by Elie Founelle, of Roubaix, and Wilfred Monod, with many of the younger laymen, are actively promoting the movement for social Christianity, which seems better adapted than any other movement to make a stand against the rapidly growing antireligious Socialism. Among the activities of these Social Christians is the founding of "solidarities"—social settlements distinguished not only by their evangelistic character, but by the prominence given to "mutuality," to works of economic betterment, and "get-together" methods of bringing class into normal relations with class.

The career of French Protestantism has been very closely interwoven with the modern political development of the country. Though a small minority, it has always been aggressive and resolute in maintaining its position. Many distinguished men have appeared in its ranks throughout its history. In education, law, finance, and reform it has taken a prominent part. In the founding of savings banks, the abolition of the slave trade, the revival of various industries, French Protestants have ever been foremost, and to-day are a very influential element throughout France.

Bibliography. The standard history in English is the series of volumes by H. M. Baird, which are an admirable product of American scholarship: *History of the Rise of the Huguenots of France* (New York, 1879); *The Huguenots and Henry of Navarre* (ib., 1886); *The Huguenots and the Revocation of the Edict of Nantes* (ib., 1895). Consult also: Puaux, *Histoire de la réformation française* (Paris, 1859-34); Smiles, *Huguenots in England* (American ed., New York, 1868); Blackburn, *Admiral Coligny and the Rise of the Huguenots* (Philadelphia, 1869); Meaux, *Les luttes religieuses en France au XVI^{ème} siècle* (Paris, 1876); Kervyn de Lettenhove, *Les Huguenots et les Gueux, 1560-85* (Bruges, 1883-85); C. W. Baird, *History of the Huguenot Emigration to America* (New York, 1885); Willert, *Henry of Navarre and the Huguenots in France* (ib., 1893); Félice, *Les Protestants d'autrefois; Vie intérieure des églises, mœurs et usages* (4 vols., Paris, 1897-1902); Durand, *Histoire du Protestantisme français pendant la Révolution et l'Empire* (ib., 1902); Thompson, *The Wars of Religion in France* (Chicago, 1909).

HUGUENOTS, u'g'-nô', LES. An opera in five acts by Meyerbeer, with words by Scribe, first produced in Paris in 1836. It is the first of the historical, as distinguished from the purely romantic operas. The plot deals with the persecutions of the French Huguenots in the seventeenth century.

HUGUENOT SOCIETY OF AMERICA, THE. An hereditary patriotic society, organized in New York City on April 12, 1883, and incorporated on June 12, 1885. Its objects are to perpetuate the memory and to foster and promote the principles and virtues of the Hugue-

nots; to commemorate publicly at stated times the principal events in the history of the Huguenots; and to collect and preserve all existing documents, monuments, etc., relating to the genealogy or history of the Huguenots of America. Membership is extended to descendants of Huguenot families which emigrated to America or to other countries prior to the promulgation of the Edict of Toleration, Nov. 28, 1787, as well as to writers who have made the history of the Huguenots a special subject of study. The insignia of the society consist of a badge, pendent from a gold dove with spreading wings surmounted by a rising sun, and worn on a watered-silk ribbon of white, bordered with red, white, and blue. The badge itself is of gold, surrounded by a wavy, ornamental border, and bearing on the obverse the device of Marguerite de Valois, a marigold turning towards the sun, and a ribbon with the motto "Non Inferiora Secutus," while on the reverse is the name of the society as well as the name of the member and number of the badge. This society has its headquarters in New York City, where a valuable library, consisting of Huguenot books, manuscripts, etc., has been collected. There are branch societies in several States and cities, notably in Virginia, Pennsylvania, South Carolina, and New Jersey. Its publications are known as *Collections of the Huguenot Society of America*. In 1898 it celebrated the tercentenary anniversary of the promulgation of the Edict of Nantes, at which delegates from societies abroad were present. A memorial volume containing a full account of the exercises was published in 1900.

HUGUES CAPET. See HUGH CAPET.

HUIA, hoo'ya (Maori name). A remarkable bird of New Zealand (*Heteraloea acutirostris*), now considered one of the starling family and approaching extinction, because it is

HEADS OF HUIA.

a, female; b, male.

confined to the limited forests of certain mountain ranges and is constantly pursued as a cage bird or as a curiosity and also by the natives, who regard its tail feathers as the emblem of rank. It is about the size of an American thrush, and both sexes are glossy green black, excepting a white terminal band upon the tail and the large rounded wattles at the gape, which are orange red. Their ivory-white bills, however, differ to a degree unknown elsewhere among birds. That of the female is long, slender, curved, and hoopoe-like; that of the male only half as long and much straighter and shorter. Sir William Buller has described the species very fully (*Birds of New Zealand*, 2d ed., London, 1888). He says its favorite food is the grub of a large, timber-boring beetle. The male

bird, with his short stout bill, attacks the more decayed portions of the wood and chisels out his prey, while the female, with her long slender bill, probes the holes in the sounder part, the hardness of which resists the male's weapon, and elsewhere she obtains for him grubs beyond his reach. The pairs are devoted companions, and when one has been captured the other is easily taken. These birds nest in hollow trees. The huia is protected by Act of Parliament, and strong efforts are being made to save it from extinction.

HUICHOL, wé-chôl' (a corruption of the native name, signifying prophet, doctor). A wild tribe of the remote Nahuatl stock, occupying six villages in the rough mountain region of northwestern Jalisco, Mexico. Despite former missionary efforts and long-continued contact with Spanish civilization, they are said to be living in the same state of barbarism as when Cortes first put foot on the Mexican soil. Their culture is that of the well-known Pueblo type, displaying a number of ceremonial rites, especially in connection with the Peyote (qv), which they call Hikuli. They number 4000. Consult Lumboltz, *Unknown Mexico* (New York, 1902).

HUILA, wé'la. A department of Colombia, having an area of 8100 square miles. It lies between the central and eastern Cordilleras, which form its boundaries. The Magdalena River has its headwaters in the highlands of the south of the department and flows northward through its centre. The department is one of the most backward in the country, having no means of communication except a few trails and the Magdalena, which is navigable only at certain seasons. The chief industries are stock raising and agriculture. The principal products are cacao, rice, coffee, sugar cane, tobacco, and corn. Gold mining is carried on to some extent, and there are manufactures of Panama hats, cigarettes, and cotton and woolen goods. In the southern part near the village of San Agustín are found important ruins of an ancient civilization. Pop., 1912, 158,191. Capital, Neiva (qv).

HUI-SHEN, hwé'shén'. A Buddhist monk and traveler of the fifth century. See HWEI-SANG.

HUISMAN, hois'man, ROELOF. See AGRICOLA, RODOLPHUS.

HUITFELDT, hwét'fêlt, ARILD (1546-1609). A Danish historian and statesman. After studying in Germany and France he entered the diplomatic service and finally became Chancellor of the kingdom. He published a long series of volumes on the history of the Kings of Denmark to the death of Christian III. These were afterward issued under the title *Denmarks Riges Krønike* (1650-52). The work is uncritical in its judgments, but preserves many valuable documents.

HUKAU. See HOKOW.

HULAKU KHAN, hū-lā'kū kan. See MONGOL DYNASTIES.

HUL'DA, or HOLDA. In the mythology of northern and central Germany, especially of Franconia, Hessen, and Thuringia, a spiritual being, usually benign, corresponding to the Berchta of southern Germany and Switzerland and the Frigga of Scandinavian mythology. She is supposed to frequent springs and lakes. To her the souls of dying children betake themselves. She flies through the air with her attendants, bringing fortune to the good and misfortune to the evil. She sometimes has witches

among her followers. See BERCHTA, FREYJA AND FRIGGA.

HULEH, hū'lē. See MEROM, WATERS OF.

HULL. A city, the capital of Wright Co., Quebec, Canada, on the Ottawa River, opposite the Rideau Canal and the city of Ottawa, with which it is connected by two suspension bridges, and on the Canadian Pacific Railroad (Map Quebec, C 5). The city is the seat of a Roman Catholic college and possesses a fine park. It is a manufacturing city; its products include pulp, paper, matches, sulphur and sulphite, wooden ware, Portland cement, pork packing, lumber, axes, hi-cuts, tents, awnings, and electric supplies. The value of its manufactured products in 1910 was \$7,250,301, as compared with \$3,182,050 in 1900. The city was almost totally destroyed by fire in 1900, 3000 buildings in all being burned. It has been rebuilt. Pop., 1901, 13,933. 1911, 18,222.

HULL, officially KINGSTON-UPON-HULL. A seaport city and a parliamentary and county borough in the East Riding of Yorkshire, England, at the confluence of the Hull with the estuary of the Humber, about 20 miles from the North Sea and 41½ miles by rail east-southeast of York (Map England, F 3). The town stands on a level plain amid uninteresting surroundings. The modern portion has spacious, regular, and well-paved streets, while the old quarter, which serves as the business section, has narrow, crooked lanes and is very crowded, forming an irregular peninsula. Among noteworthy public buildings are Holy Trinity Church, founded 1412, a Decorated and Perpendicular building, one of the finest parish churches in England; the town hall, the new exchange, corn exchange, and market hall. There are statues of William III, erected 1734, and of Bishop Wilberforce, who was born at Hull. The chief educational establishments are the grammar school, founded in 1486, the Trinity House nautical school, 1716, Cogan's charity school for girls, 1763, the Hull and East Riding College, Hymers' College, the Royal Institution, the literary and philosophical institute, mechanics' institute, technical school, and school of art. There are numerous charitable endowments. The city owns the markets, tramways, electric lighting, and a profitable water supply from springs, and maintains parks, free libraries, public baths and washhouses, a fire brigade, a crematorium, a sanitarium, cemeteries, a refuse destructor, and a disinfectory.

Hull has an extensive coasting, fishing, and foreign trade. It has regular communication with Germany, Russia, Holland, Belgium, Scandinavia, Denmark, the United States, India, and Australia, and is the seat of a United States consul. It exports the woolen and cotton goods of the midland counties, coal, oil, machinery, and mill work, and imports cattle, grain, timber, wool, flax, hemp, tallow, pitch, etc. It has capacious docks covering about 200 acres. Since 1888 the ports of Hull and Goole have been administratively combined.

The net tonnage (excluding coasting vessels) entered in 1912 was 3,964,583, and cleared, 3,496,169. Hull is thus, in respect of tonnage, the sixth port in the United Kingdom, being exceeded by London, Liverpool, Cardiff, Newcastle, and Southampton. Imports at Hull in 1905 were valued at £32,545,886, and exports at £21,002,686; in 1912, £48,607,902 and £31,738,505, in the value of its foreign and colonial

trade it is exceeded only by London and Liverpool. Oil mills, shipbuilding yards, engineering works, iron foundries, rope and sail making, tanneries, breweries, chemical and color works, and the many industries of a large seaport, afford employment to thousands of workmen.

The city is governed by a mayor, 16 aldermen, 48 councilmen, a recorder, and a sheriff. As a parliamentary borough, it sends three members to Parliament. Consisting of Myton and Wyke, two villages, as Myton-Wyke it developed into an important port shortly after the Conquest. Struck with its advantages as a port, Edward I purchased it in 1298, renamed it Kingston-upon-Hull, and gave it the charter of a free borough. Its fisheries and trade prospered under the enterprise of its merchant princes, the De la Poles, and in 1339 it supplied Edward III with 16 ships and 466 seamen for his armament against France. In 1588 it furnished Elizabeth with £600 and 800 men against the Spanish Armada. During the Civil Wars Hull was garrisoned by the Parliamentarians, and the Governor, refusing to admit King Charles, precipitated hostilities, it successfully resisted two long sieges by the Royalists. In 1534 it was made the seat of a suffragan bishop and again in 1891. After the fifteenth century its commercial importance increased with its imports of fish from Iceland. It was one of the first ports to engage in, and until late in the nineteenth century was the headquarters of, the whale fishery. Pop., 1801, 29,500, 1851, 84,700, 1891, 200,473, 1901, 240,259; 1911, 278,024, in population the city is thus the fourteenth in the United Kingdom. Area, 904.2 acres. Consult Symons, *Hulliana, or Selections from Local History* (Hull, 1872), and Freeman, *English Towns* (London, 1883).

HULL, CHARLES HENRY (1864-). An American educator, born at Ithaca, N. Y. He graduated at Cornell University in 1886, until 1890 was in the Cornell Library, and studied at the universities of Göttingen, Halle, and Berlin. He returned to Cornell to be assistant professor of political economy (1893-1901), professor of American history (after 1901), and dean of the College of Arts and Sciences (1908-13). He edited *The Economic Writings of Sir William Petty*, which was brought out by the Cambridge University Press, England.

HULL, CORDELL (1871-). An American legislator, born in Overton (now Pickett) Co., Tenn. He studied at the National Normal University at Lebanon, Ohio, in 1889-90, and he graduated from the Lebanon (Tenn.) Law School in 1891. He was admitted to the bar in 1891, was a member of the Tennessee House of Representatives in 1893-97, served as captain in the Fourth Tennessee Infantry during the Spanish-American War, and was judge of the Fifth Judicial Circuit of Tennessee in 1903-07. After 1907 he was Representative in Congress of the Fourth Tennessee District. A Democrat in politics, Hull was especially active in the legislation making effective the income tax.

HULL, EDWARD (1829-). A British geologist and physiographer, born in Antrim, Ireland, and educated at Trinity College, Dublin. He was appointed to the Geological Survey of the United Kingdom in 1850 and in 1869 became professor of geology in the Royal College of Science. In 1883-84 he led a scientific expedition to Palestine for the Palestine Exploration Fund, gathering material which he used

in his *Mount Seir, Sinai, and Western Palestine* (1905) and in *Physical Geology of Arabia Petrea and Palestine* (1886). Among his published works are *Building and Ornamental Stones* (1872), *The Coal Fields of Great Britain* (5th ed., 1903), *Physiology* (1888), *Physical Geology and Geography of Ireland* (2d ed., 1891), *Volcanoes, Past and Present* (1892), *Our Coal Resources* (1897), *Sub-Oceanic Physiography of the North Atlantic Ocean* (1912). Consult his *Reminiscences of a Strenuous Life* (London, 1910).

HULL, ISAAC (1775-1843). An American naval officer. He was born at Derby, Conn., became a cabin boy on a merchant vessel at the age of 14, soon showed great aptitude for the handling of a ship, and before he was 21 was placed in command of a merchantman. In 1798 he entered the United States navy as lieutenant, serving for several years on the *Constitution* and becoming first lieutenant in 1801, and, after distinguishing himself against the French at Port Plate, Haiti, participated, as commander of the *Argus*, in the war with Tripoli. He became captain in 1806 and at the opening of the War of 1812 was in command of the *Constitution*. While on his way from Annapolis to New York in July, 1812, he escaped by masterly seamanship from a British squadron of five strong men-of-war, which pursued him for three days. On August 19 he fought his celebrated engagement with the *Guerriere*, a slightly weaker British frigate, which after a brief conflict was forced to surrender. (See CONSTITUTION, THE.) The victory was the first obtained by the Americans over the British in this war and aroused the greatest enthusiasm throughout the United States. Subsequently he was a member of the Naval Board, was at the head of the Boston and New York navy yards, and, as commodore, was in command for a time of squadrons in the Pacific and the Mediterranean. He is regarded by naval critics as the ablest single-ship commander on either side during the War of 1812. Consult Barnes, *Naval Actions of the War of 1812* (New York, 1896). For a spirited account of the fight between the *Constitution* and the *Guerriere*, consult C. F. Adams, *American Historical Review* (ib., 1913).

HULL, WILLIAM (1753-1825). An American soldier. He was born in Derby, Conn., graduated at Yale in 1772, studied law at Litchfield, Conn., and was admitted to the bar in 1775. In July, 1775, soon after the outbreak of the Revolutionary War, he entered the American army as a captain and served thereafter until the close of the war, taking part in the battles of Trenton, Princeton, Saratoga, and Monmouth, leading a column in the assault on Stony Point, and rising (August, 1779) to the rank of lieutenant colonel. After the war he removed to Newton, Mass., became major general of Massachusetts militia, and was elected to the State Senate. In 1805 he was appointed by President Jefferson to the governorship of the Territory of Michigan, which position he held until 1812, when he was raised to the rank of brigadier general and placed in command of the Northwestern Army. He joined his troops at Dayton on May 25 and led them through the wilderness to Detroit, where he arrived on July 5, having heard three days before of the declaration of war against England. On the 12th he took the offensive and crossed over to Sandwich, Canada, but wasted time in issuing futile proclamations

and, soon becoming alarmed, recrossed to Detroit. On Aug. 16, 1812, intimidated by the aggressive movements of the British General Brock, he surrendered without making any real attempt at resistance. A general outcry was raised against Hull, and finally, on March 26, 1814, a court-martial, assembled at Albany, N. Y., sentenced him to be shot. This sentence was approved by President Madison, who, however, remitted the punishment. There has since been much controversy over Hull's case, but it is now pretty generally agreed by historians that, though he surrendered with unsoldierly alacrity and might possibly have preserved Detroit and his army altogether, the blame for his surrender must rest fully as much with the administration as with himself. Consult Hull, *Defense of Brigadier-General Hull, with an Address to the People of the United States* (Boston, 1814), Forbes, *Report of the Trial of Brigadier-General Hull* (New York, 1814), Maria Campbell, *Revolutionary Services and Civil Life of Gen. William Hull, together with the History of the Campaign of 1812*, by James Freeman Clarke (ib., 1848).

HULLAH, JOHN PYKE (1812-84). An English musical composer, teacher, conductor, and lecturer. He studied the organ and piano under W. Horsley, and singing under Crivelli at the Royal Academy of Music. He was one of the most important factors in modern English musical life and accomplished more for the cause of music among the masses than any other English musician of the century. In 1840, while pursuing his studies in Paris, he was much impressed with the French system of tuition and upon his return to London in 1841 prevailed upon the National Education Committee to permit him to use a modification of it in his singing school for schoolmasters, which he inaugurated at Exeter Hall. His ideas and reforms met with determined opposition from the very beginning, but notwithstanding it is recorded that in the 20 years from 1840 to 1860 over 25,000 people availed themselves of the advantage of his classes. In 1847 his pupils and friends built and presented to him a building known as St. Martin's Hall, in which his pupils could give their public performances. He held appointments as professor of singing at King's, Queen's, and Bedford colleges, London, and succeeded Horsley, in 1858, as organist of Charter House. From 1870 to 1873 he led the Royal Academy concerts and for several years conducted the annual concert of the metropolitan school children, held at the Crystal Palace. In 1872 he was appointed government inspector of training schools. Besides three operas, which have but a local significance, he was the composer of many successful and widely known part songs, motets, anthems, and songs. His published writings cover every phase of musical art and aesthetics and include *A Grammar of Vocal Music* (1843), *A Grammar of Musical Harmony* (1852), *A Grammar of Counterpoint* (1864), *The History of Modern Music* (1862), *The Third or Transition Period of Musical History* (1865), *The Cultivation of the Speaking Voice* (1870), *Music in the House* (1877). He received the degree of LL.D. from Edinburgh University, was elected member of the Cecilia Society of Rome and member of the Academy of Music in Florence. He died in London.

HULL HOUSE. One of the most famous of

American social settlements, situated on South Halstead Street, Chicago. It takes its name from its original building, erected in 1852 by Charles J. Hull. In 1889 Miss Jane Addams (qv) and Miss Ellen Starr secured a lease of a part of the building, with the purpose of founding a social settlement after the pattern of Toynbee Hall (qv). Shortly afterward the owner of the building, Miss Helen Culver, gave a free leasehold on the entire building, which was remodeled and opened as a social settlement late in 1889. The earliest activities of Hull House were purely social. Readings were given before groups of young women from the neighborhood, an early volunteer conducted a kindergarten, the aged residents of the neighborhood were gathered together for New Year's festivities. Gradually the activities of the settlement were extended to the economic life of the district. Attempts were made to introduce cooperative buying and to give instruction in the economical use of foods, etc. After the Pullman strike, when class lines were sharply drawn in Chicago, Hull House came to be identified with the labor movement. Active discussion of economic questions was carried on at Hull House by a "working people's social science club," organized in 1890. In the movement for factory laws and regulation of the labor of children and women Hull House played a conspicuous part. One of its early residents, Mrs. Florence Kelley (qv), conducted an investigation of the sweating system for the State Bureau of Labor—an investigation that was in large measure responsible for the enactment of the first factory law of Illinois. The trade-unions of the women shirt makers and the women cloak makers were organized at Hull House and for a time held their meetings in its parlors. Residents of Hull House investigated the padrone system and conducted an active campaign for the creation of State employment bureaus. Thoroughgoing investigations by Hull House of the sanitary conditions in the immediate vicinity led to improvements in the enforcement of the laws and eventually to active participation by Hull House in the struggle for the purification of city politics. The settlement has taken active part in the movement for the more humane treatment of the juvenile delinquent, for the suppression of the truancy evil, and, in fact, in all movements for civic and social reform. No other agency has been more successful in meeting sympathetically the problems of the shifting body of immigrants making up the population of the ward in which the settlement is situated.

The organization of Hull House is extremely simple. The residents are volunteers, each free to pursue such work as may seem to him most fruitful. Throughout its history, however, the institution has been dominated by the personality of Miss Addams, and its work in its broad outlines has taken its direction from her. Investigation of actual conditions, when possible in conjunction with other similar organizations or with the public authorities, is a characteristic feature of the work. The ultimate object of much of this work is the arousing of the public to the necessity of State action in behalf of the city population. Consult Jane Addams, *Twenty Years at Hull House* (New York, 1910). See **SOCIAL SETTLEMENTS**.

HULLIN, u'lan', PIERRE AUGUSTIN, COUNT (1758-1841). A French general of the First

Empire, born in Geneva. He came to Paris (1787) as a watchmaker and was one of the leaders in the attack on the Bastille. He took part in all the great events of the early Revolution, but was too moderate for some of his fellows and was imprisoned during the Terror. On his release he entered the Italian army and in 1796 became Bonaparte's adjutant general and in 1802 a division general. He was appointed president of the military court which sentenced the Duke d'Enghien (1804), and he wrote, in the attempt to shift the blame on Talleyrand, *Explications offertes aux hommes impartiaux*, etc. (1824). He was made Count in 1809 and was one of Napoleon's most trusted servants. In 1812 he was Governor of Paris. When the Emperor was sent to Elba, Hullin tried to ingratiate himself with the new regime, but failed. In 1815, during the Hundred Days, he was again Governor of Paris, but afterward was banished to Brussels and lived for a time at Hamburg. He was pardoned in 1819 and returned to France.

HULLMANN, hul'man, KARL DIETRICH (1765-1846). A German historian, born at Eideborn and educated at Halle. He became in 1797 professor of history at Frankfurt-on-the-Oder and in 1808 at Königsberg. Ten years afterward he was made the first rector of Bonn and began his important service to that university. His principal works are *Deutsche Finanzgeschichte des Mittelalters* (1805), *Geschichte des Ursprungs der Regalien in Deutschland* (1806), *Geschichte des Ursprungs der Stände in Deutschland* (2d ed. 1830), *Geschichte des byzantinischen Handels* (1808), *Staatsrecht des Altertums* (1820), *Das Stadtrecht des Mittelalters* (4 vols. 1825-29), his most valuable work, *Römische Grundverfassung* (1832); *Staatsverfassung der Israeliten* (1834), *Handelsgeschichte der Griechen* (1839), *Griechische Denkmäler* (1840), *Geschichte des Ursprungs der deutschen Fürstentümer* (1842). Consult Delbriick, in *Allgemeine Zeitschrift für Geschichte*, vol. vi, pp. 1-14 (Berlin, 1846).

HULLSHOFF, BARONESS VON DROSTE. See DROSTE-HULLSHOFF.

HULSEAN LECTURES. A course of lectures given annually at Cambridge, founded by the Rev. John Hulse (1708-1790), of Elworth, in the County of Chester. He was educated at St. John's College, Cambridge, and at his death, Dec. 14, 1790, bequeathed the bulk of his property to his university. His will provided for the founding of two divinity scholarships in St. John's College, the Hulsean prize, the office of Christian advocate, and that of Hulsean lecturer or Christian preacher. By a statute confirmed by the Queen in council in 1860, the office of Christian advocate was changed into the Hulsean professorship of divinity. The office of Hulsean lecturer, or preacher, is an annual one; and the duty of the lecturer is to preach not fewer than four nor more than six sermons before the university in the course of the year. The first series was delivered by Rev. Christopher Benson. The list of Hulsean lectures, from their beginning in 1820 down to 1893, is given in Hurst, *Literature of Theology*, pp. 32-34, and to 1894 in Hunt, *Religious Thought in the Nineteenth Century*. The list from 1893-94 to 1908-09 inclusive is given in the *New Schaff-Herzog Encyclopedia of Religious Knowledge*, vol. v, p. 401 (New York, 1909). The name of

the year's lecturer may be found in *Whitaker's Almanack* (London, annually), and the complete list of lecturers from 1820 is given every year in the *Cambridge University Calendar* (Cambridge, annually).

HULTSCH, hulch, FRIEDRICH (1833-1906). A German philologist, born in Dresden. He was educated at Leipzig, where he taught in the Nikolaischule. After several years at Zwickau he became professor in the Kieuzschule of Dresden, of which he was rector from 1868 to his retirement, in 1889. Hultsch's special study was ancient mathematics. He edited the *Scriptores Metrolologici* (1864-66), *Heronis Geometrika et Stereometrika* (1864), *Polybi Historiæ* (1867-72), *Pappus* (1876-78), for a large part of the text an editio princeps, and *Autolyi de Sphæra quæ Movetur Liber* (1885). He wrote the very valuable *Griechische und römische Metrologie* (1862, 2d ed. 1882), *Die Elemente der ägyptischen Teilungsrechnung* (1895), *Die Gewichte des Altertums* (1898), *Die ptolemäischen Münz- und Rechnungsweiser* (1903).

HULTZSCH, hulch, EUGEN (1857-) A German Sanskritist. He was born in Dresden and was educated at Leipzig and Bonn. In 1882-86 he was lecturer at Vienna and then was government epigraphist of Madras until 1903, when he succeeded Pischel as professor of Sanskrit at the University of Halle. He edited *South Indian Inscriptions* (1890-1903), *Reports on Sanskrit Manuscripts in Southern India* (1895-1905), and *Epigraphia Indica* (1894-1906), and published several texts, including the *Bauddhayanadharmasūtra* (1884), *Annam-bhatta's Tarkasamgraha* (1907), *Simharaja's Prakritarupaiatara* (1909), and *Kalidasa's Megadūta* (1911).

HUMACAO, ō-ma-ka'ō. A city of Porto Rico, the capital of the department of the same name, situated on Humacao River, about 6 miles from the coast (Map Porto Rico, F 3). It lies in a beautiful valley, surrounded by mountains, and enjoys cool sea breezes, which give it an agreeable climate. It has a number of schools and a municipal library. Sugar cane and tobacco are produced in the surrounding lowlands, and coffee is grown on the slopes of the mountains. It was founded in 1793 and raised to the rank of a city in 1894. Population of the municipality in 1910, 26,678, urban population, 6541.

HUMAITÁ, ō-ma'ê-ta'. A town and fort of Paraguay, situated at the southwest end of the country, on the river Paraguay, near its confluence with the Paraná. During the Paraguayan War (1865-70) it was besieged for over a year by the forces of Argentina and Brazil and finally surrendered in 1868. The fortifications were razed at the end of the war. The surrounding region yields rich crops of cotton, tobacco, coffee, and sugar. Pop., about 4000.

HUMANE ASSOCIATION, AMERICAN. A federation of societies of the United States for the prevention of cruelty to animals and children, formed at Cleveland, Ohio, in 1877, at a meeting held to consider the maltreatment of animals in transit between the East and West. It became a national organization, whose purpose was at first to deal with interstate traffic. It sent representatives to influence legislation at Washington, and its agents investigated the abuses which prevailed on lines of railways transporting cattle. It offered a prize of \$5000

for the best model of a cattle car that would make possible the feeding, watering, and resting of cattle in transit, as the result of which many improved cars were brought into use. In 1884 it won a suit in Massachusetts against two leading railroads for violation of the law, thus establishing an important precedent. For many years its purpose has been that of a federation of all local humane societies. It carries on considerable work of an educational nature. It has instituted inquiries in the United States and abroad on the subject of vivisection in the schools and colleges. Prizes were offered, in 1900, to college and medical students, for essays on vivisection, its abuses and their remedy. In 1913, 310 societies having for their object the prevention of cruelty to animals or to children, or both, were represented in the association. The membership of these societies aggregated 141,000. The association has published, since 1913, the *National Humane Review*. See CRUELTY TO CHILDREN, CRUELTY TO ANIMALS, PREVENTION OF.

HUMANE SOCIETY, ROYAL. An organization for the recovery of persons apparently drowned, founded in England in 1774. It maintains receiving houses in appropriate places along the Thames and near canal banks and in various parts of London. The chief station is on the Serpentine, in Hyde Park, on ground given by George III, and was erected in 1794. The seal of the society bears the unique motto, *Lateat Scintilla Forsan* (A small spark may perhaps lie hid).

HUMANISM (from *human*, OF, Fr *humain*, from Lat *humanus*, relating to man, from *homo*, OLat *homo*, man, connected with AS *guma*, man, Gk *χῆμα*, *chthōn*, Skt *ksam*, earth). A name applied to the literary movement at the close of the Middle Ages whose object was the revival of the pagan learning of classical antiquity. The humanists from the beginning divided into two divergent schools, one of which sought to ingraft the classical learning on the tree of Christianity, while the other endeavored to revive not merely the literature of classical antiquity, but, through this, the pagan spirit of the ancient heathen cults. The first humanistic movement began in the fourteenth century in Italy where the political and social developments were preparing the way for a departure from mediæval traditions. The numerous small Italian states, despotic and republican alike, favored the development of individuality at a time when feudalism (qv), still in existence in other parts of Europe, gave less opportunity for the exercise of individual activities. The ferment of Italian politics gave the individual freer play, and the sense of personal independence was rapidly tending to looser social and political ideals. Paganism in Italy, though overpowered, had never been completely exterminated. It had lived on in popular legend and retrospective pride of race, and in countless associations connected with the Roman Forum, the Coliseum, and other historic monuments. But these survivals from ancient Rome were an insignificant moment in mediæval Italian culture, the pagan past did not seriously influence men's minds till new social and political conditions had prepared the way for the revival of classical ideals. (See RENAISSANCE.) The exile of the papal see from Rome for nearly three-quarters of a century (see AVIGNON) must also have acted as a removal of the great check

against the recrudescence of paganism. In the fourteenth century all Italy was astir with the new life. Dante, as is shown in his homage to Virgil, felt the new impulse. Petrarch, who may be regarded as the first Christian humanist, threw himself into the van of the new movement. His passion for antiquity and his intolerance of certain forms of mediævalism were boundless. He devoted great energy to the discovery and rescue of Latin manuscripts, to the collection of old Roman coins and other antiquities, and to scathing denunciation of scholastic philosophy, jurisprudence, and medicine. But while the mediævalist had looked forward to an immortality beyond the grave, the pagan humanist would be satisfied with nothing less than an earthly immortality, achieved by poetry like Virgil's and prose like Cicero's. And as the literary style of the Augustan age (qv) became the sole model for the writer, so the spirit of antiquity, with its sensuous attitude towards life and nature, its unqualified secularity, its abandonment to the charm of things seen and temporal, controlled the humanists' thought and conduct.

Consult Jakob Burckhardt, *Die Cultur der Renaissance in Italien* (Basel, 1860, 3d ed, 1877-78, Eng trans by Middlemore, London, 1878 and 1891), Georg Voigt, *Die Wiederbelebung des klassischen Altertums oder das erste Jahrhundert des Humanismus* (Berlin, 1859, 2d ed, 1880-81), L. Pastor, *History of the Popes* (2 vols, London, 1891), Symonds's (qv) works on the Renaissance, epitomized by Alfred Pearson in *A Short History of the Renaissance in Italy* (New York, 1893), John Owen, *Skeptics of the Italian Renaissance* (ib, 1893), F. A. Gasquet, *Eve of the Reformation* (London, 1898), R. C. Jebb, *Humanism in Education*, Romanes Lecture (New York, 1899), Lewis Einstein, *The Italian Renaissance in England* (ib, 1902), Ernst Borkowsky, *Aus der Zeit des Humanismus* (Jena, 1905).

A second humanistic movement—more properly called humanitarianism—came to its culmination in Comte's (qv) worship of humanity. It finds in man the highest and worthiest object of esteem and reverence and is hostile to any theory which places the divine outside of the human. It is differentiated from the pagan Renaissance attitude most markedly by its placing the golden age of man's development not in the past but in the future.

Still another humanistic movement is afoot in philosophical circles at the present day. This humanism is connected with pragmatism (qv) and is the theory that the working hypothesis of metaphysics should be the view that all nature is akin to man. Mechanism and the current presuppositions of natural science are discarded, and in their place a universal animism is assumed. F. C. S. Schiller (qv) goes so far as to attribute moral qualities to inanimate objects and accounts for the regularity of natural law by the analogy of statistical averages in human society and also by assimilating laws of nature to human habits. Consult F. C. S. Schiller, *Humanism* (New York, 1903), id, *Studies in Humanism* (ib, 1907), William James, *Pragmatism* (ib, 1907), J. S. MacKenzie, *Lectures on Humanism* (ib, 1907).

HUMANITARIANS (from Lat *humanitas*, humanity, from *humanus*, human). 1 The name assigned to the several classes of anti-Trinitarians, who regard Christ as a mere man

and refuse to ascribe to Him a supernatural origin or nature. Theodotus of Byzantium, called the Tannei, a Monarchian (qv), is said to have been excluded from the Church by Victor, Roman pontiff (189-198), because, having denied Christ in time of persecution, he afterward defended himself by declaring that in so doing 'he had denied not God, but man.' A contemporary and probably an associate of Theodotus, Artemas, taught in like manner that Christ was a mere man. Theodotus and Artemas probably represent a school or sect at Rome and were the first to formulate the doctrine, so far as known (See CHRISTOLOGY, SOGINUS, UNITARIANISM). 2 The name "humanitarian" is also sometimes applied to the disciples of Saint-Simon (qv) and in general to those who look to the perfectibility of human nature as their great moral and social dogma and ignore dependence upon supernatural aid, believing that man can attain his highest development by his own power.

HUMANITIES. A term now employed primarily to designate the study of the classical literatures of Greece and Rome, and the various sciences which deal with them, such as grammar, classical philology, etc., but sometimes secondarily it includes all "culture studies" in contrast to professional studies. Cicero, Aulus Gellius, and other Latin writers used *humanitas* in the sense of culture becoming to a man and gained by the study of the great masterpieces, mostly of Greek literature, but not exclusive of Roman. The scholastics adopted the term especially in the form of *literæ humaniores* (the more humane letters), but gave it a different emphasis by placing it in contrast and in subordination to *divinitas* (divinity or theology). This contrast gave to humanity an enlarged meaning, including all forms of secular learning. The humanistic movement (see HUMANISM) restored the word to its Ciceronian significance. But when the narrowness of humanism in regarding the study of the ancient classics as the means par excellence of gaining humane culture came to be appreciated, and when other sciences of liberal character arose, the term "humanities" began gradually to take on a larger meaning, and it is now used by some authorities to include all philological study, together with history, philosophy, political science, economics, and all other sciences which concern themselves with human civilization. In the Scottish universities, however, the singular, "humanity," is used to designate the study of the Latin language and literature. Consult Irving Babbitt, *Literature and the American College* (Boston, 1908).

HUMANN, hoo'man, KARL (1839-96). A German engineer and archaeologist, born at Steele. In 1861 he gave up his studies, as he was ordered south because of his health. In Samos he made successful excavations of the famous temple of Hera. In 1862 he built for Sir Henry Bulwer, English Ambassador at Constantinople, an island palace, two years later was employed by the Turkish government to survey Palestine for a projected railroad from Jaffa to the Dead Sea by way of Jerusalem, of which only the part from the coast to Jerusalem was completed, and, after a trip to Egypt, mapped out the Eastern Balkans, after surveys ordered by Fuad Pasha. But besides the name he made for himself by these maps and by engineering in northern Asia, he got

fame for his excavations at Pergamon (qv) (1873-86), was made honorary doctor by the University of Giefswald, director of the Museum of Berlin, and Privy Councilor (1894). His later excavations were at Zenjuli in northern Syria, at Tralles, and Magnesia. With Conze, Bohn, and others, he published *Die Ergebnisse der Ausgrabungen zu Pergamon* (1880-88) and, with Puchstein, *Reisen in Kleinasien und Nordsyrien* (1890, with maps).

HUMAYUN, hoo'ma-yoon' (1508-56). A Great Mogul of India, son of Baber and father of Akbar. He came to the throne in 1530, but after 10 years of warfare was defeated by the Afghan Sher Shah and driven from India. He took refuge at the court of Persia and with a Persian army returned and recovered control of Delhi and Agra in 1555. He died at Delhi, where a great mausoleum was built for him.

HUMBER. The continuation and estuary of the rivers Ouse and Tient, between the English counties of York and Lincoln (Map England, F 3). It is 38 miles long and from 1 to 7 miles broad with Hull on its north shore and Great Grimsby on the south. Many shoals occur, and the sailing routes have been very carefully buoyed. Canals connect it with south Yorkshire and Trent. It was the entrance for the Norse invasions of the ninth and tenth centuries.

HUMBERT I (It. UMBERTO, oom-bèr'tò) (1844-1900). King of Italy from 1878 to 1900. He was the eldest son of Victor Emmanuel II and Adelaide, Archduchess of Austria, and was born at Turin, March 14, 1844. At an early age he obtained an insight into political and military life under the guidance of his father during the War of 1859. He held the rank of captain, although he was then too young to take an active part in the struggle. He was more closely connected with the process of the unification of Italy which followed. In July, 1862, he visited Naples and Palermo, where he shared the popularity of Garibaldi. When the war between Prussia and Austria was imminent, Humbert was dispatched to Paris to ascertain the sentiments of the French government in reference to the alliance between Italy and Prussia. On the outbreak of hostilities he hastened to take the field, obtained the command of a division of General Cialdini's army with the rank of lieutenant general, and took a gallant part in the battle of Custoza, June 24, 1866, covering the retreat of the Italians by brave and skillful tactics. In 1868 he married his cousin, the Princess Marguerite of Savoy. He succeeded to the throne on the death of his father, Jan 9, 1878. He showed great bravery and contributed generously towards the relief of suffering during the cholera epidemic in 1884 and gained in popular esteem by his visit to Naples at that time. In 1887 the foreign policy of the government resulted in the Triple Alliance between Italy, Austria-Hungary, and Germany, which was so helpful to Irredentism (qv). The colonial policy of the country was not so successful, however, as the Italian troops met with great reverses in Abyssinia in 1887 and again in 1895-96. In 1898 a commercial treaty was concluded with France, but throughout Humbert's reign the country suffered under financial depression and heavy taxation. Towards the end of his reign King Humbert lost some of his former popularity. An anarchist attempted to assassinate him before the gates

of Rome in 1897, but failed. Three years later, however (July 29, 1900), Humbert was shot at and mortally wounded by another Italian anarchist, Bresci, who had come from the United States intent on this act. The King died almost immediately. Humbert was succeeded by his only son, Victor Emmanuel III. His character is summed up in his popular title "Humbert the Good." Consult Fedele Lampertico, "Discurso in Memoria di S. M. Umberto I^o, Re d' Italia," in R. Istituto Veneto, *Atti*, vol. IX, part 1 (Venice, 1900-01), and Pietro Vigo, *Annali d' Italia Storia degli ultimi trent' anni del secolo 19* (5 vols., Milan, 1908-11). See ITALY.

HUMBERT, ün'ber', GUSTAVE AMÉDÉE (1822-94). A French jurist and politician, born at Metz. He studied law in Paris and gave private lessons both before and after he was underprefect of Diedenhofen (1848-51), was professor of Roman law at Toulouse and in 1871 was elected to the Chamber of Deputies. Humbert took a prominent part in debates on legal questions, became a leader of the Republican Left in 1875, was made a life senator, and in Freycinet's cabinet (1882) was Minister of Justice. In 1890 Humbert left his post as Vice President of the Senate and became president of the chief court of accounts. He wrote *Essai sur les finances et la compatibilité publique chez les Romains* (2 vols., 1857) and *Organisation de l'empire romain* (1892). His connection with the great Humbert swindle, carried through by his son, Frédéric, and his daughter-in-law, Frédéric's wife, is problematic.

HUMBERT, JACQUES FERDINAND (1842-) A French painter, born in Paris. He studied at the Beaux-Arts and with Picot, Cabanel, and Eugène Fromentin. His first appearance in the Salon was in 1865, with "The Flight of Nero." He was made an Officer of the Legion of Honor in 1885, a professor at the Beaux-Arts, and is regarded as one of the most authoritative exponents of modern classic style. Among his paintings are "The Christ," at Orléans, "Pro Patria," a decoration for the Panthéon, "John the Baptist," at Havre, "The Virgin with Jesus and John the Baptist," in the Luxembourg.

HUMBLEBEE. See BUMBLEBEE.

HUMBLEDON HILL. See HOMILDON.

HUMBOLDT, hūm'bōlt. A city in Allen Co., Kans., 60 miles southeast of Emporia, on the Neosho River, and the Missouri, Kansas, and Texas and the Atchison, Topeka, and Santa Fe railroads (Map Kansas, G 7). It is in a natural-gas and oil region, has farming interests and oil refineries, and manufactures flour, Portland cement, bricks, tile. The water works are owned by the city. Pop., 1900, 1402, 1910, 2548.

HUMBOLDT. A city in Gibson Co., Tenn., 85 miles east of Memphis, on the Forked Deer River, and on the Mobile and Ohio and the Louisville and Nashville railroads (Map Tennessee, B 3). It is in a rich cotton and fruit growing region, the products of which are shipped in large quantities. The industrial establishments include marble and granite works, cotton mills, a large fruit-packing plant, flouring mill and elevator, brickyards, canning factory, cotton gins, etc. Humboldt owns its water works and electric-light plant. Pop., 1900, 2866, 1910, 3446.

HUMBOLDT, hūm'bōlt, *Ger. pron. hūm'bōlt*, ALEXANDER, BARON VON (1769-1859). A Ger-

man naturalist and traveler. He was born in Berlin, Sept. 14, 1769. His father, who died in 1779, was a chamberlain to the King of Prussia, his mother was of Burgundian descent, and his youthful life was spent in the old castle of Tegel, near Potsdam. He studied, in company with his brother Karl Wilhelm (qv), first under private tutors, then at the universities of Frankfurt-on-the-Oder, Berlin, and Göttingen. His preference for scientific studies was strongly manifested in his early years and highly developed by the influence of Blumenbach and other university instructors. During his residence at Göttingen (1788 and 1789) he made geological examinations in the Harz Mountains and Rhine valley, which resulted in his first important publication, *Ueber die Basalte am Rhein, nebst Untersuchungen über Syenit und Basanit der Alten* (1790). In 1790 Humboldt made a tour through France, the Netherlands, and England, in company with Georg Forster, already eminent as a scientific traveler, whose influence was strong in shaping the younger man's career, and in 1791 he entered the Academy of Mining at Freiberg, Saxony, where Werner was then professor of geology. His eight months' residence at Freiberg gave him materials for several technical papers in chemistry and physics, and for some more elaborate essays, especially those upon the cryptogamous plants of the mines (*Flora subterranea Freibergensis*, etc.). In consequence he was soon (1792) appointed superintendent of mines in the principalities of Bayreuth and Ansbach and resided for the next three years at Bayreuth. The breadth of his interest and researches at this period is exemplified by his work and speculations on the nature of muscular and nervous force, entitled *Versuche über die gereizte Muskel- und Nervenfasern, nebst Vermutungen über den chemischen Prozess des Lebens in der Tier- und Pflanzenwelt* (1797).

The desire for larger freedom and especially for exploratory travel led Humboldt to resign his office in 1797. He had already in 1795 wandered about the Alps, studying geology, but further intended journeys to Sicily and up the Nile were prevented by political obstacles. The next three months were spent at Jena, in intimate association with Goethe, Schiller, and the men at the university, who then made an extraordinary circle of intellects, and here he began to plan for the great journey to Spanish America with which his fame is now most closely associated. In Paris he made the acquaintance of a talented young French botanist, Aimé Bonpland, who joined in his plans and was destined to be his principal collaborer. Meanwhile Humboldt was incessantly at work, and the years 1797-99 witnessed the publication of many notable contributions to science, among which those pertaining to the composition of the atmosphere were particularly notable. Many of these were brought together in his book *Versuche über die chemische Zerlegung des Luftkreises* (1799). At length, after spending some time in Spain and getting letters from the government, Humboldt and Bonpland sailed in a Spanish frigate from Coruña, in June, 1799. They visited Teneriffe, ascended the peak, and made valuable observations there as well as at sea during the voyage, which terminated at Cumana in Venezuela.

The travelers explored the region for upward of a year, crossing over to the upper waters of the Orinoco, and establishing the connection between that stream and the upper Amazon. The

year 1801 was spent in explorations in Cuba, the basin of the Magdalena River, and in the Andes of Quito, the famous ascent of Chimborazo, to an altitude of about 19,000 feet, being accomplished in June, 1802. The explorations were then extended to Peru, where Humboldt devoted himself largely to the electrical and astronomical studies favored by the climate, but also acquired a valuable knowledge of the cinchona (quinine) plant and its culture. From Peru the two savants took ship for Mexico, landing at Acaapulco in February, 1803. There they traveled for a year, Humboldt paying special attention to the determination of positions on the map and to volcanic phenomena, and then returned to Europe by way of Cuba and the United States (where several weeks were spent), reaching Bordeaux in August, 1804.

Humboldt now went to Paris and occupied himself with Bonpland in the arrangement of their manuscripts and collections, a large part of which, however, had been lost by a shipwreck, at the same time he pursued continuous experiments in physical chemistry. Having visited his brother, then Prussian Ambassador at Rome, and returned to Berlin, he accompanied Prince Wilhelm of Prussia, in 1807, on a political mission to France, and obtained leave from the government of his own country to remain thenceforth in Paris for the publication of the account of his travels. He enlisted the cooperation of Gay-Lussac, Cuvier, and many others of the most eminent French specialists of the day in the elaboration of his materials, and began in 1807 to publish the results in magnificent volumes (20 in folio and 10 in quarto, illustrated by 1425 copperplates). The title was *Voyage aux régions équinoxiales du Nouveau Continent fait en 1799-1804 par Alexandre de Humboldt et Aimé Bonpland*. The first 14 volumes were devoted to botany and were actually prepared mainly by C. S. Kunth, vols xv and xvi were an "atlas pittoresque", vols xvii, xviii, xix, xxi, and xxii were devoted to physical geography, geognosy, and astronomy, vol xx contained a "geography of plants", vols xxiii and xxiv were zoological, vols xxv and xxvi were devoted to a sociological account of the countries of Spanish America, and vols xxviii, xxix, and xxx contained Humboldt's narrative of his journey, which was left unfinished. The original of this work contains the *Essai politique sur le royaume de la Nouvelle Espagne*, the *Essai politique sur l'île de Cuba*, and the *Vues des Cordillères*. Among the minor works of the great master, the *Ansichten der Natur* (1st ed., 1808) had an immediate and widespread welcome. It was translated into almost every European language and issued in English in both London and Philadelphia. The publication of the great *Voyage* continued at irregular intervals until 1827, and the volumes or groups of volumes appeared under individual titles, by which they are more usually known. The bibliography of Bruhns's biography of Humboldt disentangles the confusion of titles and editions which resulted, and to that the curious reader is referred. After Humboldt's death an octavo edition of his principal works was published in Paris (1864-66).

The favor of Frederick William III of Prussia, who had settled upon Humboldt a pension of 2500 thalers and later of 5000, required him to make frequent journeys with that monarch and at last he was summoned to reside at the court. In 1827, then, he took up his permanent resi-

dence in Berlin, and with much discontent endeavored to carry on his investigations amid uncongenial surroundings. One of the best results of his work at this period was his success in establishing for the first time international cooperation in furtherance of scientific observations. In 1827-28 he gave a series of remarkable lectures on physiography at Berlin, which formed the basis of his subsequent *Kosmos*. In 1829, under the patronage of the Russian government and accompanied by Ehrenberg and Gustav Rose, he made a rapid journey as far east as the Yenisei, one of the most striking results of which was the discovery of diamonds and other precious stones in the Ural Mountains, as Humboldt had predicted would be the case from his knowledge of their geology. Many geographical positions were astronomically determined, and erroneous views as to the physical geography of the northern interior of Russia were corrected. The record of this journey was first written by Humboldt as *Éragments de géologie et de climatologie asiatique* (1831) and afterward enlarged into *Asie centrale, recherches sur les chaînes de montagnes et la climatologie comparée* (1843).

The subsequent years were spent in occasional diplomatic journeys and in the preparation of what he deemed the crowning monument of his intellectual life, his *Kosmos*, an encyclopedic account and explanation of the physical universe. Four volumes were written and published in Berlin, in 1845, 1847, 1850, and 1858. They were translated as fast as issued into many languages and created a profound impression.

He kept health and vitality and continued at work until the winter of 1858-59, when his strength declined. He died May 6, 1859, and was buried with royal honors at Tegel. After his death new editions of many of his works were issued, and several collections of his letters appeared.

Humboldt's influence upon scientific thought has been vast and far-reaching. "With him," says Agassiz, "ends a great period in the history of science—a period to which Cuvier, Laplace, Arago, Gay-Lussac, De Candolle, and Robert Brown belonged." His grasp of the universe as a whole was no less remarkable than his faculty of observing and explaining single phenomena. His scenic descriptions are strikingly picturesque. Humboldt has contributed to nearly every branch of science, either by direct investigation or by the accumulation of valuable material. He may be regarded as the founder of the modern science of physical geography, and he placed meteorology upon a firm basis. We can only allude to his observations on the cultivation of the soil in different climates and its effect upon civilization, his study of the languages, the architecture, and the customs of the ancient peoples of South and Central America, his discovery of the decrease in intensity of the earth's magnetic force from the poles to the equator, his fruitful labors in chemistry with Gay-Lussac, his experiments concerning the respiration of fishes, and his contributions to the science of geology (especially in the departments of petrography, vulcanology, and seismology).

Humboldt's published correspondence with some of the most distinguished men of his time, such as Goethe, Varnhagen, Pictet, Bunsen, Gauss, and Raumer, as well as with his brother Wilhelm, attests the almost unparalleled breadth of his intellectual interests. Consult R. H. Stoddard, *Life, Travels, and Books of Alexander*

ALEXANDER VON HUMBOLDT

FROM AN ENGRAVING BY P. HABELMANN, AFTER A PAINTING BY EMMA RICHARDS

von Humboldt (New York, 1860), P F H Klencke, *Alexander von Humboldt's Leben und Wirken, Reisen und Wissen* (6th ed, Leipzig, 1970), C C Bruhns and others, *Eine wissenschaftliche Biographie* (3 vols, ib, 1872)

HUMBOLDT, KARL WILHELM, BARON VON (1767-1835) An eminent German philologist, author, and statesman, elder brother of the preceding, born at Potsdam, Prussia, June 22, 1767. He was educated at the universities of Frankfurt-on-the-Oder, Göttingen, Jena, and Berlin, where he was especially trained in jurisprudence, but also studied æsthetics, antiquities, and the Kantian philosophy, then newly propounded. After continental travel he spent some time in 1789-90 at Erfurt and at Weimar, where he met Schiller (then professor extraordinarius at Jena), with whom he formed a lasting friendship. In 1790 he became referendary in the Supreme Court of Judicature at Berlin, with the title of Prussian Councillor of Legation, but in 1791 resigned his appointment, and in 1794-97 was at Jena, active in scientific and literary study, and one of the Schiller circle. His interesting correspondence with Schiller, extending from 1792 to 1805, was published by him in 1830 with a "Vorerinnerung" (2d ed., by Vollmer, 1876, in the *Cotta'sche Bibliothek*, ed by Muncker, 1893). From 1801 to 1806 he was Prussian Resident Minister at the papal court and in 1806-08 Minister Plenipotentiary. At Rome he was a most liberal patron of artists, including Rauch and Thorvaldsen, made philosophical, æsthetic, philological, and archæological researches, and wrote the elegy *Rom*, his most ambitious poem. In 1809 he was appointed Privy Councillor of State, in charge of public worship and education. After a successful administration, which introduced many reforms and organized and obtained endowment for the Berlin University (decreed 1807, opened 1810), he resigned the post in 1810, to accept that of Envoy Extraordinary and Minister Plenipotentiary at Vienna, with rank of Minister of State. In the political affairs of the time he took a prominent part. He was present at the Peace Congress of Prague in 1813, where he, almost single-handed, brought about the alliance of Austria with Russia and Prussia against France. In 1814 he was at the Congress of Châtillon and signed, with Hardenberg, the first Paris Treaty, and in 1814-15 attended the Vienna Congress as Prussia's Second Plenipotentiary. Humboldt likewise took part in the negotiations attending the conclusion of the second Paris Treaty, and was a member of the Territorial Commission at Frankfurt-on-the-Main in 1816-17. As a State Councillor, he strongly disagreed with Chancellor Hardenberg on certain matters of tax reform, and in consequence he was sent to London as Ambassador. He returned in 1818 to attend the Congress of Aix-la-Chapelle and in 1819 was appointed to the Ministry of the Interior (then divided into two branches), with the department of communal and municipal affairs. His liberal opinions soon involved him in difficulties with the government. He demanded a new Prussian constitution which should combine the autonomy of provinces and governmental districts, with a parliament chosen by direct election, and he attacked the Carlsbad decrees, which among various provisions established a censorship of the press and contained measures hostile to the universities and schools. Dismissed in 1819, he was not recalled to the Coun-

cil of State until 1830. In the last years of his life Humboldt devoted much attention to art matters and to the organization of the Berlin Museum. He died April 8, 1835, at Tegel.

As a statesman, Wilhelm von Humboldt was enlightened and industrious, but perhaps hardly constructive. As a critical essayist, he was of transient influence. Of his poetical works, besides the *Rom* above mentioned, only the translation of the *Agamemnon* is now much read (1816, 2d ed, 1857, in the *Universalbibliothek* of Reclam). But, as a philologist, he marks an epoch. It was he who first called the attention of scholars to the phenomenon of the Basque language, particularly in the volume *Prüfung der Untersuchungen über die Urbevölkerung Hispaniens vermittelt der baskischen Sprache* (1821). His chief publication, *Über die Kausprache auf der Insel Java* (3 vols., 1836-40), with its noted introduction, "Über die Verschiedenheit des menschlichen Sprachbaues" (separately printed 1835, 3d ed of Pott's revision, 1880), was the first on the subject. Important dissertations read before the Berlin Academy include those on the comparative study of language, the province of the historian, and the origin of grammatical forms. Humboldt was in these and other writings the first to associate the science of comparative philology with philosophy, history, and other collateral studies, and to give it a universal significance. His *Ideen zu einem Versuch, die Grenzen der Wirksamkeit des Staates zu bestimmen* (ed by Cauer, 1851, in Reclam's *Universalbibliothek*), which Schiller vainly tried to get published, limits the authority of the state to the inferior task of protecting the life and property of its citizens. The collected works appeared at Berlin (7 vols.) in 1841-52. Consult Robert Haym, *Wilhelm von Humboldt, Lebensbild und Charakteristik* (Berlin, 1856), Adler, *Wilhelm von Humboldt's Linguistical Studies* (New York, 1866), Gebhardt, *Wilhelm von Humboldt als Staatsmann* (2 vols, Stuttgart, 1896-99), Kittel, *Wilhelm von Humboldts geschichtliche Weltanschauung* (Leipzig, 1901).

HUMBOLDT BAY INDIANS See WYAT STOCK

HUMBOLDT RIVER The longest river of Nevada. It rises in Elko County, in the northeast corner of the State, and flows 350 miles in a generally southwest direction, emptying into Humboldt Lake, or Sink, in Churchill County, 80 miles northeast of Carson City (Map Nevada, C 2). This "lake" is simply an expansion of the river and is held by a great gravel bank which was thrown entirely across the valley by the currents of the lake which once occupied this region and was about 500 feet deep at this point. Now the water sometimes evaporates faster than the river can supply it, at times of high water it formerly overflowed into Carson Sink, but this is now prevented by a dam. The river is only a few yards wide and grows smaller by evaporation towards its mouth. Its water is saline, and it flows through an arid and barren region covered with sagebrush, with the exception of a few fertile alluvial plains and clumps of willows. The valley of the Humboldt is flanked by rugged peaks, some of which reach an altitude of 11,000 feet above sea level, it is the only east and west pass through the mountains of Nevada, and it is followed throughout its course by the Southern Pacific Railroad. See GREAT AMERICAN DESERT.

HUME, ALEXANDER HAMILTON (1797-1873)

An Australian explorer, born in Parramatta in New South Wales. At the age of 17, accompanied by a younger brother, he discovered the Berrima country. In 1817 he was one of the discoverers of Lake Bathurst. He is best known as leader with Hovell of the cross-country expedition of 1824, on which, when question arose as to the part he had taken in it, he wrote *A Brief Statement of Facts in Connection with an Overland Expedition from Lake George to Fort Phillip, in the Year 1824* (3d ed., 1874), and, with Hovell, *Journey of Discovery to Fort Phillip* (1837). He accompanied Sturt (qv) in his first exploration. A county in New South Wales, a mountain range in Victoria, and the Murray River (as an alternative title) bear the name of Hume.

HUME, DAVID (1711-76) An English philosopher and historian. He was born at Edinburgh on April 26 (O S), 1711. His father was the laird of Ninewells in Berwickshire, but David, being the youngest son, had to make his fortune with no other assistance than an education and the influence of his family. He appears to have studied in the University of Edinburgh when 12 years of age, but his education for the most part consisted in home reading. His family designed the law to be his profession, and he submitted to the initial steps of the proper practical training, but it was not a pursuit to his liking. Deserting it, he experimented in a mercantile house in Bristol, but commerce was not more congenial to him than jurisprudence, and he gave it a very short trial. To use his own words, "I now went over to France with a view of prosecuting my studies in a country retreat, and there I laid the plan of life which I have steadily and successfully pursued. I resolved to make a very rigid frugality supply my deficiency of fortune, to maintain unimpaired my independency, and to regard every object as contemptible except the improvement of my talent in literature." He spent much of the next three years at La Flèche in intercourse with the Jesuits, and then he wrote his *Treatise of Human Nature*, which, however, he did not publish till 1739-40. It consists of three books, "Of the Understanding," "Of the Passions," and "Of Morals." Now one of the three or four most famous philosophical productions of England, at the time of its appearance "it fell deadborn from the press without reaching such a distinction as even to excite a murmur among the zealots," as Hume himself acknowledged, much to his mortification. He now turned to political theory and published anonymously in 1741-43 two volumes of *Essays Moral and Political*. In 1744 he was a candidate for the chair of "ethics and pneumatic philosophy" in the University of Edinburgh, but his *Treatise* had given him a reputation for "heresy, deism, skepticism, atheism, etc.," and the university would have none of him. In 1746 he obtained a "very genteel" appointment as secretary to General Saint Clair on "10 shillings a day, perquisites, and no expenses." An expedition had been planned to Canada, but an unsuccessful attack on L'Orient in France led to a recall of the general. Two years after Hume accompanied General Saint Clair to the court of Turin, as secretary and aid-de-camp, and took notes of his impressions of Holland, Germany, and Italy.

In 1748, during his absence on the Continent, he published his *Enquiry Concerning Human Understanding*. The following year he returned to

England, in 1751 he gave to the public the *Enquiry Concerning the Principles of Morals*, and in 1752 the *Political Discourses*, said to have been the "cradle of political economy." At the same time he also composed *Dialogues on Natural Religion*, which, however, were not published till after his death. By this time he had put by enough money to gain him an income of £50 a year. Besides he had "a hundred pounds' worth of books, great stores of linens and fine clothes, and near £100 in his pocket, along with order, frugality, a strong spirit of independency, good health, a contented humor, and an unabated love of study," as he himself relates. In 1751 he had removed to Edinburgh, and a year later he was elected librarian to the Faculty of Advocates at a salary of £40. In 1754 he published the first volume of the *History of Great Britain, Containing the Reign of James I and Charles I*, the second volume appeared two years afterward. Then he took up the Tudors and, working backward, finished his *History of England* in 1762. In 1757 he had published *Four Dissertations: the Natural History of Religion, of the Passions, of Tragedy, of the Standard of Taste*. In 1763 he was a member of the embassy to France under Lord Hertford and here found himself famous. He was honored by the society ladies, fêted by the nobles, and taken by the men of letters into their friendship. After his return he was made Undersecretary of State (1767-69) and by 1769 had an income of £1000 a year. In 1770 he retired from public life and built a home in Edinburgh on a new street, which was jocularly called St David's Street, after him. Here he wrote *My Own Life*, and here he died, Aug. 25, 1776. His *History of England* became a classic as soon as it appeared, his economic writings were a fitting prelude to those of his friend Adam Smith (qv), while his philosophical works roused Kant "from his dogmatic slumber," gave rise by reaction to Scottish philosophy, and are among the most important of modern philosophical works. His philosophy was but the consistent development of Berkeley's idealism. (See BERKELEY.) Berkeley had denied the reality of matter and had accounted for what passed for matter by making it a complex of ideas, but he still held to the reality of mind as the percipient of ideas. Hume, claiming to find no empirical evidence for the existence of mind or spirit in Berkeley's sense of the term, dropped out mind as Berkeley had dropped out matter and thus left nothing to be known except "perception" (impressions and ideas), together with certain fictions of the imagination, of which he gives no satisfactory account that can be made consistent with his general position. "All the perceptions of the human mind resolve themselves into two distinct kinds which I shall call impressions and ideas." These differ not by reason of any differences in the manner in which they are produced, but merely in priority and liveliness. Ideas are simply those perceptions which, appearing later than similar perceptions, are less forceful and vivid. Ideas are of two sorts—ideas of the memory and ideas of the imagination. Of these the former are the more lively and retain in great measure the order and sequence of these original impressions, whereas ideas of the imagination are fainter and are "not restrained to the same order and form with the original impressions." Ideas are associated in accordance with certain principles, viz., "resemblance, contiguity in time or place, and cause

and effect." There are no abstract ideas. Ideas of space are complexes of *minima visibilia*, or colored points, disposed in a certain manner. These points are indivisible. Ideas of time are derived from the succession of our perceptions, and as these perceptions are in the last instance indivisible, time is not infinitely divisible. A perception and a thing perceived are one and the same thing. A cause is an object precedent and contiguous to another, and so united with it in the imagination that the idea of the one determines the mind to form the idea of the other, and the impression of the one to form a more lively idea of the other. "There is no substance, hence no mind except the bundle of perceptions. A true skeptic will be diffident of his philosophical doubts as well as of his philosophical convictions." Skepticism is inevitable on this theory, inasmuch as belief is the liveliness of one's ideas, and this varies from time to time. Hume himself admitted that when he left his study and entered upon practical affairs his philosophy made small appeal to him. Philosophical arguments control only when one is in a philosophical mood, at other times human nature prompts to the beliefs which philosophy shows to be without rational foundation. In ethics Hume was a utilitarian. (See UTILITARIANISM.) Self-love cannot be the sole basis of reasonable action. "Crucial experiments" render such a view impossible. Sympathy is a real principle in human nature, and reflections on public interest and utility are the sole sources of the moral approbation paid to fidelity, justice, veracity, integrity. Sympathy does the work it does because it is our pleasure in other persons' pleasures and our displeasure in their pains. Thus, our own pleasure and pain are the springs of action, but they are not the ends of action.

A complete edition of Hume's philosophical works was published by Green and Grose (4 vols, London, 1874-75), his *Treatise* and two *Enquiries* in two volumes by Selby-Bigge (Oxford, 1889-94), his *History* has appeared in almost innumerable editions, his autobiography was edited by Adam Smith (London, 1777). Consult also J. H. Burton, *Life and Correspondence of David Hume* (Edinburgh, 1846), T. H. Huxley, *Hume*, "English Men of Letters Series" (New York, 1879). For treatment of Hume's philosophy, consult Friedrich Jodl, *David Humes Lehre von der Erkenntnis* (Halle, 1871), Edmund Pfleiderer, *Empirismus und Skepsis in David Humes Philosophie* (Berlin, 1874), Meinong, *Hume-Studien* (Vienna, 1877-82), Georg von Gizycki, *Die Ethik David Humes* (Berlin, 1878), T. H. Green, *Introduction to Hume*, in Green and Grose's edition of Hume's works, also published as part of vol. II of Green's *Works* (London, 1885), W. A. Knight, *Hume* (ib., 1886), T. H. Huxley, "Hume with Helps to the Study of Berkeley," in *Collected Essays*, vol. VI (New York, 1902), Otto Quast, *Der Begriff des Belief bei D. Hume* (Halle, 1903), Oster, *Grosse Denker*, vol. II (1911), A. Seth, *English Philosophers and Schools of Philosophy* (London, 1912); and the various histories of modern philosophy by Ueberweg-Heinze, Falckenburg, Hoffding, Windelband, and Thilly.

HUME, JOHN See HOME, JOHN

HUME, JOSEPH (1777-1855) A British political reformer, born Jan. 22, 1777, at Montrose, Scotland. He was educated in the local schools of Montrose and at the age of 13 was apprenticed to an apothecary. He studied medi-

cine, was admitted in 1796 a member of the College of Surgeons, Edinburgh, and became assistant surgeon in the marine service of the East India Company. He applied himself to the native languages and during the Mahratta War, from 1802 to 1807, filled the office of Persian interpreter to the army. He also discharged duties connected with the prize agencies and the commissariat and arrived in England in 1808, with a fortune of £30,000 or £40,000. He spent some years in travel and study and published a blank-verse translation of Dante's *Inferno* in 1812. By purchase he entered the House of Commons in 1812 as a Tory for the Borough of Weymouth. In 1818 he was elected for the Aberdeen district of burghs, comprehending his native town of Montrose. In 1830 he had gained such distinction as a radical reformer that he was returned unopposed as one of the members for Middlesex, which he represented until 1837. In 1842 he was again chosen for his native burgh, Montrose, and remained until his death in the service of his fellow townsmen. As leader of the Radical party in the House of Commons, he usually found himself in active conflict with both Whig and Tory governments and at first was treated with contemptuous tolerance. He was particularly active for the retrenchment of public expenditures, the abolition of imprisonment for debt and of flogging in the army, and the repeal of laws which operated to the disadvantage of artisans. He discovered the widespread conspiracy of the Orange lodges to make the Duke of Cumberland King at William IV's death, and a tardy but sincere homage was paid to his integrity and public services by Sir Robert Peel and other political opponents. He held various public offices, was a prominent member and leader of several notable societies, was twice elected lord rector of Aberdeen University, and promoted the establishment of Lancasterian schools. He died Feb. 20, 1855.

HUME, MARTIN ANDREW SHARP (1847-1910). An English historian, long a resident of Spain. His own name was Martin Andrew Sharp, the "Hume" having been assumed as a condition of receiving a legacy from a Spanish-English relative, who was a Hume. He was born in London, was educated at Madrid, and became editor of the Spanish State Papers in the Public Record Office, London. He saw active service with the Turks in 1878-79, and traveled extensively in Central and South America. His writings, largely concerned with Spanish-English relations, literary and other, in spite of a style and methods occasionally journalistic, had real merits which academic historians and critics did not always recognize. Notable among them are *Philip II of Spain* (1897), *Spain: Its Greatness and Decay, 1479-1789* (1898, revised by Armstrong, 1913), *Modern Spain, 1788-1898* (1899, new ed., 1906), *The Spanish People* (1901), a popular recasting of the two preceding works, *The Love Affairs of Mary Queen of Scots* (1903), in which his patient research and gift of picturesque narrative are in evidence, *Spanish Influence on English Literature* (1905), which has too many marks of hasty improvisation, *Queens of Old Spain* (1907), *The Court of Philip IV, Spain in Decline* (1907), *Two English Queens and Philip* (1908), *Queen Elizabeth and her England* (1910), and a posthumous volume, *True Stories of the Past* (1910).

HUME, or HOME, SIR PATRICK (1641-1724) A Scottish statesman. Born at Polwarth, Berwickshire, he was brought up a strict Presbyte-

man, and after a term of law study at Paris he represented his native county in Parliament, where he at once took a foremost place as defender of the Covenanters. He went so far as to bring imprisonment upon himself, and on being freed was suspected of complication in the Rye House Plot, so that he was forced to remain in hiding until he could escape in disguise to the Continent. There he joined the Duke of Argyll and embarked with him on the unsuccessful expedition to Scotland (1685). Hume became a refugee with a price set upon his head, but he once more escaped abroad and lived at Utrecht under the name of "Dr. Wallace," professing to be a Scottish surgeon. He returned with William of Orange at the revolution of 1688. With estates restored, he was now a Scottish peer, Lord Polwarth, was made Lord Chancellor in 1696 and Earl of Marchmont in 1697. He strenuously opposed in Parliament the claims of the Old Pretender to the crown and voted for the union of Scotland with England, though he was not above the suspicion of having received a reward for so doing. Too dogmatic to be popular, he did not hold office in the United Kingdom till the reign of George I, when he was given some minor charges, but shortly retired.

HUMERAL VEIL (Lat *humeralis*, covering for the shoulders, from *humerus*, *umerus*, shoulder, connected with Gk *ἄμος*, *amos*, Goth *amsa*, Skt *amsa*, shoulder). An oblong veil of silk, either white or of the color prescribed for the day, which is worn over the shoulders by the subdeacon in the mass, when he holds the paten from the offertory to the patenoster, and by the priest in giving benediction or carrying the Blessed Sacrament in procession. See **COSTUME**, **ECCLESIASTICAL**.

HUMERUS (Lat, shoulder). The largest and longest bone of the upper extremity, the bone of the arm proper, extending from the shoulder to the elbow. It is divided anatomically into a shaft and two extremities. The upper extremity is rather the larger and has a semiglobular head which is partially received into the shallow glenoid cavity of the scapula, or shoulder blade, forming a ball-and-socket joint. Two processes or projections of the shoulder blade assist the glenoid cavity in completing the cavity or seat of the head of the humerus. There are three ligaments which hold the humerus to the scapula—the capsular, the coracohumeral, and the glenoid, the relations being somewhat similar to those of the hip joint (q v). The shaft of the humerus is nearly cylindrical in its upper part, but triangularly prismatic below, becoming flattened and broad at the lower extremity, where are placed the two condyles, with their articular surfaces, and the trochlea between them, which form, with the two bones of the forearm, the elbow joint. (See **ARM**, **SKELETON**.) The broad, flat lower extremity has two depressions on the anterior aspect of the bone—one slight one on the outer side called the radial depression, which is for the reception of the anterior border of the head of the radius, when the arm is strongly flexed, the other, called the coronoid depression, for the reception of the coronoid process of the ulna during flexion of the arm. Opposite the latter depression, on the posterior surface of the bone, is a deep triangular depression, called the olecranon fossa, for the reception of the olecranon process of the ulna when the forearm is extended. The humerus forms with the scapula, as above mentioned, a ball-and-socket joint, the

shoulder joint (q v). The elbow joint is a hinge joint and to a certain extent, in its relation to the head of the radius, a ball-and-socket joint.

HUMFREY, HUMPHREY, or HUMPHREYS, PELHAM (1647-74). A famous English musician and one of the founders of modern English music. He was born in London. He was one of the children of the Chapel Royal and while yet a boy composed considerable Church music, and in a book of *Divine Services and Anthems*, published by Clifford in 1664, there are five anthems ascribed to him. Upon the breaking of his voice he was sent by Charles II to France for instruction under Lully. Upon his return, in 1667, he was appointed to the Chapel Royal, he became master of the children in 1672 and composer in ordinary for the violins to his Majesty in 1673, and wrote many pieces for the King's band, an organization modeled after "Les Petits Violons" of Louis XIV. His compositions are still in use (many of them still in manuscript) in all the cathedrals and churches of England and America. They are remarkable for their expression and depth of sentiment as well as for bold innovations in harmony. He died at Windsor and was buried in the cloisters of Westminster Abbey near the southeast door.

HUMIDITY (from Lat *humiditas*, moisture, from *humidus*, *umidus*, moist, from *humere*, *umere*, to be moist, connected ultimately with Gk *ὕψος*, *hygros*, Icel *volr*, moist), **ATMOSPHERIC**. The moisture or aqueous vapor in the atmosphere. This vapor is really an invisible gas and is the most important component of the atmosphere as to quantity next after nitrogen and oxygen. When this invisible vapor becomes visible, it is called dew, fog, mist, haze, cloud, rain, hail, snow, frostwork, or frost; according to the size of the drops of water or the method in which the vapor condenses. Water and ice are not included under the term "atmospheric humidity," that term being strictly confined to the invisible vapor.

The aqueous vapor in the air is perpetually falling to the earth as rain or snow and is renewed by evaporation from the ocean, the lakes and rivers, vegetation, and the soil itself. The quantity of aqueous vapor in a cubic foot of air varies greatly with temperature and locality on the earth's surface. Thus, in the air of Arizona and New Mexico there is oftentimes only from 3 to 10 per cent of the amount that could be held in case the air were saturated. The quantity that can be held in a saturated space varies greatly with the temperature, but does not depend upon the barometric pressure and is also quite independent of the presence of air in that same space, since the aqueous vapor and the dry air coexist side by side. The elastic pressure of the dry air and the elastic pressure of the aqueous vapor added together produce what is ordinarily called barometric or atmospheric pressure. The weight of the moisture and the weight of the dry air added together determine the density of a cubic foot of atmosphere at any time. When a cubic foot of space contains as much aqueous vapor as it can possibly hold at any given temperature, it is said to be saturated with moisture. Such vapor will then exert a certain maximum pressure, known as the saturation pressure, which is the maximum for that temperature. Any effort to compress such vapor will cause condensation, but the pressure will remain the same. The saturation pressure is higher the higher the temperature. The accompanying table gives saturation

pressures for a number of different temperatures and shows, moreover, that there may be as much in an extreme case as 20 grains of invisible aqueous vapor in a cubic foot if the space is saturated at the temperature of 100° F, and this vapor will exert an elastic pressure of about one pound to the square inch, such as would be counterbalanced by a column of mercury of about 19 inches of the barometer. If, now, dry air is added to this cubic foot of space until a pressure of 30 inches is exerted in all directions, then the weight of the dry air at a temperature of 100° F will be 465 grains per cubic foot, and the combined weight of the vapor and the air, or the so-called saturated air, will be 485 grains. The accompanying table gives these relations for saturation at a pressure of 30 inches and for temperatures between 0 and 100, computed according to the data adopted in the Psychrometric Tables of Prof C F Marvin (United States Weather Bureau, 1900)

PRESSURE AND WEIGHT OF VAPOR AND AIR IN A CUBIC FOOT OF ATMOSPHERE AT A PRESSURE OF 30 INCHES WHEN SATURATED AT THE RESPECTIVE TEMPERATURES

TEMPERATURE	Vapor pressure	Dry air pressure	Vapor weight	Dry air weight	Total weight saturated air
Degrees Fahrenheit	Inches	Inches	Gr per cu ft	Gr per cu ft	Gr per cu ft
0	0.038	29.962	0.48	605.32	605.80
10	0.063	29.937	0.78	591.93	592.71
20	0.103	29.897	1.24	578.79	580.03
30	0.164	29.836	1.94	565.79	567.73
40	0.247	29.753	2.85	552.89	555.74
50	0.360	29.640	4.08	539.93	544.01
60	0.517	29.483	5.74	526.75	532.49
70	0.732	29.268	7.98	513.00	520.98
80	1.022	28.978	10.93	498.48	509.41
90	1.408	28.592	14.79	482.65	497.64
100	1.916	28.084	19.77	465.77	485.54

This table shows that the capacity of the unit volume of space or air for aqueous vapor increases very rapidly with rising temperature. When the space is not saturated, the atmosphere is said to have a relative humidity expressed as a given percentage of complete saturation. Thus, if the air has a temperature of 100° and contains only 10 grains of vapor per cubic foot, it contains only 50 per cent of the maximum amount possible at that temperature.

Water vapor at a given pressure and temperature weighs less than two-thirds as much as the same volume of pure dry air under the same conditions, hence air heavily charged with moisture is relatively lighter than dry air. The coefficient of expansion of unsaturated vapor is commonly assumed to be the same as for air.

The humidity of the atmosphere is usually determined by either the dew-point apparatus or the psychrometric apparatus. In the former the air is cooled down without altering the quantity of moisture that it contains, and the temperature at which that moisture saturates the air is determined. This dew-point temperature is always lower than the temperature of the free air. In the psychrometric method the temperature of a thin layer of water that is evaporating under standard conditions in the open atmosphere is determined. From this temperature of evaporation the psychrometric formula gives us the vapor tension, the temperature of the dew point, and the quantity of moisture in the air. In general the temperature of the dew point is about as far below the temperature of evaporation as the latter is below the temperature of the air.

The rate of evaporation from a moist surface diminishes with increasing humidity of the air, so that the total evaporation under a given wind in any given unit of time indicates the average dryness of the air during that time.

Nearly all animal and vegetable substances, by reason of their cellular structure, absorb moisture from moist air, but give it up to very dry air. They are, therefore, perpetually expanding and contracting, curling and uncurling, and their changes may be utilized in the construction of hygrometers. When moist air cools by radiation at night to temperatures below the dew point, the vapor is precipitated, forming cloud, mist, fog, or dew. On the other hand, when air rises, thereby coming under less pressure, it expands, does work, and is cooled dynamically by reason of the work done. Ordinary air cools at the rate of 1° F for 183 feet of ascent. In this way air that is forced over a mountain may be cooled below the dew point and form cloud or

rain. The moisture in ordinary dry air is easily absorbed by many substances, such as sugar, flour, salt, and in very moist weather objects may become so damp that fungus germs floating in the air and settling on them take root and cover them with mold or set up fermentation within them.

The humidity of the atmosphere, although invisible, has a special and strong influence in absorbing radiant energy, whether from the sun or from the earth. See *HYGROMETER*.

HUMILIATI (Lat nom pl, humbled). A monastic order which originated in the eleventh or twelfth century and was confirmed by Innocent III in 1201. In the sixteenth century it had 94 houses, with about 170 monks, in Italy, but, as it was corrupt, Carlo Borromeo (qv) tried to reform it. This attempt led to a murderous assault on him, so Pius V in 1571 suppressed the order. Several of their houses were turned over to the Barnabites—A female order of Benedictines, originating with the wives of the first Humiliati, known as humiliate nuns, or nuns of Blassoni, from their founder, Clara Blassoni, of Milan, served as nurses, etc. The order still exists in Italy, with five houses. Consult *Maximilian Heimbucher, Orden und Kongregationen* (Paderborn, 1908).

HUMITE GROUP. A group which includes the three minerals chondrodite, humite, and clinohumite, of which chondrodite and clinohumite are monoclinic and humite is orthorhombic. They are basic fluosilicates and are closely related chemically. A vitreous to resinous lustre is common to the group, and the general color is

red, brownish red, brown to yellow The humite group occurs mainly in ejected masses of limestone

HUMMEL, hum'mel, JOHANN NEPOMUK (1778-1837) A distinguished Austrian pianist and composer, born at Pressburg When but eight years of age, he accompanied his father to Vienna on the appointment of the latter as kapellmeister of Schikaneder's Theatre Here he came under the notice of Mozart, who became so interested in the boy that he admitted him to his own family and instructed him for two years His début in 1787 was also under the auspices of Mozart Next followed a number of very successful tours through Germany, Denmark, England, and Holland His entire career was marked by success and the appreciation of the public—so much so that at one time he was considered to rival Beethoven His principal appointments were as follows from 1804 to 1811, deputy kapellmeister under Haydn in the service of Prince Esterházy, 1811-16, a successful teacher of composition in Vienna, kapellmeister to the court of Stuttgart 1816-19, when he resigned to take a similar position at Weimar None of these appointments interfered with his concert activities. From about 1829 his health gradually failed, and after much suffering he died at Weimar As a pianist he ranked with the most famous of his generation, and as a composer he was in great vogue even for many years after his death His compositions number over 100, and include operas, cantatas, ballets, and considerable chamber music He is of importance in the history of music chiefly as the originator of the present method of fingering in pianoforte study.

HUMMELER (from *hummel*, variant of *humble*, *hamble*, to mutilate, from AS *hamelan*, OHG *hamalôn*, to maim, Ger *hammeln*, *hammeln*, to geld, from OHG *hamal*, *ham*, mutilated, possibly connected with Skt *śam*, to injure) An implement or machine used, especially in Scotland, for removing the awn from the grain of barley after it has been threshed It consists essentially of a vertical shaft set at different heights with blunt knives or beaters and revolving rapidly in a cylindrical case so as to beat the grain as it falls through the cylinder and thus detach the awns Some forms of the implement are operated by hand, while others are arranged as attachments to threshing machines

HUMMING BIRD (so called from the sound of its whirring wings) One of the diminutive birds of the order Coraciiformes and family Trochilidae, closely related to the swifts More than 600 species are known, exclusively American and mainly confined to the tropics, though a few species are summer visitors to colder latitudes, as far even as 61° N. A few, also, of the tropical species inhabit elevated mountainous tracts, even to the confines of perpetual snow In the United States 18 species of humming birds are known, but only one of these is found east of the Mississippi and north of Florida All of the others belong to the Southwestern States and the Pacific coast (see below).

Characteristics The brilliancy of humming birds, the rapidity with which they dart through the air, then hovering above the flowers from which they obtain their food, with a humming sound of wings which move so quickly as to be indistinctly visible or "like a mist," have attracted universal admiration The diminutive size of almost all of them—some are the smallest of birds and when stripped of their feathers not

larger than a bumblebee—has still further contributed to render them objects of interest Like the bumblebees too, they perform a service in the cross-fertilization of flowers Consult Belt, *Naturalist in Nicaragua* (London, 1888)

The largest-known species is *Patagona gigas* of the Andes, which reaches a length of 8½ inches, but this is really gigantic, few species exceeding 6 inches The smallest-known species is *Calypte helena*, which is only 2¼ inches long, it is a native of Cuba

The plumage of the different species exhibits an almost endless variety of form as well as of color, in crests, neck tufts, leg tufts, and many an extraordinary development of tail The plumage of the males is usually far more varied and glittering than that of the females, and to the believers in the theory this group of birds furnishes an extensive and forcible example in support of the doctrine of sexual selection (qv) Much of the metallic brilliance of the plumage, which in the gorgets and elsewhere often exhibits a gemlike conuscation and iridescence, is due to the interference of light by the minute scales upon the surface of each feather and not to pigments The young resemble their mothers until they reach maturity

Food, etc Humming birds have slender bills, which are also generally long, and in some extremely so, the form of the bill exhibiting adaptation to the kind of flowers from which the bird obtains its food—straight in some, curved in others The bill of the swordbill (*Docomastes ensifer*) is 5 inches long, much longer than the head, body, and tail of the bird together, while in *Rhamphocelus mucronynchus* the bill is only ¼ of an inch long In the sickle-billed humming birds (see HERMIT HUMMING BIRD) the bill is notably curved so as to form almost one-third of a circle, while in *Arcoactula* it is sharply and abruptly recurved at the tip Humming birds do not, as was long supposed, feed on honey alone, but to a considerable extent, and many of them chiefly, on insects, not excepting spiders, while they often snatch away the insects which have become entangled in spiders' webs The lower mandible fits into the upper, and the bill is thus adapted as a tube for sucking, in which, as well as in seizing small insects within the recesses of flowers, the tongue is also a very efficient organ The tongue is very long, capable of being darted out to a considerable length, the bone of the tongue is much elongated, and its branches pass round the back of the skull to the forehead, where they meet in a point before the line of the eyes The tongue itself consists of two filaments, joined together for the greater part of their length and separated at the tip The wings of humming birds are very long and powerful, the first quill feather the longest, and the rest shorter in succession

Nests, etc These diminutive birds construct exquisite nests of shreds of bark, soft grass, or cottony substances They are placed in a great variety of situations, from a mere saddling upon a branch to an attachment to the tip of a pendent and swaying leaf or tendril, and often the exterior is made almost invisible by having a coating of lichens or something else allying it closely to its background The eggs are invariably two in number, and they are always plain white The tiny owners are very bold in defense of their nests and young and are said to strike fearlessly with their needle-like bills at the eyes of birds of prey, which they far surpass in agil-

HUMMING - BIRDS

HUMMING BIRDS

1. HELMET-CREST (*Oxygogon guerini*).
2. SPANGLED COQUETTE (*Lophornis reginae*).
3. RACKET-TAIL (*Steganura underwoodi*).
4. CALLIOPE HUMMER (*Stellula calliope*).

5. TUFTED COQUETTE (*Lophornis ornatus*).
6. SWORDBILL (*Docimastes ensiferus*).
7. RUFOUS HUMMER (*Selasphorus rufus*).
8. FLORESIS HUMMER (*Selasphorus floresii*).
9. NEST OF RED-THROATED SAPPHIRE (*Hylocharis sapphirina*).

ity and rapidity of flight. They are very easily, however, imbued with confidence in a person with whom they are familiar and have been known to return again in spring, after a winter migration to a warmer climate, to the window from which they had been allowed to escape. Attempts to keep them in confinement have generally failed, and few have ever been carried alive across the Atlantic. Most of the hummers have no song, their only notes being queulous squeaks of wrath or fear. A few of the tropical forms, nevertheless, are said to be slightly musical. The skins of humming birds were employed for ornamental purposes by the more civilized American races before the discovery of America by Europeans, and were used by the Mexicans for making the pictures which excited the admiration of their Spanish conquerors.

Examples. The helmet crests (*Oxygogon*) are Andean and owe their name to their high-pointed head ornaments. The coquettes (*Lophornis*) are small, much ornamented hummers of the Amazon region and are easily recognized by their fanlike crests and by the spangled frills on each side of the neck. They are numerous and well scattered in South America, where one of the most beautiful is the "tufted" coquette of the island of Trinidad and the adjacent mainland. The racket-tailed hummer (*Steganura*), whose home is a limited region near the head of the Amazon, is among the smallest and most extraordinary of these birds, and is described as crossing, recrossing, and "snapping" in a marvelous way its long tail feathers in the air, as it darts about, especially when a rival male is near. The long-tailed species of the genus *Aithya* are West Indian; the one figured is a denizen of Jamaica.

Rubythroat, etc. Of the several humming birds of the United States, the ruby-throated (*Trochilus*, or *Archilochus, colubris*) is most widespread and familiar. It extends far to the north in summer and may be found breeding from Florida to Hudson Bay. In winter it retires to subtropical regions and is found from southern Florida to Central America. It is less than 4 inches long, and the principal color is bright shining green. The throat of the male is a beautiful metallic ruby red. This exquisite bird arrives in the northern United States early in May, with the opening of the cherry blossoms, and goes south late in August or early in September. In the Rocky Mountain region of the United States the rubythroat is replaced by the broad-tailed hummer (*Selasphorus platycercus*), a somewhat larger bronze-green bird with rose-purple throat. On the Pacific coast the common hummer is the Nootka Sound, or rufous, humming bird (*Selasphorus rufus*), about the size of the rubythroat, but deep rufous above, with the throat brilliant scarlet. It is notable for its occurrence as far north as Nootka Sound, Alaska, but it winters in Mexico. The commonest species in California, where it is resident through the year, is Anna's humming bird (*Calypte anna*), a trifle smaller than the rubythroat and of more exquisite coloration. The male is bronze-green above, with the whole head and throat brilliant purplish or rose red.

Bibliography. The literature devoted to humming birds is very extensive, including several hundred titles, but the most important works are John Gould, *Monograph of the Trochilidae* (London, 1861), and D. G. Elliot, *Synopsis and Classification of the Trochilidae* (Washing-

ton, 1879), while to the American reader Robert Ridgway, "The Humming Birds," in *Annual Report of the Smithsonian Institution for 1890* (Washington, 1892), is by far the best popular work. See HELMET CREST, HERMIT HUMMING BIRD, HILL STAR, SUNBIRD.

HUMMING-BIRD MOTH. See Colored Plate of MOTHS, AMERICAN.

HUMMOCK. See the first HAMMOCK.

HUMOR, AQUEOUS. See AQUEOUS HUMOR.

HUMORESKE, hu'mō-rēs'ke (Ger., Dan., from *humor*, Lat. *humor*, humor, disposition, from *humere*, to be moist). Originally a short, humorous tale or sketch, but applied by Schumann to short compositions for the pianoforte in a rather free form and distinguished by originality in harmonic and rhythmic combinations rather than by any really humorous elements. Heller, Grieg, and Dvořák have adopted the title for similar compositions of their own.

HUMORS. See HIPPOCRATES, MEDICINE.

HUMPBACK. A roqual (family Balenopteridae), or whalebone whale, of the genus *Megaptera*, in which the dorsal fin forms a lump upon the back. It is found in all seas, often reaches a length of 50 feet and sometimes much more, is thick and ungainly, and yields 50 or more barrels of oil. The baleen is short and of poor quality. This whale (*Megaptera longimana*) is recognizable at a long distance by its lolling, irregular manner of swimming, and at the mating season pairs indulge in antics highly amusing because of their size and uncouthness. They strike each other with their long flippers, and these love-pat caresses may be heard miles away. It is believed that in these performances originated the stories current about the attack on the whale by the thresher shark, which, as a matter of fact, could not injure such an opponent. See ROQUAL, WHALE, and Plate of WHALES.

HUMPBACKED SALMON. One of the smallest and poorest of the Pacific salmon (*Oncorhynchus gorbuscha*). It weighs only three to six pounds and is distinguishable by the small size of the scales and by the oblong coarse markings on the tail. It is occasionally seen in California and in the Columbia River, but is common from Puget Sound northward, where it is the dog salmon, or gorbuscha, of Alaska, also called haddo and hay-ko by the Indians, who smoke-dry it and use it as winter food. See SALMON, and Plate of SALMON.

The term "humpbacked" is applied to other fishes having an elevated dorsal outline, especially an Alaskan whitefish (*Coregonus nelsoni*).

HUMPED CATTLE, or ZEBU. The common domestic cattle of India and the East, known in books as zebu, or zubi, but not so called anywhere in the Orient. It seems to be a distinct species (*Bos indicus*), of which no wild examples remain. Certain bands of these cattle running wild have, however, ranged the forests of eastern India for hundreds of years and are large, long-horned, and shy. In addition to the enormous hump on the fore shoulders, these cattle show some convexity of the forehead, concavity of the upper border of the short horns, large drooping ears, and a very large dewlap. In size and color they vary considerably. The most common colors are ashy gray or creamy buff, but red, brown, black, and even white ones are seen. A certain number of white bulls are held sacred by the Hindus, whence the name Brahminy, often given to the entire race, and these wander about, dev-

astating crops and feeding upon the vegetables exposed for sale in the bazars without serious interference. The humped cattle are diffused over India, China, the Asiatic islands, Madagascar, and the east coast of Africa. There are many breeds, differing much in size, the largest are greater than any oxen of Europe, while the smallest are not much bigger than a large mastiff. The hump of the largest breeds is said to be sometimes 50 pounds in weight. English residents in India esteem the hump as delicious for the table. There are hornless breeds, and a breed with two fatty humps, one behind the other, is common in the vicinity of Surat. The voice resembles the grunting of the yak almost as nearly as the lowing of the ox. The zebu is used in India both as a beast of draft and of burden, is yoked in the plow, is occasionally used for riding, can travel from 20 to 30 miles a day, and is very gentle and docile. In recent years they have been introduced into Jamaica and some of the Central American republics in considerable numbers and are used on the large banana estates.

Galla Ox, or Sunga. A breed of humped cattle domesticated in East Africa, and most common in Abyssinia, remarkable for its massive horns, which sometimes form the figure of an upright lyre above its head. A sunga's horn may be 46 inches long and 15 inches around the base. This variety was known in ancient Egypt and has been regarded as the parent stock of the Indian breeds of humped cattle while Blyth finds in it an affinity to the banteng. Consult *Proceedings of the Zoological Society of London* (London, 1898), and Richard Lydekker, *Wild Oxen, Sheep, and Goats* (ib., 1898).

HUMPERDINCK, hum'pär-dipk, ENGELBERT (1854-) A German composer, born in Siegburg, near Bonn. He was studying to become an architect at Cologne, when he came under the influence of Hillel (qv) and was persuaded to devote himself to music. From 1874 to 1876 he studied at the Cologne Conservatory and from 1876 to 1879 at the Musikschule in Munich. Having won the Mendelssohn prize, he spent the next two years in Italy, where he met Wagner, who became greatly interested in him. For the last two years of the master's life Humperdinck was practically a member of his family, assisting in the preparation of *Parsifal*. Later he also became the teacher of Wagner's son Siegfried. After Wagner's death he went again to Italy and then to Spain, where he taught composition at the Conservatory of Barcelona (1885-86). After his return he lived for some years in Cologne and in 1890 accepted a position in the Hoch Conservatory in Frankfurt. In 1900 he was called to Berlin as director of the Meisterschule. His fame as a composer dates from the phenomenal success of his fairy opera *Hansel und Gretel* (1893), built almost entirely upon familiar folk tunes. In 1905 he visited the United States upon the invitation of the management of the Metropolitan Opera House, which induced him to remodel the incidental music to a fairy drama, *Die Koenigskinder*, written in 1896, into an opera. It was produced for the first time at the Metropolitan Opera House in 1910 and almost equaled the success of *Hansel und Gretel*, but was received with much less enthusiasm in Germany. Humperdinck has little inventive power, but covers this deficiency by resorting to folk themes, which he treats in truly masterly style. His exquisite harmonization and

orchestration also are important factors contributing to his well-deserved success. His other operas, none of which rise to the heights of either of the two mentioned, are *Die sieben Geiseln* (1897), *Donnoschen* (1902), *Die Heirat unter Willen* (1905), *Die Marktentendein* (1914). He also wrote incidental music to several fairy plays, to Aristophanes' *Lysistrata*, Shakespeare's *Tempest*, Maeterlinck's *Blue Bird*, and Vollmoeller's *Miracle* (staged by Reinhardt), two ballads for soli, chorus, and orchestra, *Das Gluck von Edenhall* and *Wallfahrt nach Keilnaar*, a *Moorish Rhapsody* for orchestra, and many smaller choruses for male and mixed voices.

HUMPHREY, DUKE OF GLOUCESTER, known as **THE GOOD DUKE** (1391-1447). The youngest son of Henry IV, he was Regent of England under Henry V and Protector previous to the coronation of Henry VI. He married Jacqueline, heiress of Holland and Hainault, and in 1424 overran Hainault, which was recovered by the Duke of Brabant. Later he married Eleanor Cobham, who was imprisoned for life for treason, and at the time of his death Humphrey himself was under similar charge. Consult K. H.ickers, *Humphrey, Duke of Gloucester* (London, 1907).

HUMPHREY, HEMAN (1779-1861). An American Congregational clergyman and educator. He was born at West Simsbury, Conn., graduated at Yale in 1805, and was pastor of the Congregational church in Fairfield, Conn., from 1807 to 1817, and of that in Pittsfield, Mass., from 1817 to 1823. He was president of Amherst College from 1823 to 1845, during the infancy of that institution. He was an early advocate of temperance, and a report of his on the subject made in 1813 is said to have been the first temperance tract. Among his publications there are, besides biographies, *The Sabbath* (1830), *Tour in France, Great Britain, and Belgium* (1838), and *Domestic Education* (1840). Consult W. S. Tyley, *History of Amherst College during 1821-71* (Springfield, 1873).

HUMPHREY, PELHAM. See HUMFREY, PELHAM.

HUMFREY CLINKER, THE EXPEDITION OF. A novel in the form of letters, by Tobias Smollett. The work was published in 1771 and founded partly on Anstey's *New Bath Guide* and partly on the author's own life.

HUMPHREYS, ALEXANDER CROMBIE (1851-) An American gas engineer and educator, born in Edinburgh, Scotland. Having come to the United States in 1859, he was a member of the staff of a New York insurance company (1866-72) and was afterward secretary and superintendent of a Greenville (N. J.) gaslight company. In 1877-81 he studied at Stevens Institute of Technology (Hoboken, N. J.), from 1881 to 1885 he was chief engineer of the Pintsch Lighting Company of New York, and in 1885 he was appointed superintendent of construction of a gas-improvement company, of which he became general superintendent and ultimately commercial manager, with headquarters at Philadelphia, Pa. From 1892 to 1908 he was senior member of the Humphreys and Glasgow Gas Company of London, a branch of which he established in New York in 1894 (reorganized in 1910 as Humphreys and Miller, Inc.). During his connection with these various enterprises he greatly furthered the manufacture of water gas. In 1902 he was elected president of Stevens In-

stitute In 1912 he served as president of the American Society of Mechanical Engineers He published *Lecture Notes on Some of the Business Features of Engineering Practice* (1905, 2d ed., rev and enlarged, 1912)

HUMPHREYS, ANDREW ATKINSON (1810-83) An American soldier He was born in Philadelphia, graduated at West Point in 1831, and was assigned to the artillery He resigned in September, 1836, and for the next two years was a civil engineer employed on government work under Major Hartman Bache In July, 1838, he reentered the army as first lieutenant and was assigned to the corps of topographical engineers. From 1842 to 1849 he was assistant in charge of the Coast Survey Office Later he was engaged in the surveys of the delta of the Mississippi and in those for various railroads Soon after the outbreak of the Civil War he became a member of the staff of General McClellan, with the rank of major, and in the Peninsula campaign was chief topographical engineer of the Army of the Potomac In April, 1862, he was promoted to be brigadier general of volunteers, and he was afterward in command of a division in the Fifth Corps of the Army of the Potomac, participating in the battles of Fredericksburg and Chancellorsville In the battle of Gettysburg he commanded the Second Division of the Third Corps, and as such had an active share in the second days fighting, earning promotion to a major-generalship in the volunteer service From July 8, 1863, to November, 1864, he was chief of staff to General Meade and subsequently commanded the Second Corps of the Army of the Potomac in Grant's final campaign against Lee He was brevetted major general in the regular army for services at Sailor's Creek, commanded the District of Pennsylvania for a time, and after being mustered out of the volunteer service was placed in command of the Engineer Corps with the regular rank of brigadier general He was retired from active service in 1879 He published *The Virginia Campaigns of 1864 and 1865* (1882), *From Gettysburg to the Rapidan* (1882), and, with H L Abbott, a *Report on the Physics and Hydraulics of the Mississippi River* (1861)

HUMPHREYS, DAVID (1752-1818). An American soldier, diplomat, and poet, born in Derby (now Ansonia), Conn., July 10, 1752, and educated at Yale College, where he graduated in 1771 He entered the army early in the Revolutionary War, was commissioned captain of the Sixth Connecticut on Jan 1, 1777, two or three months later became major of a brigade under General Parsons, was made aid to General Putnam in 1778, and in 1780 became Washington's aid and military secretary He conveyed to Congress the official reports of the surrender of Yorktown, was put in charge of the colors and standards captured from the British troops, was raised to the rank of lieutenant colonel, and for his services received from General Knox, in 1786, a sword voted by Congress five years before In 1784 he acted as secretary of the commission, consisting of Adams, Jefferson, Franklin, and others, that went to Paris to arrange commercial treaties between foreign powers and the United States He served in the Connecticut Legislature in 1786, participated in the suppression of Shays's Rebellion in 1787, and from 1788 to 1790 lived with Washington's family at Mount Vernon, where he wrote *An Essay upon the Life of Gen Israel Putnam* In 1789

he served on a commission appointed to treat with the Creek Indians From 1791 to 1796 he served as United States Minister in Lisbon, being the first diplomatic representative of the United States ever sent to Portugal, and was then made Minister Plenipotentiary to Spain In 1801 he returned, bringing with him the first merino sheep introduced into the United States In the War of 1812 he served as brigadier general of the Connecticut militia He was a fellow of the Royal Society of London and a prominent member of the literary coterie known as the Hartford Wits, with whom he wrote the *Anarchiad* His other writings include *The Widow of Malabar*, a translation of the French tragedy, *An Address to the Armies of the United States* (1782), *The Happiness of America*, *The Future Glory of the United States*, and many political papers and orations He died in New Haven, Feb 21, 1818

HUMPHREYS, JOSHUA (1751-1838) An American shipbuilder of Revolutionary times He was Welsh by descent, but was a native of Haverford, Pa In 1794, when Congress decided to build up the navy, the most capable shipbuilders in the country were consulted The designs of Humphreys were regarded as the best and were accepted The ships laid down upon his designs were the *Constitution*, *President*, and *United States* of 44 guns, and the *Chesapeake*, *Constellation*, and *Congress* of 38 guns These famous ships formed the nucleus of the navy which achieved such success in the War of 1812, and for this reason Humphreys was called by many people "the father of the American navy"

HUMPHREYS, MILTON WYLIE (1844-) A distinguished American classical scholar, born in Greenbrier Co, W Va He served in the Confederate army from 1862 to 1865, and from 1867 to 1875 he was associate and adjunct professor of the ancient languages at Washington and Lee University (A M, 1869) In 1872-74, while absent on leave, he studied at Berlin and Leipzig and received the degree of Ph D at the latter university in 1874 Having held the chair of Greek at Vanderbilt University from 1875 to 1883, he was professor of ancient languages at the University of Texas from 1883 to 1887, and in the latter year became professor of Greek at the University of Virginia, where he remained until his retirement in 1912 In 1882-83 he was president of the American Philological Association, and for a number of years he was American editor of the *Revue des Revues* His publications include excellent editions of *The Clouds* of Aristophanes (1885), the *Antigone* of Sophocles (1891), and the oration *On the Crown* of Demosthenes (1913) Besides his extraordinary mastery of Greek, Professor Humphreys had a wide knowledge of mathematics In classics he was noted in part for his skill in interpretation, in part for his mastery of ancient Greek metres, displayed both in the introduction to his edition of the *Antigone* and in papers entitled "On Certain Influences of Accent in Latin Iambic Trimeters," "On Elision, especially in Greek," "The Influence of Accent in Latin Dactylic Hexameters," "On the Nature of Cæsura," in the *Transactions of the American Philological Association* (1876, 1878, 1879) These papers, on important topics, are of the first rank for scholarship and insight

HUMPHREYS, WILLIAM JACKSON (1862-) An American physicist, born at Gap Mills, Monroe Co, W Va He was educated at

Washington and Lee University (A B, 1886, C E, 1888), at the University of Virginia (1888-89), and at Johns Hopkins University (Ph D, 1897). He taught physics and mathematics at the Miller School (Va.) in 1889-93, physics and chemistry at Washington College (Md.) in 1893-94, and physics at the University of Virginia from 1897 to 1905. He was professor of meteorological physics at the United States Weather Bureau after 1905 and also at George Washington University after 1911. He participated in the United States eclipse expeditions to Georgia in 1900 and to Sumatra in 1901 and directed the Mount Weather Observatory in 1905-08. He is author of contributions on electric discharges, on flash spectra, on pressure effect on arc spectra, and on isothermal layers of the atmosphere.

HUMPHRYS, PELHAM See HUMFREY, PELHAM.

HUMPTULIP See SALISHAN STOCK.

HUMP YARD, RAILWAY. A hump yard is a set of railroad tracks so arranged as to facilitate separating trains or drafts of cars according to prearranged plans for distributing the cars in groups according to destinations, routes, or traffic requirements. The hump yard, as distinguished from a classification yard operated in some other way, has a track raised over a natural or constructed hump from 6 to 15 feet high, with a grade on either side of from 0.4 to 3 per cent. Cars are pushed by a locomotive to the summit of this hump, are uncoupled there, and run down from the hump by gravity. The first hump yard built in the United States was at Huff's Station, south of Greenbush, Va., and was built in 1892 by the Pennsylvania Railroad. A large modern hump yard may have four tracks over the hump, two in each direction, with a classification yard on either side of the hump. In a yard such as this there would be from 20 to 30 classification tracks on either side of the hump, and each track would have a capacity of from 40 to 50 cars. The classification tracks branch off from the track running from the hump, and the switches from the hump track to the classification track are in a modern yard controlled by compressed air from a central station.

HUMUS (Lat., ground). A generic term for the decomposed organic matter contained in soil. During decomposition of vegetable matter the carbon, nitrogen, oxygen, and hydrogen pass off in the form of water, carbon dioxide, ammonia, etc., or are carried down into the earth in solution, while the remainder of the constituents form compounds less easily removed, to which the name "humus" is properly applied. These compounds have been investigated chemically, but little is known as to their nature and relations, special names have been given to a few of them, as crenic acid, apocrenic acid, ulmic acid, and ulmin. They are of importance in relation to the fertility of the soil, increasing its power of absorbing and retaining water, lessening its tenacity, and causing more rapid absorption of heat from the sun's rays. They may also indirectly afford nutrition to plant life. See SOIL, COMPOST.

HUMUS PLANTS. Plants which grow naturally in humus soil. Ordinarily in nature, where large amounts of humus are found, there is a rich development of forest trees. Associated very intimately with the humus, however, are a number of plants which depend not only upon

the rich organic food found in the humus and in the shade furnished by the trees, but also upon the presence of fungi which permeate the humus. The significance of these fungi is discussed under the head MYCORRHIZA. Until recently the plants dependent upon humus have been called saprophytes, but inasmuch as more close investigation has shown that the dependence is very rarely directly upon the humus, but rather upon the fungi spoken of above, such plants are now referred to as symbiotic saprophytes. Among these are found not only plants destitute of chlorophyll, like the Indian pipe, but also a large number of green plants, even forest trees, such as beech and pine. Another group of humus plants is found in the soils of peat bogs having an acid reaction. Plants of very xerophytic character are peculiar to these soils, and members of the heath family (Ericaceae, qv) are particularly abundant (see Bog), the leatherleaf (*Chamaedaphne calyculata*), the cranberry, and some of the blueberries being among the best known. Attempts to cultivate the blueberry, until recently, have been quite unsuccessful, but a few good patches have been grown upon acid humus, thus opening a new field in horticulture and at the same time utilizing areas that were productive only after the acid, naturally in the soil, had been neutralized by heavy applications of lime. See FOREST, SAPROPHYTE.

HUN, HENRY (1854-) An American neurologist. He was born at Albany, N. Y., graduated in 1874 from Sheffield Scientific School (Yale), where he was an assistant in physics in 1874-75, and in 1879 graduated from Harvard Medical School. In 1885 he became professor of nervous diseases at the Albany Medical College (Union University). He served as secretary (1888-1909) and as president (1910) of the Association of American Physicians and as president of the American Neurological Association for the year 1913-14. His writings include *Guide for American Medical Students in Europe* (1883) and *Differential Diagnosis of the Diseases of the Nervous System* (1913).

HUNAN, hōo'nan' (Chin., south of the lake, i.e., the Tung-ting Lake). An inland province of China, bounded on the east by the mountains of Kiangsi, on the south and southwest by the Nan-shan Mountains, which separate it from the provinces of Kwangtung and Kwangsi, on the west by Kweichow and Szechwan, and on the north by Hupeh (Map China, K 6). Area, 83,880 square miles. It is made up of the basins of four rivers, which discharge into the Tung-ting Lake and through it into the Yang-tse. The chief of these rivers are the Siang, which rises in the Nan-ling and flows north, receiving many tributary waters in its course, the Tsze, and the Yuen, which has its origin in the southeast of Kweichow, the latter furnishing the shortest and most satisfactory route to Kweichow, Yunnan, and Burma, being navigable by native boats as far as Chenyuanfu on the Kweichow frontier. The general slope of the province is towards the lake. Hills attaining in some places the height of mountains are found in the south, southeast, and along the Kweichow border on the west. The soil is fertile, and in many parts two crops a year are produced. The chief agricultural products are tea, rice, hemp, and tobacco. Hunan is one of the principal tea-producing regions of China, and immense quantities, over 300,000 piculs, are shipped every year to foreign countries from Hankow. The coarser varieties are

prepared in brick form and sent overland via Hankow to Siberia and Russia. Rafts of timber are floated annually down the Yuan River to Hankow, in value as high as 10,000,000 taels a year. Both bituminous and anthracite coal is found and mined. The anthracite is of good quality and is exported. Iron, copper, and tin are also found. Capital, Changsha (pop., 250,000). Changsha was opened to foreign trade in 1904. The population of Hunan is estimated at from 20,500,000 to 23,600,000. Hunan was for a long time a closed province to foreigners, and Changsha was noted for its antiforeign propaganda, but this hostile spirit has almost entirely disappeared. Changsha is noted at present for its learning, culture, wealth, and the independence and sturdiness of its people, the latter trait characteristic of the Hunanese in general. Other large cities are Changteh (pop., 150,000), the "treaty port" Yochow, opened in 1899 (pop., 20,000), and Siangtan (pop., about 350,000). The Changsha-Chuchow section, 33 miles in length, of the Canton-Hankow Railway was built entirely by the Chinese and has been in operation since September, 1911.

HUNCH'BACK', THE The most successful comedy of J. Sheridan Knowles, produced in 1832.

HUN'DRED (AS *hundred*, Ger. *hundert*, from AS, Goth. *hund*, OHG. *hunt*, Ger. *hund*, OIr. *cét*, Lith. *szimtas*, Lett. *simts*, OChurch Slav. *sūto*, Lat. *centum*, Gk. *ekátov*, *hekatón*, Skt. *śata*, hundred + AS *-red*, connected with OHG. *radān*, Ger. *Rede*, account, speech, Goth. *raþjō*, Lat. *ratio*, reckoning, *rerī*, to think). An ancient territorial unit in England, less than a shire or county, and usually greater than a parish or town. The origin of the name is involved in obscurity, but it is supposed to be derived from a convenient grouping of 100 families for purposes of defense or for local administration. Hundreds varied greatly in size in different parts of England, from 2 square miles in the southern counties to 300 square miles in Lancashire, but they maintained considerable uniformity within the limits of a given county. They were not mere subdivisions of the county, being both historically and for various administrative purposes independent of the greater territorial division within which they were included. See **WAPENTAKE**.

Each hundred had a court of ancient and forgotten origin, which was known as the *Hundred Court*. This was held at frequent intervals and appears to have been of equal authority with the county courts, though its jurisdiction seems to have been more restricted, being apparently confined to civil causes, such as actions of debt and trespass. Like the other customary courts of the feudal period, such as the county courts, courts baron, and the like, the hundred courts were composed of the freeholders of the hundred, who were liable to do service as "suitors," i.e., triers of suits, as one of the obligations of their freehold tenure. Most of these courts have been abolished and their jurisdiction transferred to the county courts, but a few, which were courts of record, have been permitted to survive.

But the hundred was more than a political and administrative unit, it was also a communal unit. It was liable in damages for a false judgment given by the hundred court. As early as the reign of Edgar it was provided that the hundred should be responsible for the administration of justice and liable to punishment by

fine or otherwise if thieves and other criminals were not brought to justice. The Statute of Winchester in 1285 (13 Edw. I, c. 2) made the hundred liable to respond in damages for robberies committed within its limits if the offender was allowed to escape punishment. At a still earlier period it was subject to the famous murder fine imposed by the laws of Canute upon any hundred in which any one not an Englishman was found slain. (See **ENGLISHERY**.) As lately as 1886 a hundred was held liable for damages resulting from rioting. Consult William Stubbs, *Constitutional History of England* (3 vols., Oxford, 1880), Pollock and Maitland, *History of English Law* (Boston, 1899), W. S. Holdsworth, *A History of English Law*, vols. i-iii (ib., 1908-09). See **CHILTERN HUNDREDS**.

HUNDRED DAYS, THE (Fr. *les cent jours*). The term of Napoleon's second reign as French Emperor. The period extended from March 20, 1815, the date of his entry into Paris, to June 28, when Louis XVIII. once more assumed power. At Elba Napoleon had been kept informed of the dissension prevailing among the allies at the Congress of Vienna and of the extreme unpopularity of the restored Bourbons in France. Seizing the opportunity, he left Elba, February 26, landed with 900 men near Cannes, and called upon the country to rise in his favor, March 1. The apathy of the Bourbons at Paris allowed Napoleon time to recruit his strength. When Louis at last bestirred himself, it was too late. The Napoleonic fever had spread, the soldiers of the Empire rallied around their old leader, and the troops sent out against him joined his standard. The final blow to the monarchy came when Ney, after great hesitation, went over to Napoleon, who entered Paris in triumph March 20, Louis having fled northward to Ghent. Napoleon immediately organized a government, issued writs for the election of an extraordinary assembly to draft a new constitution, abolished the existing Legislature, and began to raise troops. Meanwhile the allies at Vienna, on hearing of his landing, pledged themselves to hunt down the "bandit" and to put him out of power once for all. Eight hundred thousand men were sent out against him. At Paris there was a foreboding that this sudden restoration could not last, but though men had lost much of the fear and respect Napoleon had been wont to inspire, the work of organization nevertheless went on actively. On June 1, in the Champ de Mars, Napoleon solemnly swore to this new constitution, which was very liberal in character, and then set out with his army, for he had succeeded in raising 287,000 men, for the north. (See **LIGNY**, **QUATRE-BRAS**, **WATERLOO**.) Four days after Waterloo, June 22, he abdicated in favor of his son, attempted to escape to America, failed, gave himself up to the English, and ended his days at St. Helena. See **FRANCE**.

HUNDRED YEARS' WAR, THE The name of the long series of contests waged by the English kings, between 1337 and 1453, to gain the French crown and French territory. It was by no means an uninterrupted war, but rather a succession of battles, truces, and peaces. The first great period of the war extends from 1337 to 1380. Philip VI. (1328-50), of the house of Valois, had succeeded Charles IV., the last of the direct descendants of Hugh Capet, since, in accordance with the Salic Law (q.v.), the crown of France could be transmitted through the male line only, though Edward III. of England was

a nearer relation to the late King, his mother, Isabella, being a sister of Charles Edward's claim, however, was weak in this, that if females could transmit claims to the crown, then there were others who had even better claims than the English King. On June 6, 1330, and May 30, 1331, Edward by letters patent recognized Philip's claims, and, had the latter been a more capable man, war might not have resulted. The French King interfered in the affairs of the Flemish cities, with which England had intimate commercial relations. Moreover, Edward was influenced by the exiled Robert of Artois, who had been unable to obtain his inheritance from Philip VI. Edward declared war in 1337 and gradually made alliances with the Emperor Louis IV and John of Brittany, who was opposed by Charles of Blois, cousin of Philip VI, in his attempts to secure his inheritance. It is this war in Brittany which the great chronicler Froissart (qv) has especially described. On the other hand, Philip established that close alliance of France and Scotland which was to endure for centuries. There were many small skirmishes during the first years of the war, the most important of which was the naval battle of Sluys in 1340, but neither side gained decisive victories, and on Jan. 9, 1343, a truce was concluded for three years, each side retaining its possessions. Hostilities, however, were resumed in 1345. At this juncture the alliance of the Flemish cities was lost to England by the death of Jakob van Artevelde (qv), the leader of the Flemings, who perished in a popular tumult. On Aug. 26, 1346, the English, under the leadership of Edward himself, won their first great victory at Crécy (qv), which showed that the French knights could not stand against the well-disciplined yeoman archers of England. The victors took possession of Calais in 1347.

Meanwhile France was already experiencing the evils of war, the distress of the peasants was great, financial troubles set in, made worse by the tampering with the coin and the ever-increasing taxes. The second great defeat of the French took place at Poitiers (qv) in 1356, where the famous Black Prince led the English, and where King John, the successor of Philip VI, was taken prisoner. The States-General now for a time had control of the administration. Their leaders were Etienne Marcel, provost of the Merchants, Robert le Coq, Bishop of Laon, and Charles the Bad of Navarre, but the revolt of the peasants (see JACQUERE) in 1358 caused the more conservative classes to rally to the aid of the Dauphin Charles, who had been appointed regent by the States-General during King John's captivity. A brief breathing spell was brought about in 1360 by the Peace of Bretigny (qv). John died in 1364, and his son Charles V (qv), who was to be known as "the Wise," succeeded him. Himself an unwarlike man, he had the help of a great soldier in Du Guesclin (qv). His object was to regain the lands his father had lost, and by interfering with the possessions of the English in France and attacking them in Spain he forced a new war in 1369. Du Guesclin did not attempt to meet the English in the open, but harassed them and cut off their supplies, and the English experienced a succession of misfortunes. Moreover, in 1376 the Black Prince died, and there was no one capable of taking his place, a year later Edward III also died and was succeeded by Richard II, a minor. When, in 1380, Charles VI (qv) succeeded his father, few pos-

sessions remained to the English in France. In 1396 a truce for 28 years was signed, which ended the first period of the war.

In France meanwhile Charles VI had become insane, civil war broke out between the factions of the Armagnacs (see ARMAGNAC) and the Burgundians, and Paris itself was distressed by the rising of the Cabochiens (qv) in 1413. In England Richard II was overthrown by Henry IV in 1399, and the latter was succeeded in 1413 by his son Henry V. But the house of Lancaster did not feel secure on the throne, and nothing would turn the attention of the people away from internal affairs as completely as a foreign war. So in 1415 the war began again with the invasion of France by Henry V. France disunited offered an easy prey to the English, and soon the country was almost entirely in their possession, especially as they were aided by Philip, Duke of Burgundy (qv), who was eager to revenge the murder of his father, John the Fearless (qv). To the first year of this period belongs the battle of Agincourt (qv), fought on Oct. 25, 1415, the last of the three great English victories. On May 20, 1420, the Treaty of Troyes was signed, by which Henry V was recognized as Regent of France and the heir of Charles VI, while the Dauphin was disowned by his own mother. The English held practically the whole of France.

In 1422 both Henry V and Charles VI died, and the former was succeeded by his son, Henry VI, a child of 10 months, who was crowned Henry VI of France at Paris, his uncle Bedford being Regent. Charles VII, the successor of Charles VI, gave no signs of ability, and it seemed as if Henry VI would really hold France permanently. But when affairs looked darkest, France was saved by Joan of Arc (qv), who came forward and raised the siege of Orléans in 1429, thus turning the tide of war. From that time on the English slowly but surely lost ground, and when, in 1453, their last great captain, Talbot, fell at Castillon, the war ceased. Of all the extensive English conquests in France, nothing remained except the city of Calais and a small adjoining district. This France did not regain until 1558. HUNEBOURG, un'boor', COMTE DE See CLARKE, H. J. G.

HUNEEUS, ōn'ā-ā'ōos, JORGE (1831-89) A Chilean statesman, born in Santiago. He was educated at the University of Santiago and after graduation taught mathematics in the institute. A fine speaker and a leader of the Liberal opposition, he was sent into exile by President Montt, but improved his time by studying the government and people of the United States. Recalled to his native land in 1861, he was elected to the House of Representatives and became its Speaker. He was made professor of administrative and constitutional law in the university the same year, professor of political economy in 1869, and rector in 1883. While lecturing at the university, he successively held the positions of secretary of the departments of Justice, Public Instruction, and Foreign Affairs, and senator from

the Province of Atacama. He published *Historia política de Chile* (1862), *La administración Montt* (1863), *Historia de la guerra con España* (1866), *Historia de la guerra del Pacífico* (1883). His most important work is *La Constitución ante el Congreso* (1879). Consult J. Huneus, *Obras* (4 vols., Santiago, 1890-91), edited by his sons and published by the government.

HUNEKER, hūn'k-ēr, JAMES GIBBONS (1860-) An American musical writer and critic, born in Philadelphia, Pa. He was a pupil of Alfredo Barilli, and of Ritter and Doutréau for theory, in Paris. On the completion of his studies in the latter city he returned to New York, where he took up his permanent residence (1885). He was musical editor, and in 1902 became dramatic editor, of the New York *Sun*. His numerous contributions to the leading magazines and reviews contain vigorous and consistent presentations of his musical ideals. Much of his later work is in the nature of essays. His writings include *Mezotints in Modern Music* (1899), *Chopin as Man and Musician* (1900), *Melomaniacs* (1902), *Overtures* (1904), *Iconoclasts* (1905), *Visionaries* (1905), *Egoists*, *A Book of Supermen* (1909), *Franz Liszt* (1911), *The Pathos of Distance* (1913).

HUNERIC. See HUNNERIC

HUNFALVY, hūn'fōl-vē, JÁNOS (1820-88) An Hungarian geographer and statistician. He was born in the County of Zips, Hungary, became professor of statistics in the Academy of Kesmark, took part in the political agitation preceding the revolution of 1848, and was professor of history in the polytechnic school at Buda (1866-70) and of geography in the University of Pest after 1870. He was elected a member of the Hungarian Academy in 1865 and died in Budapest. Hunfalvy wrote a *Universal History* (1850-51) and a *Universal Geography*. Of the latter only two volumes appeared during the author's lifetime, the third was published in Budapest in 1890. An excellent descriptive work on Hungary, entitled *A magyar birodalom természeti viszonyainak leírása*, appeared in 1863-66. He issued in German his *Ungarn und Siebenbürgen in Originalansichten* (1856), and in both German and Magyar his work on the *Travels of Ladislas Magyar* (1859).

HUNFALVY, PÁL, or PAUL (1810-91) An Hungarian philologist, ethnographer, and historian, brother of the preceding. He was born in the County of Zips, studied law at Pest, and from 1842 to 1848 was professor of law at Kesmark. Then he was elected to the Hungarian Diet, in which he sat until it was dissolved, when he went to Pest and in 1856 founded the philological review *Magyar Nyelvészeti*. Having been elected to the Hungarian Academy in 1859, he was for many years its librarian. He wrote *Chrestomathia Fennica* (1861), *Utazás a Balti-tenger vidékein*, travels in the Baltic country (1871, German, 1874), treatises on the dialects of the Voguls (1872) and the Ostiaks (1875), a Magyar ethnography (1876, German, by Schwicker, 1877), in Prochaska's series on the peoples of Austria-Hungary, a volume entitled *Die Ungarn oder Magyarer* (1881), *Die Rumänen und ihre Ansprüche* (1883), in which he contends that the place of origin of the Rumanian nation must be sought south of the Danube and a *Ruman nyelv*, a study of the Rumanian language (1878).

HUNGARIAN CONFESSION, THE A

confession of faith prepared by the Synod of Czengei and adopted by the Reformed church of Hungary, 1558. Its chief points were its emphatic rejection of the anti-Trinitarian views which had spread widely through Hungary, of the Roman Catholic and Lutheran doctrines of the Eucharist, and of Anabaptism. Upon the point of reprobation it is silent. The confession was superseded in 1567 by the Hungarian Synod's acceptance of the Second Helvetic Confession (1566). Consult Schaff, *Creeds of Christendom*, vol. 1 (New York, 1881), and Curtis, *History of Creeds and Confessions* (Edinburgh, 1911).

HUNGARIAN GRASS. See FOXTAIL GRASS

HUNGARIAN LANGUAGE. Called by those who speak it, Magyar, one of the Ural-Altaic group of languages, and both politically and literally the most important representative of the group. With the exception of the closely allied Finnish (including the various Finnic dialects spoken in Russia, as well as the Lapp) and Turkish, and the problematic Basque in the Pyrenees, it is to-day the only European language that does not belong to the Indo-Germanic group. The Ural-Altaic languages are divided into (1) the Finno-Ugric and (2) Samoyedic, forming the Ural branch, and (3) Turkic, (4) Mongolic, and (5) Tungusic, forming the Altaic branch. The linguistic position of Hungarian was for many years the subject of a heated controversy—one school, led by Vámbéry, claiming its close affiliation with Turkish, while the other, under Hunfalvy, placed it where it is now recognized as belonging, in the Finno-Ugric division.

Hungarian, like other Ural-Altaic tongues, is agglutinative in structure. It is built upon a basis of monosyllabic roots, through the addition of successive suffixes, which entail no inner change or structural modification in the original stem, but are merely set up in a row, one after another, like a row of bricks. The suffixes themselves, however, are modified in obedience to a law of so-called vowel harmony, which forms the most distinctive feature of this group of languages. The vowel sounds in Hungarian are divided into three classes: open vowels, *a, á, o, ó, u, ú*, close vowels, *e, ö, ő, ü, ü*, middle or neutral vowels, *é, i, í*. These neutrals may be used indifferently in words containing vowels of either of the other classes, but suffixes containing open or close vowels may stand only after a root containing a vowel of the same class, e.g., *házban*, 'in the house', *kertben*, 'in the garden', *várastandának*, 'they will be expected', *létezendek*, 'they will be entreated'. The pronunciation of the consonants is similar to that of Latin, excepting the sibilants and a few others which are peculiar to the language. Thus, Eng *s* is written *sz*, Eng *sh* is represented by *s*, Eng *ts* by *c* or *cz*, Eng *ch* by *cs*; Eng *j* by *ds*; and the sound of *z* found in *azure* by *zs*. Hungarian has no inflectional endings, in the strictest sense of the term. It has no grammatical gender, or even suffixes indicative of sex, *ő* means 'he' or 'she', *neki*, 'to him' or 'to her', and so on. In expressing case relations the bare stem is used regularly for the nominative and to some extent for the possessive, the other cases are represented by means of the various postpositive particles which in Hungarian take the place of prepositions, e.g., *ház*, 'house', *házban*, 'in the house', *házból*, 'out of the house', *házelőtt*, 'in front of the house', *házhoz*, 'towards the house', *házal*, 'with the house', *házat*, 'house' (accusa-

tive), *házalatt*, 'under the house', *házfellett*, 'above the house', etc. A noteworthy peculiarity is the system of possessive suffixes employed with substantives, closely analogous to the personal endings of the verbs e.g. *házam*, 'my house', *házad*, 'thy house', *háza*, 'his (her) house', *házunk*, 'our house', *házatok*, 'your house', *házuk*, 'their house'. In the absence of the auxiliary verb 'to have,' these possessive endings are used with the verb 'to be,' to denote ownership, *nekünk van házunk*, 'to us is house ours,' i.e. 'we have a house'. The verbal system in Hungarian is highly developed, giving the language a remarkable flexibility and a wide range of expression, though it offers to foreigners the chief difficulty in acquiring the language. There are two distinct forms of the active verb—a definite and an indefinite form, differing throughout in their terminations. Their respective uses are exceedingly idiomatic, but in general the distinction between them depends upon whether or not the object of the verb is a definite person or thing *látok*, 'I see', *a kutyát látom*, 'I see the dog'. Hungarian is especially rich in derivative verbs. Not only are there suffixes which, added to the simple verbal stem, form causative, frequentative, inceptive, intensive, diminutive, reciprocal, potential, and desiderative stems, but with the characteristic facility of agglutinative languages, two or more of these suffixes may be used in combination, resulting in such linguistic anomalies as reflexive-frequentative-potential, intransitive-diminutive-potential, and transitive-frequentative-causative-potential verbs. The following examples will give some idea of the formation of derivative verbs *látni*, 'to see', *látogatni*, 'to visit', *beszélnek*, 'they talk', *beszélgetnek*, 'they chatter', *beszélkednek*, 'they talk with each other', *ver*, 'he beats', *verintet*, 'he can beat gently'. Among the peculiarities of the language are the two-person suffix, *lak*, used in place of the regular ending of the first person, when the subject of the verb is 'I,' and the object 'thee' or 'you', the use of the singular number with ordinal numerals, e.g. *tíz ház*, 'ten house' (not 'houses'), and the inverted order of name and surname, e.g. Arany János = John Arany, Petőfi Sándor = Alexander Petőfi. The requirements of emphasis often allow the words in a short Hungarian sentence to be put in an order the reverse of that in English e.g. *Pénzemet elvett szolgádom*, 'money-my away-took servant-my' ('my servant took (away) my money'). The extent to which agglutination may be carried in the Hungarian language will be illustrated by the fact that it is possible to perform the following operation of word building *Magyar*, 'Hungarian', *Magyarázni*, 'to render into Hungarian,' hence 'to explain', 'to translate', *megmagyarázni*, 'to translate,' with the added notion of the accomplishment of the action, the syllable *meg* having the force of the German prefixes *be* and *er*, *megmagyarázhat*, 'he may translate', *megmagyarázhatatlan*, 'that cannot be translated', 'untranslatable'; *megmagyarázhatatlanabb*, 'more untranslatable', *legmegmagyarázhatatlanabb*, 'most untranslatable', plural subs *legmegmagyarázhatatlanabbak*, 'the most untranslatable', a *legmegmagyarázhatatlanabbakal*, 'with the most untranslatable'. A large number of names of common things in the Hungarian language are borrowed from the Slavic and German.

HUNGARIAN LITERATURE. Until modern times literature in the vernacular did not flourish to any very great extent in Hungary. Latin was the general medium of cultured expression during the Middle Ages, and even recently it has sometimes sought to supplant the popular tongue in official and literary use. There are, however, documents in Hungarian or Magyar that belong to the mediæval period, most of them being translations of legends and of books of the Bible. The earliest continuous monument of Magyar is a funeral ceremonial dating from about the beginning of the thirteenth century. From the middle of the fifteenth century until the second half of the sixteenth century there was some activity in the way of translating into Hungarian the lives and legends of the saints and the individual books of the Bible.

With the religious revolution ordinarily termed the Reformation there was inaugurated a more important era of literary production. Poetry was cultivated by Valkai, Tinódi, Rimai, Balassa, but no very great degree of originality marked the ensuing period, for from then until the closing years of the eighteenth century Magyar literature was chiefly one of imitation. Considerable attention, however, was shown to some of the more striking forms of literary art. Thus, during the sixteenth and seventeenth centuries lyric verse was cultivated, the drama was started by Karádi (1569), and much prominence was given in the seventeenth century to epic verse, by the poems of Zrínyi, Gyongyosi, László, and others. Before the commencement of the eighteenth century there also appeared many works of a polemical, legal, and philological nature.

During the eighteenth century an endeavor was made by the central authorities to subordinate Hungarian life and patriotic feelings to Germanic ideals. The attempt failed, but it resulted temporarily in an undue production of books in Latin and German, to the detriment of composition in Magyar.

Near the close of the century, and with the advent of the French Revolution, there was a reaction, and societies for the cultivation of the Magyar tongue were formed, and various periodicals (the first newspaper in Hungarian was started by Ráth at Pressburg in the eighth decade of the eighteenth century) founded in the same interest. The new movement, which coincided with the great national awakening in Hungary, bore rich fruit, and within the first quarter of the nineteenth century all foreign elements

gave way before it. The credit of this is largely due to Francis Kazinczy, the great linguistic reformer, and the poets Csokonai, Dajka, Verseghy, Alexander Kisfaludy, and Virág. The golden age of Hungarian literature was the 30 years preceding the revolution of 1848-49. Charles Kisfaludy, brother of Alexander, created the Hungarian drama by his tragedies and comedies, and his contemporary Katona won great fame as a writer of tragedy. Kolcsey, by his poems, ballads, prose writings, and orations, exerted a potent influence upon the patriotism of the nation. Fáy's fables and Cuczor's and Vorosmarty's popular epics also did much to evoke and foster a true national feeling. In the lyrics of Alexander Petőfi, one of the greatest and most original of modern poets, whose "Up Magyars!" became the war hymn of the revolution, and in the epic verses and ballads of Arany, Hungarian literature reached its culmination in the middle of the nineteenth century. Their contemporary, Bajza, was not only an eminent lyrical poet, but an historical writer and æsthetic critic. Jósika (a disciple of Scott's) and Eötvös, eminent in the field of fiction, exercised a large influence. In the domain of political literature and journalism Szechenyi, Kosuth, Eötvös, and Csengeri hold high rank. In the field of history Horváth, Jászay, and Szalay deserve mention. In 1848 the powerful national awakening culminating in revolution supplied a new inspiration. National consciousness prompted Tompa's *Folk-Tales* and *Folk-Sagas* (1846) and Erdélyi's *Hungarian Folk-Songs and Tales* (1846-48), with literary and æsthetic essays. Erdélyi's *Poems* (1844), lyric in the main, exercised a powerful influence over the famous trio, Petőfi, Arany, and Tompa. Arany (1817-82), the greatest ballad writer, surpassed him in formal perfection, and his greatest work also was a national epic, *Toldi*, in 12 cantos, celebrating the exploits of Toldi, the Hungarian Samson. Tompa (1819-68), unexcelled for sombre melancholy, struck the popular fancy with his *Poems* (1847). In drama Szilágyi (1814-78), with a wonderful mastery of dramatic development and situation, mostly based on intrigue, created a new genre with *The Deserter* (1843), which still holds the boards. His masterpiece, *Mamma* (1857), and other successful plays called forth a host of successors, with the results that the Viennese farces and vaudevilles were banished from the Hungarian stage.

However, the revolution of 1848-49 doomed many gifted writers to the dungeon, the scaffold, or exile. Lyric poetry was under the ban, the activity aroused sought new channels. Arany translated Shakespeare, Tasso, Goethe, Szász followed suit with masterly versions of Molière, Hugo, Dante, Shakespeare, Tennyson, Goethe, Schiller, and Heine. At this time the novel, with its opportunities for covert allusions, and the drama gained ascendancy. Jókai (1825-1904), novelist, poet, publicist, historian, and political champion, won his reputation, and Szász (1829-1906) proved his genius equally prominent in lyric poetry, fiction, and journalism. In 1860 the Austrian restraint was modified, and this gave a new impetus to literature. Tolnay's (1837-1902) *Ballads* (1861) were justly classed with Arany's, his *Lyric Poems* (1865) are strikingly original and tinged with melancholy, while the same brooding over life's problems characterizes his novels. Madách (1826-64) grappled with philosophical questions in *Man's Tragedy*,

his best work. Rákosi (1842-) produced in *Æsop* (1866) a comedy remarkable for poetic language and deft character drawing, while his keen drama, *Magdalen*, and the æsthetic study of tragedy are among the best contributions to Hungarian drama.

The constitution of 1867 marked a new epoch, the fight for nationalism being over, the Hungarians could look more soberly upon themselves, the wider horizons of cosmopolitanism having opened new vistas. In short stories, novels, and especially in his comedies, *The Good Patriots* (1872) and *New Men* (1873), Toldy (1844-79) gave splendid satires of contemporary life. Csiky (1842-91), the most fertile playwright, elicited applause with his *Proletarians*. Hungarian literature has its realistic writers, its psychological fiction, the short stories of Gyulai (1826-1909), who fosters the highest literary ideals in his *Poems* (1882), his critical studies and university lectures. Kornél Abrányi (1849-), in the character play *The Infallible Man* and the novels *Who is Stronger?* and *The Philosophy of the Husband*, devoted himself to a study of the problems of marriage. Mikszáth (1849-1910), probably the most popular novelist of the day, champions the peasants in North Hungarian village stories, matchless in their style, language, and sympathetic tone. Herczeg (1863-) shows an extraordinary power of psychological analysis in his portraits of the higher classes of Hungarian society. Finally Sigmund Bródy (1840-), a wonderful complex of unusual powers and nonchalance in workmanship, represents symbolism hand in hand with the most uncompromising realism.

Bibliography. Toldy, *A Magyar nemzeti irodalom története* (*A Description of the National Literature of Hungary*, Budapest, 1851); the first volume, which deals with the mediæval period, was translated into German (ib, 1865); Dux, *Aus Ungarn* (Leipzig, 1880), Schwicker, *Geschichte der ungarischen Literatur* (ib, 1889), Horváth and others, *Histoire de la littérature hongroise*, French adaptation by Kont (Budapest, 1900), Reich, *Hungarian Literature* (London, 1906), Beöthy, *A Magyar irodalom története* (Budapest, 1906, etc.), J. Kont, *Geschichte der ungarischen Literatur* (2d ed., Leipzig, 1909), Frigyes Riedl, *History of Hungarian Literature* (London, 1909), Katona and Szinnyei, *Geschichte der ungarischen Literatur* (Leipzig, 1911), with bibliography. The most useful bibliographic works are those of Kertbeny, covering the period 1454-1600 (Budapest, 1880), K. Szabo, for 1473-1711 (ib, 1879-98), Petrik, *Bibliographia Hungarica, 1712-1860* (ib, 1888-92), Kertbeny and Petrik, *Ungarns deutsche Bibliographie, 1801-1860* (ib, 1886), Petrik, *Bibliographia Hungarica, 1860-1900* (ib, 1885-1906), Kont, *Bibliographie française de la Hongrie* (Paris, 1913). There are also several periodicals devoted to Hungarian bibliography. The biographical dictionaries of C. von Wurzbach (Vienna, 1856-91, in German) and J. Szinnyei (Budapest, 1891 ff., in Hungarian) are very useful. Of the periodicals, not written in Hungarian, dealing with Hungarian literature, the most noteworthy are *Ungarische Revue*, edited by Hunfalvy (Leipzig, 1881-95), *Revue de Hongrie*, edited by Huszár (Budapest, 1908), *Jung Ungarn*, edited by Vész (Berlin, 1911-).

HUNGARIAN VERSION See **BIBLE**
HUN'GARY, *oi*, officially, **THE LANDS OF THE HUNGARIAN CROWN** A kingdom of central Europe, constituting one of the units in the dual monarchy of Austria-Hungary. It occupies a compact area of 125,608 square miles, comprising Hungary proper, with Transylvania and the crownlands of Croatia and Slavonia and Fiume, which are united to Hungary, but have more or less independent administrations. The Lands of the Hungarian Crown are often designated as *Transleithania*, or the country beyond the *Leitha*, the Austrian half of the monarchy being called *Cisleithania*, or the country on this side of the *Leitha*, the *Leitha* being a small river which forms a part of the boundary between the two divisions. The Hungarian name of the country is *Magyarország* (pronounced *möd'yör-ör'sag*), the 'land of the Magyars' (Hungarians), the German name is *Ungarn*. The Kingdom of Hungary, exclusive of Croatia and Slavonia, has the form of an oval with its longest axis lying east and west along the parallel of 46° N. It is encompassed for two-thirds of its perimeter by the broad curve of the Carpathian Mountains, which, beginning at the Danube a short distance below the Austro-Hungarian capital, Vienna, extend northeast, then east, then southeast and south, and finally west, forming a great wall on the side of Moravia, Galicia, Bukovina, and Rumania. On the west Hungary proper borders on Lower Austria and Styria, and on the south, for a distance of about 100 miles, on Servia, from which it is separated by the Danube. Southwest of Hungary proper, and separated from it by the Drave and the Danube, is the dependent Kingdom of Croatia and Slavonia, a great part of whose boundary is formed by the Save, separating it from Bosnia and Servia. Croatia has a coast line on the Adriatic, and on an arm of this sea is Hungary's busy port of Fiume.

Topography The two great orographic features of Hungary are the Carpathians and the vast plains which they inclose in their broad sweep of about 800 miles. Croatia and Slavonia are traversed by the eastern offshoots of the Alps. The Carpathians spread out laterally in minor ranges, and a large portion of Transylvania, in the extreme east of the kingdom, is covered by them. The loftiest portions of the Carpathians are the High Tatra Range in the north and the Transylvanian Alps in the southeast, which rise in peaks over 8000 feet above sea level. The culminating point of the High Tatra is the *Gerlsdorferspitze*, 8737 feet. The Carpathians, rising above their densely wooded lower slopes, present an imposing aspect, with their naked granite peaks, on whose summits but little snow rests through the winter. The great stretch of monotonously level land in the central and southern parts of Hungary proper is divided into the Little Hungarian and the Great Hungarian plains. The Little Hungarian Plain (*Kis-Alfold*) in the northwest, with an area of about 5000 square miles and a mean elevation of 450 feet, lies upon the islands and both sides of the Danube from *Pozsony* to *Esztergom*. A portion of its surface is swampy, but for the most part it is exceedingly fertile. The Great Hungarian Plain (*Alfold*), which is the basis of Hungary's agricultural wealth and the principal seat of the

Magyar nationality, lies in the centre of the country between the Danube and the northeastern highlands. It covers an area of nearly 40,000 square miles and lies at an average elevation of 325 feet above sea level. Its surface has a very gradual slope from north to south. Low hills of loess and sand, with deep, swampy hollows, some impregnated with alkaline salts, lend the only appearance of relief. Trees rarely break the surface line except at villages, which are shaded generally by acacias. The soil, especially in the broad alluvial lands, is exceedingly fertile. In spite of its monotony, the *Alfold*, with its interminable expanse, its boundless fields and widespread villages, its great herds of cattle and droves of horses, and its picturesque types of peasants, herdsmen, and fishermen, is a region replete with interest for the traveler and with poetical charm for its inhabitants.

Hydrography The Danube receives the drainage of the entire country, except a small area in the north, which is drained into the *Vistula*. The course of the Danube from *Piessburg* to *Orsova* is nearly 600 miles, and the river is navigable throughout. The principal tributary from the north is the *Theiss* (*Tisza*), which traverses the Great Hungarian Plain, and the principal affluent of which is the *Maros*, from the west and south the Danube receives the *Drave* and the *Save*. In the Hungarian coat of arms four silver stripes represent the Danube, the *Tisza*, the *Drave*, and the *Save*. There are two large lakes in Hungary—the *Balaton* (*Platten See*), with an area of about 400 square miles (including submerged marshes), and the *Neusiedler See* or *Ferto*, 110 square miles, both lying in the western part, south of the Danube. In the Carpathians there are many beautiful little lakes of great depth, to which the Hungarians apply the name "*tengerszem*" (eye of the sea).

Climate Hungary has a continental climate and may be divided into two main climatic belts—the highland belt forming the north, east, and southeast portions, and the lowlands occupying the great central and southwestern parts. The winter, however, is severe throughout the country, and in the highland region the temperature sometimes falls as low as -18° F, while in the lowlands it seldom falls below 5° F. The summers are oppressively hot in the central lowlands, the *Alfold*, where the mercury rises to 95° F or even 105° F. The rainfall differs considerably between the highlands and the lowlands, the annual precipitation in the former being 47 inches and in the latter only half as much. The *Alfold* suffers frequently from prolonged droughts, but may at other times receive even excessive rains.

Geology and Mineral Resources Hungary stands in marked contrast to Austria in that by far the greater part of its surface consists of geologically recent formations. The Great Plain, watered by the Danube and the *Theiss*, presents an almost unbroken surface of Quaternary and recent alluvial deposits, while the great northern and eastern mountain systems show a preponderance of Tertiary rocks on their surface. The Croatian and Slavonian highlands are of Jurassic and Triassic formation, and here also are the chief outcroppings of the coal measures. Achaean diabases and granites occur in west and east Transylvania, and along the entire south slope of the Carpathian Mountains runs an extensive belt of volcanic rocks. The nuclear mass of the Carpathians is largely con-

structed of granite Hungary possesses a very considerable mineral wealth. There are great deposits of coal, iron, and salt, lead, copper, silver, and gold are found in various localities, the last mentioned chiefly along the rivers of Transylvania. Antimony, cobalt, nickel, mercury, and zinc also occur, and among the non-metallic minerals there are precious stones, kaolin, marble, and porphyry. The Hungarian opal, found in the trachyte beds near Vorosvágás, is particularly worthy of mention. It is only within recent times that the wealth of coal and iron has begun to be exploited on a large scale. The deposits of salt in the County of Mármaros, in the eastern Carpathians, which are worked by the state, are practically inexhaustible. There are hundreds of mineral springs scattered throughout Hungary. Among the most celebrated are those at Tatra-Fured (Schmeks), in the northern Carpathians, Mehádia (Baths of Hercules), near Orsova and the Iron Gate of the Danube, and Fured, on Lake Balaton, and Harkány, near Fünfkirchen (Pecs).

Agriculture, Live Stock, Forests, etc. Hungary is preeminently an agricultural country, 68 per cent of the total population being included in the agricultural class. The country made marked progress, both in the extent of the industry and in respect to agricultural methods, during the last three decades. A large majority of the cultivators of the soil are independent landowners. There are, however, a great many large estates belonging to the state and to members of the nobility, upon which the prevailing system of agriculture is very similar to that in vogue upon the large English estates. The average size of these 3977 large holdings is 4630 acres, or $7\frac{1}{4}$ square miles. The smallest holdings, numbering 1,459,893, average somewhat under $2\frac{1}{2}$ acres. The improvement in agriculture is largely indebted to the activity of agricultural societies. The natural conditions are generally favorable to the industry, the great fertility of the soil being especially a marked feature of the Hungarian plain. In some respects this plain is comparable to the Western prairies of the United States, but, like that region, it is subject to an uncertain rainfall, and it contains considerable stretches of sandy, arid land as well as marshy tracts, which have never been brought under cultivation. While the products of the country are characterized by their great variety, Hungary is best known for its production of wheat, live stock (including horses), and wine, the first two entering the European markets in competition with American products. The area devoted to wheat increased from a little less than 6,500,000 acres (on an average) during the period 1881 to 1885 to 9,153,688 acres in 1911, but decreased to 8,771,200 acres in 1913 and is now about equal to the combined acreage of rye, barley, and oats, which are about on a level with each other in importance. The increase in the area devoted to wheat was principally in the sandy and previously uncultivated tracts of central and south Hungary. Increased attention is also being given to corn, 7,189,219 acres having been devoted to its cultivation in 1911 and 7,212,404 acres in 1913. A large variety of root crops are grown, of which the potato leads in importance, followed by beets, much less than half of the latter crop being sugar beets. In 1913 nearly 450,000 acres were planted with sugar beets. The yield of the principal agricultural staples will be found in the table

under AUSTRIA-HUNGARY. Vine culture is extensively carried on in the hilly districts, the Hungarian wines being the most excellent known to the market. The most famous Hungarian wines are those that bear the name of Tokay. During the latter part of the nineteenth century the phylloxera devastated the Hungarian vineyards, and their area greatly decreased. From an average of 367,360 hectares (907,763 acres) in the period 1881 to 1885 it decreased to 245,405 hectares (606,407 acres) in 1895, but had increased again in 1911 to 357,867 hectares (884,305 acres). Hungary has an extraordinary wealth of temperate-zone fruits. The grapes are unsurpassed in flavor, and the plums and watermelons are of an excellent quality. Apples, pears, cherries, etc., are very extensively raised, and some semitropical fruits are cultivated in the south. Nuts are found in great variety. There is a considerable production of tobacco, but this is under the monopoly of the crown.

The Hungarian horse, though not large, is in great demand in the European market, because of its endurance and swiftness. The superiority of the breed is due to the care of the government, which selects and owns most of the stallions kept in the country. The fondness of the Hungarian for horses is well expressed in the saying, "The Magyar was created on a horse." The number of horses in 1911 was 2,351,481. In the same year there were 7,319,121 head of cattle, 8,548,204 sheep, 7,580,446 hogs, and 426,981 goats. As compared with the figures of the 1895 census, there was a decided increase in all varieties of live stock. In some sections buffaloes are used in considerable numbers in tillage. The Hungarian oxen are characterized by the extraordinary spread of their horns. The principal forest area is in the Carpathian Mountains and consists of forests of beech, oak, and pine. The numerous rivers of the country are rich in fish, and thus contribute an important item to the food supply of the people.

Manufactures. Since no duties can be collected upon the imports from Austria, the Hungarian manufacturing industries must compete with the long-established and highly developed industries of the sister monarchy, but in spite of this much progress has been recently made. The government has sought to encourage industries by favorable legislation, such as exemption from taxation. Most of the industries are being thoroughly modernized—concentrated under large plants, with highly improved machinery. Those which draw their supplies from the abundant agricultural products of the country—flour milling, brewing and distilling, sugar and tobacco manufactures, etc.—have taken first rank in importance. Iron products, clothing, and many less important items are also included among the manufactures. Many of the large establishments are centred in Budapest.

Transportation and Commerce. In respect to railway mileage Hungary will compare favorably with other European countries. Including Croatia and Slavonia, there were, in 1911, 13,041 miles of railway lines, 5048 miles of which were owned by the state, while 5902 miles of the remainder were operated by the state. Hungary has the distinction of having first applied the "zone-tariff" system to its railroads. The Danube and its tributaries afford extensive facilities for water transportation. The navigation of some of the rivers, notably the Theiss, has been greatly improved through the shortening of the course

by means of numerous cuts. In 1911 the country had 2176 miles of rivers and canals navigable by steamers. In 45 years (1867-1911, inclusive) the government expended more than \$60,000,000 on the maintenance and improvement of the waterways. The limited coast line tends to restrict the country's participation in the seagoing trade. The principal port, however, Fiume, is rapidly growing in importance, and a subvention is granted to Hungarian vessels registering in this port, the number of which has rapidly increased. About 70 per cent of the imports are from Austria, which takes about the same proportion of the exports. This arises from the fact that the two countries are mutually complementary in respect to their products, and that trade between them is free, whereas there is a tariff barrier to the trade with other countries. Grain, cattle, and other farm products pass from Hungary to Austria in return for manufactured products, principally textiles. Germany occupies a second place in the trade with Hungary. In 1913 the imports were valued at \$406,400,000 and the exports at \$375,500,000.

Government. The Emperor of Austria is King of Hungary. The foreign, military, and naval affairs of the Austro-Hungarian monarchy are conducted jointly by Austria (Cisleithania) and Hungary (Transleithania) through the medium of common ministries (including a ministry for the common finances) and the so-called delegations representing the separate halves of the monarchy. The Crownland of Croatia-Slavonia enjoys autonomy in local affairs, having its own Diet and its own ban or governor. It is, however, also represented in the Hungarian Diet. Since 1867 Transylvania has been an integral part of Hungary. In the national Hungarian Parliament the Magyar interests are predominant, and the Magyar language is official throughout Hungary proper, being obligatory in schools, etc. Croatia and Slavonia are allowed the official use of their native language. A full exposition of the government and the educational system, and a statement of finances, will be found in the article **AUSTRIA-HUNGARY**.

Defense. For army, see under **AUSTRIA-HUNGARY**, and for navy, under *Austria-Hungary* in article **NAVIES**.

Population. The population of the Lands of the Hungarian Crown in 1910 was 20,886,487, or 166 per square mile. This was somewhat more than two-fifths of the population of the Austro-Hungarian monarchy, exclusive of Bosnia and Herzegovina. There are a large number of racial elements represented in Hungary, and the bitterness of racial feeling is the occasion of much political and social friction. The Magyar-speaking population numbers 10,050,000, but this figure includes a large number of persons not of Magyar blood. The Rumanians (Wallachs), mostly in Transylvania, number 2,949,000, and the southern Slavs (Croats and Serbs) about 2,940,000. The northern Slavs number 2,441,000, about four-fifths of them being Slovaks, and the remainder mainly Ruthenians. Hungary has a German-speaking population of 2,037,000. The Germans constitute an important element in many of the cities, and in Transylvania there is a German-speaking district known as the "Saxon Land." There are over 932,000 inhabitants of Jewish blood, most of whom are included in the Magyar-speaking population. Next to Rumania, Hungary contains a larger number of gypsies than any other European country. They form a

picturesque element in the population, and their music is quite a feature in the charms of rural life in Hungary. There are a number of Armenians and Bulgarians in the kingdom. The population of Transylvania consists mostly of Rumanians, and the Magyar element is but feebly represented in Croatia and Slavonia. The Magyars are, as a rule, the landowners of the country. Hungary is unique among progressive European countries in the extent to which the different races still retain their own peculiar and long-established costumes. The costume of an Hungarian peasant is made of a linen shirt with long sleeves, reaching to the knee, a bodice ornamented with metal buttons or cords, wide linen trousers or tight-fitting ones, made of black or blue cloth, and stuck into leather boots ornamented with cords, a black round hat with feathers, or a black fur cap for headdress, and a cloak made of close, coarse cloth and trimmed with fur, cords, etc., or a wide sleeveless sheepskin coat, worn also to some extent in summer. The costume of the Hungarian peasant woman is also very picturesque and is made usually of lighter materials. The population is very largely centred in villages, some of which contain several thousand inhabitants, but there are a few large towns. Budapest in 1910 had a population of 880,371, showing a gain of 20 per cent in the last decade. Szegedin, with a population in 1910 of 118,328, is the only other town containing over 100,000 inhabitants. Cities having between this and 50,000 inhabitants in the order of size, are Szabadka (Maria-Theresiopol), Debreczin, Agram (Zágráb), the capital of Croatia and Slavonia, Pressburg (Pozsony), Temesvár, Keskemet, Grosswarden (Nagy-Várads), Arad, Hódmező-Vásárhely, Klausenburg (Kolozsvár), Ujpest, and Miskolcz. Other well-known towns are Kionstadt and Hermannstadt in Transylvania, Fiume, Kaschau, Oedenburg, Stuhlweissenburg, Raab, Eszék, and Gyan (Esztergom), the seat of the Roman Catholic Primate of Hungary. The population of the Kingdom of Hungary in 1910, according to religions, was as follows: Roman Catholics, 10,888,000, Orthodox Greeks, 2,987,000, Calvinists, 2,621,000, Lutherans, 1,340,000, United Greeks and Roman Catholic Armenians, 2,025,500, Israelites, 932,000; Unitarians, 74,300.

History. The Hungarians—or, as they call themselves, the Magyars—have been settled in their present abode somewhat more than 1000 years. They constitute a branch of the Finno-Ugric race (Ural-Altaic family), their nearest kin being the Finns (See **HUNGARIAN LANGUAGE**). They figure in the old writers as Ugri, Wengri, Ungri, Ungari, Hungari. They first entered the lands now known as Hungary under the leadership of the legendary Árpád, who by 906 is said to have conquered the Slavic inhabitants. The invaders were a barbarous horde, who for more than half a century were the terror of the nations to the west and the south. They broke up the Moravian realm, made incursions into Germany and Italy, everywhere pillaging, burning, and slaughtering, and awakening superstitious terrors in the minds of the inhabitants, and carrying their devastations far and wide. At last the German kings succeeded in putting an end to their onslaughts. They were defeated in 933 by Henry the Fowler on the Unstrut, and Otho the Great vanquished them on the Lech in 955. Forced to accommodate themselves to a settled existence, and in possession of a fruitful

domain, the Hungarians showed themselves amenable to the civilizing influences emanating from without, and among other things they developed a capacity for the adoption of political institutions based upon Western models. In 975 their ruler, Geyza, embraced Christianity, which had begun to take root in the nation. His son Stephen, the first King of Hungary, known as "the Saint," was crowned in the year 1000 (some years after he began his rule), with a crown sent him by Pope Sylvester II, who at the same time bestowed on him the title of "Apostolic Majesty." With St. Stephen, whose reign of over 40 years terminated in 1038, a new era began for Hungary. Christianity took the place of heathen superstitions, the royal authority was firmly established, new laws were made, and the people advanced rapidly in civilization. After Stephen's death there was a reaction, and his immediate successors had to contend against a pagan revival and a general tendency to disintegration. Ladislas I the Saint (1077-95), renowned for his wise legislation and for great personal valor, proved a worthy successor of Stephen, and under his rule Hungary again became a strong kingdom, with its boundaries increased by the acquisition of part of Croatia. Coloman (Kálmán) (1095-1114), known as "the Learned," was far in advance of his age, as many of his laws show. He gained possession of Dalmatia. Under King Geyza II (1141-61) German colonists settled in north Hungary and in Transylvania, in consequence of which mining and several branches of industry made rapid progress. Andrew II (1205-35) is known in connection with the Crusades. The Golden Bull, the Hungarian Magna Charta, was granted by him to his nobles in 1222. Béla IV (1235-70) showed great qualities in subduing the pride of the nobles and in healing the wounds of his people after the terrible invasion of the Mongols in 1241. Andrew III was the last male scion in the Árpád line, dying without issue in 1301.

The succeeding period of Hungarian history, terminating with the battle of Mohács in 1526, witnessed the culmination and decline of the independent monarchy. Louis I, called "the Great" (1342-82), was the second king of the house of Anjou, which obtained the throne in 1308, being by his great-grandmother connected with the Árpád dynasty. He reestablished the authority of law, which under his predecessors had been openly violated by the powerful nobles. He promoted science, industry, and commerce. He had long and difficult struggles against the Turks and against the buffer colonies of Hungary, such as Moldavia, Servia, Bosnia, etc. The latter either became practically independent or else paid tribute to the Turks. Sigismund (1387-1437), the son-in-law of Louis, succeeded him as King, but he is better known as Holy Roman Emperor. In the person of Sigismund's son-in-law, Albert V of Austria (1438-39), the Hapsburgs first came into possession of the Hungarian throne. After his death the country was for a few years under the rule of King Ladislas of Poland, who was overwhelmed and slain by the Turks at Varna in 1444. He was succeeded by Ladislas the Posthumous, the son of Albert of Hapsburg, under whom the government was administered by John Hunyadi, an heroic figure in the wars between Christendom and the Turks. Hunyadi's son, Matthias I, ascended the throne in 1458. Matthias I—better known as Matthias Corvinus—has been called not only the greatest

King of Hungary, but also the greatest sovereign of his age. By his military successes, sagacity, and love of learning he raised his nation to a high pitch of splendor. From the death of Matthias (1490) to the fatal day of Mohács Hungary exhibited the fiercest strife of factions—a protracted agony, preceding the loss of national independence. Among the many calamities during the reign of Ladislas of Bohemia (1490-1516), the peasant war occupies a prominent place. Dózsa (qv) and his insurgent bands, after having committed great havoc, were exterminated by the famous John Zápolya, or Szapolyai, Voivode of Transylvania. Louis II (1516-26), who was also King of Bohemia, was but 10 years old at the death of his father, Ladislas. The Turks, who had been making incursions into the kingdom since the early part of the fifteenth century, took advantage of the anarchy under the young Louis to attempt the conquest of Hungary. In 1521 they captured Belgrade, and on Aug. 29, 1526, an army of 100,000 men under Solymán the Magnificent crushed the forces of the Hungarians at Mohács, where the King and more than 20,000 of his men perished. The national party in Hungary chose John Zápolya, Voivode of Transylvania, to be Louis's successor, while a part of the nobles offered the royal crown to Ferdinand of Austria (brother of the Emperor Charles V), between whom and Louis a double marriage connection had existed. After a struggle between the rivals and fresh invasions by Solymán the Magnificent (who had given his support to John Zápolya), Hungary, after 1541, remained rent into three parts. The central part of the kingdom, with the capital, Buda, came into the immediate possession of the Turks.

The Austrian power for a long time was confined to the western part of the country. The religious policy of the Hapsburg emperors and the activity of the Jesuits excited the fierce opposition of the Protestants, which culminated in 1604 in a great rising, headed by Stephen Bocskay (qv), who in the Peace of Vienna, in 1606, forced the Emperor Rudolph II to grant religious freedom to his Protestant subjects in Hungary. At the beginning of the Thirty Years' War (1618-48) and towards its close, the princes of Transylvania were in arms for the Protestant cause against the Hapsburgs. Ferdinand III (1637-57) was compelled to concede a large measure of self-government and religious freedom to the Hungarians, but his successor, Leopold I, initiated a policy of repression which led to a formidable uprising under Tokolyi (1678), who summoned the Turks to his aid. In 1683 Vienna, the capital of the Hapsburgs, after a heroic defense, was on the point of falling into the hands of the Moslems, when the victory achieved before the city by John Sobieski and the German princes turned the tide of war, and the power of Turkey collapsed. Buda was recovered by the Christians in 1686. After sanguinary vengeance had been wreaked on the leaders of the rebellion Leopold I forced the Hungarians in 1687 to declare the crown of Hungary forever hereditary in the house of Hapsburg. The dominion of the Turks rapidly disappeared from Hungary, the Treaty of Karlowitz (1699) left only the Banat in their hands, and that, too, was acquired by the Treaty of Passarowitz (1718) as a result of the victories of Prince Eugene. The Treaty of Karlowitz also secured Transylvania to the Hapsburgs. In 1703 Francis Rákóczy excited the

Hungarians to rise in defense of their liberties against the Austrian house, and a struggle ensued which was not terminated until 1711, when Charles VI immediately after his accession found it necessary to come to terms with his Hungarian subjects. Charles VI succeeded in gaining the approval of the Hungarians for his Pragmatic Sanction by the grant of extensive privileges, and after the Emperor's death, when the onslaught of Frederick the Great, the Saxons, the Bavarians, and the French threatened the dismemberment of the Austrian realm (1741), the nation rallied to the support of the young Queen, Maria Theresa, who had appealed to the National Diet, assembled at Pressburg. During her reign Hungary enjoyed an era of progress and prosperity. The reforms of Joseph II, her son and successor (1780-90), were received with violent opposition, because of their attack on the local liberties of the people through the institution of a strongly centralized administration. Bitter dissatisfaction was also aroused by the Emperor's attempts to make German the official language of the country. In 1790 Joseph II saw himself driven to repeal his measures of reform, except those dealing with the abolition of serfdom and the establishment of freedom of worship. Under Leopold II (1790-92) the old constitution was restored, but his successor, Francis I (1792-1835), ruled in an arbitrary fashion and seldom troubled himself to assemble the Diet. In his reign a great political upheaval began to manifest itself in Hungary. The period after 1815 witnessed the rapid development of an intense national (Magyar) consciousness, which evinced itself in the demand for a strictly constitutional government and the enactment of widespread reforms. The strife of parties was carried from the legislative hall to the press, and the Liberals grew in strength as their support among the mass of the people increased. This great national and reform movement, which was headed by such men as Széchenyi, Batthyányi, Eötvös, Deák, and Kossuth, and which was accompanied by remarkable activity in the field of literature, constitutes a brilliant and stirring episode in the annals of Europe in the second quarter of the nineteenth century. Notable gains were the Law of 1843, which made men not of noble blood eligible for office, and the enactment of measures for making the Magyar tongue the official language of Hungary. The revolutionary movement of 1848, which, emanating from France, convulsed a great part of Europe, brought upon Hungary a sudden and terrible catastrophe. In March of that year, immediately after the downfall of Metternich, who had so long guided the reactionary policy of Austria, the Hungarians were accorded an independent ministry. Under its guidance the progress of Liberal reform continued. But the hostile attitude of the Austrian court towards the new order, and the encouragement which it gave to the Croats and Wallachs, who rose in revolt against the Magyar rule, resulted in an open war between the house of Hapsburg and Hungary, which under the lead of Kossuth declared its independence in April, 1849. After an heroic struggle (the details of which will be found in the article AUSTRIA-HUNGARY), Hungary succumbed to the combined forces of Austria and Russia and was deprived of its constitutional liberties and treated as a conquered country. Before many years, however, the Emperor Francis Joseph was forced to recognize the necessity of

some kind of reconciliation with his Hungarian subjects, and the blow sustained by Austria at the hands of Prussia in 1866 brought about the reerection of Hungary as a constitutional kingdom. The demands of the Hungarian people, as set forth by their great spokesman, Francis Deák, were acceded to in the Ausgleich of 1867, by which the present dualistic frame of the Austro-Hungarian monarchy was established. The settlement was sealed by the coronation of Francis Joseph as King of Hungary on June 8 1867, the ceremony taking place at Buda with extraordinary pomp. The revived Magyar people now set itself with ardor to the task of the strengthening of its nationality, the introduction of political and ecclesiastical reforms, the extension of public education, and the development of the economic resources of the country. The nation enthusiastically followed the lead of the great Francis Deák, who at his death, in 1876, had an able successor in Tisza. The patriotic zeal of the Magyars has at times transgressed the bounds of moderation, and the measures taken to extend the use of the Magyar tongue have excited fierce opposition, especially in Croatia. The economic progress of Hungary in the last three decades of the nineteenth century resulted in a more aggressive attitude towards Austria.

The expiration of the commercial Ausgleich in 1897 was followed by prolonged negotiations with Austria, but though a new alliance was formulated in 1902, it failed to receive the approval of the respective parliaments. The contributions of the two halves of the monarchy to the common expenditure were determined provisionally from year to year by the Emperor. In 1903 the opposition began a violent campaign for the complete nationalization of the Hungarian army. In the contest the powerful Liberal party was overthrown early in 1905, and as the Independent majority led by Francis Kossuth declined to take office, an extraparlimentary condition ensued. The crisis, which was regarded in Austria as arising from the real desire of the Hungarian majority to transform the monarchy into a personal union, was averted by compromise in 1906.

The problems of Hungary concern not only Austria, but the subject races, mainly Slavonic, who constitute more than half of the population of the Kingdom of Hungary. The ruling race of Magyars, who form the overwhelming majority of the electors, have done everything in their power to Magyarize the country, but so far their efforts have not been successful.

In 1906 the Coalition ministry came into power pledged to universal manhood suffrage, but it did nothing to carry out this pledge for fear of losing Magyar ascendancy. On the contrary, the subject Slavs were persecuted more than ever. As a result of great demonstrations in favor of electoral reform, in 1908, Count Andrassy introduced a franchise bill which, while extending the suffrage, was so drawn as to insure Magyar hegemony. The bill aroused so much opposition that it was dropped.

The relations between Austria and Hungary, always contentious, became acute over the demand of Hungary for a separate national bank. The ministry divided on this matter, Count Andrassy opposed it, but the extremely nationalist Independence party, led by Ferencz Kossuth, the son of the great revolutionist, strongly favored the scheme. Realizing the threat to the dual monarchy contained in the project, Austria declared its opposition to it and started an agita-

tion among the non-Magyar population. The conflict over the bank became serious, as the Hungarian Parliament refused to vote the estimates. A new cabinet was formed in 1910 under Count Klueen Hederváry, a Moderate, which immediately went to the country in the issue of universal suffrage and conciliatory relations with Austria. The ministry was returned by an overwhelming majority, and the bank matter was dropped.

Another question which came to trouble Austro-Hungarian relations was that of a separate Hungarian army. Kossuth and his Independence party had put this demand in the forefront of their programme and in 1912 compelled the resignation of the Hederváry ministry because it refused to endorse it. The Emperor-King Francis Joseph then threatened to abdicate if such a law were enacted, and for this reason the matter was dropped.

The unceasing agitation for universal suffrage among the lower classes and subject races of Hungary finally compelled the Premier, Ladislaus von Lukács, to introduce a franchise bill (Jan. 2, 1912). This measure to some extent was democratic, as its provisions would have resulted in doubling the electorate. But the special electoral privileges given to age, class, property, and education so disappointed the Radicals and Socialists that they organized great demonstrations against the bill and threatened to call a general strike. Scenes of violence were enacted in the Hungarian Parliament. Count Stephen Tisza, the conservative President of the Chamber, became the subject of violent abuse on the part of the Radicals. The cabinet was forced to resign, and Count Tisza became Prime Minister. A new opposition party committed to democratic franchise reform was then organized by Count Andrassy. The Great European War of 1914 brought Hungary enthusiastically to the side of Austria. The Magyars in Hungary fear the Slavic propaganda of Russia almost as much as Austria, as a Russian victory would endanger the loyalty of the subject Slavs in Hungary as well as in Austria. HUNGARY, JACOB OF. See PASTORELS.

HUNG'ER. See DIGESTION, ORGANS OF.

HUNGERFORD, hūn'gēr-fērd, MRS. MARGARET WOLFE (c. 1855-97). An Irish novelist known by her pseudonym The Duchess, though the majority of her books were published anonymously. She was born at Ross Carbery, County Cork, where her father, Fitzjohn Stannus Hamilton, was rector and vicar choral of Ross Cathedral. She was twice married—to Edward Ar-

gles and to Thomas H. Hungerford. The Duchess began to write in 1877—*Phyllis* appearing in that year and her most successful novel, *Molly Bawn*, in 1878—and from that time to her death she published nearly 30 volumes of short stories and novels, which attained a remarkable popularity, and among which *His Geoffrey* (1881), *April's Lady* (1891), and *A Conquering Heroine* (1892) were favorites. They are sentimental and melodramatic, the plot conventional, but the reproduction of the general air and small chatter of society very truly done.
